Malignant neoplasm, is that diseases in which a crowd of cells illustrate abnormal growth, invasion and sometimes called metastasis . This disease begins in the moment that cells in body start to grow without control . More than 100 kinds of neoplasm are identified . The stimulation of tumors is named carcinogen, that have the capacity to change DNA in behavior that are inherited by daughter cells which called mutagens. Most of these tumors are associated to ecological, life, or expected behaviors . The statement “ecological”, as used by cancer investigators, means everything outside the body that reacts with humans . On the other hand some chemicals, like benzene, ketones, vinyl chloride, ethylene bromide, and dichlorodiphenyl-trichloroethane (DDT), known as carcinogens . When multiple factors are accumulated, altered genes and carcinogens change a normal cell into a cancerous one. Carcinogens which promote cancer have various precursors , exogenous and endogenous factor lead to cause Cancer development such as nutritional habits (food preservation and preparation), socio-economic status, way of life, physical agents (ionising and non-ionising radiation), chemical compounds (natural and synthetic) and biological agents (Helicobacter pylori, Epstein Barr virus, human T lym-phototropic viruses I and II, human papilloma virus and thehepatitis B virus .

Material and Method

Experimental animals and Tumor induction in rats:

Twenty female of Wistar albino rats and aged between (7-8) week were weighing between 150 – 250 g used in this study. All they were kept in ventilated cages, with temperature of 25±2C°. A 12:12 h light:dark cycle is regulated for the animals. Balanced rodent food and water is provided. The rats were randomly assigned to 2 groups, every group of 10 rats.

The following groups:
Group 1: Taking one dose of DMBA (positive control) 20 mg DMBA/kg body weight (single dose)

Group 2: Did not received any treatment (negative control).

**DMBA administration:** Breast cancer that induced by 7, 12-

Dimethylbenz (a) anthracene (DMBA). One dose of DMBA dissolved within corn oil and given orally to each groups with the syringe and needles. DMBA was taken from Sigma Aldrich and melted in corn oil. The concentration of the mixture was 20 mg DMBA per 1 ml corn oil for each rat.

**Preparation of tissue sample**

The liver was exteriorized and excised. All samples in the same time fixed in 10% formaldehyde. And then they processed in known method, and placed in paraffin for histopathological testing for liver. A scoring system (of no abnormalities, mild, moderate, severe) was used to classify the liver changes according to the severity of the damage and extent of histological changes. The histological sections were evaluated by a pathologist without prior knowledge of the treatment given to the animals.

Blood parameters were determined in whole blood by the applying rat method of veterinary practice with a blood cell counter (Abocus Junior Vet-5, Austria). Measurements of biochemical parameters were made with a Modular PP autoanalyzer (Mindray BS800, China).

**Result**

Histopathological findings: In the DMBA group, the livers exhibited dilatation of the sinusoids, cholangiohepatitis in the portal region, and congestion in the sinusoidal and portal regions (Figure 1A). The control group showed normal histological structure in the liver tissue (Figure 1B).

Hematological parameters also change in negative group compared of positive group Table 1, in positive group: white blood cell (WBC), LYM, MON, GRA and PLT while other parameter such as RBC was decrease. The state of free radicals and antioxidants is given in Table 2. As seen in Table 2, the levels of MDA increased in liver groups in compare with control group, also SOD, GSH-Px, CAT, and GSH values decreased.

Discussion

7, 12-dimethylbenz (α) anthracene (DMBA) is a famous carcinogen and immunosuppressor used in rodent model to learn tumor. DMBA is reported to make mutations by creation DNA adducts, while, it is a well-known skin carcinogen, however, lots of researchers have reported the harmful result of DMBA in liver. Liver is the main site of metabolism and is frequently prone to injury by xenobiotics. Obviously, liver cancer is the second most general source of cancer deaths universal.

A number of hematological and haematochemical parameters were altered when treated with DMBA and establish that DMBA caused hepatocellular carcinoma. New studies showed that DMBA-induced skin, oral, mammary and ovarian tumors.

The carcinogenic and mutagenic effect of DMBA needs to its metabolic activation by mixed gathering oxidases. The hydroxylation of DMBA at 7-methyl collection is a critical step towards its carcinogenesis. Additional metabolism of DMBA leads to development of a large range of metabolites with changeable toxicity. Along with these, trans-3,4-dihydrodiol-1,2-epoxide is the carcinogenic result of DMBA. The metabolic products of DMBA, when present within body, hampers ROS-antioxidant balance by overproduction of free radicals and the body go round reacts by modulating activities of antioxidant enzymes to control the destructive effects of an enlarged ROS.

Hematological and biochemical parameters may be affected by a variety of factors such as race, age, gender, pregnancy, lactation, muscular activity, area, season, environmental heat, maintenance, and nutrition.

A significant increase in the GPX, CAT, SOD level in rat treated with DMBA only was reported. On the other hand, find MDA substance increase significantly with rat treated with DMBA only.

Abstract

Background/aim: The aim of this study was to determine the expression of CD68, P53 and Bcl2 in thyroid tumors and correlation between them.

Materials and Method: The expression of CD68, P53 and Bcl2 was examined by immunohistochemistry on paraffin-embedded tissues obtained from patients with benign and malignant tumors between 2010 and 2015. Thirty three malignant thyroid tumors of variable subtypes and 10 benign tumors. The extents of staining and intensity were scored semi quantitatively.

Results: CD68 have shown strong positive score expression in (28.9%) in PTC while score was found in (18.5%). The higher percentage of strong weak positive score expression of P53 was in PTC (6.1%) Followed by (3.03%) strong score in FTC, (3.03%) moderate score in benign and (3.03%) in MTC. The expression of Bcl2 was higher in benign tumors (20%) than in malignant tumors were PTC (9.1%) followed by FTC (3.03%), the strong positive expression seen in MTC (9.1).

Keywords: Thyroid tumors, Immunohistochemistry, CD68, P53, Bcl2.

Introduction

The commonest type of endocrine malignancy is thyroid cancer, although it is rare. Thyroid cancer accounting for about 1.5% of all newly diagnosed cancer in the United States, its occurrence being steadily increasing worldwide in the last three decades. It is categorized into three main histological types: differentiated including “papillary, follicular and hurthle» «medullary» and «anaplastic» (aggressive undifferentiated tumor). Papillary thyroid carcinoma (PTC) represents 80.3% of malignant endocrine tumors and 65% of malignant thyroid tumors. According to Iraqi cancer registry, it ranks the eight cancers from commonest ten cancers in general and the second cancer in female (Iraqi cancer registry, 2019). Combined with there are different cellular and molecular factors that plays a role in development and progression of thyroid cancer. One of the main cellular constituents in the stromal of many cancers is “tumor-associated macrophages” (TAM). Advanced staging and poor prognosis in many human cancers including thyroid cancers related to tumorigenic role of “TAM”. TAMs have an essential role in tumor advancement at different levels, including stimulating genetic instability, nurturing cancer stem cells pavement the way to metastasis, taming defensive adaptive immunity. Transformations in the p53 gene are the most widely recognized in human cancer and they express to the most frequent genetic changes in malignant transformation. P53 protein assumes an essential role in the regulation of the cell cycle. Wild sort p53 protein is capable of inhibiting cell proliferation and transformation and it has been observed to be latent in tumor cells. This gene mutation is the most prevalent genetic alterations in human tumors and has been found in over 15% of thyroid neoplasm. The p53 gene mutations are promoting more aggressive cancers. Bcl2 protein is a modular of programmed cell death and is involved in both lymphoid and epithelial malignancies. The reporting of bcl2 protein expression in thyroid cancer has been sporadic and some have shown a down regulation of bcl2 in papillary carcinomas.

The present study aimed to evaluate level of CD68, P53 and Bcl2 expression in both malignant and benign thyroid...
tumors, and to correlate the results with the variable clinicopathological parameters (taking in respect the age and sex of the patients combined with tumor types histopathological).

**Materials and Method**

Our study involved paraffin-embedded tissue blocks samples of 43 thyroid tumors patients, of which 33 thyroid carcinomas and 10 benign as control group. All these samples were collected from the Pathology Department of Teaching Laboratories /Medical city and Central Public Health Lab between the years 2010-2015. All Hematoxylin and Eosin stained tissue sections were reviewed by pathologist. Immunohistochemistry study was prepared on serial sections and the antibodies panel that has been used is shown in the table below (table 1).

CD68, P53 and Bcl2 immunohistochemical staining.

Immunohistochemistry: Four µm sections were cut from formalin-fixed, paraffin-embedded tissue blocks and placed on polylysine-coated glass slides. After overnight packing at 65°C, tissue sections were deparaffinized in xylene and rehydrated in descending grades of alcohol. Antigen retrieval was performed in a water bath for 15 min in 95 °C citrate buffer pH 9.0 for CD68, P53 and Bcl2. Endogenous peroxidase action was blocked by 3% hydrogen peroxide. The sections were incubated at room temperature for 1 hour with primary monoclonal antibodies.

**Scoring of immunohistochemistry:** The stained slides were observed microscopically by histopathologist using the p53, Bcl2 and semiquantitative criteria: 0= negative; 1+ =<33% area of positive staining; 2+ =34-66% area of positive staining; 3+ = >67% area of positive staining. Positive staining was also graded on intensity, 0 to 2+. A combined score of 0 to 6 was allocated. Tumors assumed a score 0 to 1 were classified as negative; those given a score of 2 were ordered as weakly positive; a score of 3-4 was regarded as moderately positive; and a score of 5-6 was considered strongly positive.  

The proportion of CD68 cells in each tumor on each slide was assessed after staining. Based on a median value of 25%, weak (+) and strong positive (++) staining were defined as <25% and ≥ 25%, respectively.

**Statistical Analysis**

Data were analyzed by one -way analysis variance (ANOVA) followed by Fisher’s test for multiple comparison, using Statview version 5.0. Differences were considers “significant when p<0.05”. Reversion analysis was done by analysis of covariance (ANCOVA) likewise by Statview version 5.0.

**Results and Discussion**

**CD68**

In this study, the results of immunohistochemical analysis for CD68 have shown in table 2, 3 and 4. As shown in table 2 there significant correlation between CD68 with thyroid patients age less than (45 years) (P=0.01) and (P=0.0001) with thyroid patients age more than 45 years.
In table 3 and 4 the results recorded depended 2 scores weak positive and strong positive. There is significant difference between score of CD68 and gender (P.value: 0.058). (Table 3)

Score of CD68 showed associated with gender in table 2, from total 29 female were (20 cases, 98.9%) weak positive and (9 cases, 31%) strong positive while from 9 male were (5 cases, 55.6%) weak and (4 cases, 44.4%) strong positive.

P53

Expression of P53 was related with age group, gender and tumor type summarized in table 5. Of 26 patients were less than 45 year, only (5 cases, 11.6%) were positive. These 5 cases were 4 female and 1 male which of them 1 benign tumor case, (2, 6.1%) PTC, (1, 3.03%) FTC and (1, 3.03%) MTC.

Table 6 showed significant difference between score of P53 and gender (p.value:0.001).

The results in table 7 show that high percentage of strong score was in PTC (2 cases, 6.1%), followed by 1 case 3.03% strong score in FTC, 1 case 3.03% moderate score in benign and 1 case 3.03% in MTC.

Discussion

The host’s immune response to the tumor represent by macrophage infiltrates in the context of or surrounding a variety of malignancies \(^4,7\). The “tumor-associated macrophages” (TAMs) had fundamental jobs in tumor development and metastasis of various cancers, including advanced thyroid malignant growth \(^17\). This study demonstrated the presence of CD68+ in benign and malignant thyroid tumors. But all (7 cases, 18.5%) of CD68+ in benign were in weak score. While (11 out of 21)28.9% from PTC were strong positive score which came in similar with Qing et al. \(^,2012\) who investigated TAM density in both benign thyroid tumors and PTC by CD68 immunostaining. They establish that overall density of TAM was higher compared with “thyroid goiter” and “follicular adenoma”. On the contrary to previous studies, \(^17\) pointed to the expression of TAM in 36 PTC Patient with L.N metastasis using immunohistochemical staining with anti-CD68 antibody. And Ryder et al. \(^,2008\) who recorded a higher TAM thickness in ineffectively separated PTC and ATC This different was explained by the mixed cell populates of macrophage with CD136 ,CD68 and undifferentiated monocyte/macrophage which are for all positive for CD68 ,these kinds of macrophages play special roles in the advancement and progression HNSC \(^18\). Other study by \(^10\) using CD68 immunohistochemistry, observed that TAM anticipated metastasis in a number of patients. Of 121 patients with PTC, 15% had TAMs (CD68) that seemed to have a phagocytic capacity on cancerous cells. These patients had fundamentally less blood vessel attack and remote metastasis and largely supplementary invasion lymphocyte and dendritic cells, than patients without a CD68 cells. Further, the findings of the current study are in similar with other study by \(^21\).

Who observed expression of p53 was more frequently in malignant than in benign lesions. Since p53 has been known to be rarely mutated in well differentiated tumors of the thyroid where an frequently expressed in poorly differentiated or undifferentiated tumors which are of different number, in our study, however there is a concerned of tumor suppressor gene where it plays an important role in cancer progression. Yet a serious studies should that it plays a role in early stages different types of cancers including thyroid cancers. We found a moderate immunoreactivity of Bcl2 in cytoplasm of epithelium of the benign and well-differentiated PTC and these findings are accordance with other studies by \(^21\).

Conclusion:

CD68 + macrophages are key players in thyroid tumors microenviroment leading to thyroid tumor development where its indirectly correlated with BCL2 family oncoproteins where antiapoptotic pathway is down regulated leading to increased aggregates of CD68+macrophages and that CD68+macrophages are positively correlated with p53 gene mutation expression where both markers can explain the biological behavior of tumor. BCL2&P53 have an inversed correlation since both have an opposite functions (p53 represent cell death gene while bcl2 is an antidote to a programmed cell death ,bcl2 was more expressed in benign tumor in our study than in malignant tumors unlike to p53.
where its more expressed in WDT (PTC 6% followed by FTC 3.03%) indicating that expression of p53 may be a late event in thyroid tumor genesis and that there’s a mutual expression between both bcl2 & p53 in thyroid tumors.

Prevalence of Lung Cancer in Non Smoker Patients Attending Al-Diwaniyah Teaching Hospital

Hassan Raji Jallab1, Thimar Malik Khudhair2
1M.B.Ch.B., H.D.S.M. (PH.D.) College of Medicine/ University of Al- Qadisiyah, Iraq,
2 M.B.Ch.B/ Al-Diwaniyah Teaching Hospital / Al-Diwaniay Province/ Iraq

Abstract

Background: Smoking is a well known risk factor that is implicated in a number of human malignant disorders.

Aim of the study: To study the prevalence of lung cancer in a sample of Iraqi non smoker patients and the main risk factor implicated in such malignant tumor.

Patients and Method: In this hospital based study, in order to explore the prevalence rate of bronchogenic carcinoma in non smoker patients, it retrospectively collected data about those patients for the last four years, starting from January 2016 through June 2019. These information were retrieved from patients records that are already present in oncology and respiratory units in Al-Diwaniyah teaching hospital, Al-Diwaniyah province, Mid-Euphrates region of Iraq. The following variables were included in the questionnaire form: Age, gender, occupation, education level, residency, socioeconomic status, marital status history of smoking, history of second hand smoking, number of household smokers, type of smoking, history of alcoholism, history of chronic illness, the main presenting clinical features and clinical features of carcinoma and finding in examination as well as those obtained from investigations.

Results: In the current study, the prevalence rate of all cases of lung cancer during the period of study was 61 out of 403 (15.1 %). the rate of lung cancer in none smokers, in the current study, was 39.3 %. Old age individuals were the main age group affected and there was female predilection. there was also no significant difference in the distribution of patients and control subjects according to residency, occupation, level of education marital status and socioeconomic status (P > 0.05). In the current study, the prevalence rate of passive smoking in patients was significantly higher than that in control subjects, 70.8 % versus 40 %. Moreover, the number of household smokers was significantly higher inpatients group than in control group.

Conclusion: Lung cancer in non smokers appears to be significantly correlated with passive smoking in addition to increase incidence in old age and women.

Key words: Prevalence; Lung Cancer, Non Smoker, Iraq.

Introduction

The term, never smokers, refers to persons who have smoked fewer than 100 cigarettes in their lifetime, including lifetime nonsmokers. Most studies that track the trend of lung cancer rates often include both smokers and never smokers, and few studies independently study the trends over time for never smokers because of the limited longitudinal collection and the limited reliability of smoking information in population-based registries. From what is available, however, the overall global statistics estimate that 15% of lung cancers in men and up to 53% in women are not attributable to smoking, with never smokers accounting for 25% of all lung cancer cases worldwide 1. If lung cancer in never smokers were considered separately, it would rank as the seventh most common cause of cancer death worldwide before cervical, pancreatic, and prostate cancer 2. In countries in South Asia, up to 80% of women with lung cancer are never smokers 3. In the United States, one study estimated that 19% of lung cancer in women and 9% of
Lung cancer in men occurs in never smokers\(^4\). The age-adjusted rate for lung cancer in never smokers (ages 40–79 years) ranged from 11.2 to 13.7 per 100,000 person-years for men and from 15.2 to 20.8 per 100,000 person-years for women. The rates are 12 to 30 times higher in current smokers of the same age group. Lung cancer included heterogeneous group of malignant epithelial disorders that comprises squamous cell carcinoma, adenocarcinoma, small cell carcinoma and large cell carcinoma as well as a number of rare histopathological subtypes such as bronchoalveolar carcinoma. The most common subtype by far is squamous carcinoma and is mainly attributed to smoking but a number of cases have been reported in life time non smokers. Because of the shortage of Iraqi literatures dealing with lung cancer in non smokers since most published Iraqi articles deal with smoking related lung cancer, and because we are interested in making an idea about the prevalence rate of lung cancer in non smokers and to outline its possible risk factors in our community we planned and conducted the current study to one of leading articles in the Mid-Euphrates region dealing with this important human cancer.

**Patients and Method**

In this hospital based study, in order to explore the prevalence rate of bronchogenic carcinoma in non smoker patients we prospectively interviewed 5 cases during 2019 and retrospectively collected data about those patients for the last 3 years, starting from January 2016 through June 2018. These information were retrieved from patients records that are already present in oncology and respiratory units in Al-Diwaniyah teaching hospital, Al-Diwaniyah province, Mid-Euphrates region of Iraq. However for purpose of comparison in order to evaluate possible risk factors in association with non smoker bronchogenic carcinoma we included in the study 25 apparently healthy individuals serving as control group. Records of all patients with established diagnosis of bronchogenic carcinoma were included in the present study. Variables were registered concerning those patients who are never smokers. Although records of smoker patients with bronchogenic carcinoma were retrieved, information about them were used for calculation of prevalence rate of lung cancer in non smoker only, and the rest of information were excluded. The total number of patients with all kinds of malignant tumor was also obtained to calculate the prevalence rate of bronchogenic carcinoma out of all malignant tumors. The following variables were included in the questionnaire form: Age, gender, occupation, education level, residency, socioeconomic status, marital status, history of smoking, history of second hand smoking, number of household smokers, type of smoking, history of alcoholism, history of chronic illness, the main presenting clinical features and clinical features of carcinoma and finding in examination as well as those obtained from investigations. The study was approved by the institutional ethical approval committee and formal agreement was obtained from the directorate of Health in Al-Diwaniyah province, the formal representative of Iraqi Ministry of health. Data were collected and transformed into a spread sheet of Microsoft Office Excel 2010 and then into an SPSS (statistical package for social sciences) version 23. Numeric quantitative data were expressed as mean, range and standard deviation (SD), whereas, qualitative data were expressed as number and percentage. Comparison of mean between any two groups was done according to independent sample t-test, while chi-square test was used to evaluate association between any two categorical variables. The level of significance was considered at \( P \leq 0.05 \).

**Results**

During that period the number of cases with malignant tumors, including lung cancer, accounted for 403. In addition, the total number of cases with lung carcinoma during the period of study, irrespective of smoking, was 61. Therefore, the prevalence rate of all cases of lung cancer during the period of study was 61 out of 403 (15.1 %), out of which 24 cases were associated with evidence of passive smoking (39.3 %). Table 1 outlines the comparison of age between control and patients group. There was no significant difference in mean age between patient and control group, 61.63 ±15.31 years versus 68.28 ±8.50 years, respectively (\( P = 0.065 \)). The age range of patients with bronchogenic carcinoma was form 30 – 85 years. In addition the frequency distribution of patients according to 10 years intervals was as following: 8.3 %, 16.7 %, 4.2 %, 41.7 %, 12.5 % and 16.7 % as 30-39 years, 40-49 years, 50-59 years, 60-69 years, 70-79 years and ≥ 80 years, respectively. Thus, the highest incidence rate was observed at age interval of 60-69 years, table 1.

With respect to gender, women accounted to 15 out 24 patients with bronchogenic carcinoma thereby accounting for 62.5 %, making the male to female ratio 1:1.7. Control group included 12 men and 13 women; therefore there was no significant difference in the distribution of patients and control subjects according to gender, as shown in table 2. There was also no significant difference in the distribution of patients and control subjects according to residency, occupation, level of education marital status and socioeconomic status (P > 0.05), as shown in table 3. Regarding bad habits, none of patients or control subjects admit to be alcoholic of experience cigarette smoking.

Discussion

In the current study, the prevalence rate of all cases of lung cancer during the period of study was 61 out of 403 (15.1 %). It has been estimated that lung cancer accounts for about 16 % of all cancers, a proportion that is nearly similar and in total agreement with our finding. On the other hand, the rate of lung cancer in none smokers, in the current study, was 39.3 %. Most published articles indicated that the proportion of non smokers with lung cancer ranges between 10 to 25 % (6,7, 8,9). This indicates that a significant proportion of patients with bronchogenic carcinoma, in our study, have acquired the disease irrespective with cigarette smoking. Therefore, identifying other possible risk factors in association with lung cancer in those patients was the main aim of the current study. Indeed, we supposed that passive smoking may play a principal role in the development of lung cancer in patients who are not habitual smokers. Unfortunately lung cancer in never-smokers has been studied far less extensively than tobacco-related lung cancer. This indicates that age by itself may be a risk factor. Indeed, most published articles dealing with lung cancer in non smokers has linked age as a potential risk factor for such malignant disorder (10, 11,12,13). Older age is associated with cancer development due to biologic factors that include DNA damage over time and shortening telomeres. Accordingly, the median age of lung cancer diagnosis is 70 years for both men and women. On the other hand and with respect to gender, in the current study, women accounted to 15 out 24 patients with bronchogenic carcinoma thereby accounting for 62.5 %, making the male to female ratio 1:1.7. There are conflicting data regarding the possibility that women may be more susceptible to developing lung cancer 15. There is a higher rate of lung cancer in non-smoking women compared with non-smoking men, a higher proportion of epidermal growth factor receptor (EGFR) mutations in female NSCLC, and a higher incidence of adenocarcinoma with lepidic features in women (16,17). Some genetic mutations found to be more common in females may predispose toward lung cancer development in women, including over-expression of the CYP1A1 gene, mutation of the glutathione S-transferase M1 enzyme, mutations of the p53 tumor suppressor gene, and over-expression of X-linked gastrin-releasing peptide receptor (15, 16,17). Moreover, in the current study, there was also no significant difference in the distribution of patients and control subjects according to residency, occupation, level of education marital status and socioeconomic status (P > 0.05). In agreement with our results, a number of authors have denied any association between residency, rural versus urban and lung cancer (18,19). Exposure to pollutant in association with occupation is the main hazard precipitating to lung cancer. The occupational and environmental exposure to carcinogenic agents is an everyday phenomenon.

Aging Influence Mitochondrial Dysfunction and Oxidative Stress through Check Some Proinflammatory Cytokines Levels and Oxidant Status in Older Adults: an Observational Study

Kaniaw R. Khafar1, Esmail S. Kakey2
1Sulaimany Technical Institute, Sulaimany Polytechnic University, Sulaimany, Iraq, 2Biology Department, Faculty of Science and Health, Department of biology, Faculty of science & Health, Koya University, Koya KOY45, Kurdistan Region – F.R. Iraq

Abstract

The experiment design is that of a cohort study within the setting of a medium private laboratory with participants being common people (healthy individuals of 20–99 years=108; mean age 55 years and 71.3% man) were classified into six age groups. Oxygen saturation (SpO2), pulse rate, systolic blood pressure (CSBP) and diastolic blood pressure were assessed. Blood sera (once) was obtained for proinflammatory cytokines levels (including c-reactive protein (CRP), insulin growth factor-1 (IGF-1), apolipoprotein E (apoE), interleukin 6 (IL-6), 8-hydroxy-2’–deoxyguanosine (8-OHdG) and tumor necrosis factor-α (TNF-α)) and oxidant status (including malondialdehyde (MDA), superoxide dismutase (SOD) and total antioxidant capacity (T-AOC) analysis. The mean calculated of the whole participants were equal for proinflammatory cytokines levels: CRP 3.24 mg/dL, IGF-1 54.03 ng/mL, apoE 488.29 mg/mL, IL-6 65.464 pg/mL, 8-OHdG 1.34 ng/mL and TNF-α 105.63 pg/mL; and oxidant statue: MDA 0.59 ng/mL, SOD 3.48 U/mL and T-AOC 1.21 mmol/L, receptively. Our findings highlighted that survey of mitochondrial dysfunction and oxidative stress through check some proinflammatory cytokines levels and oxidant status of aging in older adults can be applied to build a global frailty index as a tool to quantify aging in preclinical experiments.

Keywords: Physiological aging, Proinflammatory cytokines, Oxidant status, Adults, Iraq

Introduction

The world population continues to grow older rapidly, mostly because of declining fertility and increasing longevity. For this reason, aging research has experienced an unprecedented advance over recent years, particularly with the discovery that the rate of aging is controlled, at least to some extent, by biochemical processes and genetic pathways conserved in evolution.

Aging is a process of the progressive functional decline of various physiological functions in various organs and tissues with time, which lead to disability, dependence, morbidity, and mortality. This reduction manifests as a decreased physiological reserve in response to a time-dependent failure of complex molecular mechanisms and stress (termed homeostenosis) that cumulatively create disorder.

Given the intricacy of the ageing process in organism, the underlying exact mechanisms are still not good understood. In current literature, free radical theory of aging is the most intriguing among the various mechanisms that are postulated to participate in the course of aging. And, mitochondria are important determinants of cellular homeostasis and longevity since they are the main producers of cellular ATP and play a vital role in regulation of apoptotic death pathways in many tissues. And, based on free radical theory of aging mitochondria are the origin source of intracellular reactive oxygen species (ROS, which are not readily

Email: kaniaw.khafar@spu.edu.iq
removed) in normal human aging. ROS accumulate as side products of the electron transport chain, causing mitochondrial dysfunction.  

In the past decade, efforts to develop an aging metric based on genetic profiles, epigenetic changes and telomere length have met with limited success. Thus, inflammatory cytokines and oxidant status proportion in the blood may be practical to monitoring those at risk of cognitive and functional decline in older adults aging. The main aim this experiment a set of unifying hallmarks of free radical theory of aging that has been defined providing an outline for understanding the process of mitochondrial ageing and oxidative at older adults function through check some proinflammatory cytokines levels and oxidant status.

**Materials and Method**

**Experimental design**

The experiment design is that of a cohort study within the setting of a medium private laboratory with participants being common people (healthy individuals of 20–99 years=108; mean age 55 years and 71.3% man) were classified into six groups according to age of participants (years): I) 20-39 (n=15); II) 40-49 (n=24); III) 50-59 (n=23); IV) 60-69 (n=22); V) 70-79 (n=13) and VI) 80-99 (n=11). All samples were obtained from Sulaimani Nursing House and New Medical Center (Private Laboratory) from December-2016 to April-2017. Experimental protocols were approved by the Ethics Review Committee of Medicine, Sulaimani Nursing House, Iraq (approval no: 0529.1.75/3).

**Data collection**

Reagents and equipment were purchased from Roche (Germany). Before blood sampling, operators medical were took some clinical examination from participants including oxygen saturation variability (as described previously by), pulse rate, systolic blood pressure (SBP) and diastolic blood pressure (DBP) by automated Watch Allyn sphygmomanometer (Germany). Fasting blood samples (once) were obtained of all participants into vacuum tubes (non-heparinized) for the assay of serum. The serum was separated by centrifugation (15,000×g for 10 min), kept at −80 °C and assessed by Human ELISAs kit, as recommended by the manufacturer.

**Sera proinflammatory cytokines and oxidant measurements**

The sample characteristics of proinflammatory cytokines and oxidant statue kits are shown in Table 1. Blood sera was obtained for assay proinflammatory cytokines levels (including c-reactive protein (CRP), insulin growth factor-1 (IGF-1), apolipoprotein E (apoE), IL-6, 8-hydroxy-2′–deoxyguanosine (8-OHdG), and tumor necrosis factor-α TNF-α) and oxidant statue (including MDA, SOD, and total antioxidant capacity (T-AOC)) analysis.

Statistical Analysis

The results were analyzed using the SPSS 22 software. ANOVA and post-hoc LSD test was used to test differences between treatments. The results were expressed as the mean ± standard deviation (SD). Differences with values of \( p<0.05 \) were considered statistically significant.

Results

No participant recruited chose to withdraw from the experiment then all participants were considered for analysis. The descriptive statistics presented in Table 1, show that the highest (97.4±0.99) and least (95.45±2.77) mean of oxygen saturation (SpO2) in groups of 20-39 and 80-99 years, respectively. And, the only significant differences were detected between the groups 70-79 and 80-99 years (\( p<0.05 \)). The analysis revealed that significant differences for pulse rate (\( p=0.037 \)) and systolic blood pressure (\( p=0.005 \)) were detected between the means of the age groups, but the pattern was not consistent. The mean pulse rate of the whole participants was 78.06 beat/minute. Higher means were detected in the young and the old age groups, and the lowest were observed in the 50-69 years group. The highest (136.82±11.89) and least (119.71±13.2) mean of systolic blood pressure (mmHg) were shown in groups of 80-99 and 40-49 years, respectively. The diastolic blood pressure of the whole sample was 84 mmHg. The highest mean (107.83±12.5) diastolic blood pressure (mmHg) was in the age group 50-59 years, but the difference was not significant (\( p=0.482 \)).

SpO2: oxygen saturation; SBP: systolic blood pressure; DBP: diastolic blood pressure

The same letters mean non-significant difference, while the different letters mean significant difference at \( p<0.05 \).

Table 3 and 4 provides a summary of the outcomes for sera levels of proinflammatory cytokines and oxidant statue by treatment group and study time points. The mean calculated of the whole participants were equal for proinflammatory cytokines levels: CRP 3.24 mg/L, IGF-1 54.03 ng/mL, apoE 488.29 mg/mL, IL-6 65.46 pg/mL, 8-OHdG 1.34 ng/mL and TNF-α 105.63 pg/mL; and oxidant statue: MDA 0.59 ng/mL, SOD 3.48 U/mL and T-AOC 1.21 mmol/L, receptively. Several parameters significantly differed between age groups. The blood sera analysis in all age groups revealed that the levels of some proinflammatory cytokines (except IGF-1) and oxidant statue (except MDA) adults in middle to late adulthood significantly decreased \( (p<0.001) \). The kits analysis revealed that the levels of IGF-1 (chemiluminescent/immunometric assay) and MDA (colorimetric/fluorometric assay) adults in middle to late adulthood decreased and increased, receptively \( (p<0.001) \). LSD test showed that mean of IGF-1 the significant difference between each of two groups except for the difference between groups of 70-79 and 80-99 years \( (p=0.244) \). In contrary, mean of MDA the significant difference between each of two groups except for the difference between groups of 20-39 and 40-49 years \( (p=0.975) \).

Discussion

Pulse oximetry is a method used to quantify SpO2 non-invasively. And, it is a technique regularly utilized clinically whether that be in concentrated consideration, in medical procedure, or in some out-patient clinics. The results current experiment showed no substantial variance between groups in association with SpO2, only a slight decreasing was found in group of 80-90 years age, and it’s in agreement with the study of in which the SpO2 showed no substantial variance in groups under 35 ages and above 50 ages. Other previous studies indicated that there were a number of ways in which free radicals are formed but their most abundant source are the mitochondria (which uses some 90% of the O2 used by the human body) where oxygen is reduced in sequential steps to produce water. CRP functions as a marker of systemic inflammation and is one of the top studied inflammatory biomarkers in coronary arterial disease. According to the current edition of Harrison’s Principles of Internal Medicine (2012) the normal range of CRP 0.2–3.0 mg/L, while the presently obtained results showed that adults in middle to late adulthood showed higher serum CRP levels 3.0-5.0 mg/L (Table 3). Importantly, the population differences should also be taken into multiple factors including genetics, environmental conditions, developmental programming determine maximal organ function, diet and polymorphism which varies significantly between individuals.
In summary, described that IGF-1 the cross road of the nutritional, inflammatory and hormonal pathways to frailty. And, targeted deletion of specific genes has demonstrated that multiple components of the IGF-1/insulin signaling pathway play a role in the aging process spanning from nematodes to rodents. This hormone endorses cell survival, prevents apoptosis, and motivates neurogenesis in the hippocampus that affected early in Alzheimer disease. The results of our investigation showed that the minimum IGF-1 (ng/mL) mean (38.15) was observed in group 80-99 years age, while the maximum mean (78.36) was displayed in group 20-39 years age (Table 3).

Previous studies indicated that apoE is a useful player in studies of longevity and age-related diseases, such as inflammatory status and atherosclerosis that are known risk factors for functional decline and early mortality. Moreover, it is possible that apoE may also play a role in other pathological conditions including, for example, cancer, rheumatoid arthritis and macular degeneration, but the exact biological mechanisms underlying these observations are poorly understood until now. Our study observed the least (251.97±74.48) and highest (821.98±77.68) mean of apoE (ng/mL) were shown in groups of 20-39 and 80-99 years, respectively (Table 3).

Measuring biomarker signatures of inflammation, such as IL-6, TNF-α, and IL-1β that change with aging may be an effective way to assess for inflammaging in older adults and thus risk for inflammatory diseases with high morbidity and mortality rates. The results observed in the present study that extreme mean of IL-6 (95.45 pg/mL) and TNF-α (171.46 pg/mL) in group 80-99 years, and the minimum mean IL-6 (46.73 pg/mL) and TNF-α (59.92 pg/mL) in group 20-39 years age (Table 3).

**Conclusion**

This study might provide a therapeutic target for aging and age-related disease. On the other hand, “check some proinflammatory cytokines levels and oxidant status”, can be itself considered a hallmark of ageing.

Robust Bayesian Estimators For Survival Function Under Prior Data Conflict With Practical Application in the Health Side

Entsar Arebe Al.Doori¹, Ahmed Sadoun Mannaa¹
¹Baghdad University, College of Administration & Economic, Department of Statistics, Iraq; Emil:entsar_

Abstract

The analysis of survival functions is concerned with knowing how long humans will survive. This means studying and analyzing the time from the beginning of the disease to the end point of death. For example, the survival function of patients with heart attacks was studied and analyzed at Al Manathira General Hospital. The Weibull distribution was used to match the real data. The scale parameter & survival function have been estimated for Weibull distribution with have two parameters, this distribution was used in two cases, prior data unconflict & prior data conflict. A regular Bayes method & robust Bayes were used for estimation. We used inverse gamma distribution as a prior where it is a conjugate prior for Weibull distribution. Two simulation experiments have been used; the first experiment used was prior data unconflict where the regular Bayes method is the best for estimating the scale & survival function by using the integrated mean square error (IMSE) as a criterion for comparing. The second experiment is in the case of prior data conflict. The results showed that the robust Bayes method is the best for estimation of the scale parameter & survival function by using (IMSE).

Keyword: Robust Bayesian, Prior data conflict, Survival function, iLuck Model, Regular Bayesian

Introduction

The statistical inference in the Bayesian method also relies on the prior information or the so-called prior distribution so that the prior distribution is combined with the distribution of observations according to the base of the Bayes rule so we get the posterior distribution from here, a problem might appear, which is the prior data conflict (prior data are the default values For the prior distribution parameters), ⁶. In the sense that the prior data does not necessarily correspond with the views or sample under study, and because of that you should know the existence of this problem or not when using the methods of Bayesian estimation, & to know the existence of this problem by modeling the parameters of the prior distribution, ⁸. So that the prior distribution should be the conjugate prior, & then after modeling the prior distribution parameters we produce the standard deviation of the prior distribution & the standard deviation of the posterior distribution, ¹¹. If the value of the standard deviation of the prior distribution is greater than the standard deviation of the posterior distribution, then there is a problem, ¹⁰. Hence, the main objective of our research is to obtain the best estimate of the survival function under prior data conflict by addressing this problem by assuming a set of prior information to obtain a set of prior distributions & thus we will obtain a set of posterior distributions, ⁷.⁸ After that, we obtain the estimates that are more efficient & accurate so that the method is called the robust Bayesian estimation, where a two-parameter Weibull distribution will be used to estimate the parameter of scale parameter & survival function because it is considered to be the most common distributions of survival models. ⁹ So that the use of the usual Bayesian method & the robust Bayesian method for estimating the scale parameter & survival function & the IMSE will be used to compare these methods.

The estimation of methods

We will estimate the survival function for Weibull distribution & the scale parameter λ & consider the shape parameter β is known, in the Bayesian & robust Bayesian method as shown below:
\[ f(t) = \frac{\beta}{\lambda} t^{\beta-1} e^{-\frac{t^\beta}{\lambda}} \]  

(1)

The prior distribution of the parameter \( \lambda \) will be used, which is inverse gamma:

\[ f(\lambda | a, b) = \frac{b^a}{\Gamma(a)} \lambda^{-a-1} e^{-\frac{b}{\lambda}} \]  

(2)

Then we get the posterior distribution as follows:

\[ f(\lambda | t) = \frac{\left( \sum t_i^\beta + b \right)^{(a+n)}}{\Gamma(a+n)} \lambda^{-(a+n)-1} e^{-\frac{(\sum t_i^\beta + b)}{\lambda}} \]  

(3)

The above equation is the posterior distribution of parameter \( \lambda \), & according to the quadratic loss function mean that the posterior distribution represents the Bayes estimator of parameter \( \lambda \) as shown below:\footnote{3}.

\[ \hat{\lambda} = \frac{(b + \tau(t))}{a + n} \]  

(4)

where \( \tau(t) = \sum t^\beta \)

2-1-2: Bayesian Estimation for Survival function

The estimation of the survival function & it is based on the quadratic loss function as shown below by:\footnote{2}:

\[ \hat{S}(t) = \int_0^\infty S(t) h(\lambda | t) \, d\lambda \]

\[ \hat{S}(t) = \left( \frac{b + \tau(t)}{b + \tau(t) + t^\beta} \right)^{a+n} \]  

(5)

Robust Bayesian Method

Checking for prior data conflict

Suppose that we have a sample distributed with the Weibull distribution & concisely \( t \sim \text{wei}(\beta, \lambda) \) as shown below:\footnote{11,12}:

\[ f(t | \lambda, \beta) = \frac{\beta}{\lambda} t^{\beta-1} e^{-\frac{t^\beta}{\lambda}} \]

The prior distribution of the scale parameter \( \lambda \) is inverse gamma because it is conjugate prior as shown below:

\[ f(\lambda | a, b) = \frac{b^a}{\Gamma(a)} \lambda^{-a-1} e^{-\frac{b}{\lambda}} \]

Then the prior parameters need to update so that it is \((n^0 > 1, y^0 > 0)\) instead of the parameters \((a, b)\), through two methods, we get the prior distribution as shown below:

\[ E(\lambda | a, b) = y^0 = \frac{b}{a-1} = \frac{b}{n^0} \Rightarrow b = n^0 y^0, n^0 = a - 1 \Rightarrow a = n^0 + 1 \]
After that, the prior distribution is obtained by the parameters $n^0$, $y^0$, through testing the problem of prior-data conflict as shown below:

$$f(\lambda/n^0y^0) = \frac{(n^0y^0)^{n^0+1}}{r(n^0+1)} \lambda^{-(n^0+1)-1} e^{-\frac{n^0y^0}{\lambda}}$$  \hspace{1cm} (6)

$y^0$: The prior guessing for the scale parameter $\lambda$.

$n^0$: The prior guessing to sample size $n$.

The equation above represents the distribution of prior by parameters $n^0$, $y^0$, which is also inverse gamma. After we obtain the prior distribution with parameters $n^0$, $y^0$, we derive the standard deviation of this distribution.

$$M_r = \frac{(n^0y^0)^r}{r(n^0+1)} r(n^0 - r + 1)$$  \hspace{1cm} (7)

$$s.d\ prior = \sqrt{\frac{(y^0)^2}{1-n^0}}$$  \hspace{1cm} (8)

The equation above represents the standard deviation of the prior distribution, & then the posterior distribution is derived as shown below:

$$f(\lambda|t) = \frac{(n^0y^0+\tau(t))^{n^0+n+1}}{r(n^0+n+1)} \lambda^{-(n^0+n+1)-1} e^{-\frac{(n^0y^0+\tau(t))}{\lambda}}$$  \hspace{1cm} (9)

After the posterior distribution is obtained & according to the equation above we derive the standard deviation for the posterior distribution as shown below:

$$M_r = \frac{(n^0y^0+\tau(t))^r}{r(n^0+n+1)} r(n^0 + n - r + 1)$$  \hspace{1cm} (10)

$$s.d\ posterior = \sqrt{\frac{(n^0y^0+\tau(t))^2}{(n^0+n)(n^0+n-1)}}$$  \hspace{1cm} (11)

Equation (13) represents the standard deviation of the posterior distribution to compare the standard deviation of the prior distribution of parameters $n^0$, $y^0$ with the standard deviation of the posterior distribution. If the standard deviation of the prior distribution is greater than the standard deviation of the posterior distribution, this means a prior-data conflict. This problem is needed to solve through the following steps.
A second way to obtain variance for posterior distribution is through the steps below:

As \( f(\lambda/t, n^0, y^0) = f(\lambda/n^ny^n) \) It means:

\[
f(\lambda/t, n^0, y^0) = f(\lambda/n^ny^n) = \frac{(n^0y^n)n^{n+1}}{t(n^{n+1})} \lambda^{-(n^{n+1})-1} e^{-\frac{n^0y^n}{\lambda}}
\]  

(12)

The variance of this distribution is:

\[
V(\lambda/n^n, y^n) = \frac{(y^n)^2}{1 - \frac{1}{n^n}}
\]

Therefore, the standard deviation of the prior distribution & the standard deviation of the posterior distribution can be written according to the following formula:

\[
s.d \text{ prior} = \sqrt{\frac{(y^0)^2}{1 - \frac{1}{n^0}}}
\]  

(13)

\[
s.d \text{ posterior} = \sqrt{\frac{(y^n)^2}{1 - \frac{1}{n^n}}}
\]  

(14)

Address the problem of prior data conflict

Although this is a problem of prior-data conflict, a model can be presented to address the problem of prior-data conflict, through the submission of a set of parameters prior as suggested by 5. Through the following model \( \prod_0^n = n^0x[y^0, y^0] \). Another suggestion was made by 7. For result a set of prior parameters through the model \( \prod_0^n = [n^0, \bar{n}^0]x[y^0, y^0] \). In general the model submitted for resulting a set of prior parameters is called (generalized iLuck-Model). Then we get the updated parameters to be more accurate as shown in the following steps 10:

\[
f_1(\lambda/n^0, y^0) = \frac{(n^0y^0)n^{n+1}}{t(n^{n+1})} \lambda^{-(n^{n+1})-1} e^{-\frac{n^0y^0}{\lambda}}
\]  

(15)

\[
f_2(\lambda/n^0, \bar{y}^0) = \frac{(n^0y^0)n^{n+1}}{t(n^{n+1})} \lambda^{-(n^{n+1})-1} e^{-\frac{n^0y^0}{\lambda}}
\]  

(16)

\[
f_3(\lambda/\bar{n}^0, y^0) = \frac{(\bar{n}^0y^0)n^{n+1}}{t(n^{n+1})} \lambda^{-(n^{n+1})-1} e^{-\frac{n^0y^0}{\lambda}}
\]  

(17)

\[
f_4(\lambda/\bar{n}^0, \bar{y}^0) = \frac{(\bar{n}^0y^0)n^{n+1}}{t(n^{n+1})} \lambda^{-(n^{n+1})-1} e^{-\frac{n^0y^0}{\lambda}}
\]  

(18)

\( n^0 \): lower, \( \bar{n}^0 \): upper
\( \bar{y}^0 \): upper
\( y^0 \): lower

The equations (15)-(18) represent a set of prior distributions & a set of posterior distributions is obtained as shown below:

\[
f_1(\lambda \mid t) = \frac{(n^0 y^0 + \tau(t))n^0 + n + 1}{r(n^0 + n + 1)} \lambda^{-(n^0 + n + 1)-1} e^{-\frac{(n^0 y^0 + \tau(t))}{\lambda}} \tag{19}
\]

\[
f_2(\lambda \mid t) = \frac{(n^0 y^0 + \tau(t))n^0 + n + 1}{r(n^0 + n + 1)} \lambda^{-(n^0 + n + 1)-1} e^{-\frac{(n^0 y^0 + \tau(t))}{\lambda}} \tag{20}
\]

\[
f_3(\lambda \mid t) = \frac{(n^0 y^0 + \tau(t))n^0 + n + 1}{r(n^0 + n + 1)} \lambda^{-(n^0 + n + 1)-1} e^{-\frac{(n^0 y^0 + \tau(t))}{\lambda}} \tag{21}
\]

\[
f_4(\lambda \mid t) = \frac{(n^0 y^0 + \tau(t))n^0 + n + 1}{r(n^0 + n + 1)} \lambda^{-(n^0 + n + 1)-1} e^{-\frac{(n^0 y^0 + \tau(t))}{\lambda}} \tag{22}
\]

The equations (19) - (22) represent a set of posterior distributions & after taking the averages for those posterior distributions we get the iLuck-Model as shown below:

\[
\bar{y}^n = lower(y^n) = \begin{cases} 
\frac{n^0 y^0 + \tau(x)}{n^0 + n} & \text{if } \bar{\tau}(x) \geq y^0 \\
\frac{n^0 y^0 + \tau(x)}{n^0 + n} & \text{if } \bar{\tau}(x) < y^0
\end{cases}
\]

\[
\bar{y}^n = upper(y^n) = \begin{cases} 
\frac{n^0 y^0 + \tau(x)}{n^0 + n} & \text{if } \bar{\tau}(x) \leq \bar{y}^0 \\
\frac{n^0 y^0 + \tau(x)}{n^0 + n} & \text{if } \bar{\tau}(x) > \bar{y}^0
\end{cases}
\]

The posterior distribution will be final & as follows: (what does that mean)

\[
f(\lambda \mid n^m, y^m) = \frac{(n^m y^m n^m + 1)}{r(n^m + 1)} \lambda^{-(n^m + 1)-1} e^{-\frac{n^m y^m}{\lambda}} \tag{23}
\]

\[
n^m = \frac{lower(n^n) + upper(n^n)}{2}, \quad y^m = \frac{lower(y^n) + upper(y^n)}{2}
\]

Robust Bayesian To Estimate The Scale Parameter \( \lambda \)

From equation (23), the Bayesian estimator can be obtained for scale parameter \( \lambda \) under quadratic loss function which is the mean of the posterior distribution as shown below:

\[
\hat{\lambda}_{Rob} = \frac{n^m y^m}{n^m} \tag{24}
\]

Robust Bayesian To Estimate The Survival Function
From equation (23), the Bayesian estimator can be obtained for survival function under quadratic loss function which is the mean of the posterior distribution as shown below:

\[
\hat{S}_{\text{Rob}}(t) = \left( \frac{n_{my}^m}{n_{my}^m + t^m} \right)^{n_{m+1}}
\]  

(25)

**Steps of the simulation experiment**

The program was written using R & according to the following steps:

1. **The first step**
   - This step is one of the basic steps in which the default values are chosen as in the following steps: Different default values were chosen for scale parameter $\lambda$ and shape parameter $\beta$. The prior distribution parameters (a, b).
   - Three different samples were selected as follows:
     - $n$: 10, 20, 40
   - The frequency of the experiment was equal to (1000).

2. **The second step**
   - At this step, data is generated according to the following steps:
     - Generate the random variable $U_i$ that follows the uniform distribution:
       
       
       $U = R$
       
       Where:
       
       $U_i \sim U(0,1), \quad i = 1,2, \ldots, n$
       
     - Random variable $U$ is a random variable that describes a model under study using a statistical mathematical method. This method is used to generate various random variables that follows the various probability distributions. This method is characterized by its ease & efficiency:
       
       $u = F(t)$
       
       $t = F^{-1}(u)$
       
     - The random variable that follows the Weibull distribution is generated based on the above steps & is as follows:
       
       $t = e^{[\log(-\lambda \cdot \log(1-u))]}/\beta$

3. **Third Step**
   - The survival function and the scale parameter are estimated according to the Bayesian method & the robust Bayesian method.

4. **The fourth step**
The estimation methods are compared by using the following measures:

\[
\text{IMSE}(\hat{\lambda}) = \frac{1}{r} \sum_{i=1}^{r} (\hat{\lambda} - \lambda)^2
\]

\[
\text{IMSE}[\hat{S}(t)] = \frac{1}{r} \sum_{i=1}^{r} \left( \frac{1}{n_t} \sum_{j=1}^{n_t} [\hat{S}_i(t_j) - S(t_j)]^2 \right)
\]

Where:

r: Represents the frequency of experiment.

\( n_t \): Represents the sample size for each experiment \((t_i)\)

The simulation results will then be analyzed to estimate the scale parameter \(\lambda\) & the survival function of the Weibull distribution & according to the following tables as follows:

Phenotypic detection of AmpC β-lactamase in *Pseudomonas aerogenosa* isolated from Burns and Wounds in Al-Rumetha Hospitals

Abeer Mohammed Ali Al-garawyi

*Biology Dep./ Education for Pure Science College/Al-Muthanna University, Email:alibabere297@gmail.com*

**Abstract**

Ampicillin hydrolyzing class C β-lactamase (AmpC) producing *Pseudomonas aeruginosa* has been recognized to be a serious opportunistic infection and due to the wide ability to create β-lactamases made this bacteria resistance to many antibiotics. The results of the current study showed that 36 (27.7%) isolates of *P. aeruginosa* from 130 isolates examined for cefoxitin susceptibility by disk diffusion method. Out of thirty six *P. aeruginosa* isolates, 29 (80.6%) were cefoxitin resistant. The modified three dimension test and AmpC disk test were used confirm the production AmpC β-lactamase in all cefoxitin resistant isolates, only 23 (79.3%) isolates were phenotypically confirmed to produce AmpC beta-lactamase. The result of this study showed that 12/36 (33.3%) isolates were positive with blaAmpC gene by conventional PCR technique.

**Keywords:** *Pseudomonas aeruginosa, AmpC, MTDT, Cefoxitin*

**Introduction**

*Pseudomonas aeruginosa* is a responsible for opportunistic diseases which commonly causes infections in burned patients and is mostly resistant to varied antimicrobial agents, also this microorganism is leading to nosocomial infection among immunocompromised patients suffering from burn, cystic fibrosis, AIDS and cancer. Commonly *P. aeruginosa* infections have been treated by fluoroquinolones, carbapenems, aminoglycosides and cephalosporins antibiotics. Nevertheless, resistance rate of *P. aeruginosa* to beta lactams, aminoglycosides, quinolones and carbapenems has been recorded from several countries. *Pseudomonas aeruginosa* producing of AmpC enzyme pose a threat to public health and demands the need to detect by phenotypic methods, the occurrence of AmpC β-lactamases from various clinical and environmental isolates due to the fact that antibiotic resistance is an growing problem in hospitals in a worldwide. Cephalosporinases such as AmpC β-lactamases are clinically important encoded on the chromosomes of the Enterobacteriaceae and a limited other organisms such as *Pseudomonas aeruginosa* where they responsible of resistance to penicillins, cefazolin, cephalexin, cefoxitin, and β-lactamase inhibitor-β-lactam combinations. Resistance to multiple drugs in *Pseudomonas aeruginosa* is commonly the result of mixture of many mechanisms such as metallo β-lactamases (MBLs), AmpC β-lactamases, extended spectrum β-lactamases (ESBLs), excessive expression of efflux pump and modifications of active site or outer membrane. Hydrolytic enzymes such as AmpC β-lactamases cleave the β-lactam ring and confer bacterial resistance to β-lactam antibiotics. MBLs and AmpC beta lactamases classified by Ambler as class B and class C respectively. Biotyping and serotyping are phenotypic method while plasmid profile analysis and PCR are molecular methods used for diagnostic purpose. Genes responsible for the beta-lactamase production in *P. aeruginosa* are typically resides either on plasmids or on the chromosome with the possible to exchange between bacterial populations.

**Materials and Method**

**Sample Collection**

A total of 130 clinical samples of *P. aeruginosa* from Al-Rumetha hospitals in Al-Muthanna province during the period of five months. Out of these, 60 wound and 70 burn swabs. Burn swabs were taken from the center of burn and wound lesion, depending on Collee *et al.* a dry swab must first be soaked with a little amount of Brain-Heart Infusion broth, then organisms...
were diagnosed using standard biochemical tests such as ability to produce oxidase, pigment formation, Gram staining, oxidation of glucose, growth at 42°C, gas and acid production on triple sugar iron agar as well as the samples were directly inoculated in CHROM agar™ Pseudomonas, blood agar, MacConkey agar, Nutrient agar and incubated for 24hr and at 37°C under aerobic conditions.

**Antibiogram:**

Antibiotic susceptibility of the all isolates were determined by Kirby-Bauer disk diffusion method according to CLSI recommendations. The antibiotics used comprise disks (Himedia, India): Ceftazidime (CEF, 30 μg), Imipenem (IMP, 10 μg), Meropenem (MEM, 10 μg), Cefotaxime (CTX, 30 μg), Amoxicillin/Clavulanic acid (AMC, 20/10 μg), Amikacin (AK, 10 μg), Erythromycin (E, 10 μg), Piperacillin (PI, 10 μg), Chloramphenicol (CHL, 30 μg), Cefoxitin (30 μg), Aztreonam (ATM, 10 μg), Rifampicin (R, 5 μg), Ciprofloxacin (5 μg), Tetracycline (30 μg). Moreover, different class of antimicrobials used by VITEK2 automatic system for confirmatory susceptibility tests of isolates.

**Detection of AmpC β-lactamases**

The ability of *Pseudomonas aeruginosa* isolates to produce AmpC enzyme was screened by testing cefoxitin susceptibility. The isolates that exposed resistance to the antimicrobial activity of cefoxitin were supposed initially to produce AmpC enzyme when their inhibition zone diameter ≤ 18 mm; and this acceptable phenotypic confirmation.

**Modified three dimensional test (MTDT):**

According to Manchanda and Singh and Parveen et al. This test was accomplished.

**AmpC Disk Test:**

This test also carried out as recommended by Parveen et al. Basak et al.

**Molecular detection of AmpC –lactamase:**

**DNA extraction**

The method of extraction Plasmid DNA was done by using the genomic DNA Mini kit, based on the manufacturer’s instructions (Geneaid, Korea).

**Determination of DNA product and purity:**

The use of nanodrop spectrophotometer for purpose of genomic DNA checking by measurement of the concentration and purity of extracted genomic DNA via evaluation the absorbance at (260 /280 nm).

**Preparing the Primers suspension:**

The whole volume of the PCR mixture set up in 20 μl includes 5 μl of lyophilized AccuPower® PCR PreMix (Bioneer, Korea), 10 pico/μl of each specific primer for target gene and 5μl of *P. aeruginosa* DNA template, so as according to presented in (table1) the amplification conditions started with thermocycler program.

**Table 1. The amplification conditions of PCR thermocycler for blaAmpC gene.**

**Results**

This study showed that out of the One hundred and thirty samples were taken from Al-Rumetha hospitals, 36 (27.7%) *P. aeruginosa* isolates were diagnosed. The frequency of *P. aeruginosa* isolates from the wound and burn swab samples presented in (Fig.1). The highest *P. aeruginosa* percentage occurred in the burn 23(32.9%) followed by wound infections 13 (21.7%)(p≤ 0.05).
All the P. aeruginosa isolates were tested for various antibacterial agents to determine the resistant rate which include (Ceftazidime, Imipenem, Meropenem, Cefotaxime, Amoxicillin/Clavulanic acid, Amikacin, Erythromycin, Piperacillin, Chloramphenicol, Cefoxitin, Aztreonam, Rifampicin, Ciprofloxacin and Tetracycline). Fig. (2) show that the isolates were diverse in susceptibility to antimicrobial agents (Chloramphenicol 100%, Piperacillin 100%, Rifampicin 94.4% Erythromycin 94.4%, Ceftazidime 94.4%, Cefotaxime 94.4%, Cefoxitin 80.6%, Amoxicillin/Clavulanic acid 75%, Aztreonam 61.1% Ciprofloxacin 55.6%, Amikacin 47.2%, Tetracycline 41.7% Meropenem 27.8%, Imipenem 19.4%). The isolates that resist three classes of antibiotics or more are considered multidrug resistant.

Two methods were used to check of production AmpC β-lactamase among cefoxitin resistance P. aeruginosa isolates, of the 36 P. aeruginosa isolates, 29(80.6%) were cefoxitin resistant by the disk diffusion method and initially regarded as AmpC β-lactamase producers Fig.3.
The modified three dimension test was also used to confirm the production AmpC β-lactamase in all cefoxitin resistant isolates, only 23(79.3%) isolates were phenotypically confirmed to produce AmpC beta-lactamase. However, there is another method used to detect production AmpC β-lactamase among cefoxitin resistant P. aeruginosa isolates, this test is AmpC disk test and 23(79.3%) out of the 36 P. aeruginosa isolates were positive for AmpC beta-lactamase as demonstrated in (Table 2).

Molecular detection of AmpC β-lactamase production among the P. aeruginosa isolates 36(27.7%) with blaAmpC gene by PCR technique. This result showed that 12/36 (33.3%) isolates were positive with blaAmpC gene as presented in Fig. 4 and 5.
Discussion

The present study showed that the highest rate of *P. aeruginosa* occurred in the burn infections 23(32.9%) followed by wound infections 13 (21.7%)(p≤ 0.05). In Al-Muthanna, AL-Aaajipi 19 found that the *P. aeruginosa* prevalence rate was (44.64%) from the burn which is higher than our study. The current results are agreement with Azeez and Bakr 20 who found the highest *P. aeruginosa* prevalence rate occurred in the burn(40%) followed by wound infections (17.5%). As well as, Nasih et al. [2014] recorded (17%) *P. aeruginosa* from the patients. Another study showed that (38%) *P. aeruginosa* isolates among 100 burn samples in Baghdad hospitals 21. *P. aeruginosa* is currently one of the major bacterial pathogens responsible for nosocomial infections and due to resistance to various antibiotics the treatment of these infections has become very difficult. The results described in (Fig.2) demonstrates that the isolates were (100%) resistant to Chloramphenicol and Piperacillin respectively, similar studies were performed by other researcher Azeez and Bakr 20 showed that among 50
isolates of P. aeruginosa, 100% resist to Penicillin, Lincomycin, Vancomycin, Piperacillin, Rifampicin, and Chloramphenicol, as well as Ali 2016 illustrated that out of the 60 P. aeruginosa isolates, 30% resist to fourteen various antibacterial agents but all isolates were resistant to G, L, CEF, ATM, PI, and CTX. The reasons of wide range of resistance is dependent upon excessive use or misuse of antibiotics, hospital setting, transmission of resistance genes among bacterial species. In this study, 94.4% of the isolates were resistant to Rifampicin, Erythromycin, Ceftazidime, and Cefotaxime, also 80.6% to cefoxitin, this resistance is due to the presence of other mechanisms such as AmpC type β-lactamases or MexAB-OprM Efflux Pumps. This resembles with the results of Chika et al. who reported P. aeruginosa isolates were resistant to Ceftazidime (92%) and cefoxitin (80%). Furthermore, the percentage of the susceptibility to Meropenem was 27.8% and Imipenem 19.4% therefore considered most effective antibiotics, this is agreed with Azeez and Bakr who found the lowest resistance ratio was for Imipenem 4% and Meropenem 20%. Therefore due to the sensitivity of the bacterial isolates to imipenem and meropenem, making them the best therapeutic option. This sensitivity is due to the patients infected with bacterial isolates producing AmpC beta-lactamases using imipenem as last option. But this results mismatched with Salimi and Eftekhari, 2013 who showed P. aeruginosa was 93.20% resistant to Imipenem and 94.17% to Meropenem. The production of AmpC beta-lactamase is one among numerous resistance mechanisms discovered in P. aeruginosa from both the community and hospital environment is fast becoming an international risk and the appearance and development of these multidrug resistant organisms is a warning to existing drugs when antibiotics are over prescribed so as when people lack of interest in personal hygiene this leads to resistance to antibiotics. The primary screening test of the molecular class C β-lactamases (AmpC) used in the laboratory is modified three-dimensional test, this results revealed 23(79.3%) isolates were phenotypically confirmed to produce AmpC beta-lactamase in this test, all the isolates were resistant to Cefoxitin while the remaining 6(20.7%) cefoxitin resistant isolates were negative for molecular class C β-lactamase due to the reduction of antibiotic penetration across porins or these isolates probably have genes for plasmid-mediated and/or chromosomal AmpC beta-lactamase production but silent genes or not encoded in these isolates.

**Conclusion**

The best way to diagnose AmpC β-lactamase is PCR technique. The current study showed high rates of resistance to Phenics, Penicillins, Ansamycins, Macrolides, Cephalosporin III and Cephamycins in P. aeruginosa isolated from patient in Al-Rumetha Hospitals, Iraq, which could help many doctors prescribe the best antibiotics for treatment of P. aerogenosa infections. Furthermore, the current study also showed most of these isolates had ampC genes and there was important correlation between resistant to β-lactam antibiotics and existence of ampC gene.

**Financial Disclosure:** There is no financial disclosure.

**Conflict of Interest:** None to declare.

**Ethical Clearance:** All experimental protocols were approved under Biology Dep./ Education for Pure Science College/Al-Muthanna University and all experiments were carried out in accordance with approved guidelines.

Assessment Knowledge of Thalassemia Care Giver in Kirkuk City

Idrees Hasan Mohammed
College of Nursing / University of Kirkuk, Iraq

Abstract

Thalassemia is an inherited blood disorder, which is described by diminished synthesis or lack of globin, this synthetic defect leads to the formation of fragile abnormal red blood cells (RBC), which can be easily hemolyzed, leading to chronic anemia. Quantitative design descriptive study was used to assess Knowledge Thalassemia Care givers in Kirkuk City. A non–probability / Convenience sampling technique was applied in the present study, (30) Thalassemia Care givers were participate in the study sample (Azadi Teaching Hospital) in Kirkuk City. A questionnaire was designed and constructed by researchers to measure the variables underlying the present study. Data were obtained directly by the researchers through interview technique. Content validity of the instrument was determined through the of panels which involve (5) experts to investigate the clarity. The findings in general indicated that Majority of the sample In general has good Knowledge about Thalassemia it was recorded (74.8%) were answered “I Know.

Keywords: Assessment Knowledge of Thalassemia care giver in Kirkuk city

Introduction

Thalassemia is an inherited blood disorder, which is described by diminished synthesis or lack of globin, this synthetic defect leads to the formation of fragile abnormal red blood cells (RBC), which can be easily hemolyzed, leading to chronic anemia. This disorder is exceptionally pervasive among children in the Middle East, Mediterranean region, and South Asia, though, only a few studies on pediatric quality of life have been available from those areas. The management of thalassemia contains regular blood transfusion, iron chelation treatment, and suitable management of comorbidities. These modalities led to an increase in the life expectancy of thalassemic children, therefore, stressing the significance of keeping up the personal satisfaction in kids with thalassemia. Thalassemia has a negative influence on the physical functioning of children and adults. It can likewise influence social connections and emotional well-being, in the long run prompting poor school execution and general disability in the wellbeing related personal satisfaction. It has been accounted for that around 80% of thalassemic patients have psychiatric issues, it was accounted for already that enthusiastic pain and sickness trouble affect the personal satisfaction of patients as gloom and uneasiness related indications; nonetheless, culture and the sort of treatment did not. Pediatric personal satisfaction estimation is an instrument that is utilized to evaluate the impact of ailment on a patient’s prosperity, distinctive perspectives are canvassed in pediatric personal satisfaction, including physical, mental, and social working as different components can influence personal satisfaction.

General objective:

“Assessment Knowledge Thalassemia Care givers in Kirkuk City”

1.2 Specific objectives:

1- To identify socio demographic characteristics of the caregiver’s (age, gender, educational level, occupation, marital status).

2- To identify caregiver’s knowledge regarding thalassemia.

Alpha thalassemia

Each human diploid cell contains four copies of...
the alpha-globin gene, located on chromosome, Alpha thalassemia is the result of reduction in the synthesis of the alpha globin chains and a form of thalassemia involving the gene HbA1 and HbA2. Two main types of alpha thalassemia are described as alpha thalassemia major and hemoglobin H disease that Alpha thalassemia major is a very serious disease of severe anemia that begins even before birth, most affected babies do not survive full gestation or die shortly after birth. Hemoglobin H disease is milder than beta thalassemia and does not generally require transfusion therapy.

**Beta Thalassemia**

The most familiar type of thalassemia is beta thalassemia. Thalassemia was first recognized clinically in 1925 when Thomas Cooley described a syndrome of anemia, splenomegaly, and bony deformities among Italian descents, Beta thalassemia or Cooley’s anemia is caused by a change in the gene for the beta globin component of hemoglobin. Beta thalassemia is caused by damaged or missing genes, thalassemia can be subjected to modification in the hemoglobin genes depending on the mild and mild side effects. Beta thalassemia patients is most found in people who are from Greek, Italian, African, or Asian origin especially India, Beta thalassemia major has begun since childhood and will last until the end of the life, the severe anemia can result in severe lethargy, paleness, and insufficient growth and development, Other characteristic physical complications such as heart problems and excessive liver and spleen growth which decrease life-expectancy, this condition is becoming more prevalent in the USA as a result of Asian immigration.

**Management of Thalassemia**

**Thalassemia minor**

Patients with thalassemia minor generally don’t require a particular treatment, educate patients that their condition is genetic and that doctors now and then mix up the turmoil for iron insufficiency, some pregnant patients with the beta thalassemia characteristic may create simultaneous iron inadequacy and serious sickness; they may require transfusion bolster on the off chance that they are not receptive to iron repletion modalities. (Karimi M., 2009)

**Thalassemia major**

The objective of long-term hypertransfusion bolster is to keep up the patient’s hemoglobin level at 9 - 10 g/dL, along these lines enhancing his or her feeling of prosperity while all the while smothering upgraded erythropoiesis, this methodology treats the weakness and smother endogenous erythropoiesis with the goal that extra medullary hematopoiesis and skeletal changes are stifled. Patients accepting long haul transfusion treatment additionally require iron chelation. (Fatimah Sharif Modawi., 2017).

Blood banking contemplations for these patients incorporate totally writing their erythrocytes for Rh and ABO antigens preceding the primary transfusion. This methodology helps future cross-coordinating procedures and limits the odds of all immunization. Transfusion of washed, leukocyte-poor red blood cells (RBCs) at roughly 8 - 15 mL RBCs for each kilogram (kg) of body weight more than 1 - 2 hours is suggested.

Erich-repointing (EPO) levels were higher in guys: 72 versus 52 mIU/mL (P = 0.006). The frequency of splenic tomy was higher in guys (61%, versus 40% in females; P = 0.031). Allogeneic hematopoietic transplantation can be remedial in some patients with thalassemia major, the early successful allogeneic stem cell transplant from an HLA-identical sibling donor was stated in 1982, an Italian group led by Lucarelli has the most experience with this procedure, this group’s research documented a 90% long-term survival rate in patients with favorable characteristics (young age, HLA match, no organ dysfunction), transplantation-related issues such as graft versus host disease, graft failure, chronic immunosuppressive treatment, and transplantation-related mortality must be cautiously considered earlier to proceeding with this method.

**Surgical Treatment**

Splenectomy is the vital surgical system utilized for
some patients with thalassemia, the spleen is known to contain a lot of the labile nontoxic iron (i.e. stockpiling capacity) got from sequestration of the discharged iron. The spleen additionally expands RBC decimation and iron conveyance, these realities ought to dependably be considered before the choice is made to continue with splenic tomy, what’s more, with late reports of venous thromboembolic events after splenic tomy, one ought to precisely consider the advantages and the dangers previously splenic tomy is supported, the spleen goes about as a store for nontoxic iron, along these lines shielding whatever remains of the body from this iron. Early evacuation of the spleen might be unsafe.

**Methodology**

This chapter deals with the presentation of the administrative arrangement, design of the study, setting of the sample, sample of the study, Instrument of the study, validity, pilot study, method of data collection, period of data collection statistical analysis and limitation of the study.

**Design of the Study:**

A descriptive study was carried out from February, 1st, 2019 to April, 15th, 2019 in order to achieve the objectives of the present study.

**Setting of the Study:**

The study was conducted in Azadi hospitals in Kirkuk city.

**Sample of the study:**

Non-probability sampling approach (purposive sample) consists of 62 nursing staff of premature units in Azadi hospitals.

**Criteria:**

**Inclusions:**

Only nursing staff who were working in the premature unit in the hospitals

**Instrument Construction:**

1. For the purpose of the present study, a questionnaire format was constructed to assessment of the nursing staff knowledge and practices regarding neonatal jaundice.

2. The questionnaire format was based on the review of literature and related previous studies. The questionnaire was designed in English and then translated into Arabic language. It was reviewed by supervisor and experts.

3. Formal consent was obtained from the nursing staff who agreed to participate in the study, the questionnaire was self-administer and took 10-15 minutes to be complete.

4. The study instrument of comprised of three parts, which was consisted the following variables:

1. **Part One/Socio-demographic characteristics**

   Include: Type of hospital, Sex, Educational level, Marital status, residence, Socio-economic status, years of experience in premature unit, participation in a training course, period of the training course and the place of the training.

2. **Part Two/Assessment of knowledge:**

   Include 20 items regarding knowledge of the sample. It has been consist of three scales as ‘Know’, ‘I didn’t know’ and ‘Uncertain’.

3. **Part Three/ Assessment of practice**

   Include 4 items regarding practices of the study sample.

**Validity of the study scale:**

To ensure the validity of the scale, method and procedure were proposed to be carried out during the study. Nine experts of different specialties related to the field of the present study were chosen to review face and content validity. They were asked to review the scale format for clarity and adequacy in order to achieve the present study objectives. Those experts were all faculty members from the College of Nursing/ University of Kirkuk, (82%) of them had agreed that the scales were clear, relevant and adequate. Certain modifications were employed based on the experts’ recommendations and suggestions.

**Method of Data Collection:**

Data were collected through self-administered technique, The investigators had demonstrated objectives and the significance of research and the benefit of the study to the participant. Verbal consent obtained from premature unit nursing staff. Each nurse
spends approximately (10-15 min) to respond to the questionnaire.

**Period of Data Collection:**

The data collection has been conducted during a period of two months extending from February 15th, 2019 to April 15th, 2019.

**Statistical Analysis**

Data were analyzed in several steps. First, descriptive statistics, which includes frequency and percentages, and Mean score. Data are prepared, organized and entered into the computer file; Statistical Package for Social Science (SPSS)(20 version) is used for data analysis at (P. value ≤ 0.05). Data are analyzed through the application of two approaches:

**Descriptive statistical data analysis:**

This approach is employed through:

- Frequency distribution
- Percentage (%)

\[
\% = \left( \frac{\text{Frequencies}}{\text{sample size}} \right) \times 100 \quad (32)
\]

- Mean of Scores

This computation is applied for the determination of item’s significance of the assessment tool relative to each aspect. Cut-off points are used for this determination low-significant, moderate significant, and highly significant.

\[
\text{M.S} = \frac{f_1 \times \text{score}_1}{n_1} + \frac{f_2 \times \text{score}_2}{n_2}
\]

It is computed as follows:

M.S = Mean of score

f = Frequency

n = Number of cases

**Rating and scoring of the scale:**

The knowledge and practices questionnaire items were rated and scored to items as, Know, I didn’t know and Uncertain. Data of the study were ordinal according to three levels scale which were scored for each level respectively.

**Result**

This chapter will present the research according to the statistical analysis for the data collection during the study period. Regarding to sex, (70%) of the participants were female, while only (30%) were male. According to the educational level (10%) of the participants were Illiterate, (26.7%) of them had write & read, (20%) of them were primary school, (23.3%) of them were secondary school, while (20%) were Institution. According to marital status, (80%) of study sample were married, while (13.3%) were single, while (6.7%) were separated. Regarding to Occupation of caregiver, (10%) were Governmental employee, (40%) were Non-governmental employee, and (50%) were Jobless. According to socio-economic status, (58.1%) had barely sufficient economic status and (27.4%) had sufficient economic status. Regarding to Age of caregiver, (26.6%) of participants had (≥ 19 years)’ experience, while (40%) of them had (20 – 29 Y) years of experience, while (30%) of them had (30 – 39 Y), while (3.4%) were (≤ 40 Y) years.

**Conclusion**

Thalassemia intermedia has a wide clinical spectrum, as some patients are completely asymptomatic until adult life whereas others present with the condition at 2 years of age and experience retarded growth and development. Many patients with thalassemia intermedia do not currently undergo transfusion therapy due to difficulties in deciding when to initiate therapy as well as the lack of a convenient and effective iron chelator. However, the availability of such a therapy may increase the use of transfusions in patients with thalassemia intermedia, allowing them to benefit from this therapeutic approach and avoid any subsequent clinical complications. As there are currently no clear guidelines for the management of thalassemia intermedia, in this paper, we present some recommendations based on a system-centered risk stratification model to help individualize patient treatment. All patients diagnosed to have thalassemia based on High Performance Liquid Chromatography (HPLC) will be included in the study. It includes β thalassemia trait, β thalassemia intermedia, β thalassemia major, α thalassemia, double heterozygous conditions like Beta thalassemia HbS, Beta thalassemia HbE and Beta thalassemia HbD.
Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under College of Nursing / University of Kirkuk, Iraq and all experiments were carried out in accordance with approved guidelines.

Evaluation the Effect of Nano Yttrium Oxide Addition on the Mechanical Properties of Room Temperature-Vulcanized Maxillofacial Silicone Elastomers

Yasir N. Al-Mohammad

MSc. Dept. of Prosthodontics, College of Dentistry, University of Baghdad, Baghdad-Babulmoadam, Iraq

Abstract

Objective: This study aims to investigate the effects of yttrium oxide (Y$_2$O$_3$) nanopowder inclusion on the mechanical properties, including tear strength, tensile strength, elongation percentage, hardness, and surface roughness, of room temperature-vulcanized maxillofacial silicone elastomers.

Materials and Method: Y$_2$O$_3$ nanoparticles (30–45 nm) were added to VST50F platinum silicone elastomers in two weight percentages (1 and 1.5 wt%) as tested by the pilot study that showed superior results. A total of 120 specimens were qualified and divided into the control group and experimental groups (1 and 1.5 wt% Y$_2$O$_3$). Each group was subdivided into four identical subgroups in accordance with intentionally performed tests (tear strength, tensile strength and elongation percentage, shore A hardness, and surface roughness). For each subgroup, 10 specimens were used for each test. Data were statistically analyzed with significance level considered at $p<0.05$. Scanning electron microscopy (SEM) and Fourier transform infrared spectroscopy (FTIR) were also conducted.

Results and Discussion: SEM showed that NPs were distributed well within the silicon matrix. FTIR spectra proved no chemical reaction occurred between the Y$_2$O$_3$ NPs and VST50F silicone. Tear strength and hardness values significantly increased in the experimental groups compared with the control group. Tensile strength and surface roughness values increased non significantly. Elongation percentage values decreased non significantly.

Conclusion: Incorporating Y$_2$O$_3$ NPs into VST50F maxillofacial silicone improved the tear strength with slight increase in tensile strength. Hardness and surface roughness increased but within accepted clinical levels. Elongation percentage slightly decreased.

Keywords: maxillofacial silicone, Y$_2$O$_3$, nanoparticles, mechanical properties.

Introduction

Prosthetic rehabilitation may become unavoidable for multiple reasons because of the extent or site of facial defect following congenital anomaly, injury, or after excision of tumors. Materials such as ivory or metals were used in the past, but polymers such as silicone elastomers have recently become the most preferred for the construction of maxillofacial prostheses because of their chemical dormancy, endurance, easy usage, and biocompatibility. However, given their anticipated half-life and deterioration of mechanical properties and color stability, maxillofacial prostheses composed of silicone elastomers require refabrication. Factors that influence the mechanical propriety of silicone elastomers are the atomic density of polymer chains, cross-linking closeness, and presence of fillers. Throughout the evolution of the nanoparticle (NP) industry, NPs have...
merged into the polymer matrix to equip a modified polymer characterized by an augmented properties gained from the reinforcing effect of the nano-oxides.  

Considerable studies were operated to overcome the mechanical weaknesses of materials, such as reinforcing fillers. A previous study found that adding TiO$_2$, ZnO, and CeO$_2$ as nanofillers to A-2186 silicone in two weight percentages (2.0% and 2.5%) improves the overall mechanical properties (tear strength, tensile strength, and elongation percentage) of the material. Another study analyzed the influence of adding (nano ZnO, BaSO$_4$, and TiO$_2$ at 1 and 2 wt%) on the tear strength, hardness, and permanent deformation of silicone and recommended the use of ZnO NPs to reinforce (Silastic MDX4-4210) silicone. In general, a powerful interaction occurs at the interface between the organic polymeric matrix and the NPs and produces a reinforcing effect. In the present study, Y$_2$O$_3$ nanofillers were added to VST50F RTV maxillofacial silicone elastomer to enhance its mechanical properties.

**Materials and Method**

Y$_2$O$_3$ nanopowder (US Research Nanomaterials, Inc., USA) was added to VST50F room temperature-vulcanized maxillofacial silicone elastomers (Factor II, Inc., Lakeside, AZ, USA) to investigate its effect on some mechanical characteristics.

**Pilot study:** The best weight percentage of nano Y$_2$O$_3$ to improve the tear strength with minimal effect on the hardness of the silicone elastomer was selected. The most suitable weight percentages were 1 and 1.5 wt%.

**Study grouping:** A total of 120 specimens were fabricated and divided into the control group (silicone without nano Y$_2$O$_3$ addition referred to as group A) and experimental groups (with 1% Y$_2$O$_3$ addition referred to as group B and with 1.5% Y$_2$O$_3$ addition referred to as group C). Each group was subdivided into four identical subgroups in accordance with intentionally performed tests.

**Mold making:** An autoCAD (Computer Aided Design) software was used to design the dimensions of specimens, and then a Computer Numerical Control machine (JL-1612, Jinan Link Manufacture and Trading Co., Ltd., China) was used to obtain the matrix compartment of the mold where the material will be poured.

**Mixing base, catalyst, and nano Y$_2$O$_3$:** Y$_2$O$_3$ nanopowder was measured using a digital electronic balance with 0.000 accuracy (China) followed by adding the intended amount of silicone base to avoid the scattering of volatile nanopowder and subsequent weight measurement change. The silicone base was mixed with the nanopowder by using a vacuum mixer (Multivac 3, Degussa, Germany) for 10 min at 360 rpm to form the modified base. The first 3 min of mixing comprises no vacuum suction to preserve the nanopowder, whereas a vacuum pressure of -10 bar was applied in the next 7 min to remove air bubbles. To obtain a proper working time, we combined the accelerator at a base-to-catalyst ratio of 10:1 (according to the manufacturer instructions) with the modified silicone base for 5min with vacuum suction of -10 bar. The mixing was accomplished at a relative humidity (RH) of 50% ± 10% and temperature of 23 °C ± 2 °C.

**Pouring the material into the mold:** The mixture was poured on the acrylic mold in excess amount to reduce the percentage of air bubbles that may be formed on the top surface of the samples when the cover was placed. The cover was then applied and locked with screws, nuts, and G-clamps with a constant load application of 1 kg. The air bubbles on the specimen surface were removed by applying constant pressure until the material was completely cured. The material was poured under standard conditions (RH of 50% ± 10% and temperature of 23 °C ± 2 °C).

**Specimen storage, retrieval, and finishing:** The specimens were reserved in a storage box (for constant results, atmospheric conditions that might affect the silicone properties were controlled) for 16–72 h. Temperature must be within 20 °C – 25 °C, humidity should be within 50% – 60%, and care must be taken to avoid laying the specimens one over other. Specimens were protected from light exposure from vulcanization to testing (the minimum time for vulcanization is 16 h). After polymerization, the specimens were removed from the molds. The tested specimens must remain intact with well-defined borders, free from air bubbles and clear from irregularities on the surface and inside, particularly at the stress-loaded areas. Defects would cause the specimen to be discarded. Flashes of the specimens were removed with a scalpel and surgical blade.

**Mechanical testing procedures:**

A) **Tear strength:** Specimens were prepared and
tested in accordance with ASTM D624, 2013 (type C specimens) by using a universal testing machine (Laryee Technology Co., Ltd., China) running at a velocity of 500 mm/min, by which specimens were stretched until complete rupturing at the apex. The following equation was applied: Tear strength = f/d, where f is the highest force recorded to rupture the specimen at the apex (kN) and d is the specimen average thickness (m).

B) Hardness: Specimens were prepared and tested in accordance with ISO 7619-1, 2010 (square specimens with 25 mm length and width and 6 mm thickness). A Shore A hardness digital tester (HT-6510A, China) with a dull indenter having a diameter of 1.25 mm was used. The hardness value is the mean of five different measurements whose points lie at a distance of 6 mm from each other and from the border.

C) Tensile strength and elongation percentage: The specimens were prepared and tested in accordance with ISO 37, 2011 (Type 2) in a dumbbell shape by using a universal testing machine running at a velocity of (500 mm/min) by which the specimen will be stretched until complete rupturing at the thin portion. The tensile strength = F/A, where F expresses the highest force recorded to rupture the specimen at the thin portion (kN) and A expresses the specimen cross-sectional area (m²) (width x thickness). The elongation percentage can be calculated simultaneously where the specimen length at the beginning and the length at rupturing can be applied in the following equation:

\[ \text{Elongation percentage} = \left( \frac{L_b - L_o}{L_o} \right) \times 100 \]

D) Surface roughness: The specimens resemble those of hardness with dimensions (25 mm×25 mm×6 mm). A digital surface roughness tester (SRT-6200S, China) was used, and its diamond probe acts by moving on the specimen surface. The average of three readings represents the surface roughness value of that specimen.

Additional tests:

A) Scanning electron microscopy (SEM): An electron microscope (Inspect S50, FEI company, Nederland) was used to check the distribution of the NPs within the silicon matrix.

B) Fourier transform infrared spectroscopy (FTIR): A Fourier transform infrared spectrometer (Tensor 27, Bruker, Germany) was used to confirm whether or not a chemical reaction had occurred between the Y₂O₃ nanopowder and the silicone elastomer.

Statistical analysis: The analysis was accomplished by an SPSS software with significance level set at \( p < 0.05 \) and includes

(1) Descriptive statistics: bar chart graphics.

(2) Inferential statistics: ANOVA and post-hoc tests such as Levene, Tukey’s HSD, and Dunnett T3 tests.

Findings

SEM and FTIR examinations: SEM images show the well dispersion of the Y₂O₃ NPs within the silicone matrix (Figure 1A and B). From the chemical point of view as shown in the FTIR spectrum, no interaction occurred between Y₂O₃ nanopowder and VST50F maxillofacial silicone.
**Tear strength:** The tear strength significantly increased after the addition of Y$_2$O$_3$ ($p < 0.05$) with groups B and C exhibiting higher means than group A (Table 1).

### Table 1: Descriptive statistics, one way ANOVA and Tukey's HSD of tear strength.

Levene statistics=2.645, p value=0.089[NS]

The highly significant increase in the tear strength may be related to the physically trapped networks formed due to the 3D cumulative capability of the NPs that creates networks of fillers within the polymer matrix. These trapped networks participate in hindering the movement of the polymer segment against the NP surface and preventing the movement of other polymer chains against each other, thereby changing the overall network density and markedly increasing polymer stiffness$^{22}$.

**Hardness:** The hardness significantly increased after the addition of Y$_2$O$_3$ ($p < 0.05$) with groups B and C exhibiting higher means than group A (Table 2).

### Table 2: Descriptive statistics, one way ANOVA and Dunnett's T3 of hardness.

<td>B C</td>
<td>.011 S</td>
</tr>
</tbody>
</table>

Levene statistics=7.860, p value=0.002[HS]

The highly significant increase in hardness may result from the filler-to-filler binding caused by increased concentration of nanofillers occupying the areas between polymer chains rendering them lesser. This phenomenon increases the rigidity of the polymer to resist penetration$^{23}$ and may also explain the significant difference between the two experimental groups where the addition of 1.5% Y$_2$O$_3$ increases the hardness more than the addition of 1% Y$_2$O$_3$.

**Tensile strength:** The tensile strength increased non significantly after the addition of Y$_2$O$_3$ ($p > 0.05$) with groups B and C exhibited higher means than group A (Table 3).

### Table 3: Descriptive statistics and one way ANOVA of tensile strength.

<td></td>
<td></td>
</tr>
</tbody>
</table>
The slight increase in tensile strength can be attributed to the physical interaction occurring between the NPs and the silicone matrix as polymer chains and the filler particles within slide over each other as a result of the applied tensile forces; the nanofiller presence prevents breakage of the polymer chains 24.

**Elongation percentage:** The elongation percentage decreased non significantly after the addition of Y$_2$O$_3$ ($p > 0.05$) with group A had mean value higher than group B and C (Table 4).

**Table 4: Descriptive statistics and one way ANOVA of elongation percentage.**

<table>
<thead>
<tr>

<td>6.940</td>
<td>5.973 .610</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The slight decrease in elongation percentages might be caused by the disruption of the proper orientation and flow of molecular chains, providing the matrix with additional restraint and causing earlier failure at several areas and eventually less elongation percentage values 25.

**Surface roughness:** The surface roughness increased non significantly after the addition of Y$_2$O$_3$ ($p > 0.05$) with groups B and C exhibited higher means than group A (Table 5).

**Table 5: Descriptive statistics and one way ANOVA of surface roughness.**

</tbody>
</table>

The randomly arranged NPs within the silicon matrix and on the specimen surface during preparation might increase the mean value of surface roughness after the addition of Y$_2$O$_3$ nanopowder 26.

**Conclusion**

No chemical interaction occurred between the Y$_2$O$_3$ NPs and VST50F silicone. The addition of Y$_2$O$_3$ NPs to VST50F maxillofacial silicone improved the tear strength and slightly increased the tensile strength. The hardness also increased within the accepted clinical range, and the surface roughness slightly increased. The elongation percentage slightly decreased.

Immunohistochemical Correlates of Epidermal Growth Factor Receptor Mutations in Lung Adenocarcinoma in Iraq Patient

Sabreen Saleem AbdAlkreem Alsaqi1, Merza Hamza Homady Almurshidi1, Rand Muhammed Abdul-Hussein Al-Husseini1

Department of Biology, Faculty of Science, University of Kufa/Iraq

Abstract

We aimed to investigate the Detection of epidermal growth factor receptor (EGFR) mutations in lung adenocarcinoma by Immunohistochemical and correlation with Clinicopathological features. We used Fifty tissue blocks embedded in paraffin wax were obtained from 50 patient (16 female and 34 males) suffering from lung adenocarcinoma, while controls were 30 samples from healthy, Histopathological examination, Study by (H and E stain) and detection of Mutation in EGFR(exon19) by RFLP-PCR, detection of protein expression EGFR by immunohistochemical method. Our results have confirmed the mean age of patients group was 51.84 +/-15.70 years and the median was 54, performed study the non correlation between stage of disease and age of patients. site of tumor was right sided of lung tumor, accounting for 58%. Distribution of patients according to grade of tumor was, The results of this study showed non-significant correlation between age and grade, results of this study showed significant difference in EGFR Positive between patients and control healthy in Imunohistochemical, had found as not significant with age, gender, sit of tumor, grade, stage, in Immunohistochemical method of EGFR Expression. while Gene EGFR deletion of exon 19 were analyzed using mutant-enriched polymerase chain reaction (PCR) was not detected in all patients and control.

Keywords: Epidermal growth factor receptor (EGFR); Immunohistochemical; lung adenocarcinoma; prognostic factors.

Introduction

Lung cancer is currently the most frequent cause of major cancer incidence and mortality worldwide.1 Two main histological categories are included: small-cell lung cancer (SCLC) and non-small-cell lung cancer (NSCLC). NSCLC comprises about 80% of all diagnosed lung cancer, and lung adenocarcinoma is the most common subtype of NSCLC.2 This fact is due to several reasons, including increases in life expectancy, higher pregnancy age, poor nutrition, sedentary lifestyle and cigarette smoking.3 The use of tobacco cigarettes is the single greatest risk factor in the development of lung cancer, with up to 90% of lung cancers attributed to smoking.4

The EGFR (also referred to as: ERBB, ERBB1, HER1) gene is located on the short (p arm of chromosome 7 at position 12 (cytogenetic chr band 7p12.1).5 Among its main exons (n=28), exons 18/19/20/21 are critical for oncologists handling lung carcinoma patients. The most common mutations are a deletion in exon 19 and L858R point mutation,(6,7,8) clustered around the amino-acid residues 747–750(delE746-A750,delL747-T751insS, and delL747-P753insS) and a specific exon21 point mutation L858R(leucine to arginine [L858R] and leucine to glutamine [L861Q]) have been reported to comprise up to 90% of all activating EGFR mutations.(9,10) Mutations, amplifications or miss regulations of EGFR or family members are implicated in about 30% of all epithelial cancers lung epithelial malignancies constitute the diagnosis attributed to the majority of patients suffering from lung cancer (about 85% of all pathologically defined lung cancer cases).11 Immunohistochemical techniques detect antigens in tissue sections by means of immunological and chemical reactions.12 while PCR is a method for the in-vitro enzymatic synthesis of specific DNA sequences using two synthetic oligonucleotides primers that each hybridizes to opposite strands and flanks the region of interest in the target DNA, permitting the amplification of small amounts of genetic material13.
The aims of our study were to fined correlation between the IHC expression and presence of EGFR mutations with study of clinicopathological (age, sex, stag, grade) in the Patients.

**Patients and Methods**

This study was done in the department of Biology Lab, Faculty of Science, Kufa University during the period from April 2018 to May 2019. A total of 80 samples, Fifty tissue blocks embedded in paraffin wax were obtained from 50 patients (16 female and 34 males) suffering from lung adenocarcinoma, while controls were 30 samples from healthy volunteers, our study included the following:

A. **Histopathological Examination Study:**

Sections were obtained with 5 μm-thick from paraffin embedded tissues, these sections were stained by using Haematoxylin and Eosin staining method (H and E stain).

B. **Immunohistocemical staining.**

For IHC staining, 5-micrometer-thick sections were deparaffinized and placed on +ve charged slides, EGFR Monoclonal Mouse antibody (Anti-Human Primary antibody) Abcam, (Cambridge, UK for detection EGFR proteins not specific. Three scoring scales were connected at 40X goal as pursues Zero score with no stain, +1 score, faint staining of cytoplasmic considered (weak). +2 score, moderate staining of smooth cytoplasmic considered (moderate). +3 score, intense staining of granular cytoplasmic tumor cells considered.

C. **Molecular study : DNA Extraction** was prepared from Paraffin embedded Lungcancer specimens with sections thick 5-10 μm. Isolation of DNA genomic protocol according to Genomic DNA Mini Kit (Geneaid biotech. Ltd., Feline. No GS100,), Lot no. FE16205-N), and The extracted DNA concentration (ng/μL) assessed by using Nanodrop Spectro-photometer according to.

Amplification of the gene by the reaction prepared it used 8 μl of PreMix and 2μl of DNA samples, 1μl of primers (0.5μl forward 5'-ATCCAGAAGGTGAGAAAGATACATTCTC-3' and 0.5 μl reverse from 5'-CCTGAGGTTGAGGCATGGA-3') and added 8.5 μl distilled water and 0.5MgCl2 mixed with vortex. DNA was amplified Initial Denaturation 5 min in 94°C for 35 cycles at 94°C for 30 seconds, 55°C for 30 seconds, and 72°C for 30 seconds, extension at 72°C for 5 minutes, and Performing PCR of samples. The 1st PCR products done using MseI 10 IU at 37°C over-night PCR aliquots were used as a template for the 2nd round of PCR amplification as the first round PCR conditions but for 40 cycles. The PCR products of the 2nd amplification was analyzed on 12% Page Via Silver staining.

**Statistical analysis:** Statistical Package for the Social Sciences (SPSS) Version 23, were expressed in the of mean & standard deviation form (mean±SD), Pearson t-test and Chi-square test, correlation with (P < 0.05).

**Results**

I. **Clinicopathologic Characteristic in Patients and Control:** Our results have , the patients Male33, Female17 while control Male19, Female11, confirmed the mean age of patients group was 51.84 +/- 15.70 years and the median age of patients was 54 years (range 13-76 years) while the mean age of control 39.266 +/- 21.43 and median age of control was 38.500 years (range 10-79) years, The Male/female ratio of patients were 2:1 while the control were 1.75:1. Male/ female ratio there both of patients and control was no statistical difference (P> 0.05), The distribution of patients according to site of tumor were as the following (29) patients had a right sided lung tumor, accounting for 58 %, while (21) patients had a left sided lung tumor, accounting for 42 %. show in (Table 1 and Figure 1), our study by using Kendall’s tau-b yielded not correlated between stage and grade.

In our study showed that highly correlated difference in EGFR Positive between patients and control subjects,. Positive EGFR was limited to patients with lung carcinoma (28%) whereas non of control a positive EGFR expression (0%). EGFR of IHC expression was detected as brown cytoplasm. The score of EGFR was as follows: score 1 accounted for 3 (21.42%) of cases, score 2 was seen in 9 (64.28%) of cases and score 3 was present in 2 (14.28%) of
Table 2 Immunohistochemica of EGFR in Patients

cases show in figure(5,6,7,8) , No correlated were found both gender and EGFR expression patients with Lung carcinoma (P> 0.05), No statistically significant difference was observed for between Grade and Stag with EGFR expression but significant with Sit of Tumor (P> 0.05) show the( Table2 & figure2 ).

III- Molecular: The associated of gene EGFR exon19:

Gene EGFR deletion of exon19 were analyzed using mutant-enriched polymerase chain reaction (PCR) was not detected in all patients and control as shown in figure(3).

Discussion

In the present study the mean age of patients with carcinoma was 51.8 4+/− 15.70 years and the lung median was 52 years while the age range was from 14 years through 79 years, expressed that smoking is the main source of lung disease and the explanations behind the predominance of smoking in Iraq are people conduct and the social and social condition that advance smoking and it was accounted for that 85-90% of lung malignant growth patients Torre et al17 expressed that older age was related with disease advancement because of biologic components that incorporate DNA damage over time and shortening telomeres, Al khuzaie et al18 stated a study the first most common site in males on newly diagnosed Iraqi cancer patients. performed during a 3 years period (2005-2007),Al-Hashimi and Wang19 the reported among 2000 and 2010 demonstrated the rate is most noteworthy (19%) in the age gathering 60–69 years in Iraq/Mousl, Jaloudi et al20, An aggregate of 25 NSCLC patients were enrolled in the examination at standard (7/25 Bahrain; 11/25 UAE; 7/25Qatar) illness, The mean age of the was 56.9 which are slightly higher than that of the present study In a recent study done in Iran, on 1353 patients with Lung carcinoma, the mean age was 60 years and the age range was16-94years Khosravi et al22 these findings are substantially higher than that of the present study. It’s shown that changes in prevalence and types of tobacco smoking , physical activity, air pollution in indoor , radon environments can affect the pattern of lung cancer in terms of gender, While the men age range was (56 years) in India22. In an Saudi Arabia, Kuwait and UAE the men age range were (66 years) 23, the multiple studies which are higher than
of the present study. Male to female ratio was 2.4:1 in the present study one of the hypotheses is that results further suggest that smoking, DNA capacity repair, alcohol consumption and obesity another hypotheses hormonal factors such as estrogens which is not present in normal lung tissue Temraz et al. reported a male to female ratio of Lebanon 2.5:1, which is again, in accordance with the present study while Jaloudi et al. a total of 25 NSCLC patients (Bahrain; UAE; Qatar) disease were 2.8:1 which is again, in accordance with the present The present study showed that 54% of tumor masses were located in the Right region and that 46% of cases were located in the Left region. These findings differences in patients characteristics, According to Jaloudi et al. the tumor masses of lung is the most common in the upper right lobe approximately (57.1%) of the cases and followed by the upper left lobe. The present study showed that the majority carcinoma (50%) had a well differentiated grade I histological pattern, its findings differences in patients characteristics, other factors that showed a prognostic effect independent of disease grad include age and gender several genetic bio markers, while other factors like obesity and smoking history was associated with lung cancer. Well to Moderately differentiated morphology was the major histological grade reported by some authors. The present study showed that majority of patients enrolled in the present study (52%) had stage II disease. The finding of the present study that majority of patients had stage II disease is in agreement with many authors.

**Conclusion**

Our results indicate the non correlation between stage & grade of disease with the age of patients and Expression of EGFR of Immunohistochemical method highly significant difference between patients and control healthy, had found as not significant with age, gender, grade, stage, but significant with sit while EGFR significant difference between patients and healthy controls but not significant with, gender, sit of tumor, grade and stage the end non correlation between Expression of EGFR Immunohistochemical and mutation.

Depression in Relation to Serum Ferritin a Cross-sectional Study at Najaf Governorate

Ashwan Abdulzahra Hashim

Psychiatrist at the Department of Medicine, Medical College, University of Kufa, Head of Department of Psychiatry Al-Hakeem General Hospital

Abstract
depression is a common psychiatric disorder that leads to disability and increases morbidity and mortality, and iron deficiency is a common nutritional disorder in general population that lead to change in brain function and affecting the quality of life. Methodology; a cross-sectional study that was conducted at Iraq Al-Najaf governorate, patient with depression was (51), and control group was (95), both were assessed by Beck depressive inventory Arabic version for the scoring of depressive symptoms, for both group serum ferritin was evaluated from fasting blood sample. Result; The age of participants (mean=36.25 years), the male was (55) while the female (91), of them (88) were married, there is significant differences between groups in age group (36-45) years and female gender while not to another variable. serum ferritin was significantly deferent with P-value (0.001). Conclusion; there is a strong relationship between the level of serum ferritin and depression with inverse correlation.

Keywords: depression, serum ferritin, Beck depressive inventory, Najaf

Introduction
Depression is a common psychiatric illness, that leads to disabling and lowering of productivity, and worsening the outcome of chronic illnesses due to nonadherence and increases the cost spend on these illnesses. It is regarded as one of the leading cause of death. Symptoms of depression also had a high prevalence, and it has an intimate relationship with quality of life, social interaction, attempts of suicide and physical health. Depression rate was 8 to 20% in the United States, and its causes either inherited (genetic) and cannot be changed, or acquired can be changed or modified.

There is a firm relation between development of depressive symptoms and nutrition, role of vitamins deficiency (like vitamin C, niacin, Vitamin B12, and folic acid) in mood disorder had been confirmed, iron level play a significant role in brain function, person’s behavior, and also had effect on depression (in both negative and positive ways).

Iron deficiency is a common nutritional problem, concerning socio-economic state in both developed and developing countries, its consequences lead to many mental, emotional and behavioral change and lead to mood disturbance. Ferritin is an intracellular protein that plays a role in store and releases iron and most widely biomarker that used to determine the iron level, and it is important to notice that inflammation alter the level of serum ferritin. A national survey found that iron deficiency in women was 11% (mostly premenopausal) and in men 4%; without developing anemia.

There is a lot of questionnaires, scales or inventories that used to assess depression but Beck depressive inventory was still the most widely used and more valid and specific in detection of depression.

Methodology: One hundred and forty-six persons were enrolled in this cross-sectional study that conducted at Iraq Al-Najaf governorate from January through December 2018.

Inclusion criteria; any participant that age 18 years or more, participants that had a will to be involved in this study.

Exclusion criteria; patients that had inflammatory process (with high ESR level) where ferritin is released.
in response to inflammation (acute phase)\(^1\), those how had anemia (any person had the level of Hgb of less than 12g/dl), participant that take medication changing the mood, patients that had depression secondary to medical condition, participants that take corticosteroid\(^2\), patient with psychotic symptoms (lack of insight), those with co-morbid psychiatric disorder, those who receive multivitamin or iron, those how had chronic debilitating illness, and those who had difficulty in communication or agitated.

All selected participants are provided a written consent to be part of this study.

The patients group where selected from Psychiatric department\(1\) Al-Hakeem general hospital outpatient clinic and private psychiatric clinic, and the control group was selected from community setting and from relatives of patients that consult other outpatient clinics (other than psychiatric clinic), the study group was (\(n=146\)), the patient with depression group (51, 34.9%) and the control group (95, 65.1%), the age of the participants ranging from 18 to 56 years.

At the beginning, the participant’s data was taken and a question about medical history, history of medications use such as (\(B\)-blocker, corticosteroid, calcium channel blocker, iron or vitamins supplement, anticonvulsant) are obtained.

All participants that enrolled in this study (both groups) were assessed by using the Beck depressive inventory (BDI) Arabic version\(^2\), to evaluate the presence of depression and for scoring, although the case group was assessed also by ICD-10 criteria\(^3\) of depression to confirm the diagnosis. Scoring of BDI was from zero to 63 point in 21 items each had 4 questions scoring (0, 1, 2, and 3), more than 10 regarded as having depression. The BDI may be given to the patient for self-administration or group administration, but it should be verified that the patient understands the purpose and the answering method for the test, for those how cannot read; the researcher read to them to overcome this obstacle. The control group was assessed by the general health questionnaire (GHQ-30)\(^4\) to exclude the presence of any psychiatric or mental illnesses (by an expert psychiatrist).

A blood sample was taken from both groups (those with depression and those free from mental illnesses) after fasting for at least 8 hours before taking the blood sample, then assessment of serum ferritin level was done immediately after taking the sample by using (ELISA), assessment of hemoglobin level (Hgb); to assess presence or absence of anemia, and also evaluation of ESR to exclude inflammatory process; normal range of ESR is (for the age less than 50 years 0-15mm/hr for male and 0-20mm/hr for female, for the age more than 50 years 0-20mm/hr for male and 0-30mm/hr for female)\(^5\), normal value of serum ferritin ranging 0.015-0.2mg/l and level below that regarded as iron deficiency. While the level of Hgb of lower than 12g/dl regarded as having anemia\(^6\).

Data were entered and analyzed using the statistical package for social sciences (SPSS) version 24, 2015, IBM, USA. Descriptive statistics were presented as mean, standard deviation, and percentages. Student’s t-test (independent model) was used to compare the mean of the serum ferritin in comparison of patients and control groups. Logistic regression was used to determine the relationship in both groups. and less than0.05 of \(P\)-value was regarded as significant.

**Results**

The age of participants was (mean=36.25 years ± 4.1year), it is predominant at 36-45 years, the female was dominating both groups, being married was more than being single (divorced widowed or never married), while educational state the secondary school was more in patients group and primary school was more in control group. Most of the participants had work (98, 67.12%) and it is not a significant \(P\) value (0.66). The age period (36-45) years and female show the significant difference with \(P\) value (0.001 for the case group and 0.01 for control group), while it is not significant for other variables more than 0.05, as shown in table (1).

The serum ferritin ranging from 1 and 129 µg/l for case group and in control group ranging from 2 and 193 µg/l, and the student’s t-test clarify the difference between the study groups was significant ($P=0.001$). The correlation coefficient in the relation of S. ferritin and depression was (- 0.158) and it is significant ($P<0.05$), and this indicate a negative correlation. Assessment the odds ratio; the ferritin level was changed into phantom variable (level equal or less than 15 and more than 15), the relation to depression was assessed by using logistic regression and showed that the change from normal toward low S. ferritin level increase the depression odd’s by (1.93) and ($P<0.05$), as shown in table (2).

**Discussion**

In this work, we examine the relation of depression and effect of S. ferritin level, and shows that the level of ferritin (mean) was near normal or normal in both groups with deference about 17µg/l lower in the case group, and that goes with finding of (Vahdat M. et.al 2007) 26. And it dislike study of (Hunt and Peland, 1999) in the United States where they found no relationship between depression and level of ferritin, Hgb or iron levels 27, and that may due to in there work they did not exclude participant that take iron supplement or taking medication that affects level of ferritin or having chronic illnesses or had inflammatory diseases. Although, all these may increase ferritin level 21. other studies also found no significant relationship between depression and level of ferritin 27-30. lowering the s. ferritin level association with depressive indicated the possibility that the iron plays a role not only in oxygenation of brain cells but also in enhancing brain function and the provoking of depressive symptoms 19, 26, 31-34. Iron deficiency results in impairment of monoamine metabolism and also affect brain myelination, which result not only defects motor skills, memory, and learning capacity, but also produce psychological and emotional disturbance 15, 16. Iron play role in the synthesis of Dopamine (which a neurotransmitter that had an important action in mood regulation, lowering of dopamine level produce depression), also a study by (Kaplan et al. 2003) found that the level of blood dopamine was low in patients with depression 8.

At the same time, studies show that elevated s. ferritin level in patients may associated with development of depressive symptoms which is not examined in this study. A study by (Baune BT et.al 2010) shows that normal or increased ferritin levels may have a role in the development of depressive symptoms, as a part of the inflammatory process 19. Other suggestion was that whether serum changes in iron level did not reflect its uptake in the brain at all 28. Also, data from the experimental study suggest that brain iron uptake may not depend on plasma transferrin, transferrin saturation, or regional brain iron.

Another work done in the United States by (Lozell et al. 2000) study infant with IDA and after 10 years follow up they found that those children are more liable to get depression, anxiety, and concentration problem than other without IDA.

The study shows an inverse correlation between the level of ferritin and depression as the correlation coefficient (-0.158) and (P<0.05), goes with the finding of (Vahdat M. et al. 2007) 26, and this may reflect the role of low iron in developing depressive symptom.

Abstract

Background: Aloe Vera (AV) is a medical plant used in dentistry with multiple uses proved as antiseptic, antifungal, antiviral and anti-inflammatory and very good in building the immune system with a natural compound that has no side effect, for that reason we use it as protective layer from the heat that generated from LED light cure during the filling or cementation procedure or others.

Materials and method: Thirty-five male New Zealand rabbits of weight 1.5 –2kg were used in this study; they were divided into three groups. First group (5 rabbits) the gingiva of upper incisors is not exposed to dental LED light cure (control group), Second group (15 rabbits) which the cervical gingiva of upper incisors which is separated from light source by double transparent celluloid strips, cervical gingiva is exposed to LED curing light 6 seconds three times with 20 seconds interval. Third group (15 rabbits) same as 2nd group but gingiva covered by Aloe Vera oral gel. Animals’ scarifications were done at (0 day) immediately after exposure to curing light ,3 days,7 days healing intervals. Routine processing and sectioning technique was performed for histological evaluation.

Results: Histological findings indicated variation in epithelial thickness, irregularity in basal cells layer and number of blood vessels of 2nd & 3rd experimental groups from 1st control group. The highest mean values of all measured Histomorphometrical parameters were observed in 2nd group 3 days after dental LED light cure exposure.

Conclusion: Aloe Vera oral gel may be used on gingiva as a protective layer to decrease side effects of LED light cure on gingiva.

Key words: Aloe Vera, gingiva, Light –emitting Diodes, rabbit

Introduction

Aloe vera(AV) is a medical plant used in dentistry and proved as antiseptic, antifungal, antiviral and anti-inflammatory properties \textsuperscript{1}. The magical healing property of Aloe Vera is due to a compound called glucomannans, Glucomannans enhances fibroblast growth factor and encourages the proliferation and activity of these cells result in more number of collagen and elastic fibers. Low molecular weight compounds present in aloe inhibit the production of reactive oxygen free radicals from activated human neutrophils \textsuperscript{2}Because of the effect of LED light cure with high intensity of 1500-2000mw\watt, and the heat generated during the procedure of filing or cementation. This high intensity can damage nearby tissue like oral mucosa Although this temperature range depends on LED type, radiant emittance, and tooth characteristics,\textsuperscript{3} there is a consensus that the use of some LED because of the high temperature generated to approximately 41°C. Although the temperature increase that cause severe thermal damage on the gingival tissue is still unknown, approximately 67 % and 77 % of the tissues exposed to light for 40 and 60 seconds,
respectively, developed a gingival lesion. For that reason AV was used in this study as a protective layer on the gingiva because of anti-oxidant effect also, and it act as moisturizer, soothing and cooling agent.

**Materials and Method**

The materials used in the present study were dental diode curing light 1800 mW/cm² (China), Aloe vera oral gel (Drwolfe, New México), transparent celluloid strips (PD,SWESS) anesthetic solution: Ketamine hydrochloride 50 mg and Xylazine 2%, formalin 10%, ethanol alcohol 96%, xylol, paraffin wax, and Hematoxylin and Eosin (H&E) stain. Thirty-five male New Zealand rabbits of weight 1.5 –2kg were used in this study, they were divided into three groups. First group (5 rabbits) the gingiva of upper incisors is not exposed to dental LED light cure (control group), Second group (15 rabbits) which the cervical gingiva of upper incisors which is separated from light source by double transparent celluloid strips. cervical gingiva is exposed to LED curing light 6 seconds three times with 20 seconds interval. Third group (15 rabbits) same as 2nd group but gingiva covered by Aloe Vera oral gel. Animals were scarified by an overdose of anesthetic solution at (immediately after exposure to curing light (0 day), 3 days, 7 days) intervals. The specimens were fixed in 10% buffered formalin for 24h, then gingival tissue dehydrated with alcohol and embedded in paraffin. Sections of 5μm were prepared in the usual fashion, and stained with hematoxylin and Eosin stain.

Histological evaluation was performed using light microscope (OpticaB-350,Italy). Histomorphomatrical parameters are measure the epithelial thickness (EP, TH.) , percentage of basement membrane length to epithelial surface length (BML\EPSL) and number of blood vessels (B.V). Measurements were performed by image processing software program (ImageJ.exe). Microphotographs were taken by a camera (AIPTEK HD 1080P, China) attached to the microscope at power X40.

**Statistical Analysis**

The data were entered and analyzed using SPSS 18.0. Mean ± SD Min. and Max. were given for quantitative variables. Tukey HSD test was applied to observe associations between groups and morphological changes. A P-value ≤0.05 was considered as statistically significant.

**Results**

**Histological evaluation:**

**Fig. 1: Hematoxylin Eosin staining of the gingival tissue of rabbits in 0 day. (A) control**
Histomorphometrical analysis

The highest mean values of all measured parameters were observed in 2nd group 3 days after dental LED light cure exposure (Table 1). While at 3 days healing interval: A high significant difference noticed in this healing period among all groups in all parameter, Highest mean value of all measured parameters recorded in 2nd group((EP.TH.) 0.586, Percentage of basement membrane epithelial surfaces 361.8 and blood vessels number was 38.8. At 7 days, 3rd experimental group shows a normalcy gingival epithelium features when there are a non significant differences in(EP.TH.) and blood vessels number between 1st and 3rd group, But in 2nd experimental group still there are high significant differences from other groups.

Fig. 2: **Hematoxylin Eosin** staining of the gingival tissue of rabbits in the 3 days interval (A) 2nd group show irregular both epithelium surface and basement membrane (B.M)

Discussion

Visible Light Cure (VLC), a blue light with a wavelength between 400-500 nm. It can cause thermal reaction (5). Complaints from patients in connection with light-curing procedures have been reported, including experience of Burning sensations in teeth and in oral tissue. We used rabbits of New Zealand breed, as morphological features of rabbits are closely similar to human gingival mucosa as well as ease of their availability (Nanci, 2008). This study showed histological changes induced by LED dental light cure (1800mW/cm²) can incite thermal energy in biological tissues which can cause burns. Visible light cure absorbed by Cytochrome form excessive Reactive Oxygen Species (ROS) which can cause cell damage (Voskanyan KS, 2009).

Increase in (EP.TH.), (B.V) and (BML/EPSL) in response to elicit tissue damage this agree with Abdul khaliq in 2016 observed Acanthosis and the hyperplasia of prickle cell layer. In present study increase in blood vessels in 3 days interval can attributed to increase blood supply to overcome oxidative stress. Regarding 3rd group, Using Aloe Vera gel protection shows non significant difference between 1st and 3rd groups in (EP.TH.) and (B.V) which resemble normal gingiva this may be due to anti-inflammatory effect and angiogenesis of Aloe Vera gel.

Conclusion

Aloe vera oral gel may be used on gingiva as a protective layer to decrease side effects of LED light cure on gingiva by decrease (EP.TH.), (B.V) and (BML/EPSL) changes and accelerates return to normal condition.

A Concordance Study between Polymerase Chain Reaction Assay and Conventional Culture-based Methods for Detection of *Fusobacterium necrophorum*

Muhammed Asaad Saleh ¹, Haider Ali Muhammed² and Adil Ateyah Alnasrawi²

¹Department of Veterinary Medicine, ²Department of Microbiology, Veterinary Medicine College/ University of Kerbala.

**Abstract**

Foot rot due to *Fusobacterium necrophorum* is an important clinical economic disease in ovine, in order to inform identification and antibiotics selection, Conventional culture-based method and Polymerase chain reaction assays had been proposed to provide a good inter-rater reliability between these techniques, this study was aimed to differentiate the accuracy of conventional culture-based method and PCR technique for identification of *Fusobacterium necrophorum* in an ovine foot rot.

**Method:** The current study was conducted on three farms of Kerbala governorate (AL-husseinyia, Al-Hurr and Ain Al-tmor cities) during the period from October 2017 to April 2018, pathological swab samples of the interdigital region of affected (n= 40) sheep and (n=40) goat were enrolled in this study, after the collection of swabs, the samples were divided into two partitions, each swab of the first partition was immediately collected into lighten tube containing 5 mL of thioglycollate broth enriched with 0.5% ground sheep and was transmitted to the laboratory for conventional culture-based method and the another partition of swabs was sealed with other cooled tubes containing 5 mL of thioglycollate broth enriched with 0.5% ground sheep for the laboratory of molecular investigations.

**Results:** *Fusobacterium necrophorum* was identified in the pathological samples by the two following depended assays: and (46) swabs were positive by conventional culture-based method and (44) swabs were positive with PCR assay, Cohen’s kappa coefficient revealed P value for conventional culture-based methods vs. PCR assay of 0.056 and the current study was demonstrated a highly identification rates of *Fusobacterium necrophorum* in conventional culture-based methods rather than PCR assay.

**Conclusions:** Current study documented conventional culture-based method and PCR assays were facilitate the identification of *Fusobacterium necrophorum* in case of presumed ovine foot rot, it also concluded that molecular assays should be depended in confirmatory detection of *F. necrophorum* in affected animals.

**Key words:** Foot Rot, *Fusobacterium necrophorum*, PCR, Sheep, goat

**Introduction**

Foot rot is a highly contagious disease of ungulates characterized by exudative inflammation with offensive odor, resulting in acute or sub-acute inflammation and necrosis of the tissues of interdigital space of sheep. It is worldwide distribution but highly incidence rates in cold and wet regions, it may reach to peak occurrence in hot and wet summer in both sheep and cattle.

¹³ reported that foot rot is a frequent cause of lameness in sheep with severe economic losses in herds because of decreased weight gain and treatment costs. Also, lame bulls will not breed and occasionally, animals with severe and complicated disease may need to be discarded from the herd. *Fusobacterium necrophorum* is a gram-negative, pleomorphic rod-shaped and anaerobic bacterium, was associated with many necrotic lesions in animals and humans, it is a normal inhabitant of the gastrointestinal tract in animals and humans and this
pathogen is existed within the ruminal fluid of ruminants at concentrations of \(10^5\) to \(10^6\) per gram with variations occurring depended upon the diet of the animal \(^{30}\).

Kumar \(^{14}\) found that the *Fusobacterium necrophorum* in sheep was the primary etiological agent of liver abscesses, and two subspecies; subsp. *necrophorum* and subsp. *funduliforme*, were different morphologically, biochemically, and by the molecular analysis. The subsp. *Necrophorum* is the more virulent and occurs more frequently in liver abscesses than the subsp. *funduliforme*.

Moreover, \(^{16}\) recorded many toxins in *F. necrophorum*, such as leukotoxin, endotoxin, hemolysin, hemagglutinin, proteases, and adhesin., have been considered as virulence factors. Leukotoxin is a major virulence factor, it is a secreted protein of high molecular weight, active specifically against leukocytes of ruminants and the complete sequence of nucleotides of the leukotoxin operon of *F. necrophorum* has been detected., the operon consists of three genes (*lktBAC*) of which the second gene (*lktA*) is the leukotoxin structural gene.

Previous study was utilized the *lktA* gene of *F. necrophorum* to determine *F. necrophorum* variants in cattle, sheep and goats which diagnosed with foot rot., It was demonstrated that a particular variant of *F. necrophorum* *lktA* (designated variant A) tended to be determined in sheep with foot rot and this *lktA* sequence matched the strain of *Fnn* (NCTC 10575) which isolated from bovine with liver abscess \(^{34}\).

**Materials and Method**

**Animals:** eighty ovine (40) sheep and (40) goats were conducted in the present study from un-organized three farms in kerbala city which included (AL-husseinyia, Al-Hurr and Ain Al-tmor cities), all data like age, gender of animals and duration of the study were recorded., the study was extended from October 2017 to April 2018. At all (80) animals were observed on the following properties, the site of lesions of foot rot (unilateral or bilateral) and the claws were cleaned and better trimmed for investigating of bacterial lesions and achieving the pathological swab samples.

**Collection of Samples and Bacterial Cultivation**

Direct swab smears were collected from the interdigital lesions of the affected animals and directly stained with grams stain. After collection of swab samples, they were divided into two partitions in lighten tubes containing 5 mL of thioglycollate broth enriched with 0.5% ground sheep hoof (Aguiar), the first partition was transmitted anaerobically to the medical microbiology laboratory for bacterial cultivation, then, the swab samples were incubated anaerobically at 6% CO2 and 37°C for 24 hours, and cultivated on Colombia blood agar plates, incubated anaerobically at 37°C for 48 hours, then, the cultivated plates were examined morphologically to determine the characteristic colonies of *Fusobacterium necroforum* which appeared on the culture media and biochemical characterization of the colonies of *F. necrophorum* according to the procedures of \(^{30,80}\) were performed.

**Biochemical characterization**

The following biochemical activities included Catalase test, Oxidase test, Indole test, MR/ VP test, H2S production, Litmus milk, DNase test, Lipase test in addition to fermentation of the following sugars-Glucose, Maltose, Fructose Sucrose, Galactose, Lactose, Mannitol and Mannose as well as Motility test were performed.

**Molecular identification:**

The second partition of swab samples were used for PCR assay for molecular detection of *Fusobacterium necroforum lktA* gene according to the following procedures.

**DNA Extraction:**

Preparation of DNA :- each of the contains of 5 ml of enriched broth of swab samples were centrifuged and washed with sterile normal saline and suspended in 2 ml of 50 mM Tris-HCl buffer (pH 8.0) containing 5 mM EDTA and 50 mM NaCl. and the suspension which prepared was incubated with shaker incubator at 37°C for 30 min and used for DNA extraction according to the instructions of the commercial kit (the Presto™ Mini gDNA Bacteria Kit/ Korea) and amplification of *Fusobacterium necrophorum lktA* gene was performed according to the following program.

**Primer and PCR polymerization:**

PCR technique was performed in a final reaction volume of 25 µl master mix in a thermal cycler (Biometra – Germany) with 5 µl of extracted DNA and 1 µl of each of specific primers for *leukotoxin A* gene of
**F. necrophorum** sub sp. *Necrophorum* (lktA) (Forward 5-ACAATCGGAGTAGTAGGTTC-3) and (Reverse 5-ATTTGGTAACTGCCACTGC-3) 403 bp, they were designated by [5] based on the published *F. necrophorum* sub sp. *necrophorum* leukotoxin gene sequence (GenBank accession number DQ672338). PCR products were electrophoresed in 1.5% agarose gel containing ethidium bromide (5μl /100ml) with DNA ladder at along with 100 bp. and PCR products were visualized as a single orange fluorescent band under UV light.

**Statistical Analyses**

Chi square and Cohens Kappa coefficient tests were used to investigate the degree of concordance between the two identification assays (conventional culture and PCR), A P value <0.05 was considered as statistically significant by using statistical analysis of social science data software version 22.

**Results and Discussion**

Obtained results were depended cohens kappa coefficient (K) to measure inter-rater agreement between the two identification assays (conventional culture and PCR), they found the moderate interobserver agreement (0.645) between the two assays on comparing with the results of routine diagnosis have cohens kappa coefficient 0.645, with no significant association between the two identification assays (P value >0.05), according to the kappa interpretation there was a relatively interobserver agreement found table 1.

Previous studies revealed that conventional culture-based methods was more robust measurement for detection of *F. necrophorum* than PCR assay, interestingly, the recovery of *F. necrophorum* by culture-based methods was similar to that of PCR and they were consistent with the results of another study demonstrating that PCR was predominantly and useful technique for detecting of low concentrations of *F. necrophorum* [2]. In spite of these different clinical findings, there was a considerable confusion about the causative agents, particularly related to duplication of names for *F. necrophorum* but also due to misattribution of a role of other etiological organism such as *Streptococci* [1], or inadequate anaerobic culture methods. Thus, increasing the likelihood of occurrence false positive.

The clinical examination of (80) infected sheep with foot rot in the current study have been revealed the development of fever in affected animals, the temperature ranged between 40-41°C according to severity of foot rot lesions, the increase of body temperature reached (41°C) in (45) animals with marked increase in heart beats to (90 b/m) and respiratory rate to (45 b/m) as demonstrated in another similar study [21]. During the period extended from October 2017 to April 2018 the examination of (80) sheep suffered from foot rot lesions in both gender with different ages in Karbala governorate revealed various degrees of lameness in one or two limbs. These clinical signs were agreed with the study of [6] and [26]. The typical lesion occurs in the skin at the top of the interdigital cleft and takes the form of a fissure with the swollen and protruding edges might extended along the length of the cleft or be confined to the anterior part or
the part between the heel bulbs. Exudates secretions were few but the edges of the fissure were covered with necrotic materials and the lesion has a characteristic offensive odor \((23, 21)\). Moreover, the lesion was concentrated in hind limbs more than in forelimbs and this feature was agreed with \((4,10,22)\) Table (3).

![Figure 2: Number and percentage of positive samples and site of lesion on feet in sheep and goat. * matched both tests (+,+). 2X= 0.08 , P>0.05](image)

The highly occurrence of foot rot lesion with the scores (3,4 and 5) were tend to be undetectable lesions in the early stage of infection in animals which led to progress the lesions in deep structures of claws and caused severe inflammation and abscessations; so, there was decreased in the productivity and fertility of animals and this feature was agreed with previous study by \((31,12)\).

Abstract

Background: This is the first study in Iraq that was carried on alive police cases referred to be examined in the medico-legal directorate (M.L.D.) of Baghdad such as victims of violence and sexual assaults for HIV infection. Reaching subgroups of population that have risky behavior for HIV infection is difficult for the time being in our community due to reasons related to culture, religion &security state

Objectives: To find the prevalence of HIV infection among the attendance to the M.L.D. of Baghdad referred to as alive police cases.

Method: This study had involved (76) cases (45) were males and (31) females among various alive police cases that referred to M.L.D. of Baghdad during the period from 1\1\2011 till 31\10\2011. A written agreement had been taken from all involved individuals. Blood samples were taken, centrifuged, deeply freezed, and tested in specialized HIV laboratory using ELYZA technique EIA Test Kit Laboratories Tes Forsight Acon USA lot; 1105010.

Results: All of the (76) tested samples were negative for HIV infection.

Conclusion: The results of this study supported the general impression that Iraq considered as a low prevalence country to HIV infection, even in high risk groups.

Key Words: Medico-legal directorate, Alive police cases, HIV infections.

Introduction

Many forensic situations involve drug abusers and persons with promiscuous sexual behavior, where the statistical risk of HIV and hepatitis infection is markedly greater than in general population. This poses a risk to pathologist and laboratory staff. ¹

In 1981, a new disease syndrome appeared in human populations in the United States and elsewhere characterized by a deficiency in the immune system (²,³).

Two years after the recognition of AIDS, the causative agent, a human retrovirus in the lentivirus family, was identified (⁴-⁶). Early observations had indicated this virus was spread through intimate sexual contact (e.g., genital fluids), blood and blood products, and through mother-to-child transmission ⁷. Among the above mentioned examples are medico-legal cases that may be examined by forensic doctors as alive police cases referred from the concerned authorities to the medico-legal centers. ⁸

Acquired Immune Deficiency Syndrome (AIDS) is the late clinical stage of the Human Immunodeficiency Virus (HIV). It weakens the immune system and makes
the human body susceptible to and unable to recover from other opportunistic diseases. Consequently, it may lead to high rates of deaths of certain people and worldwide wreaking devastation, involving millions of people and communities.³⁹

Three decades after the first description of AIDS, an estimated 34.0 million (uncertainty range 31.6–35.2 million) people were living with HIV, 2.7 million (uncertainty range 2.4–2.9 million) had become newly infected with HIV over the previous year, including 390 000 children, and 1.8 million (uncertainty range 1.6–1.9 million) HIV-infected persons died. More than two-thirds of HIV infections, roughly 22.9 million persons, were in sub-Saharan Africa, which also accounted for close to 80% of women and 90% of children living with HIV. South and south-east Asia were home to some 4.0 million HIV-infected persons, and the Americas, including the Caribbean, to about 3.0 million. Although HIV/AIDS has caused appalling mortality in MSM and IDUs, the experience of sub-Saharan Africa has made HIV/AIDS the greatest challenge to global health in modern times. Moreover, there has been a severe secondary epidemic of HIV-associated tuberculosis, with an estimated 350 000 deaths among the 1 100 000 persons affected by both infections in 2011.¹⁰

Despite much progress on understanding HIV epidemiology globally, the Middle East and North Africa (MENA) stands as the only region where knowledge of the epidemic continues to be very limited and subject to much controversy.¹¹

There is considerable evidence on HIV prevalence and risk behavior practices among IDUs (Injecting drug users), MSM, (Men who have sex with men) and FSWs (Females sex Workers) in MENA.¹² And this has also a great concern from the medico-legal point of view.¹³

Patients and Method

The study has been performed in Baghdad, the capital of Iraq in the Medico-legal institute after the achievement of the approval from the appropriate health manager authority.

The study has been started in the beginning of 2011 and extended to the end of October of the same year.

The respondents’ that has been included in this study were alive police cases referred to that institute, sample of five milliliters of blood has been aspirated from each body in concern according to his acceptance and voluntarily, putting in mind freedom and confidentiality, the blood that was aspirated has been separated and kept in deep freeze till transportation maintained by cool box to the HIV lab.

ELYZA technique EIA Test Kit Laboratories Tes Forsight Acon USA lot; 1105010 was implied.

It Important to mention that Medico-legal Institute Receive medico-legal cases from both Baghdad Major sectors; Al-Karkh and Al-Rusafa.

Results

A total of 76 respondents were involved, 45(59.22%) males and 31(40.7%) females as shown in figure (1).

Of the study group, 43(56.5%) were married ,while 33(43.4%) were unmarried as shown in figure(2).

Various medico-legal cases had been tested. physical trauma constituted the most important cause as their cases were 34(44.7%), followed by cases of sexual abuse including virginity examination and homosexual (sodomy) cases, in addition to other causes of referral as shown in table (1).

The result of all samples have been tested were negative to HIV.

**Discussion**

Iraq is classified as a low prevalence country to HIV infection in the region together with other Arab countries and this was attributed to religious and ethical constrictions and low prevalence of illegal sexual practice. Even those who practice illegal sex have no or rare contact with higher risk people from higher risk areas in the world. Probably the immune state of people in this region has a role in this low prevalence which had been noticed in other microbial and viral diseases such as those affecting the intestinal tract.  

Reaching subgroups of population that have risky behavior is so crucial but it is difficult for the time being due to reasons related to culture of community, religion, and security state, so there is shortage in learning about the groups concerned.

Although there is no accurate data on the number of victims of sexual violence who have been infected with HIV as a result of sexual assault, the risk of HIV infection from sexual violence is relatively low.

This study might help for certain extent particularly most of the respondents’ included in this study having sexual abuse in addition to violence activities as shown in table (1). This study also helps to clarify the important role of forensic practice in this vital subject.

It is important to mention that this study is the first one to be performed on alive medico-legal cases in Iraq so there is no previous study to compare with.

**Conclusions**

Negative HIV testing on cases referred to the Medico-legal institute in Baghdad as police cases supports the general impression that Iraq considered as a low prevalence country to HIV infection. Particularly there were cases having risky behaviors that had been included in the study group. This study is not only supporting the Iraqi surveillance but it penetrates by indirect way the risky subgroups which is not always easy to reach. This study also could be regarded as an initial step to state those laboratories tests used to detect HIV infections as routine or mandatory especially in high risk groups of alive police cases examined in the medico-legal centers in Iraq like those involved in sexual assaults in cooperation with specialized AIDS centers to catch up those cases, as this thing is of great value regarding the preventive measures. In spite of low prevalence of HIV infection in Iraq that we hope it remains, but we are not sure of that.

Determination of Copper and Lead in Samples of Fungicides and Insecticides in Diyala Governorate

Zeina Gany Fadeel¹, Suaad k. Abd-Alwahab¹
¹College of Education for Pure Sciences, Biology Dep. / Univ., of Diyala, Iraq,

Abstract

This investigation included the estimation of heavy metals (copper, Cu and lead, Pb) in four types of pesticides that were been selected randomly from commercial markets in the Governorate of Diyala. Two types of insecticides (Lambada Cyhalothrin 5% EC and Zoro Super) and two types of fungicides (Folicur and Goldtanol 50% SL) were tested. The results showed that the highest concentration of lead was found in the insecticide Lambada Cyhalothrin 5% EC (5.621 Mg. l⁻¹), while the lowest value was recorded in the fungicide Folicur (0.147 Mg. l⁻¹). The highest concentration recorded for copper was found in the fungicide Goldtanol 50% SL (28.323 Mg. l⁻¹) whereas a much lower value was found in the pesticide Lambada Cyhalothrin 5% EC (5.995 Mg. l⁻¹). When a search of pesticides banned in the Gulf Cooperation Council (GCC) was performed it was found that the insecticide Lambada Cyhalothrin 5% EC is among the banned pesticides.

Keywords: Copper and Lead, Fungicides, Insecticides, Diyala Governorate

Introduction

A pesticide is a substance or a mixture of several substances that kill agricultural pests and prevent their propagation. The term “pesticide” refers to toxic chemicals that are spread in the environment of the pest by different means and forms ¹. Pesticides are classified in several ways, some of which are classified according to the targeted pest as fungicide, insecticide or spiders pesticide etc. They can be also classified according to the final form of the pesticide, such as liquid, emulsion, concentrated or wettable. Another criterion for classification is toxicity, where pesticides are classified as highly, moderately or lightly toxic, while they are classified according to the mechanism of action into systemic pesticides and contact-transmitted ². The circulation of pesticides and irrational use of them have caused some undesirable environmental manifestations. In fact, pesticides are elements that contribute to shifting the environmental balance with serious threats to both nature and humans which confirms the urge of their avoidance ³. Shortage in farmers’ knowledge about the risks of pesticides to humans and the environment was previously reported, as well as the poor application of measures necessary to reduce their risk ⁴. Addition of farmers to the use of pesticides was reported to cause countless environmental problems ⁵. As high as 20% of the amount of pesticide used remains for one day after treatment, which may lead to higher rates of colon and stomach cancer according to the report of the World Health Organization, due the consumption of food contaminated with pesticides ⁶. Despite the different components of pesticides, the present study sheds the light on the concentration of copper and lead, which are considered as heavy elements with highest specific density. They exist in different environments at low levels, but increase through the introduction of various industrial and agricultural wastes, leading to increased change in the quality of the environment and damage to the living organisms ².

Materials and Method

Pesticides were taken from the commercial markets at random. Four pesticide brands of two types were studied, including two brands of insecticides, Lambada Cyhalothrin 5% EC and Zoro Super, and two of fungicides, Goldtanol 50% SL and Folicur

1: Pesticides for which heavy metals are estimated

1.1. Lambada Cyhalothrin 5% EC

An insecticide that works by skin contact and through digestive system and has an active effect on
insects that attack fruit leaves and soil surface, including the biting and the sucking insects.

1.2. Zoro Super

An effective pesticide on insects and spiders that is used to treat vegetables, broad plantations, fruit trees, and ornamental plants. It is a concentrated emulsion with an active ingredient called Abamectin with a concentration of 36 g / L.

1.3. Goldtanol 50% SL

A fungal and bacterial pesticide that is used to treat soil and has a soluble liquid form.

1.4. Folicur

A systemic fungicide that is emulsified in water and specialized in the control of fungal diseases of wheat and other crops such as vegetables.

*Method of Digestion of Pesticides

The pesticides were directly digested by placing them in the furnace according to the previously described “graphite tube” method 7.

* Quantification of heavy elements in pesticides

Quantification of the copper and lead in the samples was conducted using the atomic absorption device (AA-700 Atomic Absorption Shimadzu) because of its high precision in the diagnosis of heavy metals.

Results and Discussion

The results in table 1 show the presence of copper and lead in all pesticides used in the current study, with the highest value of the lead element in the Lambada Cyhalothrin 5% EC insecticide (5.621 Mg. Γ⁻¹) whereas the lowest was recorded in the fungicide Folicure (0.147 Mg. Γ⁻¹). Copper concentration showed a highest value in the fungicide Goldtanol 50% SL (28.323 Mg. Γ⁻¹) and a lowest value in the insecticide Lambada Cyhalothrin 5% EC (5.995 Mg. Γ⁻¹). The results demonstrate the presence of copper and lead in all of the tested pesticides. It was reported 8 that lead as well as chemical pesticide residues are serious sources of environmental pollution 9. It was also demonstrated that insecticides and heavy metal compounds such as lead and copper, which are spread in the aquatic environment, are considered as dangerous environmental contaminants. The insecticide Lambada Cyhalothrin 5% EC is a pyrotechnic insecticide that is widely known and highly used in Iraq. The chemical structure of this type of pesticides includes a Cyanide atom (a-cyano-3-phenoxybenzyl 3-(2-chloro-3,3,3-trifluoroprop-1-enyl)-2,2-dimethylcyclopropanecarboxylate). So far, there is no specialized substance that acts on the toxic antagonism of pyrethroid pesticides, but some sedative drugs that relax muscles and reduce spasm levels can be used 10. It was reported that most of the pollution with heavy metals is resulting from human environmental activities, including pesticides and chemical fertilizers 3. A previous investigation of the effect of heavy metals in Al Hilla River region demonstrated that exhausts of cars, generators and waste materials are sources of lead pollution that affects human health, especially children. Lead can be distributed in the body reaching the brain, liver, and kidneys and is stored in teeth and bones where it accumulates over time. There is no current known level of safe exposure to lead. However, this study and our results propose to include chemical pesticides as main sources of heavy elements 11. It was reported that fungicides that are added to the seeds or the soil are transferred from the roots to the leaves, whereas those sprayed on the leaves are transferred to the inside of the plant 3. This cycle suggests that caution is required when using fungicides, because, in addition to the increased damage that may occur as a result of chemical compounds of the pesticide, there is an accumulation of heavy metals found in these pesticides, which increases the risk and effects of their frequent use. Lead and copper are dangerous elements that are sometimes transmitted from the plant to the body of the consumer (human and animal) through the food chain 12. Lead is dangerous due to its cumulative feature, causing physiological damages such as mental retardation and lack of vital functions. The absorption of heavy metals by plants may vary from one class to another and from one type to another. The absorption of elements depends on many factors, including the movement of elements from the soil to the root, the ability of the elements to transit through the cells of the root epidermis, and the transfer of elements from the epidermal cells to the xylem tissue. These metals are then transferred to the leaves that perform the processes of photosynthesis and food manufacturing for all parts of the plant. At the end, the transmission of these elements takes place from the leaves to the storage tissues such as seeds, roots, and buds 13. Previous reports demonstrated that henna extract can inhibit the radial growth of the fungus in tissue cultured of different varieties of date palm trees 14. The inhibitory effect of the growth of
fungus when using henna leaf extracts may be attributed to the effect of active compounds found in the extracts such as resin, flavones, tannins and glycosides. Those results of henna leaf extract inhibition were consistent with many studies that proved similar effects in inhibiting the growth of other fungi. In addition, studies on the effect of volatile oils from lemon and mandarin showed a complete inhibition of the growth of the fungal pathogens compared with the use of fungicides. Thus, such treatments could become substitutes for chemical pesticides. The use of powdered Cinnamomum cassia bark and bitter orange leaves showed inhibitory effects on the growth of Aspergillus ochraceus isolated from some grains and poultry, leading to reduced negative effects.

Phytochemical Study and Evaluation of Iraqi Fennel Seed Oil as Antibacterial of Urinary Tract Infection

Baydaa H. Abdullah1, Ibrahim S. Abbas, Thamer Mouhi Jasiem2

1Department of Clinical Laboratory Sciences, College of Pharmacy, Mustansiriyah University,
2Department of Pharmacognosy And Medicinal Plant , College of Pharmacy, Mustansiriyah University

Abstract

Objective: This study were designed by investigation of active compounds of the fennel seeds in Iraqi plant and determined the terpenes compounds by gas chromatography analysis and finally shown the biological activity of the volatile oil of fennel seeds upon different pathogenic bacteria which isolated from patients suffered from urinary tract infection.

Methods: in this study we used different methods and different solvent for extract the active compounds such as clavenger for volatile oil, decoction and Soxhlet for main other active compounds.

Results: The results of this study had shown that bacteria such as Pseudomonas aeruginosa, Streptococcus spp and Salmonella spp. were more resistant to The volatile oil of fennel seed than bacteria such as, Staphylococcus aureus and E. coli. five compounds were identified from the n-hexane extract of volatile oil of fennel seeds. Anethole was in maximum content (43.13 %) in retention time 13.762, followed by Estragole (40.84 %) in retention time 12.062, 1,6, octadien-3-ol ,3,7-dimethyl (3.71%) in retention time 9.937, l-fenchone compounds (3.49%) in retention time 9.645 and the minimum one is d-limonene (1.28%) in retention time 8.435.

Keywords: fennel seeds, antibacterial activity, phytochemical screening, GC analysis

Introduction

Medicinal plants are nature’s gift to human beings to make healthy lifestyle free from diseases, and play an important role to look after our health. They are considered to be much safer and certain cure in the treatment of several conditions. Iraq is one of the countries that consider traditional medicine is very important, Iraq, like to any other country in the world, the use of medicinal plants betake back thousands of years. The strategic location, the climatic state of affairs and geographical diversity make it suitable place for cultivate of many medicinal herbs as source of treatment or protection of many diseases. The Foeniculum vulgare consists one of those plants and consider as one of the most important aromatic plant.

There are many traditional medicine for part used (fennel seeds) of F. vulgare consider as carminative and its mainly used with purgatives. There are similarity between fennel water and dill water both used to correct flatulence of infants (gripe water). The volatile oil or called essential oil one of the most active constituents in fennel seed it’s made as flavoring agent in additional used as medicine which reported it have been many components like estragol, trans-anethole, fenchone, and α-phellandrene. The major active compounds of F. vulgare are some of the most important active constituents such as phenols and phenolic glycosides. The phenolic acids structures like 3-O-Caffeoylquinic acid, 4-O-caffeoylquinic acid, 5-O-caffeoylquinic acid, and the flavonoids like eriodictyol-7-rutinoside and quercetin-3-rutinoside, also isolated others constituents from F. vulgare were Quercetin-3-O-galactoside, kaempferol-3-O-rutinoside and kaempferol-3-O-glucoside. The phenolic compounds which isolated from F. vulgare were associated with the prevention...
of some of dangerous diseases because they are caused by oxidative stress like cancer and inflammation. In many studies reported the volatile oil which isolated from fennel seeds of \textit{F. vulgare} act as antibacterial effect against many pathogens bacteria such as Escherichia coli, Bacillus megaterium and \textit{Staphylococcus aureus}, \textit{E. coli}, \textit{Listeria monocytogenes} and \textit{S. aureus} (12,13).

\textbf{Material and Method}

\textbf{Collection of plant material}

The fennel seeds plant was authenticated by National Iraqi Herbarium, Botany Directorate at Abu-Ghraib. The seeds of the plant was washed and dried in the shade at room temperature at Pharmacognosy and medicinal plants department-college of pharmacy-Mustansiriyah University for (7 days) until crisp and then was grinded by mechanical mills and weighed according to previous studies.

\textbf{Extraction}

The essential oil content of fennel seeds was extracted by hydro distillation method by the use Clevenger apparatus (100 g) of the plant material was hydrodistilled by adding (500 mL) of distilled water D.W. in round flask bottom, the plant was left boiling for three hours; the volatile oil was collected after observing that there is no increase in volatile oil was achieved.

\textbf{Preliminary phytochemical investigation}

The extracts of fennel seeds from Baghdad plants was screened according to standard procedures of qualitative investigation to identify the major classes of natural secondary metabolites such as Tannins, Saponins, Flavonoids, Terpenes, Alkaloids, Anthraquinone glycoside and Carbohydrate (16,17).

\textbf{Antimicrobial screening}

The essential oil of fennel seeds was tested for antimicrobial activity of six different pathogenic bacteria which were \textit{Staphylococcus aureus}, \textit{Streptococcus spp.}, \textit{Pseudomonas aeruginosa}, \textit{Salmonella spp.}, \textit{Serratia} and \textit{E. coli} which isolated from patients suffered urinary tract infections by using diffusion well agar method.

\textbf{Results and Discussion}

\textbf{Phytochemical study :}

The preliminary investigation results of active compounds were referred to different active compounds presented according different solvents were used in this study. Ethanol 70% extract was contained Carbohydrate, tannin and flavonoids. while terpene investigated with hexane extract [table1]. Also used Decoction method with water as a solvent and Ethanol 70% by Soxhlet apparatus extract was investigated the others active compounds.

The GC-MS analysis of the individual extracts indicated a complex mixture of constituents of different chemical classes. five compounds were identified from the n-hexane extract of volatile oil of fennel seeds [table 2, figure 1]. Anethole was in maximum content (43.13 %) in retention time 13.762, followed by Estragole (40.84 %) in retention time 12.062, 1.6, octadien-3-ol, 3,7-dimethyl (3.71%) in retention time 9.937, 1-fenchone compounds (3.49%) in retention time 9.645 and the minimum one is d-limonene (1.28%) in retention time 8.435 [Table 2].

The volatile oil of fennel seed possessed antimicrobial activity 0.5, 0.25, 0.125, 0.06 and 0.03 concentration against all microorganisms were used in this study table (3) and the value of the concentration activity was reach to 20, 18, 18, 24, 20 and 12 as inhibition zone at 0.5 concentrated against \textit{Staphylococcus aureus}, \textit{Streptococcus spp.}, \textit{Salmonella spp.}, \textit{Serratia}, \textit{E. coli} and \textit{Pseudomonas aeruginosa} compared with ciprofloxacin as control which gave the higher activity and reach to 24 at 0.5 concentrated [table 3]. The MIC values for The volatile oil can vary depending on factors such as: chemical compositions differences between herbs collected in different countries (differences in the climate, soil composition, age and vegetative cycle stage), as well as differences in strains of microorganisms used (standardized or clinical isolates). The results of this study had shown that bacteria such as \textit{Pseudomonas aeruginosa}, \textit{Streptococcus spp} and \textit{Salmonella spp.} were more resistant to The volatile oil of fennel seed than bacteria such as, \textit{Staphylococcus aureus} and \textit{E. coli}.

Detection Antimicrobial Susceptibility Patterns of Bacterial Species Isolated from Burns and Wounds Infections in Basrah Hospitals

Ghsoon Al-Kanaany
Assist. Prof. Department of biology, College of Science, University of Basrah, Iraq

Abstract

Burn and wound infection is one of the most frequent serious sicknesses caused by pathogen, chiefly by both gram positive and gram negative bacteria. This study was carried out to identify 25 bacteria isolated from burns and wounds surgical belong to the species: (Staphylococcus aureus, Staphylococcus lentus, Staphylococcus intermedius, Staphylococcus lugdunensis, Pseudomonas aeruginosa, Pseudomonas oxyzihabitans, Pantoea spp., E.coli, Rhizobium radiobacter, Ochrobactrum anthropic, Burkholadia cepacia, Sphingomonas paucimobilis, Klebsiella pneumoniae, Aeromonas sobria). Staphylococcus 9(36%) was the most dominant organism, followed by Pseudomonas 6(24%). Antibacterial activity of some antibiotics was investigated against bacterial isolates. the data demonstrate the most commonly isolated from burns and wounds surgical were Staphylococcus followed by Pseudomonas. All bacterial isolates revealed high resistance to antibiotics were used, Whereas Staphylococcus aureus revealed resistance for three antibiotic: Amikacin, Nitazoxanide, Neomycin. Pseudomonas aeruginosa revealed resistance for four antibiotic: Neomycin, Amoxicillin/Clavulanic acid, Cefotaxime. Pantoea spp revealed resistance for five antibiotic: Neomycin, Trimethoprim, Amoxicillin/Clavulanic acid, Cephalothin, Cefotaxime. E.coli revealed resistance for four antibiotic: Neomycin, Trimethoprim, Amikacin, Cephalothin.

Key words: Staphylococcus; wounds; infections; Neomycin

Introduction

Burn wound infections are a major medical problems in all areas of the world. They can be caused by heat, scalds, electricity, chemical agents. Infections of burns caused by pathogenetic bacteria is one of the most frequent hospital problems in world, especially in modern countries. Hospital acquired infection in burn patients might be caused by exogenous or endogenous. Exogenous infection is obtained during exposure to the hospital workers or medical devices, hospital environment, while Endogenous infection is induced by microorganisms present as the normal flora of the patients. Infection is still source of mortality and morbidity in burn patients. It is assessed that approximately 75% of the mortality associated with burn infections is related to sepsis particularly in modern countries.

Burn injury is one of the most frequent and destructive forms of trauma. Patients with serious thermal injury require specialized care to minimise mortality and morbidity. Human skin surface is the main layer that represents the natural protection of the body tissues from the invasion of potential pathogens, and the occurrence of burns or injury in the skin can lead to destroy and destruction of these tissues and may happen infections of bacteria transmitted to the blood and internal tissues, which is a proteins-rich environment and encourage the growth of microorganisms that play an important role in the pathogenicity.

Burn injuries of patients are high risk of infections for a variety of reasons. For instance, immune compromising effects of burns, available exposed body surface, prolonged hospital stay, invasive diagnostic and therapeutic procedures.

Wounds are defined as a crash in the defensive function of the skin and damage of continuity of epithelium with or without loss of underlying connective tissue. Tainted wounds are probably to be more grievous,
allergic and odoriferous, resulting in increased disquiet and malaise for the patient. Surgical wound infection is determined as festering exude from the surgical wound. It is distinguished by inflammation encircling periwound area. Surgical wound infections are the second most common cause of nosocomial infections. Microorganisms that are liable for surgical wound infection cause activation of immune system results tissue destruction and inflammation.

The dominant microorganisms that associated with wounds infections comprise multi-drug resistant gram-positive and gram-negative bacteria, the most common microorganisms are Staphylococcus aureus which from different studies have been found to form 20-40% and Pseudomonas aeruginosa 5-15% .Escherichia coli, Klebsiella spp and Acinetobacter spp. of the nosocomial infection, with infection chiefly following surgical operation and burns. Pseudomonas aeruginosa is one of the significant species among the genus Pseudomonas. P. aeruginosa is widespread distribution in nature, its virulence and its high antibacterial resistance. P. aeruginosa is nosocomial infection pathogen and an opportunistic, that causes diseases in immuno-compromised individuals.

The aim of this study is to isolate and characterize bacterial species causing burns and wounds infections from patients admitted in Basrah hospitals and determination of the antimicrobial susceptibility of bacterial isolates.

Materials and Method

Collection of specimens

Fifty three swabs have been collected from patients of burns and wounds surgical units with different sex and ages and dissolved into 2ml brain heart infusion broth media after then transported to bacteriological lab and incubated at 37°C for 48 hours. Transported samples comprise 25 post operative wounds and 28 burns from two hospitals: Al-Fayhaa General hospital, Al-Basrah General hospital.

Isolation and characterization of bacterial isolates

The swabs sticks used for collection of specimens were streaked on Nutrient, MacConkey, Blood and Mannitol salt agar and incubated overnight at 37°C. Growth of bacteria have been identified by appearance of colonies, blood hemolysis, microscopic examination by Gram stained. Then bacterial isolates were identified at level of species by using Vitek-2 compact was performed with ID-GN, ID-GP cards, according to the manufacturer’s instructions.

Antimicrobial Susceptibility tests

The antimicrobial susceptibility tests have been accomplished as present in Kirby–Bauer (1966) technique using nutrient agar and different single antimicrobial discs fitted out commercially. Zones of inhibition around the discs have been measured by millimeter (mm) using a metric ruler as present in clinical laboratories standards institute (2011). The antibiotics tested were: amikacin30μg, cefotaxime30 μg, ceaphalothin 30μg, tobramycin 10μg, trimeth- oprim5μg ,neomycin30 μg, nitazoxanide30μg, imipenem 10μg ,meropenem 10μg, amoxicillin/clavulanic acid20/10μg,nalidixic acid30μg.

Results

Out of 53 patients of burn and surgical wounds, 50 cases infected with bacteria. These isolates were identified to Gram negative and Gram positive bacteria by using conventional methods. Whereas the isolates exhibited differential pattern on blood agar and some of isolates ferment lactose when grown on MacConkey media. The identification results with Vitek2 compact system were grouped in fig 1. Among 50 bacterial isolates, 25 isolates identified to species (Staphylococcus aureus, Staphylococcus lentus, Staphylococcus intermedius, Staphylococcus lugdunensis, Pseudomonas aeruginosa, Pseudomonas oryzihabitans, Pantoaea spp., E.coli, Rhizobium radiobacter, Ochrobactrum anthropic, Burkholdria cepacia, Sphingomonas paucimobilis, Klebsiella pneumoniae, Aeromonas sobria).

The study revealed the commonest organism was Staphylococcus with percentage 36% (9 isolates) followed by Pseudomonas 24% (6 isolates), E.coli 8% , Pantoaea 8% with (2 isolates for each), Klebsiella 4%, Rhizobium 4%, Ochrobactrum 4%, Burkholdria 4%, Sphingomonas 4% Aeromonas 4% with (1 isolates for each).

The results demonstrated that the bacteria isolates characterized at species level by Vitek2 compact system was separated into four groups based upon the probability of accurate identification as follows:8(32%) isolates with probability of accurate identification(96-99%),4(16%)

isolates with (93 - 95%), 7(28%) isolates with good(89 - 92%), 6(24%) isolates with (85 - 88%) as show in fig 2.

Antibiotic susceptibility patterns

**Staphylococcus aureus**

The present study showed that *Staphylococcus aureus* exhibited the highest resistance against antibiotics: Amikacin, Nitazoxanide, Neomycin, while they were sensitive to antibiotics Tobramysin, Imipenem as show in fig 3.

**Pseudomonas aeruginosa**

The most effective antibiotics on *Pseudomonas aeruginosa* were Tobramysin, Imipenem while the highest resistance were to Neomycin, Amoxicillin/Clavulanic acid, Cephalothin, Cefotaxime as show in fig 4.

**Pantoea spp**.

The study revealed that *Pantoea spp.* exhibited the highest resistance against antibiotics: Neomycin, Trimethoprim, Amoxicillin/Clavulanic acid, Cephalothin, Cefotaxime while they were sensitive to antibiotics Tobramysin, Imipenem, Amikacin as showed in fig 5.

**E. coli**

In our study, *E. coli* exhibited the highest resistance against antibiotics: Neomycin, Trimethoprim, Amikacin, Cephalothin while they were sensitive to antibiotics Tobramysin, Imipenem as showed in fig 6.

**Antibiotics resistance for Staphylococcus aureus and Pseudomonas aeruginosa**

The results revealed that both *Staphylococcus aureus* and *Pseudomonas aeruginosa* exhibited high resistance against antibiotic Neomycin while both of
them showed sensitive to Tobramycin ,Imipenem.

Discussion

Bacterial infection of wounds is a grave problem in hospital ,chiefly in surgical usage where the place of a sterile operation can become contaminated and subsequently infected 20. In this study , the majority isolated organisms from burns and wounds surgical were Staphylococcus followed by Pseudomonas .the reasons for this high diffusion may be due to factors associated with the acquirement of nosocomial pathogens in patients with long term hospitalization,prior administration of antimicrobial agents, complicating illnesses , recurrent, ,or the immunosuppressive effects of burn these results are not agreement with the work of 18 but agreement with results from previous study 14. Findings from study accomplished at hospital in Nigeria revealed that the most common microorganism were Staphylococcus aureus(25%) and Pseudomonas aeruginosa (20%) 1 . Pseudomonas aeruginosa in this study was resistance to four antibiotics as showed in Fig.4. A primary cause of drug resistance in gram negative bacteria is their ability to generate extended spectrum β-lactamase 19. In results showed that most bacterial isolates exhibited multi drugs resistant. Pseudomonas aerogenosa is adapted to the habitat of hospital due to biofilm construction that provides long survival advantage for the pathogens,and prevent elimination by the host immune system or antibacterial drug treatment 10.

Conclusion

The most common causative agents of wound,burn infections and antibiotics resistance in the present study were Staphylococcus aureus and Pseudomonas aeruginosa respectively,a lso the study observed that Staphylococcus aureus and Pseudomonas aeruginosa were multidrug resistant.

Evaluation Protective Role of *Salvia officinalis* Silver Nanoparticles Against Toxic Effect of Bisphenol a in Female Rats

Hussein Abdulmaged Raheem1, Rana Fadhil Mousa2, Ayyed Hameed Hassan2

1MSc. Student, 2Assistant prof., College of Veterinary Medicine / University of Kerbala - Karbala – Iraq

**Abstract**

Bisphenol A (BPA) is a chemical compound found in the environment and used in the manufacturing of plastic, which is known as deleterious part of different body parts. *Salvia officinalis* (SO) is a perennial round shrub in the family of Labiatae/Lamiaceae. It has potent antioxidant and anti-inflammatory effects. The present study was conducted to evaluate the protective role of SO as nanoparticles against harmful effect of BPA in female rats. Eighteen adult female rats were used and divided equally and randomly into three groups as following: first group received DMSO orally and served as control group while second and third groups were gavaged either with BPA alone or in combination with SOSNPs respectively, all the treatments extend 30 days. The result revealed harm effect of BPA by significantly increase the level of estrogen, AST, ALT, ALP, urea and creatinine with significantly reduction in the FSH and LH. SOSNPs show ameliorative effect on all above parameters.

**Keywords**: *Salvia officinalis*, Bisphenol A, FSH, LH

**Introduction**

BPA consider one of the most famous xenoestrogens in the nature before 80 years and enter in many product such as packaging of beverages and food, epoxy, polyvinyl carbon and electronic. Its mimic estrogenic effect via its ability to stimulate estrogen receptors (ER), so its can cause disturbance in the endocrine system. The polymerization increase the risk of exposure, by acceleration the hydrolysis of the ester bond due to heating or acidic environment so the risk of exposure will increase. As a result to frequent wash of the polycarbonate and the temperature may be high or acidic medium, this will increase the risk of hydrolysis. The estrogen receptors are diffused in different organs such as reproductive organs (ovary, uterus, oviduct and ovary) as well as mammary, pituitary, thyroid glands and many other organs, so the binding of BPA with these receptors will lead to increase expression of these cells. BPA has similar effects of diethylstilbestrol on sexual maturity so its banned to use in the baby milk bottles. Nanotechnology is modern technology, this technology focused by the researchers recently due to wide range of applications in energy, electronic purposes as well as in medicine. The nanotechnology recently enter to pharmaceutical line which used in the preparation and development Nano scales particles in the formation of drugs conjugates, Nano crystals, etc. Nanoparticles are cluster of atoms their size range from 1 – 100 nm, due to its size have noble properties as well as morphology and distribution. It have novel properties and functions due to its small size or intermediate, nanoparticles give high efficiency than traditional method for treatment due to mentioned properties as well as decrease the dose and the side effects of chemicals. *Salvia officinalis* rich in canosic acid and rosmarinic acid so it have antioxidant properties, anti-inflammatory, antiproliferative, antibacterial, and anticancer, as well as, sage used as anti-diabetic. Due to aromatic properties the sage used as flavoring agent and antioxidant additive for canned food. *Salvia officinalis* good reducing agent, so it used as reducing agent in the preparation of nanoparticles.

**Materials and Method**

The tested compound is bisphenol A (BPA)

BPA (cas 80 – 05 – 7, > 97%) was obtained from high media company (India), Dimethyl sulfoxide (DMSO) assist as vehicle for suspension of BPA as
well as used as control substance. *Salvia officinalis* herb buy from local market of karbala.

**Animals of study**

This study was carried at the college of veterinary medicine / university of Kerbala, eighteen adult female rats. There ages was ranged from 14 to 16 weeks old and the average of weight (200 – 250 gm). After 15 day of accommodation in metal cages under suitable environment conditions at temperature 23±2 °C and 12 h light / 12 h dark, with ad libitum feeding and water daily, divided randomly into 3 groups 6 animals on each group.

**Experimental design:**

First group administrated 0.25 ml DMSO and, the second group administrated 250 mg / kg BPA and the third group co administrated 250 mg / kg BPA and 150 mg / kg SOSNPs.

**Extraction of salvia officinalis**

After collection of sage plant, wash it by double distilled water (DDW) then cut and grind until powdered it. Weighs fifty grams of powdered SO then mixed with 250 ml from DDW and boiled for 5 minutes, then cooled the aqueous extracts and filtered by filter paper.

**Preparation of salvia officinalis silver nanoparticles (SOSNPs)**

At first prepare 1nM of silver nitrate solution, this solution prepare by adding 0.0170 grms of AgNO3 to 100 ml of DDW by carefully addition, then store in dark colored bottles to avoid auto oxidation after that put the silver nitrate solution and adding it gradually to 10 ml of SO aqueous extract then heat the mixture to 40 C° until see the color from pale yellow to brown.

**Identification of silver nanoparticles**

**Spectrophotometry**

The spectrophotometry was evaluated by using UV-visible double beam (lapomed) were used to identify the stability and formation of silver nanoparticles. The wavelength for this apparatus ranged from (100 – 800) nm, 480 nm was the optimum wave length for SOSNPs solution.

**Scanning Electron Microscope**

By using scanning electron microscope (SEM) (Hitachi), the solution was tested to show the size and shape of the silver nanoparticles. This procedure was done by put one drop of solution on the aluminum – covered by copper grid and films on the SEM system, then let it for 2 minutes, by using blotting paper remove the extra solution then dying the grid.

**Blood sample collection**

At the end of experiment, The animals anesthetized, this done by putting the rats in closed jar containing soaked by chloroform. Then the blood collected by heat puncture. the blood gelled tube and centrifuged for 15 minutes (300 RPM). The supermatant serum was drawn and kept by eppendorf tubes and store at (-4 C°) until analyzed.

**Statistical Analysis**

The results was collected and analyzed by SPSS program version 13, the mean and standard error were dependent in this analysis.

**Hormonal assay**

The (FSH, LH and estrogen) hormones was evaluated at the end of experiment. Assessing the concentration of FSH and LH in the blood is a valuable tool in diagnosing equilibrium in regulating fertility across the pituitary-pituitary gonadal axis. As well as, estrogen evaluation generally considered useful tool in the diagnosis follicular growth and development. The FSH, LH and estrogen concentration was evaluated according to ELISA kit of Monobind incorporation (USA).

**Biochemical tests**

A- **Liver enzymes**

Liver enzymes (AST, ALT and ALP) were determined to evaluate the toxic effect of BPA on the liver and the protective effect of SOSNPs, these tests was done by ELZA depending on the (Agappe diagnostic, spectrophotometer kit, India).

B- **Kidney enzymes**

The kidney enzymes (creatinine and urea) were evaluated to determine the renal toxicity caused by the effect of BPA and the protective effect of SOSNP,
these tests was done depending on ( Agappe diagnostic , spectrophotometer kit , India ) kit 29

Results and Discussion

Synthesis of Silver nanoparticles by using saliva officinalis extract ( SOSNPs ) :

saliva officinalis extract was used to prepare the silver nanoparticles as reductive material , the change in the color is the indicator for silver nanoparticles reduction , this reduction occur due to high content of carnosol, carnosic acid, flavonoid glycosides, niacin, nicotinamide, flavones and estrogenic substances which get it high reductive effect 30 and make the SO suitable for preparation sliver nanoparticles ( 31 , 32 ) .

Identification of silver nanoparticles

The silver nanoparticles were identified by UV identification and SEM scanning . Depending on the optical absorbance of UV radiation ((Labomed Spectro UVD-3200 spectrophotometer ) , the result show the peak of absorption at 480 nm ( figure 1 ) when the color changed to brown this effect by the shape and size of nanoparticles and due to increase in the surface Plasmon resonance ( SPR ) 33 , the change in the color occur due to the reduction of nanoparticles by SO 34 .

Figure ( 1 ) show the peak of wave length for SOSNPs UV test

Figure ( 2 ) SEM image for SOSNP reveal the shape and size of silver nanoparticles
Protective effects of SOSNPs on the reproductive hormones of rats exposed to BPA.

The statistical analysis for the rats reproductive hormones table (1) show significance increase ($P \geq 0.05$) in the estrogen level of the rats exposed to BPA in comparative with control group, due to the effect of BPA at hypothalamus pituitary regulatory circuit by interfering with estrogen receptors ($\alpha$ and $\beta$) in the hypothalamus–pituitary–gonadal axis while in the rats treated with SOSNPs combined with BPA show significance reducing the level of estrogen lower than BPA treated rats to be clear to normal level due to antioxidant properties of SO.

Table 1 statistical analysis for the effect of BPA on reproductive hormones and the protective effect of SOSNPs (Means ± SE).

Effect of BPA on the liver enzymes and the protective effects of SOSNPs

The statistical analysis for liver enzyme results table (2) show significance ($P \leq 0.05$) increase in the liver enzymes (AST, ALT and ALP) as effect of BPA administration in comparison with control group, these enzymes were tested to evaluate toxicity in the liver, which leakage into the tissue. The toxic effect of BPA come from oxidative stress effect, in addition to cellular damage which come from reactive oxygen species (ROS) this may lead to increase in the liver enzymes level.

Assessment of the Needs among Families of Martyrs of Terror Victims in Al Furat Al awsat Governorates / Iraq

Dalal Z. H.¹, Hussein J.M²

¹Msc. Student, in Community Health Nursing/ College of Nursing, Babylon University, Babylon Province-Iraq.
²Asst. PhD. Community Nursing/ College of Nursing, Babylon University, Babylon Province-Iraq.

Abstract

Background: Terrorism is a global phenomenon that does not concern religion without religion, sex without sex, land without land or color without color. Who ever monitors the current world situation finds terrorism in various countries of the world and in many.

Methodology: A cross sectional descriptive design study was carried out among families of martyrs of terror victims the period from 31th July 2018 to 29th July 2019. The sample of the study was non-probability "convenient sample" (n=550) of Families Martyrs of Terror Victims in Al Furat Al awsat Governorates. Data are collected Through the use of the questionnaire instrument. Data were analyzed through the application of Statistical Package for Social Sciences (SPSS) program.

Results: The results of the present study show that the the highest percentage of families refers that they resident in city center (25.6%). most of these families expressed an accepted level of such needs (62.6%) and (27.6%) of them expressed an insufficient level of administrative needs. Conclusion: the study concludes that the Most of martyrs’ families expressed moderate level of psychological needs. The majority of these families expressed a lack of support for their social needs. Most of these families have poor monthly income which in turn increase their financial needs.

Conclusions: the Most of martyrs’ families expressed moderate level of psychological needs. The majority of these families expressed a lack of support for their social needs. Most of these families have poor monthly income which in turn increase their financial needs. A small proportion rated the healthcare services they receive as sufficient. Most of these families rated the legal and administrative services as acceptable. Most of these families rated the overall services as insufficient.

Keywords: Assessment, Family, Need, Terrorism and Terror victim.

Introduction

Family is a multidimensional unit performing various functions in a society. It has been a great interest for sociologists to define it on the basis of its various aspects like size of the family, functions of the family, relationship between the family members etc.¹ At the same times families can be classified as nuclear or small family and joint or extended family. The size of the nuclear family depends on the number of children in the family whereas number of uncles, aunt, cousins and grandparents decide the size of joint or extended family.² From the bottom of Maslow hierarchy upwards, the needs are: physiological, safety, love and belonging, esteem and self-actualization. Needs lower down in the hierarchy must be satisfied before individuals can attend to needs higher up. Model of the five-stage can be divided into deficiency needs and needs for growth.³ Terrorism is frequently recognized as referring to acts of violence targeting civilians for political or ideological purposes. In legal terms, although a extensive definition of terrorism has yet to be adopted by the international community, current declarations, resolutions and universal "sectoral" agreements on particular elements of terrorism describe certain acts and key elements.⁴ Victims of terrorism have significant needs which are: the need of being respected, recognized and supported (through data, mental, psychological, practical, expert and involvement in peer support organizations), safety
need (physical, protection from secondary victimization and media victimization), the need of having access to justice and the right to receive compensation from the member State. Victim needs should be evaluated and victims should be notified of their right to access support facilities and aided in the arrangement of suitable referrals where necessary. The use of mass and social media and other support or community-based organizations can be highly helpful and efficient in identifying and informing victims of particular support facilities and how to access them. From the Statistical Information Facility (TIS) compiled by the Counter-Terrorism Center, part of the National Intelligence Director's office, gathered through the Global Tracing System (WITS), the complete amount of terrorist attacks reduced by 14% in 2015 compared to 2014 by 13%. “This is largely due to the decrease in the number of attacks and deaths in Iraq, Pakistan and Nigeria. This marks the first decline in total terrorist attacks and deaths worldwide since 2012.” Terrorism is one of the most serious problems of the present century, and one of the most important phenomena currently affecting human societies, because it has negative effects on the progress and prosperity of nations. An accepted extensive definition of terrorism has never been developed by the international community. Terrorism consider to be the most common problems in Iraq as a developing country. Therefore, the research to find out those families who need to try such care in service that supporting them economically as well as covering them with health services. The present study go which counted the study aided very the needs among families of martyrs of terror victims in Al Furat Al awsat governorates.

**Methodology**

The study aims to assess the needs among families of martyrs of terror victims and to find out the relationship between the family needs with their certain socio demographic characteristics of family such as (age numbers, occupation, marital status, economic status, level of education, family possessions, home sanitation and health care).

**Design of the Study:** The study was a cross sectional descriptive through the period (from 31st July 2018 to 29th June 2019).

**Sample of the Study:** A total of 550 family of martyrs of terror victims in Al Furat Al awsat governorates.

**Study Instrument:** After an intensive review of relevant literatures, the questionnaire is developed and used as a tool of data collection which includes the following:

**Part I:** This part contains of two section socio-demographic family and information of the martyr/injured data; part II assess the needs of the families of martyrs of victims of terrorism.

**Data Analysis:** Descriptive and inferential statistical study tests used through the use of the (SPSS ver-24).

**Results**

The descriptive analysis in this table indicates that the highest percentage of families refers that they resident in city center (25.6%). Regarding number of age, the findings show that (32%) of families having one male with age less than fifteen; the highest percent of families haven’t male age between (16-30) years (35.8%), but (29.3%) of them having only one; families also having only one male with age more than (31) year (41.1%); regarding age of female, (30.4%) of families having two female with age less than fifteen; (33.3%) having one female with age between (16-30) years; and (41.1%) are having two female with age more than (31) years. More than half of families are shown that they are nuclear families (54.7%), and more of them are speaking Arabic (85.1%). Regarding the number of earning family member, (59.8%) having one member among the family. This table reveals that more of martyrs are young adults (75.3%) who are males (68.7%) with intermediate level of education (18.7%), (35.8%) of them are civilian. The social situation for them refers that they are married (44.9%). The relation to martyr/injured family refers that they are father and mother (55.8%).

**Discussion**

The descriptive analysis indicates that the highest percentage of families reported that they live in urban areas (25.6%). This finding is inconsistent with that of the Iraqi Ministry of Planning who reported that the proportion of people who live in rural areas outweigh those who live in urban areas (52.0% vs 48.0%) respectively (Ministry of Planning, 2018a). Regarding number of age, the findings show that (32%) of families having one male with age less than fifteen. This finding is less than that reported by the Ministry of Planning in that the people younger than 15-years is 861.655 who constitute 41.7% of the total population in Babylon.
More than half of families are shown that they are nuclear families (54.7%). This finding is lesser than that of the Ministry of Planning who reported that (95.7%) of families in Babylon are nuclear families (Ministry of Planning, 2018a). Regarding the number of earning family member, (59.8%) having one member among the family. This finding could be explained as that the majority of job opportunities in Iraq are governmental. Concerning the education and occupation of families; the findings reveal that (36.2%) of them reported that less than (50%) of their children are “going or ever gone to school/university”. This finding is less than that reported by the Ministry of Planning who stated that 37.5% of family’s siblings who age 6-years and older have been joining educational institutions in Babylon (Ministry of Planning, 2018a). Around a fifth of fathers are primary school graduates (20.2%). This finding is a little bit lesser than that reported by the Ministry of Planning who reported that 22.3% of population in Babylon are primary school graduates (Ministry of Planning, 2018a). More of families reported that they get health information from social communications (70.9%). The occupation of father indicates that (36%) of father are not working and only (27.3%) has formal working. This finding is higher than that reported by the Ministry of Planning who reported that the percent of unemployment in Babylon is 7.3% in 2017 (Ministry of Planning, 2018a). (50%) of mothers in those families are housewives. This finding is higher than reported by the Ministry of Planning who reported that the percent of housewives in Babylon is 50.0% in 2017 (Ministry of Planning, 2018a). Regarding communication devices, only 0.7% reported that they have telephone. According to the Ministry of Planning, there are 144.434 families who live in the urban areas in Hilla City. Of them, 98.085 have telephones which represents 67.9% (Ministry of Planning, 2018b). With respect to the cellular phones, most of families having mobile phone (99.3%). According to the Ministry of Planning, the total population in Babylon is 2.065.042; of them, 1,791,786 are subscribers for cellular phone lines (Zain, Asiacell, Korek), plus 158,730 who are subscribers for wireless phone lines (Kelemat, Fannos, Iraq communication & post commission (Umniya + Wataniya) (Ministry of Planning, 2018b). Most of them are having television (98.5%). This finding is almost consistent with what reported by the Ministry of Planning in that 98.9% of families in Babylon have TV. With respect to having washing machines, the study findings reported that (84.9%) of families having washing machines. This finding is higher than that reported by the Ministry of Planning in that 78.5% of families in Babylon having washing machines. Most of them have refrigerator (95.8%). This finding is lower than that reported by the Ministry of Planning in that 98.0% of families in Babylon have refrigerators. Regarding car’s possession, only (22.4%) of families having car. This finding is almost consistent with that reported by the Ministry of Planning in that 22.6% of families in Babylon having car(s). Only (4.9%) having agricultural land. This finding is almost consistent with what reported by the Ministry of Planning in that only 1.8% of families in Babylon work in agriculture, hunting, forestry, and fishing (Ministry of Planning, 2018a). Less than half of them have a computer (49.6%). This finding is higher than that reported by the Ministry of Planning in that 22.2% of families in Babylon have personal computers (Ministry of Planning, 2018a). Concerning the monthly income, the study finding revealed that (48.7%) of families having indent income. (66%) of them reported that they receiving support from government. According to the Ministry of Planning, the families in Babylon receive an average of 105.2 Iraqi Dinar from the social care networks (Ministry of Planning, 2018a). The highest percent among families that is (36.2%) reveal that they are living in rented houses. This finding is inconsistent with what was reported by the Ministry of Planning in that 84.2% of families in Babylon live in owned houses compared to those who live in rented houses (6.5%). Regarding the area of homes, (53.8%) of families reported that they live in a home with an area of (50–100) meter. This finding is much higher than that reported by the Ministry of Planning in that 19% of the families in Babylon live in houses of an area of (50–100) meter. With respect to the material from which the houses are built, (58%) of families reported that their houses are built from bricks. This finding is a little bit higher than that reported by the Ministry of Planning in that 56.3% of families in Babylon live in houses that are built from bricks (Ministry of Planning, 2018a).

**Conclusions**

Most of martyrs’ families expressed moderate level of psychological needs. The majority of these families expressed a lack of support for their social needs. Most of these families have poor monthly income which in turn increase their financial needs.

**Financial Disclosure:** There is no financial disclosure.
Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the College of Nursing, Babylon University, Iraq and all experiments were carried out in accordance with approved guidelines.

Abstract

One of the most serious diseases that affect human health, psychological, mental and physical life is the defamation crimes in the society that have a relationship that affects the individual and directly affects the emotions and feelings and the human mind and kill him and affect human behavior in general. The individual by the press and its impact turns to God acting unconsciously and concentrate in attaining the behavior that he did without realizing the magnitude of the damage caused. **Goals of search:** Psychological, mental, health and physical effects and their severity on human health. Diseases that are dangerous to human mental, physical and mental health in Iraqi society. Prohibitions of publishing defamation crimes in the press that are related to human mental, mental and physical health in Iraqi law. The research community of (100) The sample was adopted at the University of Baghdad (College of Information) as a model has been the research sample (100) of the total research community. The social survey, interview, questionnaire and statistical methods were used.

**Keywords:** psychology, physical effects, crimes, Iraqi individual

Introduction

The press is the fourth authority, this trait has taken it with all merit and power. Why is it an authority because it tickles emotions, activates minds and kills them, it affects human behavior in general¹. The individual is influenced by the press which its influence is transformed into a god acting unconsciously and concentrating in attaining the behavior that he has performed without realizing the magnitude of the damage which inflicted upon him². The problem of research in the crimes of press publication of a special nature has made the legislator not only to punish the writer of the article, but the director of publishing ³ as a pyramid management of the newspaper, this makes proving the judicial responsibility for publishing crimes is very difficult. The author of the article often has an interest to achieve it from publication. The press commits crimes of more than one hundred crime in ten articles, including the permissible and the reduced one ⁴. As well as committing certain crimes that would violate public order and security as a crime of publishing false news that touches on state security or contains a secret of military secrets.

Second: The importance of the research

The press is a collective recognition chair that produces participation because it can paint events for use or not. Crimes are less when newspapers do not talk about them. They do not promote people who are boring and they are services to the government. The press expands to represent the culture and information, which leads to the expansion of the horizons of readers and cultivate in their minds all kinds of knowledge. It plays an important role in detecting corruption, but if it is constrained by legal constraints, it is an obstacle to its functioning.

Third: the goals of the Research

1- Identify the theoretical interpretation that explained the journalistic crime?

2- Identify the most important taboos in publishing in the press in Iraqi law?

3. Identify the most important crimes of the press?
The second topic

Identify scientific concepts and terms

First: The offense

The offense is defined as a crime and it is said that he has committed a crime and his people, and he has committed a crime against them, and to them he has committed a crime and a crime for his family. Books and men earned him an offense. papers that condemn them during the twenty-four hours of the crime(1). It is also known as: is the one who has watched during the occurrence or seen the effects after a period of time in special circumstances limited by the law", but the definition can be avoided in terms of the control of crime and in terms of procedures for the application of the laws of the Code of the "Criminal Procedures"(2).

The offense is defined as procedural: it is the offense that is seen in the course of its occurrence. Its punishment is limited by law that includes all the crimes that arrest the perpetrators(3).

Second: The Journalist

Linguistically the journalist is known: A person works in a newspapers means paper man "Alorak" or "Journalist". Which is quoted from the western label to denote daily newspapers(4).

A journalist is defined as the one who collects information about an event or consequences of that coverage by publishing or broadcasting because its results are often beyond the will of the sender(5).

The journalist also known as: the person who transmits the events that occur in the place where he is sent and the news is conveyed by Powell to the news agency (6).

It has another definition: the person or individual who works in a media company or the individual is working in the press departments in universities or some media organizations which employ these journalists (7).

Third: The Press

Linguistically the press defined as: A source that is derived from the work of newspapers is that the press, it is the art of creating and writing newspapers and magazines (8).

The press defines a convention: In the words of English "Burke": (the press is the fourth authority) (9).

The press is defined as a number of pages that are issued daily or on the dates of the organization of political, economic, social, cultural and related news. that can be one (10).

Fourth: the intellectual

Is the one who has a comprehensive view of the change of society and works for the benefit of all sectors of society and has the ability to critique the social and scientific and agreed person intervenes and nudges his nose in what does not matter (11).

The intellectual is also defined: A person who imposes himself and his presence in society and he does not need to specify because he declares himself through his scientific practice, of confusion (12).

The intellectual also is known as: A part of the social sacrifice that is concerned beyond its craft, relying on it together with the general issues of Hungary. The intellectual is characterized by the neighborhood of cultural adaptation and the ability to learn from othersn (13).

Chapter Three

The first topic: Theoretical interpretation of the research subject

Theory of PH.D. Laila Abdelmajeed tagged (media legislation), 2005.

it works to support the authority that has given it the right to exist, and the freedom of the media under this theory exists to the extent permitted by national leadership at any time (14).

The Press Freedom Committee was invited to a free and responsible press within and outside the United States. The First Royal Committee of the Press was formed in 1949. of this theory, as well as forming a press council (15).

1- The press as well as other media must accept and implement certain commitments to society (16).

2- These commitments can be implemented by adhering to professional standards for the transmission of information such as truth, accuracy and objectivity.
Prohibitions of publishing the press in Iraqi law

First: Violation of internal security: The press must refrain from publishing any news or information or anything that might touch security within the state ideas and encouraging the overthrow of the regime by force and spreading news that frightens people (17).

Second: It is not permissible to harm the interests of the State or States by means of matters that may lead to this (18).

Fifth: Which the law or the investigating authority has decided to ban publication and prosecution at the trial court (19).

Third: the government and may lead to the criminalization and restrict their personal freedom to enter the prison so they will impose the penalty of imprisonment (20).

Third topic: The Crimes of the Press:

but the crimes of public law are concerned with material fact, whether signed in secret or overtly in reverse with press crime that requires public (21).

Press Crimes

First: Crimes of defamation:

1-Ejaculation: It is the attribution of facts or specific things that should be scorned by those who have sought it, he is punished legally if it is correct (22).

Secondly: Crimes of disclosure: are the dissemination or broadcast of news, data, information or documents relating to the secrets of defense. The most important crimes of disclosure are punishable by law (23).

1- The crime of disclosing the secrets of defense: It relates to the dissemination or broadcasting of information related to the armed forces, their formation or equipment, and in general.

2- The crime of disclosing the secrets of the state is related to the dissemination of security and its reasons of publication From these conditions a (24):

1-The news is incorrect.
2-Bad faith of the journalist.

The penalty varies according to the type of news (25):

A- If the intention of publication is to disturb the public peace or to cause panic

Fourthly: Crimes of incitement: is to urge others to commit a particular matter. Creates the design he has to commit to it. And the conditions that make the fair is as a partner in the crime (26).

1-The incitement shall be direct in the sense that the subject of push shall be subject to commit a crime or certain offenses.

2- The crime w committed indeed as a result of incitement.

Chapter Three: Field Research Procedures

A-Community and a sample This community has been identified by the College of media at the University of Baghdad. As for our study, the research community may be (100). The whole sample was adopted from the research society (College of media - University of Baghdad). The research sample was (100) of the total research community (27).

Second: Research hypotheses:

After reviewing the literature that dealt with journalistic crimes, in light of this, the following hypotheses were formulated (28):

1- "That the press is one of the factors fueling violence at different levels."

2-"There is a relationship between sex and the enactment of legal legislation that eliminates the publication of press offenses."

Third: Research areas:

1-The human field: means the individuals to be conducted the field study, and the human area of our research was based on the professors at the College of media at the University of Baghdad.

2-Geographical area: It is intended to determine the place or geographical organization where the field study will be conducted and identified in the professors of the Faculty of media at the University of Baghdad a geographical area for conducting the study.

3-Timetable: This is the period of time taken for the collection of research information and data. The field
study process took place from 8/2/2018 to 1/3/2019.

Statistical methods were used: statistical methods in the process of describing and analyzing research data (29):

1- percentage(%):

\[ \text{Percentage} = \frac{\text{part}}{\text{All}} \times 100 \]

2- Kay box test (Ka 2):

Presentation and analysis of research data

First: First topic: Preliminary data of the research community:

Table (1) shows the gender of the respondents

<table>
<thead>
<tr>
<th>Sex</th>
<th>Num</th>
<th>Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Males</td>
<td>53</td>
<td>53%</td>
</tr>
<tr>
<td>Females</td>
<td>47</td>
<td>47%</td>
</tr>
<tr>
<td>Total</td>
<td>100</td>
<td>100%</td>
</tr>
</tbody>
</table>

The results of the above table show that the percentage of males was (53%), while females were (47%). We conclude from this that the proportion of males was lower than the proportion of females. This indicates that the community is the majority of males.

Table (2) shows the certificate obtained by the respondents

<table>
<thead>
<tr>
<th>Kind of answer</th>
<th>Num</th>
<th>Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Master</td>
<td>54</td>
<td>54%</td>
</tr>
<tr>
<td>Ph.D</td>
<td>46</td>
<td>46%</td>
</tr>
<tr>
<td>Total</td>
<td>100</td>
<td>100%</td>
</tr>
</tbody>
</table>

We conclude from this that the highest percentage is among the respondents who obtained the master’s degree, reaching (54%) of the research community and the lowest percentage among the respondents who obtained the doctorate degree, reaching (46%) of the research community.

Table (3) shows the most common press crimes

<table>
<thead>
<tr>
<th>Kind of answer</th>
<th>Num</th>
<th>Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Crimes of disclosure</td>

<td>7</td>
<td>7%</td>
</tr>
<tr>
<td>Do not affect</td>
<td>19</td>
<td>19%</td>
</tr>
<tr>
<td>Total</td>
<td>100</td>
<td>100%</td>
</tr>
</tbody>
</table>
We conclude from this that the highest percentage of respondents (74%) which is higher than those who did not respond by (19%). Consequently, the lowest percentage of respondents (7%) responded to the research community.

**The results**

1. We conclude from this that the percentage of respondents who answered that they live in their own houses, who is the highest percentage (50%).

2. The answer with (yes) which the researchers support the enactment of legal legislations that abolish the publication of press offenses, is (56%).

3. We conclude from the answer rate (yes) that the researchers are the ones who believe everything that is said in the press, which was (53%).

4. We conclude that the answer to (yes) that the researchers believe that these crimes affect individuals, which was (78%).

5. We conclude from the answer rate (yes) that the researchers believe that these crimes are a threat to society, which was (87%).

6. We conclude from the answer rate (yes) that the researchers believe that the press plays a role in inflaming violence at all levels, which was (70%).

7. We conclude from the percentage of answer (yes) that the press has a role in fighting crime in all its forms is the highest percentage which was (73%).

8. We conclude from the percentage of the answer (yes) that the researchers emphasize the role of press crimes in the flags of community members of community issues that are committed in secret is the lowest percentage which was (48%).

**Financial Disclosure:** There is no financial disclosure.

**Conflict of Interest:** None to declare.

**Ethical Clearance:** All experimental protocols were approved under the Babylon University and all experiments were carried out in accordance with approved guidelines.

New Diaz Coupling Reaction, Cloud Point Extraction Spectrophotometric Determination of Sulphadimidine Soudium in Pure form and Pharmaceutical Preparation with Salicylic Acid as the Coupling Reaction

Esraa Amer Kadhim 1, Saadiyah A. Dhahir2, Muna S. Sando2

1Assistant Lecturer, 2Assistant prof., Department of chemistry, College of science for Women, University of Baghdad, Iraq

Abstract

In this research we study two simple methods, rapid of use spectrophotometric determination of sulphadimidine sodium (SDMS). The first method based on diazotization of drug by sodium nitrite at 5Cº followed by coupling with Salicylic Acid in basic medium to form yellow color. The product was measured at 453 nm. Beer’s law is obeyed in the concentration range of (1-16) μg·ml⁻¹. Sandell’s sensitivity was 0.07575 μg·cm⁻¹, the detection limit was 0.3992 μg·ml⁻¹, and the limit of Quantitation was 1.07879 μg·ml⁻¹. The second method was used cloud point extraction (CPE) with used Triton X-114 as surfactant. Beer’s law obeyed in the range of concentration was (1-12) μg·ml⁻¹. Sandell’s sensitivity was 0.04 μg·cm⁻¹, the detection limit was 0.0259 μg·ml⁻¹, and the limit of quantitation was 0.029563 μg·ml⁻¹. All variables were study including of the reagent concentration, reaction time. The composition of product (1:1). The methods were effectively useful to the determination of SDMS in pharmaceutical dose form, and the attained results were in good agreement with the official and other methods in literature. No interference was observed from the commonly encountered additives and recipients.

Keyword: Cloud Point Extraction, Salicylic acid, Triton X-114, Sulphadimidine Sodium.

Introduction

Sulfa drug (sulfonamide) were the fist antibiotics, discovered in 1935 by Gerhard Domagk (1). Above 5400 products of sulfanilamide were formed, however around 20 products formulas are usually obtainable the structure of sulfonamide (2).

**Instrumentation and Apparatus:**

**Instruments:**

UV-Vis spectrophotometer: SHIMADZU, Double beam UV-Vis, model UV-1800 made in Japan. The range of wavelength (190-1100) nm, cell quartz with path 1cm., Water Bath : A thermostat water bath, Memmert, made in Germany, Electric Balance: Sartorius (0.0000), made in Germany, Centrifuge: Triup International corp, TRIU 800 Centrifuge, made in Korea & PH meter: HANNA, PH meter, HI 83141.

General procedure for Azo coupling:

The prepared Azo Coupling product are added in volumetric flask (10ml) in ice bath , 1ml of Sulphadimidine Sodium (SDMS) (1000 µg ml-1) ,1ml for hydrochloric acid , 1ml for sodium nitrate (1%) ,1ml for sulphamic acid (1%), 1ml for salicylic acid (1000 µg ml-1) ,at last added 1ml for sodium hydroxide and complete the volume by distilled water .Then absorbance is measured by UV-VIS. And the maximum wave length show in figure:(1-1).

General procedure for CPE:

A typical experiment of cloud point include the following steps: taking the volumetric flask (10ml) and added the optimum condition of azo coupling and added 1ml for surfactant (10%) and complete the volume by distilled water . The contain of volumetric flask transfer to centrifuge test tube then added the mixture in water bath 60 C° at 20 min and separated by centrifugation 4000 rpm at 20 min. Test tube taken in ice bath to increased viscosity micelles layer 1min. then become easily separated . The separated sediment s dissolved by 1ml of ethanol and measured the absorbance by UV-VIS.

**Result and Discussion**

**First methods:** Spectrophotometric determination of sulphadimidine sodium (SDMS) by oxidation coupling reactions .

**Optimization Parameters for Reaction .**

All of the factors that affect to the absorbance of formation of azo dye product are optimized to improve the sensitivity and detection limit for the determination of the drugs .All optimization work under wavelength at 473 nm.

![Figure(1) : Absorbance spectra of the Resulting Dye,SDMS](image-url)
Effect of Acid Type.

In this study, made series experiment using (0.1 – 0.5 and 1 M) of different acid [HCl, H$_2$SO$_4$, HNO$_3$, H$_3$PO$_4$ and CH$_3$COOH] that follow the same procedure that [1 ml of drug SDMS, 1 ml of each acid, 1 ml of NaNO$_2$, 1 ml of H$_3$NSO$_3$, 1 ml salisilic acid and 1 ml of NaOH] in volumetric flask 10 ml and complete the volume by distilled water to formation diazonium salt. After that measuring the absorbance at 453 nm.

It is clear from this study that the phosphoric acid (0.5 M) gives higher absorbance for SDMS, this acid is a few of use in subsequent experiments.

Optimum Volume of 0.5M phosphoric acid.

The same addition for SDMS is [1 ml drug, with varying volumes of 0.5 H$_2$PO$_4$ from (0.1-1) ml, 1 ml NaNO$_2$, 1 ml H$_3$NSO$_3$, 1 ml Salsilic acid and 1 ml of NaOH in 10 ml volumetric flask and complete the volume by distill water. Then measured the absorbance at 453 nm and the optimum volume for higher absorbance were fixed for sequence experiment 0.7 ml.

It is obvious that absorbance increased with increased of the volume of acid, suddenly the absorbance decrease because the primary amine becomes inactive (5).

Base Type.

We used different bases [NaOH, KOH, K$_2$CO$_3$, Na$_2$CO$_3$, NH$_4$OH, NaHCO$_3$] with different concentration (0.1, 0.5 and 1 M) and that follow the addition in 10 ml volumetric flask. Then see the higher of absorbance for the base is KOH 90.5 M)

It is clear the potassium hydroxide give the higher absorbance, this base it is fixed in subsequent (6).

Optimum Volume of 0.5M KOH.

The same addition for SDMS in volumetric flask of 10 ml with different volume of KOH (0.1-1 ml) and complete the volume by distill water. Then the absorbance were measured at 453 nm and higher absorbance that fixed at 0.9 ml.

It is clear that absorbance increased with increased the volume of KOH, but rapidly decrease because this volume was essential to coupling with SDMS (10).

Optimum Volume of 1% Sodium nitrite.

The same additions were added with varying volume of 1% NaNO$_2$ from (0.1-1.5) ml and the absorbance were measured of optimum volume and fixed at 1.1 ml.

It is obvious the absorbance increase when the volume of NaNO$_2$ increase, suddenly the absorbance decrease because the nitrate toxic became a high rate of pollutants affected on diazonium salt (8).

Optimum Volume of 1% Sulphamic acid.

The additions were added of [1 ml for SDMS, 0.7 ml H$_3$PO$_4$, 1.1 ml NaNO$_2$ with varying volume of 1% H$_3$NSO$_3$ from (0.1-1) ml, 1 ml sulisilic acid and 0.9 ml KOH] in volumetric flask 10 ml and the higher absorbance were measured of optimum volume and fixed at 0.4 ml.

In this figure is obvious when the volume of Sulphamic acid increase, the absorbance increase however the absorbance decrease rapidly because this volume remove nitrite and escape as nitrogen gas (9).

Optimum Volume of (100 µg mL$^{-1}$) Reagent.

The same additions are for [1 ml SDMS, 0.7 ml H$_3$PO$_4$, 1.1 ml NaNO$_2$ with varying volume of 1% H$_3$NSO$_3$ from (0.1-1.5) ml, 1 ml salisilic acid and 0.9 ml KOH] in volumetric flask 10 ml and the absorbance of optimum volume were measured 1.1 ml at maximum wavelength and fixed for sequence experiment.

In this graph was clear when the volume of reagent increase, the absorbance increase but, gradually decrease because this volume was essential to coupling with SDMS (10).

Reaction Time on Stability Color Product.

When the optimum volumes of parameters were complete we study effect of stability color product of SDMS [1 ml SDMS, 0.7 ml H$_3$PO$_4$, 1.1 ml NaNO$_2$, 1 ml 1% H$_3$NSO$_3$, 1.1 ml salisilic acid and 0.9 ml KOH] in volumetric flask 10 ml. The stability of product was one of significant factor that diazotization and clouding reaction were depended on it, as a result the time needed was (0-60) min. Then the absorbance were measured and fixed the high reader at high maximum wavelength.
This apparent the best time of product stay stable for SDMS was 50 min \(^{(11)}\).

**Order Addition.**

All additions of diazotization and coupling reaction are added for SDMS with optimum condition. Then followed diluted by different polar solvent [ water , ethanol , methanol ,1- propanol ,acetonitrile & acetone ] in volumetric flask 10 ml ,at maximum wavelength for each drug the absorbance are measured and recorded for the best solvent.

It is obvious the greatest addition is the order two because it is give the higher absorbance \(^{(12)}\).

**Type of Solvent :**

All the compounds of the optimal parameters for SDMS were dissolved in volumetric flask and completed this volume for different solvent to study the best of solvent and measured the absorbance.

In this experiment shown the best of solvent was water because gave higher absorbance. It is sensitive, no expensive, economically and nontoxic\(^{(13)}\).

**Temperature:**

In this experiment study the effect of different temperature on the color product have been (5-60 °C). the absorbance were measured and the higher absorbance was recorded.

It is clear the best temperature is 20°C because was given the higher absorbance \(^{(14)}\).

**Stoichiometric Determination of Product. :**

**Continuous Variation Method** \(^{(15)}\).

A series of different volumes of reagent and drug are prepared (0.1-0.9) ml ,with concentration \((4\times10^{-4} \text{ M})\) in volumetric flask 10 ml .The additions are optimal condition and complete the volume by distilled water \(^{(10)}\). Then absorbance are measured by UV-VIS at \(\lambda_{\text{max}} =473\) nm . the stoichiometric ratio between reagent[R] and drug[D] result 1:1.

**Mole Ratio Method**

In this method the volume of drug is fixed at 1 ml with concentration \((4\times10^{-4}\text{M})\) and the volume of reagent is change (0.5-4.5 ml ). The optimum of addition is complete by distill water in volumetric flask 10 ml and the absorbance is measured by UV-VIS at \(\lambda_{\text{max}} =473\) nm. The stoichiometric ratio between reagent[R] and drug[D] result 1:1.

**3- Calibration Curve for complex of SDMS - α-Naphthol .**

In this study the solution are prepared in volumetric flask 10 ml continue of different volume of SDMS (1-12) µg mL\(^{-1}\) by taken [0.7 ml \(\text{H}_3\text{PO}_4\) , 1.1 ml \(\text{NaNO}_2\) ,0.4 ml \(\text{H}_2\text{NSO}_3\) , 1.1 ml \(\text{Salicylic acid}\), 0.5 ml KOH ]. The volume complete by distill water and measured the absorbance by UV-VIS at maximum wave length against a blank solution prepared same condition without drug . Linear calibration graph is established by blotting absorbance against concentration of SDMS ,it found (1-12) µg mL\(^{-1}\) obeys the Bear Law . The molar absorption coefficient of product equals \((9.970\times10^3\text{L}.\text{mol}^{-1}.\text{cm}^{-1})\) and sandal’s sensitivity (0.03012 µg mL\(^{-2}\)).

**3- Effect of interference.**

In this study effect of interference expected present with SDMS by added 1ml (1000 ppm), and the rest of optimum addition in volumetric flask 10 ml and complete by distill water. Then measured the absorbance by UV-VIS.

Second Method: Spectrophotometric determination of Sulphadimidine Sodium (SDMS) with using Cloud Point Extraction Technique.

Effect Type of Surfactant with SDMS.

The surfactant have an important part in cloud point extraction process. The basic of practical depended of micells for extraction. In this experimental we added all the last parameters with added 1 ml of different surfactant in volumetric flask 10 ml and the volume completed by distilled water at 60°C for 20 min. then by centrifugated separated at 4000rpm for 20 min and dissolved in 1 ml ethanol and considered by UV-VIS at \( \lambda_{\text{max}} = 453 \text{nm} \).
The Volume of Triton X-114.

Effect of Equilibrium Temperature.

In series used varied temperature (35-70°C) for 20 min. to formed cloud point and separation by centrifugation at 4000rpm for 20 min then dissolved by 1ml ethanol and measured by UV-VIS at $\lambda_{\text{max}}=453\text{nm}$ and fixed.

The best of Temperature were fixed at 50°C.

The Incubation Time.

The solution prepared of all the parameter and the incubation time for (5-35min) to form cloud point and separated by centrifugation then measured by UV-VIS at $\lambda_{\text{max}}=453\text{nm}$.

The best of incubation time is 20 min.

Preparation of Calibration Curve in CPE.

The set of experimental prepared by increasing concentration of SDMS (1-12 $\mu$g mL$^{-1}$) in volumetric flask 10 ml and the volume complete by distilled water then measured by UV-VIS at $\lambda_{\text{max}}=453\text{nm}$.

Application:

The proposed method applied on (silphdimidine sodium33.3% injection . Jorden). That contain (33.3 gm each 100gm). The result is good and summarized in table (5).

The Relationship of Refereeing Performance of the Leading Personality and Thyroxin Hormone Level for Football Referees (First Division)

Ali Mahdi Hassan¹, Ali Hussein Ali², Hayder Naji Habash Alshawi³

¹Assistant prof., University of Kufa/College of Physical Education and Sport Sciences / IRAQ, ²Assistant prof., University of Kufa/College of Physical Education and Sport Sciences / IRAQ, ³Assistant lecturer, University of Kufa/College of Education for Girls / Department of Physical Education and Sports Sciences / IRAQ

Abstract

Refereeing has an important part in the dictionary of football game, developing the referees’ abilities and prepare them in a suitable way with the development of the nature of competition between the teams in order to enhance their abilities to make the right decisions that achieve the justice. Thus, the referee and player are the same, both of them needs to the correct preparation in physical, dynamic, knowledge and mental aspects as well as other important personal characteristics such as: leading ability, self-confidence, emotional balance… etc., undoubtedly, refereeing has an essential role in developing football, so when the referees’ level increase that leads to increasing the level of competition. The value of the present research lies in identifying the relationship between refereeing performance, the leading personality and thyroxin hormone level for football referees (First Division), which may be contribute in the performance of referees in a stadium so through these things, referee’s level can be predicted as it achieves high results in these variables. The researchers used the descriptive method of correlation and predictive relationships because of its appropriate to the problem of referees (first division), for the academic year 2018, their number is (15) referees.

Keywords: Leading Personality, Refereeing Performance and Thyroxin Hormone Level

Introduction

Refereeing has an important part in the dictionary of football game, developing the referees’ abilities and prepare them in a suitable way with the development of the nature of competition between the teams in order to enhance their abilities to make the right decisions that achieve the justice. Thus, the referee and player are the same, both of them needs to the correct preparation in physical, dynamic, knowledge and mental aspects as well as other important personal characteristics such as: leading ability, self-confidence, emotional balance… etc., undoubtedly, refereeing has an essential role in developing football, so when the referees’ level increase that leads to increasing the level of competition. The value of the present research lies in identifying the relationship between refereeing performance, the leading personality and thyroxin hormone level for football referees (First Division), which may be contribute in the performance of referees in a stadium so through these things, referee’s level can be predicted as it achieves high results in these variables.

Practical Framework

The Procedures of the Study

The researchers used the descriptive method of correlation and predictive relationships because of its appropriate to the problem of referees (first division), for the academic year 2018, their number is (15) referees.

Tests:

First: The Measurement of Refereeing Performance:

The multiple forms have been used by the Iraqi Central Iraq Football Association and used in the assessment of the referees of the Iraqi Premier League, which is no different from the referees assessment form.
in the other major leagues and official tournaments. Referee and refereeing team are assessed and sent this form confidentially to the Central Referees Committee where the form contains the level of ease and difficulty of the game with the referee and what mistakes occurred in the game and what the positives possessed by the referee and everything that revolves around the arbitration crew, the results of the test of the referees committee of the Central Iraqi Football Association, which was held on 7-8-9 / 3/2019.

**Second: The Measurement of the Leading Personality:**

The measurement of leading personality has used, which prepared by Al-Janabi, which made up of (47) items, which are answered by choosing one of the two answers for each item. The highest score obtained on the measurement is (47), then the lowest score (zero), i.e. if the measurement degree is high that leads to the presence of adjective.

**Third: The Measurement of Thyroxin Hormone Level:**

The measurement of thyroxin hormone level has done by taking amount of the research samples’ blood, then send to laboratory of Al-Sader Teaching Hospital in order to determine the thyroxin hormone level (T3).

**The Main Experiment:**

The researchers gained the results of the research variables by the following measurements:

1- The results of the refereeing performance were obtained by the Central Iraqi Football Association, the Central Referees Committee for the test which was made in Al-Shaab Stadium on 7-8-9 / 3/2019.

2 - The measurement of leadership personality was distributed between the members of the research sample in the stadium of the College of Physical Education and Sports Science University of Kufa on 15/3/2019, at 10:O’clock in the morning, which took 10 minutes to complete the from.

3 - After completing the process of measuring the leading personality, the researchers took a blood sample from the referees of the research sample through a specialized medical team prepared in advance for this purpose, so the team took a sample of blood and kept it in special tubules and transferred directly to the laboratory for measuring hormone thyroxine level in Al-Sadr Teaching Hospital. Finally, the results were analyzed statistically.

**Statistical Devices:**

The researchers used Statistical Package for Social Sciences (SPSS).

**The Results Discussion**

This framework contained the descriptive statistical results between physical variables and psychological functions after analyzed it in a statistical way and according to the aims of the study.

The Statistical Estimation of the Research Variables for the Research Sample

The statistical estimation of the research variables for the research sample have shown in tables in order to analysis and discussion them, to complete the subsequent statistical analyzes that aims at achieving the aims of the research, so the statistical estimation of the results of the sample studied variables has represented as well as the correlation matrix in which correlations between studied variables have found.

**Table (1): Shows the Statistical Description of Results of the Research Sample in the Studied Variables**

<table>
<thead>
<tr>

</table>

Table (1) shows that arithmetic Mean (X) of refereeing performance was (8.24) with standard deviation (0.21), the arithmetic mean (X) of leading personality was (41.56) with standard deviation (7.57) while arithmetic mean (X) of thyroxin hormone level was (2.54) with standard deviation (0.26).
The Correlation Matrix of Relationship Variables

After using Pearson correlation coefficient between the studied variables, the correlation matrix between physical variables and psychological functions has gotten, as shown in table (7):

Table (2): Shows the Correlation Matrix of relationships between the Studied Variables (Physical – Functional)

<table>
<thead>
<tr>
<th>Variables</th>
<th>Refereeing Performance</th>

<td></td>
<td>1</td>
<td>0.438</td>
</tr>
<tr>
<td>Thyroxin Hormone Level</td>
<td></td>
<td></td>
<td>1</td>
</tr>
</tbody>
</table>

Through the previous table, we can see that there are (45) correlation coefficients, the highest correlation coefficient was (0.547) between refereeing performance and the leading personality i.e. any one of these simple relations between refereeing performance and the leading personality has a significant statistical function... We can find a simple predictive equations.... i.e. to predict the value of refereeing performance by knowing the degree or measurement of leadership personality ... through this we have the opportunity to know the predictive equations complex ... This is a divergent thing that may not serve us at work, so researchers will use the method of preference simple and complex relationships that can be predicted the refereeing performance through any of the studied variables (leadership personality and thyroxin hormone level), as we will see in the following topics. In order to determine the confidence of the correlation coefficients mentioned above, or to know the predictability of a variable and the existence of other variables, the researchers used the alienation coefficient, “an indicator to indicate the characteristics and features that do not share the two variables, so, confidence rate was (5.47%) for The relationship between the refereeing performance and the leading personality, and (4.13%) of the relationship of refereeing performance on the one hand and thyroxin hormone level on the other.

1. Show, Analysis and Discussion the Results of Refereeing Performance and Leading Personality:

The researchers attribute that the refereeing performance has a direct impact on the leading personality, because the presence of the character is the result and an indicator of the refereeing performance that helped the referee, as pointed out by Issam Al-Din Abdel Khaliq Mustafa (that the player have to develop a high degree of physical abilities that are commensurate with the nature of his activity).

Through the previous presentation, the equation of the regression line between the pulse, which obtained the highest correlation with the physical variables as follows:

\[
\text{Refereeing Performance} = 5.904 + (1.848 \times \text{leading personality})
\]

2. Show, Analysis and Discussion the Results of Refereeing Performance and Thyroxin Hormone Level:

Through the previous presentation, the equation of the regression line between refereeing performance that gained the highest coefficient with Thyroxin Hormone, as follows:

\[
\text{Refereeing performance} = 16.243 + (-0.153 \times \text{Thyroxin Hormone})
\]

We can see here that the proportion of public contribution has increased after the participation of the variable (hormone thyroxin) with the 7-11 variable of (leading personality), which in turn is evidence of the impact of variable (refereeing performance) in the proportion of public contribution of the referees and the relationship here positive (i.e. a positive impact) on the level of refereeing performance, through the previous view, the equation of the regression line is as follows:
Refereeing Performance = 10.214 + (0.995× leading personality) + (-0.054× Thyroxin Hormone Level)

Conclusions:
Conclude a final predictive equation through which to predict the refereeing performance in significance of the leading personality and thyroxin hormone level for the referees (First Division). By adoption of the results of the research and utilization by the Football Association to determine the level of referees in significance of the leading personality and thyroxin hormone level of football referees, making researches and similar studies by researchers to study the prediction of the level of refereeing performance in significance of other psychological variables and another sample.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the University of Kufa/ College of Physical Education and Sport Sciences and all experiments were carried out in accordance with approved guidelines.

Effect of Topical Simvastatin Therapy on Patients with Psoriasis

Sundus Hakim Abd¹, Sarmad Nory AL-Dujialy², Haider A. AL-Sabak³

¹ MSc. Student, Department of Pharmacology and therapeutics/College of medicine/ University of Kufa, Iraq, ² Prof. Dr., Department of Pharmacology and therapeutics/College of medicine/ University of Kufa, Iraq, ³ Prof. Dr., Department of Dermatology/ College of medicine/ University of Kufa, Iraq.

Abstract

Objective: Study the effect of simvastatin ointment on tissue expression of inflammatory mediators associated with pathogenesis of Psoriasis such as TNF-α, IL-6 and ICAM-1.

Background: Psoriasis is a common and complex inflammatory disease, which was described as the chronic systemic T-cell-mediated inflammatory condition characterized by the skin and joint manifestation. The patients with psoriasis are usually presented with a white-silvery scaly lesion covering various parts of the body.

In psoriatic lesions, epidermal Keratinocytes produce a variety of inflammatory mediators, such as TNF-α, IL-6, ICAM-1 will stimulate the abnormal proliferation which will cause the psoriasis characteristics to appear.

Simvastatin is an anti-hyperlipidemic agent that acts by competitive, reversible inhibition of the HMG-CoA, the rate-limiting step in cholesterol biosynthesis.

Materials and Method: The study has been carried out on 44 patients suffering from mild to moderate chronic plaque psoriasis; patients with plaque psoriasis will be randomly divided into two groups, the first group was the Placebo group (n 22) whose patients have directed to have placebo plus topical steroid (Dermosalic ointment)® (Betamethasone dipropionate 0.5 mg /g and salicylic acid 30 mg /g) two times for a period of 8 weeks.

The second group was the Simvastatin group (n-22) whose patients have been directed to have Simvastatin ointment 5% two times per day in addition to (Dermosalic ointment)® (Betamethasone dipropionate 0.5 mg /g and salicylic acid 30 mg /g) for a period of 8 weeks. Before and after the eight weeks; The skin biopsy samples have been taken from patients in the two groups at baseline and after eight weeks of treatment used to measure concentrations of TNF-α, IL-6, and ICAM-1.

Conclusion: The present study indicated the fact that Simvastatin ointment plus topical steroid improvement of psoriasis by reduce concentration of inflammatory mediators.

Keywords: Simvastatin ointment, psoriasis, Topical steroid.

Introduction

Psoriasis is a common and complex disease affecting about 2% to 3% of the world’s population. ²⁷ was described as the chronic, systemic T-cell-mediated inflammatory condition associated with skin and joint manifestation. The patients with psoriasis are usually presented with a white-silvery scaly lesion covering various parts of the body. ²⁹. In psoriatic lesions, epidermal Keratinocytes produce a variety of inflammatory mediators, such as cytokine/chemokines ¹⁰. At present, psoriasis is an immunological disorder associated with abnormal keratinocytes proliferation mediated by T-lymphocytes (²⁰, ¹⁵, ²¹). Psoriasis is related to an over expression of pro inflammatory cytokines.
of Th1 cells, and under expression of Th2 cytokines. Now, the effects of cytokines in psoriasis pathogenesis are investigated. However, the biologic activities of cytokines in the in vitro, to the in vivo models in psoriasis, there may be consider as much more complex interactions among individual cytokines in vivo than expected from the in vitro situation\(^\text{18}\). Circulating level of TNF-α is increased in psoriasis disease, and correlated with disease severity\(^\text{5,9}\). TNF-α regulating the ability of antigen-presenting cells (APS) similar to dendrites cells to activate T-cells.\(^\text{28}\)

TNF-α stimulate the expression of C-reactive protein (acute phase response), cytokines such as IL-6 (responsible for T-cell proliferation, and Keratinocyte hyper proliferation); and chemokines such as CCL20 (recruitment of myeloid dendrites cells and T-17 cells) and IL-8 (for recruitment of neutrophils). In the up regulation of intercellular adhesion molecule-I (ICAM-1), TNF-α mediated of the infiltration of inflammatory cells similar to T-cells; and monocytes to the skin. As the role of regulatory T-cells in the pathogenesis of psoriasis remains to be elucidated, IL-6 is thought to render effectors T-cells refractory to regulatory T-cell-mediated suppression.\(^\text{12}\). Plaque psoriasis is considered the commonest type of the disease accounting for 80%–90% of all psoriasis conditions. The psoriatic lesion varies in diameter from one to several centimeters, which may be single or multiple lesions covering almost any part of a body.\(^\text{21}\) The lesions are relatively spread bilaterally symmetrically and most often to be found in the lumbosacral area, knees, scalp, and elbows.\(^\text{8}\).

Topical types of treatment can used for any severity of psoriasis; with limitations based on patient compliance, specific patient needs, and therapy response. It is commonly accepted that a psoriasis-affecting BSA (body surface area) of up to 20% is suitable and is best treated with topical agents using mono therapy.\(^\text{24}\). Topical corticosteroids, the most widely prescribed psoriasis treatment, are effective in the treatment of psoriasis due to their anti-inflammatory, ant mitotic, immunosuppressive and anti-purity properties.\(^\text{17}\).

Inhibitors of HMG-CoA reductase (statins) are commonly used to control blood lipid disorder in medicine. Large clinical studies have shown that patient with or without coronary artery disease, statins significantly decrease cardiovascular morbidity and mortality.

It has also been reported that the use of HMG-CoA reductase inhibitors has immunosuppressive effects. Statins are reductase inhibitors of 3-hydroxy-3-methyl-glutaryl-coenzyme A and besides treating dyslipidemia, pleiotropic anti-inflammatory and immune modulator effects have been found\(^\text{4,7}\).

Statins has been report to cause a reduction in TNF-α, IL-6 , and malondialdehyde (MDA), together with an increased in superoxide dismutase (SOD) act as antioxidant, and cardio protective action.\(^\text{22}\)

Because statins have different pleiotropic effects; new unusual therapeutic modalities for various pathological disorders such as psoriasis; sepsis; alopecia; wound healing, and inflammatory diseases are potentially.

**Patients and methods:**

The present study was conducted from period December-2018 to June-2019. This study was permitted by Kufa university/ College of medicine (Ethical Committee) for clinical trial. Samples were composed from the out patients clinic of Dermatology in ALSaddar teaching hospital clinic.

A total of 44 patients, 25 male, and 19 females were included in this study. patients with plaque psoriasis will be randomly divided into two group:

- **placebo group:** twice daily placebo plus topical steroid (Dermosalic ointment\(^\text{®}\)) were 22 patients (12 patients males; and 10 patients females).
- **Simvastatin group:** Patients treated with (5 % simvastatin ointment) plus topical steroid (Dermosalic ointment\(^\text{®}\)) were 22 patients (13 patients males; 9 patients females).

The libratory study has been conducted in the middle Euphrates cancer unite.
Collection of Samples

Samples of skin biopsy were taken from patients with psoriasis by using a punching tool (5 mm). Five mm of skin were obtained from each subject put into plain disposable tubes contain 10cc normal saline for Elisa was stored at -80˚C in the deep freezer until analysis. Other samples put in formalin for histopathology study.

Homogenization of Samples

Place the tissue sample in eppendorf tube (1.5 cc) by using clean tools, and place it on ice as quick as possibly to prevent degradation with protease. After that add for each 5 mg weight pieces of skin tissue about 300 µL from extraction buffer to eppendorf tube on ice and homogenized manual for about 15 min.

After that Centrifuge by using ice micro centrifuge for 30 min at 14,000 rpm at 4C, when complete take the supernatant by using micropipette to a fresh eppendorf tube and store at -80C.

Statistical Analysis

Data of patients in both studied groups analyzed by using the statistical package version 25, IBM, US, 2017. Descriptive statistics of the variables and studied parameters presented as mean and standard deviation. Gender presented as frequencies and proportions with male to female ratio. Independent two samples students t-test was used to compare the mean difference of a parameter and also used to compare the mean age between both groups. Paired one sample T-test was used to compare the mean of a parameter before and after treatment in each group. Curve estimation, regression analysis was used to assess the correlation between PASI score from one side and each of ICAM-1, IL-6, and TNF-α after treatment from the other side in group 2. R-value which represented the correlation coefficient was calculated. Finally, results were presented in tables and figures with explanatory paragraphs for each using Microsoft Office Word Software for windows version 2013.

Results

Effect of simvastatin on inflammatory mediators

There were not statistically significant difference in baseline of inflammatory mediator values TNF-α ,IL-6 and ICAM-1 between both groups. there were a statistically significant decrease (p˂0.05) in TNF-α ,IL-6 and ICAM-1 after 8 weeks of simvastatin treatment in comparison with baseline in simvastatin treated group, and with that of placebo treated group after 8 weeks .

Discussion

Psoriasis is considered a common recurrent Th1-mediated chronic troublesome disease. The recent studies indicated the anti-inflammatory and immunomodulatory effects of statins and used for treatment autoimmune disease, therefore encouraging used of statins for treatment psoriasis.

The current study shows a significant reduction of inflammatory mediator such as TNF-Alpha, IL-6 and ICAM-1 levels in both groups. Compared to baseline concentrations in groups treated with simvastatin and placebo after 8 weeks of therapy, the decline in TNF-Alpha, IL-6 and ICAM-1 concentrations was more significant in simvastatin groups than in placebo group.

who documented a significant decrease in TNF-α and ICAM-1 in psoriatic hyperlipidemic patients after 8 weeks of getting simvastatin orally. to best of our knowledge there is no previous research to compare our result with it. the current study showed that simvastatin could reduce the proliferation, apoptosis, TNF-α, IL-6, and vascular endothelial growth factor secretion both in VSMC and macrophage, which is induced by TNF-alpha activated EC.

reported a significant reduction in IL-6 in patients with acute bacterial infection relative to the control group after receiving simvastatin treatment. this study investigated the relationship between the levels of IL-6, tumor necrosis factor-alpha (TNF-α), and visfatin or simvastatin usage, in the gingival crevicular fluids (GCFs) of diabetic patients with chronic periodontitis; showed the levels reduced due to simvastatin usage.

The study by revealed a significant reduction in plasma ICAM-1 in patients with hyper-lipoproteinemia following simvastatin treatment. Furthermore, reported that in patients with hypercholesterolemia, simvastatin therapy significantly reduced ICAM-1 relative to patients taking bezafibrate for six months.

Conclusion

The present study indicated the fact that Simvastatin ointment plus topical steroid improvement of psoriasis by reduce concentration of inflammatory mediators.

Multiplex PCR for detection of the predominant diarrhea-causing protozoa (*Giardia intestinalis*, *Entamoeba histolytica*, and *Cryptosporidium parvum*) in fecal samples of cattle from Babylon Province, Iraq

Nawras Abdul Bari Madlol 1, Qassim Jawad Ameer 2

1 Lecturer, Branch of Parasitology, College of Veterinary Medicine, University of Al-Qasim Green,

Abstract

The work, here, was focused on the detection of the predominant diarrhea-causing protozoa (*Giardia intestinalis*, *Entamoeba histolytica*, and *Cryptosporidium parvum*) in fecal samples of cattle from Babylon province, Iraq. Fifty fecal samples from 50 cattle were collected and processed using a specific multiplex polymerase chain reaction (mPCR) technique that employed the small subunit ribosomal RNA (SSrRNA) gene as a molecular target. Using specific primers for each protozoan, the results showed positive identification of the *E. histolytica*, *G. intestinalis*, and *C. parvum* in 38 (76%), 22 (44%), and 12 (24%), respectively, of the fecal samples. The data from the current investigation identify the presence of the *E. histolytica*, *G. intestinalis*, and *C. parvum* in the fecal samples collected from cattle located in Babylon province, Iraq.

**Keywords:** Cattle, *Cryptosporidium parvum*, *Entamoeba histolytica*, feces, *Giardia intestinalis*, multiplex PCR, protozoa.

Introduction

*Giardia intestinalis*, also known as *Giardia duodenalis*, is a well-recognized protozoan that causes important infections in human and animals. The microorganism was detected in fecal samples of bovine and dairy cattle from various countries of the world (1–5). Clinical diseases caused by *G. intestinalis* in cattle have various symptomatic pictures; however, these could be ranged from no signs appeared on the infected animals to the presence of different types of diarrhea including mucoid and fatty feces, persistent diarrhea, and reduction of weight and growth. The infection of giardiasis can be transmitted to humans through cattle-human direct contact and/or contamination of public water supplies (6–10).

In the case of *E. histolytica*, the protozoan causes amoebiasis which is an important parasitic disease that infects 500 million people with mortalities that can reach up to 40,000 to 100,000 deaths per year. Especially in countries with poor health systems, different infection sources are known for the disease; however, water contaminated with infected human and animal wastes play important roles in spreading the disease (11–16).

Cattle are considered as a major source for infections caused by *C. parvum* inducing a diarrheal disease in humans and loss of production in the infected animals. Also here, contaminated water supplies with feces from infected animals are well-known sources for spreading the infection. 17

Materials and Method

Sample collection

Fifty fecal samples from 50 cattle were collected from multiple fields of cattle in Babylon province, Iraq. The feces were aseptically collected, placed in zip logs, and transferred in an ice box to a laboratory to perform the molecular analyses.

Genomic DNA extraction

The Stool DNA extraction Kit (Bioneer. Korea) was utilized to extract the genomic DNA (gDNA) from the fecal samples. The obtained DNA was read, using a NanoDrop, for identifying its quality and quantity. Then, the DNA was stored at -20°C in a deep freezer.
Polymerase chain reaction

The samples were processed using a specific mPCR technique that employed SSrRNA gene as a molecular target. Using specific primers, table 1, that were designed via the use of NCBI-Genebank and Primer3plus and purchased from (Bioneer Company, Korea).

Then, the AccuPower® PCR PreMix kit (Bioneer, Korea) was employed to prepare the master mix. The tubes of the kit containing a freeze-dried pellet which is the premix components; 1U DNA polymerase, 250µM dNTPs, 10mM Tris-HCl (pH 9.0), 30mM KCl, 1.5mM MgCl₂, a stabilizer, and a tracking dye). Using a total volume of 20µl, the master mix was prepared according to the instructions of the kit and contained DNA template at 5µl, each primer direction at 1.5µl (10pmole), and deionized water to complete the volume up to 20µl. The conditions of the reaction inside a thermocycler (Mygene/Bioneer, Korea) were 1 cycle of 5min at 95°C to perform initial denaturation, 30 cycles of (30s at 95°C to generate denaturation, 30s at 58°C to produce annealing, and 1min at 72°C to perform extension), and 5min at 72°C for final extension. Using an ethidium-bromide-pre-treated 2% agarose gel, the PCR products were electrophoresed and screened using a UV-light based imager.

Results

The results showed positive identification of the E. histolytica, G. intestinalis, and C. parvum in 38 (76%), 22 (44%), and 12 (24%), respectively, of the fecal samples, figure 1, 2, and 3, respectively.

Discussion

Giardia intestinalis is a well-recognized protozoan that causes important infections in human and animals. The current results showed the presence of the protozoan in the fecal samples of cattle in the tested regions of Babylon province, Iraq. These findings agree with (1–5) who detected G. intestinalis in fecal samples of bovine and dairy cattle from various countries of the world. Giardiasis is a zoonotic disease that can be transmitted from different infected animals such as cattle to humans via direct contact with infected cattle and/or their feces and using contaminated public water supplies with this microorganism (9,18–23). The current results match up with those observed by 24 who identified the presence of G. intestinalis in fecal samples of cattle from Urmia, northwest of Iran in a rate of 9.34% using different molecular techniques other than the current one. The differences between the current study detection rate, 44%, could be due to climate differences between Iraq and Iran plus differences between the hygienic systems between the two countries. Moreover, the detection methods could also add variations in the results.

E. histolytica causes amoebiasis which is an important parasitic disease that infects millions of people with thousands of mortalities every year. The current work identified the presence of this protozoan in the fecal samples of cattle from Babylon province, Iraq. Those findings agree with those obtained by (11–16) who identified, especially in countries with poor health systems, different infection sources for the disease occurrence; however, public water contaminated play as important sources in the transmission of the disease.

The present study results showed the identification of C. parvum in the tested fecal samples of cattle from Babylon Province, Iraq, and those findings agree with those recognized by 17 who provided information about the importance of cattle as an infection source
for humans and other animals with inducing a diarrheal disease in humans and loss of production in the infected animals.

Conclusion

The data from the current investigation identify the presence of the *E. histolytica*, *G. intestinalis*, and *C. parvum* in the fecal samples collected from cattle located in Babylon province, Iraq.

Financial Disclosure: There is no financial disclosure.

Study on Breast Cancer Patients and Some Variables in Babylon Province

Zainab Kareem Al-Kazazz 1, Zainab Naser Nabat1

1Assistant Lecturer, Babylon Technical Insitute, Al-Furat Al-Awsat Technical University, 51015 Babylon, Iraq.

Abstract

This study included 100 women with breast cancer in Babylon province for six months at Morjan Teaching Hospital in the Department of Oncology. The study showed that the most age group with breast cancer in the age group of 40 to 49 years, where they accounted for 25% of the proportions of patients. It was also found in the study that the most affected women lived in the center of the city (Urban Area), where they accounted for 60% of the total patient. Most of them were housewives (not working outside the home), with 77%, and 79% of them were first infected with the disease, and 45% of them had a malignant type of tumor.

Keywords: breast cancer, Babylon, age group, pollution

Introduction

Cancer is the result of the growth of cells of the body and spread out of control. Most types of cancer cells are ultimately a mass called tumor, called cancer as the body part of the tumor. Most breast cancers are in the breast tissue of the glands to produce milk, and the cancer is in the ducts that connect the lobes to the nipple. The breast also contains fatty, lymphatic and amniotic tissue. Cancer and death are increasing worldwide, especially in developing countries. One of the most common malignant tumors is breast cancer in all regions of the world and ranks first among cancers affecting women in Iraq. The breast carcinoma is the more repeatedly identified damage and the secondary major source of loss of life in females in Iraq establish 23% of carcinoma associated with end the little duration for the illness is a straight result to the progress produce at recognize. According to the Ministry of Health, the number of cancer cases in 2015 was 25,269. The first breast cancer was 19.1%, the airway and lung (8.1%), leukemia (6.3%), the brain and the central nervous system (CNS) (6.1%), colon and rectum (5.7%), urinary bladder (5.1%) and non-Hodgkin’s lymphoma (4.3%) thyroid (3.8%), skin (3.2%), and stomach (3.2%). Breast cancer was the highest cancer for females (25.8 per 100,000 females). In males, however, the highest rate of lung and lung cancer (6.7 / 100,000 male population).

No qualitative etiological factor has been notarized, but different breast cancer-associated vulnerable factors have been suggested by epidemiological studies; for instance, age, menstrual, menopause, parity, breastfeeding, use of exogenous hormones or oral pill, obesity, lack of exercise, food, smoking, alcohol consumption and family history of breast cancer or other cancers. Exposure to air pollution may also be linked to breast cancer, studies have shown. It has been confirmed that contaminated air is involved in lung cancer and is suspected to be associated with other cancers such as ovaries, brain, breast, bladder and cervix. Breast tumors that have been established in animals by chemical compounds give an indication of the potential impact of environmental pollutants. The data indicate that the cases of new breast cancer, one third of which are known risk factors and many reasons are unknown and the possibility of environmental conditions may also cause breast cancer. The incidence of breast cancer varied to the presence of variables in risk factors. Therefore, the effect of age, place of residence, work and some other variables was studied in this research.

Material and instrument

The study was conducted at the Center of Cancer Oncology of Marjan Educational Hospital of Babylon Health Department where the data were collected by the patients directly. Through the distribution of questionnaire forms to patients coming to the center, which included questions such as (age, place of residence, work, and type of tumor,…etc) The study was conducted during the six months from October 2017 to March 2018.
been working on the number of 100 cases satisfactory.

**Result**

The results showed that breast cancer is common in the age group (40-49) and was 25% of the patients as shown in the figure (1).

![Figure (1) shows the number of infections per age group.](image1)

The results showed that breast cancer had the ability to live in the center of the city (Urban Area) and the lowest percentage was in rural areas as shown in figure (2).

![Figure (2) shows the residential area of breast cancer patients.](image2)

The study showed that most of the patients were not working (housewives) and that the proportion of working women was less as in figure (3).

![Figure (3) shows the proportion of women working and not working (housewives).](image3)

The study also showed that most patients with breast cancer were first infected with 79%, while the remaining 21% were recurrent. The study showed that most of the patients with breast cancer had a malignant tumor of 55% of the infected women, while the remaining 45% had a benign tumor as shown in figure (4).

![Figure (4) shows the type of injury and type of tumor for breast cancer patients.](image4)

**Discussion**

In this study, we found that the age group most affected by breast cancer is the age group of 40 to 49 years Where they accounted for 25% of the total number of patients.

These results are similar to those obtained by Al-Isawi (2016) in Anbar province where most of the patients were The age group of 41-50 got the highest proportion and had an average lifetime of injury 47.16 years old 3 This result is similar to that obtained by the Iraqi Ministry of Health in its report in 2015 that the highest rate of breast cancer was in the age group 45-49 where the number of patients 793 and 40-44 age group was 697 of the total number of 4824 patients for all age groups 5 This result is similar to the results obtained for their study in northern Iraq by Runnak A Majid et al.(2009) With a life expectancy of 47.4 years 11 and This corresponds to what Najjar and Eisson received in their study in 2010 which included 12 Arab countries. The average age of patients was 48 ± 2.8 12. And these results are also close to the study of Molah Karim et al. Which was conducted in 2015 on a group of patients in northern Iraq and their average age was49.4. 13

In this study, the percentage of infection in the center of the city was higher than rural areas where the percentage of infection in the city center was 60% and in rural areas 40%,The high percentage of infection in the center of the city is due to the high pollution in the center of factories, industries and cars compared to the rural area, which enjoys pure air and health and lack of presence of contaminants This result is similar to the report of the Ministry of Health, where the highest incidence was in the center of the city (Hilla) where the proportion of the proportion of 63.2% compared to the rest of the provinces of Babylon of districts and sub-districts (Musayyib, Mahaweel and Hashimiyah) and rural areas. 5 Polluted air has become a major health problem and the problem is growing every day because the inefficient transport system is the main cause of the
air pollution in large cities. The level of air pollution in congested cities is higher than other parts, which can have serious impacts on human health through impact on water and land ecosystems. Beijing, Tehran, Paulo, Sao, Cairo, Shanghai, Cairo, Bangkok, Mexico City and Jakarta are the most polluted cities in the world.

In general, the mortality rate of breast cancer is much greater in the urban population (industrial areas) than the rural population, and the “urban factor” is consistently attributed to the literature of air pollution.

In their studies, researchers found that breast density varied between women living in urban and rural areas. Women living in urban areas have a higher breast density when compared to those living in the rural environment. The cause of high density of non-breast endocrine disorder may result from exposure to air pollutants. Clearly, exposure to air pollutants may be environmental factors that cause breast density because urban and rural areas have different types of air pollution. The researcher Yaghjyan et al. (2017) who conducted a group of women to find out the effect of exposure to air pollution and its relationship to breast cancer, found that the majority of them are from urban areas with 60.3% of those living in rural areas and 39.7% in rural areas.

Many gases and solids are carcinogens and mutants, which in turn lead to many types of cancers. This corresponds to what was obtained by researcher Wei et al. (2012) of a positive relationship between breast cancer incidence and exposure to PAH and NO2, carbon monoxide, sulfur dioxide, volatile organic compounds, micro particles with less diameter about 2.5 microns (PM2.5), and also found Hung et al. (2012) that there was a positive relationship between death from breast cancer and exposure to PM2.5.

The incidence of breast cancer may be due to lack of movement of housewives, lack of exercise and obesity due to unhealthy food. As reported by International agency for research on cancer The main cause of breast cancer is not known. Generally, however, the main causes of breast cancer are not known, but they may not be due to physiological behavior. They may also be due to external factors such as weight differences, reproductive behavior, lack of hormone use, obesity, smoking, fat, and diet. As one of the studies conducted on Iraqi women, most of them do not self-examination of the chest and do not go to the doctor and the reason not to go to the doctor is embarrassment and lack of time and fear of the existence of disease.

### Conclusion

In our study, we concluded that the most age group with breast cancer is 40-49, and that urban areas (city centers) are more affected than rural areas, and working women are less affected than housewives.

Knowledge about Obstetric Warning Signs during Pregnancy among Mothers Attending the Primary Health Care Centers in Hilla City

Zainab Ali Hussein Al-Ali¹, Salma Kadhum²

¹MSc. Student, Community health Department, College of Nursing, University of Babylon, Hilla City, Iraq
²Professor, Community Health Nursing Department, College of Nursing/University of Babylon, Hilla City, Iraq

Abstract

Pregnancy is the most attractive stage in a woman’s life. Signs of risk of pregnancy include bleeding, fluid leakage from the vagina, unusual abdominal pain, cramping, pelvic pressure, headaches or blurred vision, marked swelling in the hands and face, burning urination, foul odors, chills or fever, reduced fetal movements and others with all those the mother need to knowledgeable. A descriptive (cross-sectional) design study was conducted in Al.Hilla city from the period 1st September/2018-13th July/2019, to assess the knowledge toward the obstetric warning signs during pregnancy and to find out the relationship between the knowledge of the study sample and their demographic characteristics with obstetrical history. The sample of the study was non-probability (convenient sample) consist of(250) pregnant women. Data was collected through the use of interview technique, each participant needs(25-30) minutes to complete the form. The questionnaire was validated through a committee of (19) experts. A pilot study was conducted to determine the reliability of the instrument. The data were analyzed using statistical and descriptive data analysis methods carried out by (SPSS version 20). The results of the present study shows that the overall knowledge assessment of the pregnant women were good responses regarding warning signs during pregnancy.

Keywords: Knowledge, Pregnancy, Primary Health Care Centers.

Introduction

Pregnancy is not a disease rather it is a natural life development. However, in many developing countries, warning signs is a major health risk for the mother. Thousands of women and newborns die every year. Almost all the mortality causes related to pregnancy and childbirth are known and most are preventable and treatable. Women with obstetric complications usually die within 48 hours. Complications during pregnancy, such as long-term labor and poor fetal representation, are common causes of perinatal mortality(1).

Danger signs of pregnancies are a warning signs that women encounter during pregnancy, child birth and postpartum. It is important, to know this warning signs for women and health care providers to rule out serious complications and initiate treatment immediately. About 72% of maternal death is attributed to direct causes of maternal mortality(2).

Globally, the maternal mortality was inappropriately high about 830 women die each day due to pregnancy or childbirth problem. In 2015, the normal maternal mortality rate was 216/100,000 live births in developing countries associated with developed countries it was 12/100,000. This high number reproduces inequity in access to health services. The leading effects of maternal deaths were severe vaginal bleeding, infections, pre-eclampsia, eclampsia and unsafe abortion(3).

Knowledge of obstetric warning signs throughout the three steps is an important first step for the applicable organization and timely referral. Increasing knowledge of obstetric warning signs for pregnant women would decrease the delay in seeking care and develop quick detection of obstetric problems(4).

The World Health Organization (WHO) around the world envisages every pregnant woman who may receive a new baby annually for good care during
pregnancy, childbirth and the postpartum. Within primary reproductive health care, antenatal care (ANC) provides a program for important and essential health care functions[5].

In Tanzania demographic health survey report (2011) shows 53% of pregnant women were told about warning signs of pregnancy through ANC visits[6]. In Iraq, the prevalence of maternal death rates around obstetric warning signs, with 84 women dying per 100,000 live births. According to the health sector review and functional review published by the Iraqi Ministry of Health in 2011, Iraq is among a group of 68 countries representing 97% of all maternal and child deaths around the world. While neighboring Iran reduced the maternal mortality rate to 220% between 2000 & 2010, Iraq’s rate declined by one-third during this period[7].

Methodology

A study aims: The purpose of the current study was to assess the knowledge of pregnant women toward the obstetric warning signs during pregnancy and to find out the relationship between the knowledge of the study sample with their demographic characteristics and obstetrical history).

Design of the study: A descriptive (cross-sectional) design study was conducted in Hilla city province from the period 1st September /2018 to 13th July /2019.

Study Sample: The study included nonprobability (convenient sample) consist of (250) pregnant women

Study instrument: A constructed questionnaire was prepared and modified after a thorough review of the relevant literature. This questionnaire covers four parts:

A. Socio-demographical characteristics of the sample includes (age, level of education, occupation, economics status, residency & first pregnancy age)

B. Past obstetric history of the sample includes (gravidity, parity, abortion, gestational age, type of previous delivery, place of delivery & type of antenatal visit)

C. Pregnant women’s knowledge regarding warning signs includes (37) domain

Validity & Reliability: The content validity of the instrument was established through a panel of (19) experts, the reliability of the items was based on the internal consistency of the checklist was assessed by calculating Cronbach Alpha which was = 0.896

A structured questionnaire used to collect data by direct interview. The approximate interview time of 25-30 minutes was provided for the questionnaire completion. Data collection is performed from 18th February - 1st May 2019. To determine whether the objectives of the study were met, the current study data were analyzed by using SPSS, version 25.

Table(5) shows that there was highly significant relationship between pregnant women’s knowledge with their past obstetric history at(P>0.05) regarding to parity & abortion, while the study result shows that there was the no-significant relationship between other past obstetric history such as gravidity, gestational age, type of previous delivery, place of previous delivery and type of antenatal visit.
Discussion

- Socio-Demographic characteristic

The results of the study showed that most of the mothers were in the age group (25-34) years, most of females in this age may get an opportunity to marry and can give birth. In a cross-sectional study of (359) pregnant women, it was reported by (7) that majority of mothers’ ages were (26-34) years.

In terms of educational level sample was distributed between secondary graduates, diploma and above. Mostly in Iraq and because some of cultural and other issues women may have only secondary education. And this is disagreed with (8) who reported that the sample educational level in their study was (79%) with primary education.

More than 50 per cent of the sample were satisfied with their economic situation from their point of view and according to their needs and their families requirement. While (9) found that economic situation of most Bangladesh mothers was unsatisfied.

The current study results illustrated that high percentage of sample were mothers live in urban areas, this can be justified due to the selection of the study sample as well as to the system followed by the Ministry of health and their distribution of the primary health care centers. This is agreed with (10) who stated that majority of participants about three fourth (76.7%) were urban residents.

Concerning the age of first pregnancy most mothers represented (54.8%) had their first one between the ages of (20–29). Most of the literatures verified that this is the reasonable age for pregnancy. (11) stated that (80.1%) became pregnant before 25 years of age.

- Past Obstetric History of the Study

The results of the study showed the high percentage of the sample was found multipara, multigravida, without any history abortion, and most pregnant mothers were in second trimester. Most of this study sample attending the health center for different reasons. Many researchers study, the obstetrical history as variable because it is related much to the topic of maternal health. (3) stated that among (137) had more than four children. About three-fourths of participants (75.9%) did not have any previous abortion.

The present study found that more than half of the participants had normal delivery, the same table illustrated that (54%) of the mothers delivered in the hospital and more than half of the sample had no risk before pregnancy (59.2%). In cross-sectional study which was conducted by (12) of 300 of pregnant women in Libya found in the history of the previous pregnancy that, majority of the pregnant women had a normal pregnancy. 71.4% of the multiparous women mentioned that they had previous normal vaginal deliveries.

The same results indicated that (57.6%) of the sample their visits to health centers were regular. A descriptive cross-sectional study was done among 170 participants conducted by (13) in India.

Overall Mothers Knowledge about Warning Signs

The result of the current study showed that most of mothers had (70%) good knowledge toward obstetric warning signs. More supportive evidence is provided by (14) in Indian who carried out a cross-sectional survey on mothers about “knowledge of danger signs of pregnancy, labor and post-partum period among mothers in rural Pondicherry.

Relationship between Mothers Knowledge & Demographic Characteristics

Socio-demographic factors can affect women’s knowledge related risk signs during pregnancy. The results showed that age was significantly associated with the level of knowledge of women. Similar findings have been reported the woman in studies from Malaysia (15). The best knowledge they have besides their previous pregnancy and childbirth experiences, especially for those who have had complications of childbirth during their previous pregnancy (16). The occupational status seems to have an impact on women’s knowledge. The study which done in Punjab by (17) matched the present results.

While the level of education appears to play a positive role in increasing women’s knowledge of signs of risk during pregnancy. Educated women have better access to reproductive health information than uneducated women, are more independent in decision making and have greater access to quality health care services. The results of this study are inconsistent with a cross-sectional study by (18) in Maharashtra, who found that there was a statistically significant relationship...
between the level of education & the mother's knowledge

**Relationship between the Mothers Knowledge & Past Obstetric History**

The result of the presented study shown significant relationship between pregnant women’s knowledge with past obstetric history (parity & abortion) this results agreement with a study done in Baghdad conducted by [19], found that parity, abortion, statistically significant with the knowledge of pregnant

While show that the non-significant relationship between regarding gravid & else, this results agreement with a study done in Debre Birhan [10].

**Conclusions**

Most of the pregnancy who attended the PHC centers are young age multipara in their second trimester of gestation and their visits were regular. Most of mothers have heard information from family, relative and friends. The overall assessment of knowledge about warning signs during pregnancy was good.

**Financial Disclosure:** There is no financial disclosure.

**Conflict of Interest:** None to declare.

**Ethical Clearance:** All experimental protocols were approved under the Community health Department and all experiments were carried out in accordance with approved guidelines.

EEG Changes in Neonatal Hypoxic Ischemic Encephalopathy

Rand Jassim Mohammed Alwatefi¹, Farah Nabil Abbas², Adnan Handhil Aljothery³
¹Student in Master of Science in Medical Physiology, ²Prof. Medical Physiology /University of Babylon /Babylon Medical College, ³Assist. Prof. Pediatrics/ University of Babylon /Hammurabi Medical College

Abstract

Background: Traditional multichannel EEG is an integral part of the evaluation of neonates diagnosed with neonatal hypoxic ischemic encephalopathy (HIE). HIE is well-defined as the clinical appearance of reduced neonatal brain function after asphyxia due to perinatal and/or an antenatal adverse incident. It is prevalence ranging from 1 to 8 per 1000 worldwide. Objectives: To evaluate EEG changes in neonates with hypoxic ischemic encephalopathy.

Method: A cross sectional study conducted from Aug. 2018 till June 2019. The patient included ,term neonate with gestational age from (37 to 42 weeks) admitted in Neonatal Care Unit(NCU) in Babylon teaching hospital for maternity and children , with diagnosis of hypoxic Ischemic Encephalopathy(HIE ). with total number of 47 were enrolled in the study. Full assessment, including: clinical assessment (history and full examination) and electrophysiological (EEG) were done to all Patients. First EEG was done at age ranged from (2 to 7 days) while second EEG was done at age ranged from (21 to 28 days).

Result: In this study, first EEG showed that 8 (17.02%) normal EEG and 39 (82.9%) abnormal EEG results, while second EEG was shown that 15 (31.9%) normal EEG, 17 patients get improvement and 7 get worse. This study was shown that, there are a strong significant statistical deference between the EEG background activity in the first week and developmental mile stone, stage of HIE, neurological examination, age of patients and seizure with p value less than 0.05.

Conclusion: EEG of neonates with HIE provides early prognostic and objective information.

Key words: EEG, neonatal hypoxic ischemic encephalopathy

Introduction

HIE has significant detrimental effects on the growing brain and is between the leading causes of death among neonates, as well as the major original cause of seizures in term neonates ¹. HIE is still a serious situation that is unresolved and causes significant mortality and long-term morbidity ². Neonatal HIE can also be considered as damage that occurs in the immature brain, producing in delayed cell death via excitotoxicity, oxidative stress and inflammation. These adverse happenings in the evolving brain often lead to long lasting detrimental neurological defects afterward in life such as mental retardation, learning disabilities, epilepsy, cerebral palsy, and other neurophysiological handicaps ³.

The “EEG picture” of a disease is frequently a visual waveform or an atypical frequency or abnormalities in waveform amplitude or a hyper synchrony ⁴. The EEG in neonates with HIE reveals the severity of brain damage and changes over time ⁵.

Method

Inclusion criteria:

1-Term (37-42 weeks of gestation).
2-HIE occur in neonatal period 28 days.
3- fitting within 7 days of delivery.

The patients were selected according to the American Academy of Pediatrics and American College of Obstetrics and Gynecology ⁶ criteria, a patient with
hypoxic ischemic encephalopathy require 3 or more of the following criteria.

(a) Neonatal encephalopathy.
(b) Apgar score ≤ 3 for elongated than 5 minutes.
(c) Intense metabolic acidosis (pH < 7.0) in umbilical artery blood.
(d) Multiorgan system failure.
(e) Fetal bradycardia. Patients in this study have low Apgar score, neonatal encephalopathy and fetal bradycardia

Exclusion criteria:
1- Infant with cerebral Sino venous thrombosis.
2- Newborns with other structural CNS abnormalities.
3- Encephalopathy due to genetic disorders, infections and inborn error of metabolism.

EEG Procedure

An EEG was done in department of neurophysiology in the hospital of Imam AL Sadiq. A neonate was lied on a bed and the EEG electrodes were located to the scalp at FP1, FP2, F3, F4, C3, C4, P3, P4, F7, F8, T5, T6, T3, T4, O1, O2, and CZ permitting to the international 10-20 system of electrode placement using adhesive paste. A pair of electrodes is required in order to get a voltage potential difference. Most EEGs was taken about 1 hour. Before the procedure, the patient’s parents are requested to wash their child hair the night before the test and stop taking certain medications before the test. The parents of neonates satisfying the criteria were approached and informed consent was achieved as soon as after the birth or with the start of clinical seizures. All EEGs were given a grade depended on background activity, which has been described Table below.
Results

The patient’s age ranged from 2 – 7 days and most of them are male and have birth weight more than 3.75 kg shown in table below.

**Discussion** In our study first EEG shows that 82.9% patients have abnormal EEG and 17% with normal EEG while in the second EEG the numbers of normal EEG became 31.9% and from those with abnormal first EEG 17.9% patients return to normal in second EEG. This mean most of the cases, EEG grades either remained constant or improved between first and second EEG this result agree with 8 in this study was used the same EEG feature we depend on for a classification of EEG background activity (Continuity, asymmetry, voltage depression and interburst interval or asynchrony). 9 tackled 31 infants and do EEGs within first week of infant age and founded that 17 normal EEG from them 15 still normal while 2 became abnormal, 13 BS all stayed abnormal. 7 founded that The EEG grade allocated correlated considerably with outcome and EEG abnormalities improved with time, with the worst EEG grade seen on the initial recording in all cases. A substantial problem in the classification of different abnormal EEG features is that there are no universal definition of diverse abnormalities in terms of voltage level, phase or frequency. For instance, voltage levels used to define an abnormality such as low voltage often differ among studies.

In this study there are a significant association between EEG background activity in the 1st week and age of patient with p value 0.011 and there are no significant association with others child characteristics. 10 has similar result to our study while (11,8) show disagreement with our study in that they found there are positive association with mode of delivery. 12 reported high incidence of birth asphyxia in rural area this result shown agreement with our study since 3 patients with home delivery all have abnormal EEG finding, 13 found that home delivery associated with more severe birth asphyxia and abnormal neurodevelopment outcome.

According to development mile stone we found that patients were classified as having mild EEG feature all with normal development which has agreement with 14, also 15 was shown that, infants with mild HIE with a continuous or to some extent discontinuous a EEG with lacking cycllicity are more likely to have the good outcome, while infants with severe HIE have a severely abnormal a EEG background (low voltage, inactive) have a high threat for adverse outcome (death or severe handicap) this result show agreement with our study since patients with severe EEG grade (10 from 12 patients with major EEG grade and all 2 patients with inactive EEG grade) associated with delay development. Explanation to these result are background features of EEG accurately expect long term neurodevelopmental outcome in term neonates with HIE. Burst suppression, flat trace and low voltage do predict neurodevelopmental outcome with a great specificity and sensitivity 14.

Patients with HIE stage one distributed between normal, mild and moderate EEG grades most of them have mild EEG grade 45% while patients with moderate HIE stage two distributed in all EEG grades with most of them have major 39.1% and the patients with severe HIE stage three distributed between moderate 25% and major 75% EEG grade 11 show agreement with our study by finding that, there are positive association between EEG background feature and severity of HIE, While 18 shown disagreement to our study in that all neonates were on hypoxic-ischemic encephalopathy (HIE) Stage I had normal EEG recording; 36.7% with HIE Stage II had abnormal EEG recording while had agreement to our study in that 100% of the neonates with HIE Stage III showed abnormal EEG. Explanation to this, the severity of encephalopathy in asphyxiated neonates correlates well with the abnormalities on EEG records.

**Conclusion**

EEG regard as the safest mode for a neonate with convulsion and informative tool for routine work up for HIE patient even in neonate without fitting.

Knowledge Attitudes and Barriers of Undergraduate Medical Students towards Research in University of Babylon

Nadia H. Sahib1, Hasan Alwan Baiee2, Hadi Mohammad Ali Al mosawi2, Zaid Amjed Al-husseini3

1 Lecturer, 2 Prof. Dr., 3Assist. Prof., University of Babylon – Hammurabi Medical College, Iraq

Abstract

Students who did not participate in this activity during their training that might negatively affect their understanding of the importance of research in their future careers.

Objective of the study: To evaluate the attitude and knowledge and barriers of a sample of Iraqi medical undergraduate students.

Methodology: Across sectional study was done using a self-administered pretested questionnaire to measure the knowledge, barriers and attitudes of students toward research.

Results: Two hundred eight medical students were studied in the University of Babylon. The female to male ratio was 2:1. Regarding barriers, the study revealed that (55.3%) of the students had efficient internet. This study explained that the skill of English language writing is very low. Only one-fourth of the students were exposed to the encouragement to participate in academic research and 8.7% of the students mentioned that there was available chance for them to conduct research. Only 15.8% agreed that they can access scientific journals through university library while 3.4% of study group knew that there are government financial support toward research, 68.2% of the students said that there are no enough training in research. Regarding the attitude 73.3% of the participants had positive attitudes. The high majority of the students (85%) believed that research is highly important for their medical practice.

Keywords: medical students, undergraduate, knowledge, attitude, barriers, Babylon.

Introduction

Research is a systematic process and simply research can be defined as “a systematic collection of data that uses disciplined methods (1,2). Research during undergraduate study is essential to reform health system this activities help in addressing the root of health problems and mitigating their risk factors (3). Research is a paramount importance for application of all levels of prevention and promotion of health program (4). Medical students usually are very busy during their study to engage in conducting medical scientific research. This is more common in source limited developing countries (5). It is well known that of undergraduate medical students involvement in research performance will help them to be a good researcher after completing their training (6). However, students are too busy to find sufficient time for research activities (7). Modern medical school’s curriculum include record programs (8). Training undergrad students on record provide students with transferable skills of communications, improve managerial skills, knowledge positive attitudes and practices in critical appraisal skills programs and practicing evidence base. Medical student involvement in research has been declining over the years (9). Medical students’ engagement in research has been associated with the acquisition of teamwork, fostering positive attitudes toward scientific methodology (10,11). Unfortunately, recent reports point to declining numbers of clinician–scientists in both developed and developing countries (12,13). In conducting research inadequate knowledge is one of the most common reasons behind suboptimal study design or interpretation (14,15). The syllabus of the education curriculum should be changed to deal with lack of training in research methodology using small group learning approach (16). The factors that affect the research training are the knowledge, the attitudes and the barriers (17). This study was done to evaluate the knowledge, attitude to and the barriers...
toward research among undergraduate medical and dentistry students.

**Methodology**

The acceptance of the ethical committee of scientific researches in Hammurabi college of medicine was taken. This was a cross-sectional study which was conducted at the University of Babylon – Hammurabi college of medicine and the college of dentistry during the academic year 2019-2020.

The research tool of the study questionnaire was adopted from variables of different studies.

Data were collected using the self-administered questionnaire which was adapted from another previous studies (18,19,20,21). The questionnaire consisted of socio demographic, previous experience of scientific research, knowledge and attitudes toward research, and perceived barriers.

Data was analyzed using SPSS version 21.

**Results**

Table 1 shows that 55.3% of the students have efficient internet connection 1.5% have no internet whatsoever. Figure (1) reveals female male ratio 2:1

Table 2 shows the distribution of 206 participates according to their skills in English language, less than one third of the students mentioned that they are good in writing and speaking English language.

Table 3 depicts the positive attitudes toward research.

Table 4 explains that only(34.5%) mentioned that they received encouragement from their tutors to participate in research activity while one-fifth of them agree that tutors are easily available to supervise research. Only 8.7% of the participants believe that there are chances are available to involve in research.

Regarding the obstacles table 5 shows that only (15.8%) cited that they have easy access to scientific journals and 72.3% of them said that there was no enough training activities in research and only 7.5% of the respondents had participated in some sort of research activities.

Table 6 shows that 85% of students believe that research is important for their future medical practice.

Table 7 reveals that only 11% don’t know the importance of studying the research methodology in the curriculum as a goal for their future career and self-learning.

More than halve of the study group (57%) believe research will be a career goal.

Figure (2) shows that 88% of the respondents either disagree or they don’t know that there are awards to encourage researcher.

Figure (3) shows that 3% of participant know that the government support research activities in Iraq.

Discussion

In developing countries, medical students are less involved in research activities owing to limited resources and other barriers.22

Attitude of undergraduate medical students and other students in health science, their knowledge about research and the barriers toward this educational activity are three key components that have an impact on research success.23 In this study there is a positive attitude toward research conducting among the study group, this finding goes with the finding of other studies (16,18,19). Positive attitude among the study group indicates very good sign to encourage them in this crucial field because poor attitude regarding conducting research act as barrier in planning and implementing research activates.23

English language skills are stronger barriers together with, lack of resources that facilitate the process of conducting research such as high speed internet, award and encouragement in the teaching environment to enhance research work as a learning tool that stimulating critical thinking and help them to gain critical appraisal skills that help in understanding the evidence medicine practice in their future career, these findings are similar to the findings reported by other researchers (16, 18, 19).

One of the main barriers toward research in this study current study is the inappropriate internet network connection which may affect the research activities.

In a local study the respondents think that the problems of slow network speed and frequent interruptions in communication are obstacles that cause problems in conducting academic research.24

In this study only one fourth of the respondents mentioned that they receive support from their mentors to bring their attention to the importance of the skills of conducting research in practicing medicine, mentorship is crucial for research.25 From our experience under graduate students who were encouraged by their professors were publishing scientific papers.26,27,28,29,30

The lack of adequate mentorship has been reported as a main research barrier in many studies.15,21

Most participants think that research mentors are unavailable, and a lack of guidance and supervision was reported by a substantial number of participants as a reason for not participating in research, lack of academic staff and institutional support in promoting health research is an important obstacle, in a local study about the status of scientific research and the obstacles according to the opinions of 600 academicians from six Iraqi universities mentioned that the absence of institutional support for the scientific research and the low level of governmental expenditure on scientific activities are the main barriers for conducting scientific research.31

Conclusion

Students had the moderate level of knowledge and positive attitudes toward the conduct of medical research. English language funding, awarding, poor internet connection and limited access to relevant medical journals and databases were the major barriers.

Study of Some Hematological and Biochemical Parameters in Children with Thalassemia in City of Karbala

Wafaa S.H. AL–Nasrawi 1, Taghreed A. Najm2, Alyaa A. Kadhum3
1Msc in Biology. Alsafwa University College, 2Msc in Biology. Alsafwa University College,
3Msc in Biology

Abstract

This research including the study of some hematological and biochemical changes in children suffering thalassemia in the province of Karbala.

To achieve this aim 50 samples was arranged in two groups first group include 40 patient with thalassemia male and female attending Imam Hussein medical city and second group include 10 healthy children as control.

The results appear decrease in concentration of packed cell volume (PCV), Red Blood cell count and Hb. Also the results appear decrease in biochemical parameters represented by (GOT) and (GPT). While there is increase in WBC count in patients as compared with control. The result also shown that thalassemia mostly occurs in male than in female.

Keywords: Thalassemia, Packed Cell Volum(PCV), Glutamate oxaloacetate Transaminase(GOT), Glutamate Pyruvate Transaminase(GPT)

Introduction

Thalassemia is a group of inherited autosomal recessive blood disorders that originated in the Mediterranean region. In thalassemia the genetic defect, which could be either mutation or deletion, results in reduced rate of synthesis or no synthesis of one of the globin chains that make up hemoglobin.¹

Abnormalities in hemoglobin, resulting from the deficiency or complete absence of one or more of the globin chains, give rise to the thalassemia. Patients with thalassemia suffer from varying degrees of anemia, that is, a shortage of red blood cells. (2, 3)

Classification of thalassemia: The two main types are called Alpha and Beta thalassemia, depending on which part of globin chain is produced in reduced amounts. Normally, alpha globin chain is made by four genes (two from each parent), two on each strand of chromosome 16. The alpha thalassemia are caused by a decrease in production of alpha globins chains due to deletion or mutation of one or more of the four alpha globins genes located on chromosome 16.⁴

Unlike the deletion that constitute most of the alpha thalassemia syndromes ,beta thalassemia are caused by mutation on chromosome 11 that affect all aspect of beta globin production : transcription ,translation , and the stability of the beta globin production. There are more than 200 of mutation within the beta globin gene found worldwide to produce beta thalassemia ¹ .Beta thalassemia includes the following two forms:

A- Major Thalassemia (Cooley’s anemia): The child born with major thalassemia has two genes for beta thalassemia and abnormal beta-chain. Inherit the defect gene from both parents. A person who is infected with this type showing clear symptoms of the disease since childhood ⁵.

B- Minor Thalassemia The individual with minor thalassemia has only one copy of the beta thalassemia gene (together with one perfectly normal beta-chain gene) occurs when received the faulty gene from only one parent. The Person have symptoms of simple anemia and be able to transmit the disease to his sons ⁶.
Material and methods:

The study included 40 patients suffering from thalassemia and 10 healthy children as control attending Al-Hussein medical city. Venous blood samples (5ml) are obtained from all patients and controls. 2ml was collected in EDTA tube and the remaining 3ml collected in plain tubes for serum collection.

Determination of hematological parameters:

Hemoglobin (Hb), red blood cells, white blood cells and Packed Cells Volume (PCV) were measured by complete blood count (CBC) apparatus.

Measurement of the enzyme GOT & GPT:

GOT & GPT enzymes were measured by using the colorimetric method depending on the kit of kind (Syrbio).

Results

Table (1) show the range and mean ± SD for some hematological changes for patients with thalassemia as comparison with healthy children.

Discussion

The results obtained from our study indicates as shown in Table (1) to decrease the rate of both the packed cell volume and the concentration of hemoglobin and the number of red blood cells in the infected children compared to healthy children. The reason that the rate of the packed volume of the cells depends mainly on the number, size and shape of RBC and on the range blood viscosity and his easing.7 As well as the reason for the lack of red blood cells, where the age of pellet of red blood normal 120 days. When dissolved, and eat up by the reticule-endothelial system 8 but when you get a pathological case such as thalassemia, the bone marrow is unable to compensate for lack RBCS so hold a total of red blood cells as quickly break it, so the numbers of red blood cells remain diminish so lead to this characteristic pallor and yellowing (jaundice) of the skin clearly 9.

The decline in the level of hemoglobin in patients as compared to control due to the rapid decay of red blood cells, and therefore decrease the amount of processed hemoglobin body 10.

The results obtained also indicate as shown in Table (1) to increases in rate of total white blood cell in the affected kids, Maybe the reason is due to the high crash blood cells inside and outside the bone marrow, causing a severe decrease of partial pressure of oxygen and this is a motivating factor for the production of the hormone Erythropoietin kidney. This hormone stimulates the bone marrow to increase hematopoietic formation through the conversion of undifferentiated cells into differentiated cells in a tissue bone marrow including white blood cells 11. Moreover, the start of some liver cells and some of the spleen cells configured centers to generate cells blood 12.

Through the results as shown in Table (2) note down some of the biochemical changes in the serum of patients with thalassemia both enzymatic GOT, GPT, compared with healthy children if both spreads enzymes in many tissues of the human body 13, that the reasons for the low effectiveness of the enzymes from the normal level of healthy people this may be due to the amount of iron found in the serum of patients, which are deposited in these organs, which results in breaking down some of the fat cells of these organs 14.

The result show the relationship between the incidence of disease, thalassemia and sex Figure (1) is observed that the number of infected males more than females and as the genes responsible for the production of the common Peptides strings in build hemoglobin located on chromosomes 11 and 16, 15 and not found in chromosomes x, y not found correlation between sex and the infection.

A Comparative Study in Psychological Burning among Football Referees And Football Referees of First Class Halls in Southern Zone in Iraq

Ahmed Sa’ad Abdul Razak 1, Ali Hussein Ali 1, Anmar Atshan Khargan2, Asmaa Sattar Khudhair2

1 Assistant lecturer, University of Thi-Qar, College of Physical Education and Sports Sciences,
2 Assistant Prof., University of Thi-Qar, College of Physical Education and Sports Sciences

Abstract

The research aimed to know about differences in the phenomenon of psychological burning among football referees and football referees of first class halls in southern zone. The researchers assumed that there are differences with moral guidance in the phenomenon of psychological burning among football referees and football referees of first class halls in southern zone. The researchers had mentioned to the theoretical studies that contained of multiple researches related to the topic of the research. The researchers used the describing method by principle of comparative studies due to is suitable for the problem of the research. The research sample was contained from (28) referees divided onto (14) football referees and (14) referees of first class halls after implementing measure of psychological burning on a sample of research the researchers did to find differences between the two groups by using the law of (T) for the independent samples, After that these results has been previewed and analysis and discussed so the researchers reached to conclusions the most important of the is that there are no any moral differences between the groups of football referees and football referees of first class halls in southern zone.

Keywords: Burnout, football referees, football

Introduction

Preface and importance of the research.

Psychology is to be considered of important sciences that needs study and big deepening due to is has big biological effecting on individuals 1, So it is a science which is so needful in last years especially in the sport field due to it has active effecting whether in training or competing some gave it priority in classification 2 because it effects on the physiological sides of different body organs that do an active role in performance so it has been repeated in last years the term of (Burnout) within the terms of sport psychology which means (burning) where it is the status of physical and psychological exhausting that may infects the athletic due to accumulating of loads of ambition and entertainment and a source for worry and fear instead of desire in superiority, win and highness.

Refereeing process is to be considered a difficult mission the referee bears heavy loads and many troubles but he feels delighted to practice it because the basis of practicing is a pure hobby so he seeks always to success through continuous work despite it has physical, technical and social obligations and this the top 3 of the evolution and success to reach top levels and big degrees.

So the occupation of referee is most occupations that being subjected to psychological stresses and these stresses by its turn causes psychological burning and the psychological burning leads to creating negative situations against others which would leads to a case of restless and self conflict and down fall of personal relations where it effects on the personality in all ad this effect would be more clear in the psychological and

DOI Number: 10.37506/ijfmt.v14i2.3009
physical health and performance in work which will causes that the referee will not be able to do his role in complete that participate in his feeling to be disable and gloominess with exhausting effort leads to a case of exhausting and psychological exhausting the thing that will enforce him to performs with low than its required from him ⁴.

The football game and football for halls are most popular games in the world and the role of the referee would be considered very important in managing the wheel of the match and to lead it to the safe lands and this requires high physical and psychological effort where the nature of psychological stresses that are being faced by the referee whether they where from the audience or press or media means , competing teams or referee committee that he works with them gives and big importance to be studied , Due to its role in rising the level of referee occupation and developing it and to rise it to the required level which will make practice of this occupation clear of problems and to get rid of its negatives that which will maintain giving his value and respected status for the sport referee in the society ⁵.

Through what has been mentioned and in view of available scientific resources about this important psychological phenomenon so the importance of the current research shows clearly in dealing with one of the sport jobs that impacts on sport field and joins with others in showing level of matches by shining & honoring vision for any sports activity being practiced , from here the importance of the research come out to know the phenomenon of psychological burning of football referees and football referees of fist class halls in order to know the referees of any of these two games are more subjecting to the psychological burning other than others. For sake to reduce the severity of psychological burning in them through knowing the reasons that causes that caused their burning.

Problem of the research:

Few of people knows the size of big work that has been assigned on the shoulders of the referee whether before or after or during the match so he works under big stresses despite multi global and Arabic studies that took the phenomenon of psychological burning in the sport field but most of them ( according to the acknowledgment limits of the two researchers ) has not mentioned to the psychological burning of the sport referee especially foot bal referees and football referees of halls which may play an important role in leading the match and give it big beauty , through observation and private meeting for some of the referees and following by the researchers of the periodic and referees the problem of the research appeared that there are a number of referees does not continues in work due to being subjected for some psychological stresses or they may continue in their work with no acceptance about this work and then falling of their level of achievements , These stresses that are causing psychological burning varies by the difference of the game and its requirements which has pushed us to try to explore about these differences in the phenomenon of psychological burning of them.

Goal of the research:

Identification on differences in the phenomenon of psychological burning among football referees and football referees of first class halls in southern zone.

Supposition of the research:

There are differences with moral guidance in the phenomenon of psychological burning among football referees and football referees of first class halls in southern zone.

Areas of research :

1 Human field: - football referees and football referees of first class halls in southern zone – republic of Iraq

Time field 15/5/2018-1/2/2019

Location field, Stadiums and halls of football in southern zone

Method of research and its field procedures:

Research method the two researchers used the describing method by principle of comparing due to its suitable for the research problem.

Society of the research and its sample

The society of the research has been formed from football referees and football referees of first class halls in southern zone ( Basra – THI-QAR – Maisaan , Mothanna) and those who had been really recorded in the union of the football federation who are (39) referees of football and ( 28) referees for halls football , but the sample of the research has been chosen by random method where (28) referees had been chosen with reality
of (14) referees for football and (14) referees for first class halls and the table (A ) represents some of the information about society and sample of the research.

**Research tool :**

**Psychological burning measurement of the sport referee :**

The measurement has been designed by ROBERT Whiteburg and Biggi Richardson to measure the feeling of the sport referee in burning under title of burning in refereeing and it is a measurement being abstracted from list of ( Masilas) of burning and has been translated to Arabic Mohammed Hasan Alawi, The measurement includes (15) phrases the referee answers on the item of the measurement according to seven substitutes (never implemented on me, implements on me very little, implements on me little, implements of me middle, implements on me with large size, implements on me with very large size, totally implements on me) the degrees from (1 – 7) is being given respectively except items (11.7.5) where their degrees is to be counted reversely. As much the total referee degree comes close from (105) it means he reached the degree of burning appendix (1)

**scientific specifications of the measurement**

**Credibility of the measurement:**

The two researchers had depended on measurement outward credibility and that a group of specialists to evaluate the validity of the measurement to measure the mark that it has been made for it, so the researchers did showed the measurement on a group of specialists appendix (2) in the field of sport psychology and football to go over the items of the measurement and to indicate how far is the validity and after collecting the forms from the specialists those forms has been emptied by the two researchers where the ratio of the agreement (100%)

**Measurement stability:**

The tool would be considered stable if it gives same results if measures the phenomenon for several times where the method of measurement stability through retesting is most used methods in finding stability factors and most common and for sake to get of measurement stability the researchers has divided the measurement on a sample consisted of (8) referees from those who do periodic first class football teams and football for the halls and not from oral test sample then the same test repeated after two weeks from the first test on same sample after collecting the data they had been treated statistically by using the factors of simple connecting and the value of (R) 0.91 and this proofs that there is high connection and then excitant of stable factor of the measurement.

**Statistical means:-**

The following statistical treatments had been used:

1. Accountant media
2. standard deviation
3. difference factors
4. simple connection factors
5. T Test for independent samples

3-preview results analysis & discussing them:

3-1 preview and analysis the results of psychological burning measurement

3-1-1 among football referees and football referees of halls

Table(2) Shows the differences in psychological burning among football referees and football referees of first class halls in southern zone

<table>
<thead>
<tr>
<th>Treatments Changes</th>

<td>45.21 11.15</td>
<td>49.66 7.41</td>
<td>1.199</td>
<td>2.06 Non moral</td>
</tr>
</tbody>
</table>

Value of (T) table at degree freedom (26) and the level of guidance (0.05) is (2.06)

Table (2) indicates the accountant middle and standard deviations and value of (T) accounted in the measurement of psychological burning of football referees and football referees of halls in the southern zone, results showed that then accountant middle of the group of football referees where (45.21) with standard deviation (11.15) but the accountant middle of the group of referees of halls where (49.66) with standard deviation (7.41) but the value of (T) accounted where (1.199) which is less than (T) table value of (2.06) with freedom degree (26) and below level guidance of (0.05) and this proofs that there are no any moral differences among football referees and football referees of halls in the psychological burning.

Discuss the Results

It is clear from the table (4) that there are no any moral differences in the results of the measurement of psychological burning among football referees and football referees of halls in the southern zone the researchers justifies that it belongs to the good preparation and programmed training by the referees whether football referees or football referees of halls to reach by their selves to high level of physical fullness that enables them to good performance along the time of match as well as big desire by referees for this job and their love to it also the personal experience of those referees and their understanding of the items of the international law in managing the match and how to deal with the players in good manner as well as the exchanged cooperation between the referee and his associates in leading the match has caused not excitant of phenomenon of psychological burning for them … and this is what has been mentioned by AMAL ALI SALOOMI (2000) that the control on the burning requires from the athletics that they are aware of resisting against the burning where it is possible that they will analysis with constructive form and conveys their feelings to the others and by that they are reducing the burning. defined steps that leads to reduce the burning, The athletic or the referee can learn principles of psychological stress and get benefits by close examination, relaxing and others also knowing stresses is the side that enable the athletic to reduce traces of burning also that the best technique for the athletic is to identify on the problem and bearing it as much as he can then reducing it and then removing it.

Conclusions

No existent of moral differences between the two research groups of referees of football and football...
referees of halls of first class in southern zone.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the University of Thi-Qar, College of Physical Education and Sports Sciences, Iraq and all experiments were carried out in accordance with approved guidelines.

Abstract

First: Problem and Importance of search

The effects of psychological, health, mental and physical are serious diseases that affect the individual drug user was not the drug of this age has been known by man since ancient times and fought ancient societies medically, culturally, socially and religiously Human life from the deterioration of his health and his illnesses complex mental health, mental and physical

Second: Goals of search

Drug addiction and the most important diseases that affect human mental, mental and physical health in Iraqi society.

Third: Society and sample of search

The study sample was selected on two middle schools in Al-Hilla city (Imam Ali School for Boys and Bint Al-Huda School for Girls). 100) Researched and used the method of social survey method intentional sample and questionnaire, interview, observation, participation and statistical methods and hypotheses and the most important treatments for addicts are psychological, health, mental, physical and social treatment.

Keywords: Drug addiction, human mental, physical health

Introduction

The problem of drugs is one of the most important problems that cause great danger to the future of society, because they have individual and social effects, and the society is responsible for it as a part of its wealth. Since ancient times and thousands of years, mankind has known some plants and herbs to use them as medicine. Drugs were not born of this era it has been known to human since the ancient times and fought by ancient societies culturally, socially and religiously, Where drugs are the most serious disaster known to humanity in its history and began to evolve into an illegal international trade sponsored by organized gangs aimed at destroying the energies and capabilities and values of the youth of society which it is true treasure and this means emptying the community of creative minds in it so that our backward society remains easy to control. For decades, Iraqi society has faced fierce attacks that are trying to overthrow Iraqi society and destroy all its capabilities. These attacks are an attempt to destroy Iraqi society, especially the youth and adolescents who are more vulnerable than others to receive everything new. In spite of all attempts, efforts must be made to combat the preservation of the entity and build a good society and having a valuable system. Drug addiction and the most important diseases that affect human mental, mental and physical health in Iraqi society. The problem is known linguistically: “The problem and the problem are all problems and problems of difficult and code ¹. The problem defines a idiom: it is a state of form and confusion, some puzzling or searching to get rid of this situation, replacing it with a feeling case of satisfaction and agreement². Drugs are linguistically called: They are all substances that lead to relaxation, debility, transport and sleepiness. They also reduce or eliminate pain. It is an incomplete definition. If we take this definition with, opium, morphine and heroin are drugs but the class of stimulants such as amphetamine or hallucinogens (LSS) cannot be placed under this definition ³. Drugs legally:
They are the materials specialized by the law of each country in special schedules, which the authors of these laws believed that it is harmful to the individual, group or nation. The United Nations Commission on Narcotic Drugs knew that it was any raw or prepared substance containing hypnotic and analgesic elements that, when used in non-medical industrial conditions, would lead to a state of habitual or addictive addiction to the individual and society, physically, psychologically and socially.

Factors leading to drug abuse.

First: The Economic Factors

1-The high standard of living, which receives a lot of burdens on the individual makes him incapable of it, which leads him to abuse trying to escape from his social reality.

2- Unemployment as a result of the great pressures placed on difficulty of life and as a result

3-Increasing the requirements of life in general where there are no longer called so-called luxury needs, but have become necessary.

Second: Psychological factors: There are a group of psychological factors exert a great impact on the person forced him making him giving up to the difficulty, the result of that is the practice of escaping from the reality to drug abuse or both:

1-The many psychological pressures resulting from frustration because it is not achieved for a particular desire or need.

2-Feeling of a deficiency compound due to a certain disability, handicap or failure to match others at certain levels of class, cultural or other.

3-Feeling of failure, inability and no efficiency.

Thirdly: Social factors:

1-Meeting or accompanying bad companions: The collection of psychological and social studies conducted on the causes of drug abuse with these friends.

2- The feeling of emptiness: There is no doubt that the existence of the vacuum with the availability of places that are good for the energy of young people.

3- Traveling abroad: There is no doubt that traveling abroad with all the means of flattering and for drug abuse.

4-Excessive cruelty to children: It is one of the things almost gathered by the scholars of reprimand, then reflected on his, sin and drug abuse which can find it.

5-The influence of the media: The media have a large role in the members of society, especially the youth group.

6-The absence of the school’s message: This is the responsibility of the director or teachers and should be withdrawn from corruption and vices.

The second topic: the most important effects and problems of drug abuse

The social effects of drug addiction are:

1-The abuser becomes a bad example to be followed by his family and society.

2- The possibility of transferring the abuser to the family members through imitation and simulation.

Second: The economic effects of the addiction:

1-Waste funds and large human resources in order to deal with this, or spend money by the state and the concerned parties.

2-Damage to the national product of the father because of the trade activities prohibited by law.

A-The economic effects on the level of the individual: that the addiction to a large impact on the individual ones lead to the destruction of money and the children’s food and perhaps a deviation to the path of dishonesty, social and economic damage.

B- Economic Impacts at the State Level: Most of the world’s countries produce drug consumption, which is an organized public trade bout $ 120 billion annually on accidents, crimes and diseases. One of the most dangerous effects of addiction on the role of economic activity as follows:

- Third: the impact of drugs on society:

1-Addiction affects the modesty of the community may show the crimes of rape, assault, murder and car accidents.

2-The spread of infectious diseases and the most serious AIDS.
Fourth: Health and psychological effects ²⁰:

1- Psychological and mental disorders due to drugs effect on the nervous system.

2- Drug abuse leads to a general disorder of thinking and difficulty ²¹

Chapter Four: Field Research Procedures

First: Research Methodology.

1- Social Survey Methodology:

A- Comprehensive survey: which conducts a comprehensive study of all the subjects of society through.

B- Survey method of the sample: In which the researcher only study a specific number of cases or subjects within the time and effort and possibilities available to the researchers ²².

Current research objectives which require a community and a search sample.

1- The research community ²³.

1- Social researchers often find it difficult to conduct a comprehensive field study of all the items of the research part of the community keen to accurately represent the characteristics and components of research ²³.

2. Sample of the research: A sample of (100) respondents was selected from the research community. For the purpose of achieving the current research, the questionnaire tool was to be distributed to the respondents in two preparatory schools and for the final stages only in Hilla city: Imam Ali School for Boys, Bin al-Huda School for Girls ²⁴.

Fourth: Fields of research: In each field study areas of study should be identified and clarified by the researcher, these areas are centered in three aspects is the human, geographic and temporal, it can be clarified these areas as follows:

• Human field: means the individuals to whom the field study will be conducted, the human field is in the city of Hilla for preparatory schools (Imam Ali school for Boys - Bint Al Huda school for girls) is a model.

• Time field: means the length of time spent in the collection of information and data related to the study, and the field study process for the study sample took a period of time from 11/1/2019 to 27/3/2019. only.

• Statistical methods in the process of describing and analyzing research data ²⁵:
  - 1- percentage(%)  
  - =\frac{\text{part}}{\text{All}} \times 100
  
  Table (1) shows the number of family members of the respondents

<table>
<thead>
<tr>
<th>Num. of family</th>
<th>Num.</th>
<th>Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>3-2</td>
<td>20</td>

The results of the research and the most important treatments and recommendations to address the problem of drugs and the most important steps to prevent children from abuse

First: Search Results: The research resulted in a number of results, the most prominent of which were:

1- It was found that 20% of the respondents answered that the level of income is over their needs.

2. It was found that (90%) of the respondents have answered that drug abuse leads to family problems.

3- The results of the field research revealed that (66%) said that the weakness of the religious.

4- It was found that the most important factors that drive society members to drug abuse are psychological factors, which came first and by (48%).

5- It was found that the use of drugs leads individuals to use the crime and a percentage of (68%) as a result of loss of feeling and lack.

Second: The most important preventive measures

1- Enhancing the capabilities of the specialized security forces in the fight against drugs, especially at border ports, ports and airports.

2- Participation of members of the security forces and police services in training courses.

3. Encouraging the citizen to report and provide information about those involved in drug crimes.

4- Enhancing the effectiveness of coordination between the security agencies to monitor.

5- Coordinating anti-narcotics efforts through continuous exchange and organizing efforts in this field.

Financial Disclosure: There is no financial disclosure.

Human biotoxic, Human Reproduction Effects and Biomarkers to Assess the Health of the Ecosystem by Estimate the Ratios of Heavy Elements

Haider Mashkoor Hussein
College of science. University of Alqadisiyah

Abstract

This study was conducted to investigate the concentration of some heavy metals (Cr, Zn, Cu, Cd, Pb) in some types of frozen and canned fish in Diwaniyah. Five types of fish were widely available (Stromateus Sp., Parastromateus niger, Labeo rohita, Sardina pilchardus). And the number of replicates of one species, where the number of fish during the study period 20 fish. The results obtained showed a difference in results and the concentrations of the heavy elements above were measured by ppm (0.231-13.18 / 0.012-0.915 / 0.028-0.0234 / 0.400-2.161 / 0.021-0.141) for Cr, Zn, Cu, Cd and Pb respectively. The above results showed the increase in concentrations of heavy metals compared to previous studies, as well as their comparison with global and local determinants of these elements. The concentrations of heavy elements in the tissues of the muscles and muscles of the Stromateus Sp fish (0.30, 0.89, 0.89, 0.89, -0.59 / ND / 0.100) for Cr, Zn, Cu, Cd and Pb respectively. But in gils and frozen erythematic muscles were (0.2 / 0.473 - 0.019 / 0.043 - 0.053 / 0.115 - 1.589 / 0.929 - ND / 0.100) for Cr, Zn, Cu, Cd and Pb respectively.

Keywords: Human biotoxic, biomarkers, health, ecosystem, heavy elements

Introduction

Studying and estimating trace element content in the living and non-living components of aquatic ecosystems helps to assess the level of pollution in them and reduce their spread and knowledge of their sources.

This type of contaminant enters the environment through two natural source and human source sources and is classified as Persistent Toxic Substances for the inability of microorganisms to decompose, as well as their accumulation and toxicity to living organisms. Their penetration through the components of the ecosystem is a serious and unavoidable future as well as threatening the living environment of aquatic organisms, possessing the ability to integrate and move in food chains, and then their concentration in living organisms with the presence of mortality, in some cases when they increase their concentrations beyond permissible limits. What is dangerous is the persistence of biotic activities and activities that transport these elements throughout the food chain, as well as the ability to bioaccumulate the food chain and affect the composition and diversity of the aquatic environment communities. And also have the capacity to form complex compounds with most organic and inorganic compounds found in organisms, leading to their accumulation in food levels increasingly from one level of food to another of these living ecosystems.

The transmission of this type of contaminant across the food chain and its accumulation in the body of organisms increasingly from one level of food to another in the aquatic environment is one of the most serious problems in the pollution of the aquatic environment. The first path is the concentration or aggregation of the elements by the living at all levels of the food chain. This process is carried out through a variety of methods, including entering through breathing to the fish or through the membrane of the body of the organism or by sticking to the body as in the zooplankton. The transition gets from As well as some species of fish, crustaceans, worms and grafts. The other way to transport these contaminants is by feeding each other through the different food chain, an important method that can reach the elements (Monperrus, et al., 2005). Therefore, the estimation of trace elements in the aquatic ecosystem is...
of great importance in determining and controlling their levels. Damage caused by contamination of trace elements in aquatic organisms is not limited to toxic and deadly effects, but also causes other damage, such as Mutagenic mutations, Embryo toxic and Gonadotoxic infections, and also reduced growth rates and disruption of processes Metabolic processes. They are also found in the bodies of living organisms, too, with very low concentrations, some of which are essential for sustaining their life, such as copper, zinc, iron and manganese. In general, these elements are important for building part of the body. They also play a role in regulating body fluids through ion exchange (Al-Tai, 1987), but high or low levels of the optimal limits lead to physiological damage and loss of life. Living organisms have the ability to absorb. The heavy elements dissolved in the water medium by some body tissues such as skin and skin. And its concentration in the liver, kidneys, muscles and muscles, leading to the accumulation of high concentrations in the body. These elements are dangerous even if they are found in low concentrations in the environment and when increased, lead to poisoning and death. (Park and Presley, 1997).

stressed that the level of toxic effect of these elements depends on the type of element and its concentration on the aquatic environment as well as the time of exposure to this element.

Sources of heavy metals:

There is a difference in the sources of heavy elements between the natural effects of volcanic eruptions, fires and sources of human activity such as household wastes and various agricultural activities such as pesticides and chemical fertilizers, as well as mining, mineral extraction, petroleum refining, and automotive and mining industries (Kuwait Institute for Scientific Research, 1989; Williamson et al., 1995) explained that the waste of battery factories is one of the most important sources of cadmium and lead in the aquatic environment. The atmosphere is an important source of trace elements due to the high tide of dust. Some trace elements in the air may increase their concentration more than 1000 times from their natural level as a result of human activity (9,10,11) notes that the Kafue River in Zambia is one of the rivers that suffer from degradation and the potential loss of biodiversity due to the change in the quality of water resulting from the use of pesticides containing heavy metals to eliminate algae. noted that the concentration of heavy elements in the environment can increase as a result of decomposition of aquatic organisms after their death. As well as the ability of high sediments to retain elements and contaminants and synthesize them in various mineral compositions in a way that is not ready (Hlavay et al., 2004). However, chemical and physical changes such as reaction, salinity, oxygen concentration and oxidative stress change, To return to the water medium, ie, the intervention of the geochemical cycle again, so that the sediment is an important source of water pollution (Cappuyns and Swennen, 2005; Audry et al., 2004).

The aims of study:

1. Determination of concentration of heavy metals (Cr, Zn, Cd, Pb, Cu) in different species of fish.

2. Comparison of the concentrations obtained from this research results of studies conducted in some countries.

3. Comparison of concentrations of these elements also allowed concentrations in international standards and standards.

Materials and Methods

Fish species studied:

1. Stromateus Sp. fish (silver)

Scientific Classification:

Family: Stromateidae

Genus: Pampus

Pampus argenteus

The species of fish follows the white Stromateus Sp species

Features and form:

These fish are characterized by the presence of a vesicle or chisel in the esophagus to grind the food and fall after the pharynx directly.

The body is flat and wide, fineless pelvic (pelvic), the scales are small circular, the body is silvery white and the head color is dark compared to the body (Coad, 2010)

2. The thickness of raho (or roho)

Scientific Classification:

Family: Cyprinidae
Genus: Labeo

*Labeo rohita* (Roho labeo)

These fish belong to the carpaceae. They have a large body length of 100-60 cm.

The head is moderate, the eyes are large round and have a single dorsal fin and a lower waist fin. Which are not threatened with extinction or extinction is very weak. (Dham, 1977)

The average length of the fish ranges between 30-23 cm and weight 113 g, body color from the top gray to blue and silver bottom color.

The fins are soft, non-forked, the caudal fin is deeply cleft, the scales are circular, the eyes are large, the mouth is frontal and the teeth are undistinguished or absent. (Coad, 2010)

5-mackerel Fish (bath thi-ckness):

Scientific classification

Scombridae Family:

Genus: Rastrelliger

Rastrelliger Kanagutra

Its body is rectangular and pressed, ranging in length between 20 - 65 cm, and may reach 70 cm. It has crusts even on the chest area except for a small area in front of the pelvic fin. Their color is silvery with a tinted tint between blue and green on the back on the body a lot of orange color spots. They feed on crustaceans and small fish, common in mid-depth waters, away from the shores of edible fish. (Dham, 1977)

* Cleaning Tools Lab wares cleaning:

Glass tools and polyethylene bottles were cleaned according to the method described (Boehnke & Delumyea, 2000). Wash the dishes thoroughly with tap water and cleaning powder and rinse thoroughly with water several times. The tools are then placed in a basin containing diluted hydrochloric acid at 10% concentration for at least 24 hours and then washed several times with distilled water (Nollet, 2007).

Collection of samples

In this study, five types of fish were widely available in the commercial markets and shops for the sale of frozen and canned fish and four replicates were taken for each type of different companies.

Extract trace elements from fish

After collecting the fish samples and transferring them to the laboratory, they were washed with distilled water. The fish were separated for the purpose of separating some of the organs (muscles and galsam). The muscle was taken from the left side after the head area of the fish. The tuna and sardines were mixed. For digestion of fish samples for the purpose of measuring the ion of trace elements in it and summarized as follows:

A dry weight of 0.5 g dry weight was taken from the fish tissue (muscle and galsum) after drying using the 80 ° C convection oven for 24 hours. After that, it was grinded and sifted with a 0.5 mm slotted sieve and placed in a baker of Teflon. (4.5 mL) and HNO3 (1.5 ml) concentrate and then heat on a heat plate at 80 ° C. Then add 4 mL of 1:1 mixture of perchlorate and hydrofluoric acid and then until near dehydration. Take the leachate and complete the volume with ions free distilled water to 25 ml, then centrifuge with 3000 cycles / min for 20 minutes and then transfer the solution to polyethylene bottles and store until the measurement of the Atomic Absorption Spectrophotometer (AA-7000)

Fish are secondary consumers by feeding on some phytoplankton and small aquatic animals. They represent an important food source, helping to understand the accumulation of trace elements and their functional behavior in the organs and levels of food. They can also be used as good biomarkers to assess the health of the ecosystem because they occupy different levels of food Karadede and Unlü, 2007). It is therefore an input to identify the contamination of trace elements in aquatic environments and to identify the type of elements prevailing in that environment and thus to determine the suitability of fish for human consumption Obasohan, 2008; (Dural, et.al., 2007).

In the following order:
Stromateus Sp. Fish: Galsam
Lymphatic fish: Galsm <muscles
RAHO Fish: GALASM

The results showed that the general concentration in fish and trace elements studied were as follows:

The general concentration of Stromateus Sp fish according to the elements was as follows:
  Cadmium component: Galsm <muscles
  Copper element: Galsm <muscles
  Element Chromium: Muscle
  Lead element: Galsm <muscles
  Zinc element: Galsm <muscles

As for the general concentration in the pigeon fish and elements were as follows:
  Cadmium component: Galsm muscles
  Copper element: Galsm muscles
  Element Chromium: Muscle
  Lead element: Galsm muscles
  Zinc element: Galsm muscles

As for the general concentration of raho fish according to the elements were as follows:
  Cadmium component: Galsm <muscles
  Copper element: Labeo rohita muscles
  Element Chromium: Muscle
  Lead element: Galsm muscles
  Zinc element: Galsm <muscles

In the sardine and tuna muscles, the concentrations were as follows:
  Cadmium component: tuna muscles> sardine muscles
  Copper element: Sardine muscles
  Chromium Element: Sardine muscles <Tuna muscles
  Lead Ingredient: Tuna muscles> Sardine muscles
  Zinc element: Tuna muscles> Sardine muscles

These changes in concentrations of trace elements are very similar in their descending sequence to their presence in the studied members of the studied species, especially in concentrations of all elements in Stromateus Sp studied fish.

As noted from the above sequence, the muscles and gazelles of the fish are ineffective for the accumulation of trace elements, except for the lead element in the Stromateus Sp muscle. The concentration of the lead element in the Stromateus Sp muscle is observed and this is consistent with Bevoets et al. (2009) Cadmium and lead in carp fish with concentrations above the ECP threshold for 2002 (ppm0.05); however, the concentration of cadmium in our study was within the permissible limits of the WHO (0.05 ppm), possibly because the musculoskeletal tissue of Stromateus Sp was high in fat.

Histological Study of the Adrenal Gland of the Adult Female Rabbit (Oryctolagus Cuniculus)

Faiza Jabar Joda1, Ahmed Obaid Hossain2
1Assistant lecturer, Director General of Education Rusafa,
2Assistant prof. College of biotechnology/Al-Qasim Green Univ.

Abstract
The aim of this study was to investigate the structure of the female rabbit adrenal gland by light microscopic observations. For this purpose, ten adrenals were collected from five adult female rabbits. The tissues were processed for light microscopy. The weight of rabbit gave mean values of 2.04 kg and the mean values of long axis of left adrenal gland 15.46 mm and the diameter of right gave mean values 11.30 mm. The adrenal glands sit at the top of the kidneys, one on each side of the body, and have an inner core (known as the medulla) surrounded by an outer shell (known as the cortex). The adrenal cortex consists of three anatomic zones: the outer zona glomerulosa; the intermediate zona fasciculata, which secretes cortisol; and the inner zona reticularis. The adrenal medulla, lying in the center of the adrenal gland, is functionally related to the sympathetic nervous system and secretes the catecholamines epinephrine and norepinephrine in response to stress.

Key word: Adrenal gland, Rabbit, Oryctolagus Cuniculus

Introduction
Rodents (Rodentia), the largest order of placental mammals, comprise more than half of the mammals known at present. The rabbit that is the subject of this study is from the Hystricidae family, which constitutes a small group of the order Rodentia (1,2,3). The adrenal gland is composed of two distinct portions: an outer cortex (mesodermal origin) and an inner medulla (neuroectodermal origin) (4,5,6,7). The adrenal cortex is subdivided into three (5, 6,7) or four (8) distinct zones of epithelial cells. The outermost zone is called zona glomerulosa in ruminants, in human (5,9) and in a few rodents (6,10,11) and is formed of irregular clusters.

Materials and Method
In this study, ten adrenal glands were collected from five adult female rabbits (the average of weight 4.2 kg and the average age five months & ten days). Animals were anaesthetized with Pentothal (6 mg/kg) and adrenal specimens were taken. For light microscopy, 10% formaldehyde solutions were used to fix the tissue. After fixation, the specimens were rinsed with buffer; treated with ethyl alcohol and xylol and embedded in paraffin blocks. Sections (5-7 μm thick) were made by microtome (Leitz) and then stained with hematoxylin-cosin. Photomicrographs were taken with a camera (Nikon) attached to a microscope. Micrometric measurements and volume were carried out with ocular micrometer.

Results
Data obtained from micrometric measurement of adrenal glands of adult rabbit are shown in table 1. The weight of rabbit gave mean values of 2.04 kg and the weight of right and left adrenal gland gave mean values of 0.14 and 0.15 g respectively. The mean values of long axis of left adrenal gland 15.46 mm and the diameter of right gave mean values 11.30 mm. The paired adrenal glands were located to the cranio-medial of the kidneys and both right and left adrenals were flat (fig.1). Morphological data obtained from this study showed that the adrenal cortex can be divided into three zones according to differences in the arrangement of its cells; an outer zone, the glomerulosa; a middle zone, the fasciculate; and an inner zone, the reticularis. The zona fasciculate is the broadest of the three. The zona glomerulosa is a relatively narrow zone in which the arrangement of the cord is such that the cells are in arcuate groups (fig 2). Fig.3 showed The cells tend to be columnar and they have spherical nuclei. A few lipid
droplets may be found in the cytoplasm, but they are sparse in comparison with the droplets in the zona fasciculata. The zona fasciculata, the broadest zone, is composed of cell cords coursing parallel in one another in a radial direction toward the medulla (fig. 4). The cords are usually only one or two cells in width. The secretory cells are generally cuboidal or polyhedral in shape and they are sometimes binucleate. The nuclei appear more vesicular than those of the glomerulosa, with less dense chromatin. The cells are relatively large. Since the lipids are dissolved by the usual technical procedures, the cytoplasm has a spongy appearance (fig. 5).

The zona reticularis is composed of network of cell cords (fig. 6&7). The cells are generally smaller than those of the fasciculata and they relatively few lipid droplets in comparison with the fasciculata and the droplets vary greatly in size.

**Medulla.** The adrenal medulla was about one quarter of the area of the gland. The chromaffin cells in irregular clusters, and at the cortico-medullary boundary cortical cells were observed. Epinephrine-storing cells (E-cells) were more numerous and smaller than norepinephrine-storing cells (NE-cells). The majority were moderately electron-dense E granules, but some were highly electron-dense NE granules. Ganglion cells were rarely observed. Numerous central sinusoidal vessels were noticed in place of a large central venule.

Discussion

The adrenal cortex is composed of two\textsuperscript{12}, three\textsuperscript{13}, or four\textsuperscript{14} distinct areas of epithelial cells. The outermost is called zona glomerulosa in ruminants and primates\textsuperscript{15}, and in a few rodents\textsuperscript{(12,11)}. In most other domestic species including dogs, cats, horses, and pigs the parenchyma forms archades just beneath the capsule.

Some investigators\textsuperscript{(8,4,7,15,16)} have reported that the zona fasciculata is the widest zone of the cortex and has a foamy appearance caused by the presence of numerous lipid vacuoles\textsuperscript{(8,5,6,7)}. The zona fasciculata forms 60\% of the cortex\textsuperscript{16} or 70.9\% of the cortex in the rabbit\textsuperscript{15}. According to\textsuperscript{7} the zona fasciculata is 65\% of the gland. Results of this study indicate that the zona fasciculata appears foamy and forms 66.3\% of the cortex and 48.5\% of the gland.

\textsuperscript{9} identified that the adrenal medulla in goat is about a quarter of the gland. According to\textsuperscript{7} the adrenal medulla is 13\% of the human gland. Our results are similar to those reported in goat by\textsuperscript{9}.

Previous reports described that the adrenal medulla contains both types of chromaffin cells\textsuperscript{(19,18)}. Furthermore, at the cortico-medullary boundary, cortical cells were together with chromaffin cells\textsuperscript{(18,19)}. Epinephrine cells were more numerous, smaller and contained less electron-dense granules than norepinephrine cells\textsuperscript{(17,18,19,5,20)}.

\textsuperscript{21} identified that the adrenal medulla in goat is about a quarter of the gland. According to\textsuperscript{22} the adrenal medulla is 13\% of the human gland. Our results are similar to those reported in goat by\textsuperscript{23}.

Abstract

The research problem is about the lack of previous studies concerning with deny foot for feet through using the modern technological devices that record and save the quantities of the feet strength, by using Bluetooth. The researchers noted weakness in some muscle abilities, and reduce the level of physical performance for fencing players. This study aims at preparing exercises according to Deny Foot, which was put in the feet of the players, in order to improve some skillful and muscular abilities among fencing young players as well as to recognize the effect of these exercises on improving some skillful and muscular abilities among fencing young players.

The researchers used the experimental method with the experimental design of two research groups (Equivalence), first experimental group and second experimental group. The research community of fencing competition has identified by choosing (10) players of Al-Jaish Sports Club for young people under the age of 17-18 years. The special exercises were applied for eight weeks and by three exercises units per week, the researchers used the Statistical Package for the Social Sciences (SPSS). The most important conclusions which the researchers reached that physical exercise have positively influenced on the development of some muscular abilities and skills for young fencing players. The researchers recommend the importance of investing modern devices and players in scientific colleges or specialized institutes and use them to provide a clear vision and information about the place and timelines.

Keywords: Physical Exercises, Deny Foot, Muscular Abilities

Introduction

The fencing sport is considered one of the sports that require special skillful abilities and special physical characteristics ¹, the most important characteristic is the muscular ability because of this characteristic collect force and speed together, which the fencer depend on it directly, so the muscles ability such as which found in legs, arms shoulder and the torso has an important role² for the fencer not only in moving sword but it also has an important in fencer transfer speed of the fencer’s chest, which rushes forward and then bounces back as the fencer performs a movement attack to make a point against the competitor or return to the standby mode to To avoid the competitor’s movement ³. The requirement to do good achievement in this efficiency is to apply modern exercise methods, based on actual experimentation, those methods aimed at improving, components of achievement in fencing ⁴. From this stems, the importance of this study is to study the effect of exercise, in accordance with the magnitudes of the forces exerted, for step one, time using, a mobile device (Deny foot) in order to develop their own exercises to develop this contest, and pressure, level of performance, which reflects, the ability of the players of the physical ⁵ effort that is directly related to the performance development level and improving the skillful level in this competition according to scientific basis which linked with the components of its actual exercise, and thus keep up with the internationally advanced level of achievement.
Aims of the Study

This study aims at:

1. Making several exercises to improve some skillful and muscular abilities among fencing young players.
2. Identifying the effect of improving some skillful and muscular abilities among fencing young players.

Hypothesis

The researcher hypothesized the following: The exercises have positive effects in improving some skillful and muscular abilities among fencing young players.

Methodology

The researchers used the experimental method with the experimental design of two equivalence groups, first experimental group and second experimental group.

- At freedom degree (FD): (10-2=8) with a significance level (0.05).
Practical Framework:

Measuring System of Deny Foot

It is a system to measure the variables of deny foot on ground through every step during running, which is made up of four parts that is considered as a base to conduct data (which is considered as foot place that shoes placed in, with a connection wire for the computer which connected with the experimenter), as well as a signal receiver that linked with a laptop and receiving signals for 30 m., the system works when the experimenter put the device on his/her foot put it in the leg with the sensor steps on the experimenter’s foot, then entering the data about the experimenter’s age, weight, length and sex, the system measures the variables of speed and recorded space of every step, these data may be used to food the training units to save information in the system.

The aim of the test is to measure the muscular ability of the feet, in the forward start up.

The Used Instruments: an appropriate place for starting up with (1.5 m.) *(3.5 m.), the place must be standard and free of chalk.

The Performance Description: The experimenter stands behind the beginning line, the instep must be on the outside of beginning line. The experimenter begins to swing the arms to back with the knees bent and tilt to forward a little, and then jumps forward to the maximum by lying the knees up and pushing the feet then swing arms ahead.

Measuring points: The measurement is from the starting line to the last part of the body touching the ground. Three attempts are given to the experimenter. The experimenter is credited with the best try.

The Test of Depth Jump Height

The aim this test is to measure the muscular ability of feet.

Instruments: Board put in the wall that its bottom edge must be about 150 cm. from the ground, then it must be put in subsequently (151 to 400 cm.), chalk toe (for the purpose of marking the board). The board can be dispensed with, by putting the marks on the wall according to the performance conditions. The height of the box is 45 cm.

The Performance Characteristics: The experimenter floods the distinctive fingers of the hand of chalk prepared for it, then jumped using a box where the player stands on the box and then down to the ground trying to jump to the top instantaneously and mark the distinctive hand, where the experimenter rises with the feet with vertical jumping and touching one hand, every experimenter has three attempts to score his/her best.

Recording Way: the first mark is placed before jumping (by extending the arms high from the ground and a first mark facing the wall). Then a second mark of jumping (after landing from the box and jumping high) and the distance between the two markers, reflects the degree of experimenter testing (jump distance).

Physical Tests Including:

The sped of moving feet tests (starting up): (Yassir Muhamed Ahmed Hajar, 2007: 43-44).

The aim of the test: To measure the speed of performance progress distance of 14 meters.

Instruments used: Duct tape - 2 clocks (timers) – fencing stadium divided into two parts.

Method of doing the test: From standby position the experimenter stands on the starting line specified on the stadium so that the performance of every 2 experimenters together for the element of competition in performance when hearing the signal occupies the clock, the player progresses at full speed forward to reach the finish line and when touching the back foot the finish line closes the clock.

Performance conditions:

- The test is conducted among the players, every player in a section.
- Maintaining a standby position during the test performance.
- Perform moving forward correctly.
- Going in a straight line.
- Turn off the clock after the back foot touches the line.

Recording Way: The time is calculated for the nearest 1/100 sec., gives three tries and depended on the
best one.

*Test the speed of movements of the feet (regression) (Ibid: 44-45)

The aim of the test: measuring the speed of the performance of the regression distance of 14 meters.

Instruments used: Duct tape - 2 clocks (timers) - fencing stadium divided into two parts.

Method of doing the test: From standby position the experimenter stands on the starting line specified on the stadium so that the performance of every 2 experimenters together for the element of competition in performance when hearing the signal occupies the clock, the player progresses at full speed forward to reach the finish line and when touching the back foot the finish line closes the clock.

Performance conditions:
- The experimenter stands of the wall and in front of fencing stadium.
- The test is conducted between two experimenters and every player on his or her section.
- Continue standby during testing.
- Perform backwards correctly.
- Backwards in a straight line.
- Turn off the clock after the back foot touches the line.

Recording Way: The time is calculated for the nearest 1/100 sec., gives three tries and depended on the best one.

**Pre-Tests:**

**The Main Experience**

- Researchers have prepared special real-time exercises in pre tests.
- The exercises were given three training units per week on days (Saturday, Monday and Wednesday).
- The experience started on Saturday, March 10, 2019 and ended on Thursday, May 9, 2019.
- The period of the exercises was within the period of the special numbers and by 6 weeks and thus 24 exercise units were applied.

**Post-Tests:**

The researcher conducted the post-tests at al-Jaish Sports Club Stadium on Saturday, 11/5/2011 until Sunday, 12/5/2019 (after the completion of the proposed exercises and the same steps and the conditions under which the tests were conducted)

**Statistical Devices**

The researchers used the Statistical Package for the Social Sciences (SPSS).

**Results and Discussion**

Discussion the Results of the Physical Tests:

By observing the table (3) we find that all the tests are moral between the pre and post-test of the first and second experimental group and attribute this to the effect of using a device sensitive force of the feet and adjust the amounts of force exerted for one step.

The implementation of these exercises in the period of special preparation has also contributed to the development of some physical abilities to the importance of skill exercise and the development of muscle strength in the period of special physical preparation, as the strength must be made in different forms and amounts and to correspond accurately with the performance of skills as the development of that strength depends on secret changes, the rhythm of nerve signals as the muscular activity is characterized by a high degree of compatibility between the time and size of the nerve signals, and indicates the importance of this special force through performance exercises which is the main means of its development (Mamdouh Muhammad Al-Shanawi, 2003: 112)

Khairya Ibrahim Al-Sukkari and Muhammad Jabir state that when performing exercises for certain muscle groups, it results in adjustments in specific muscle areas, for example, the effectiveness of endurance can be increased only by endurance exercises, i.e. when performing specific exercises that produce specific adaptations, if you want to jump up or forward, the content of the exercise must base on jumping exercises and if you want speed you have to focus on speed exercise and so on... It is imperative to develop exercise programs according to the type of activity practiced (Khairya Ibrahim Al-Sukkari and Muhammad Jabir, 2005: 25).

Present, analyze and discuss the results of the skill tests for the first and second experimental groups:

The plyometric exercises contributed the improving the movements of feet, Talha Hussam al-Din indicates that the exercises of the plyometric used have an effect on the central nervous system by reducing decelerating processes and recruiting muscle fibers to do the muscle work characterized by the strength of the contraction and its speed (Talha Hussam al-Din, 1999: 95).

Conclusions

The researchers found out the following conclusions:

1. The suggested exercises have positively effected in some physical and skillful abilities of Fencing Young experimenters.

2. Using modern technical instruments to identify the number of the correct steps in each second as well as using it as an instrument to observe the performance speed.

Assessment of Primary School Teachers' Knowledge Towards Post-Traumatic Stress Disorder among Pupils In Mosul City

Nawaf Mohammed Dhahir1*, and Saja Hashem Mohammed2.
1Ph.D /Instructor, Faculty of Nursing, University of Babylon, Iraq, 2Professor, Faculty of Nursing, University of Babylon, Iraq.

Abstract

Background: Teachers’ knowledge towards childhood mental health disorders at schools located in regions which were exposed to armed conflict, traumatic events and wars should be given the highest priority, not only for pupils’ mental health, but also as an important perspective for education. Therefore, teachers' knowledge must be adequately assessed about common childhood mental health disorders, particularly post-traumatic stress disorder (PTSD).

Objectives: The study aimed to assess teachers' knowledge towards post-traumatic stress disorder (PTSD) among pupils at primary schools in Mosul city.

Materials and Method: A descriptive study was conducted for the period from 1st December 2018 to 30th May 2019. The study included (520) primary schools inside Mosul which is the second largest city in Iraq. A probability sampling (simple random technique) was used, the sample consisted of (60) teachers who were teaching in primary schools inside Mosul city. Data were collected through the utilization of constructed questionnaire after validity and reliability of it were estimated. Reliability of the questionnaire was estimated through a pilot study and the validity was determined through (15) experts related to the field of study. All data were collected by means of interview technique. Data were analyzed through use of descriptive and inferential statistical analysis procedures using SPSS Version-23.

Results: The findings of current study indicates that the level of teachers' knowledge towards post-traumatic stress disorder (PTSD) was low.

Conclusion: The study concludes that there is a considerable lack in teachers' knowledge in regard to post-traumatic stress disorder (PTSD).

Keywords: Assessment, Post-Traumatic Stress Disorder, Teachers' Knowledge.

Introduction

Teachers have an important role in supporting pupils when they feel fear, anxiety and/or sadness as well as in referral these pupils to mental health professionals and facilities. Pupils, especially those at schools located in regions which were witnessed armed conflict, traumatic events and wars, are more susceptible to experience psychological distress symptoms than others. In order to enhance teachers' roles, their knowledge about common childhood mental health disorders should be assessed effectively, particularly post-traumatic stress disorder (PTSD) as one of the common mental health disorders among pupils in Mosul city [1]. In Iraq, Mosul city witnessed a numbers of wars and conflicts since 2005. The last conflict was triggered by the invasion of the criminal (ISIS) gangs in the beginning of 2014. As a result, the experience of war and violence increases the risk for emotional disturbing and development of psychiatric disorders among individuals. It is obvious that traumatic experiences affect people, especially children, in different ways. Posttraumatic Stress Disorder (PTSD) is a disorder that some people experience after living through a stressful and traumatic events. Traumatic events may include combat, severe accidents, or physical assault [2, 3]. Childhood trauma can have a direct and considerable impacts on the ability of a pupil...
to learn. Yet, this issue has largely been neglected by our education system [3]. Adopting a trauma-informed approach, could enable schools to conduct a model shift at the teachers and other staff to recognize, make referral, understand and address mental health and learning needs of traumatized pupils. This requires a commitment to shaping school practices and policies to be sensitive to the needs of traumatized learners. This effort positively affects schools and changes the life-track of vulnerable pupils[4]. Poor emotional and mental health impacts a considerable number of children and young people[5]. Teachers are in a unique position to identify pupils who are experiencing difficulties after stressful events due to their prolonged and closed contact with pupils[6]. Following a traumatic event, children may respond in different range of responses, so it isn't obviously what types of reactions they will show. Therefore, building strategies to help teachers in winding up additional more attuned for identifying the symptoms of emotional and behavioral difficulties in their pupils following a stressful events is very necessary[7, 8].

Objectives: The study aimed to assess teachers' knowledge regarding post-traumatic stress disorder (PTSD) among pupils at primary schools in Mosul city.

Methodology

A descriptive design using the assessment approach was conducted for the period from 1st December 2018 to 30th May 2019 to assess the teachers' knowledge toward post-traumatic stress disorder (PTSD) among pupils at primary schools in Mosul city. A probability sampling (simple random technique) was used. A sample of (60) primary schools were selected after dividing the city into two sides (Right and left side of the Tigris River), then selected (30) schools from each side and then one teacher was selected from each school in a probable manner. The teachers were participated voluntarily in the study. The data were collected through using a special questionnaire after the validity and reliability of it were estimated. The content validity of the questionnaire was estimated through a panel of experts related to the study field, and its reliability was estimated through a pilot study which included (10) teachers who were excluded from the final sample. The reliability of study instrument was determined by using test-retest technique, the alpha correlation coefficient (r) was =0.82. The questionnaire was constructed by the researchers after reviewing many related literatures, it is composed of two main parts: Part-I: Teachers' socio-demographical data such as (age, gender, marital status, years of employment, and educational level). Part-II: This part is concerned with multiple choice questions (MCQs) to assess teachers' post-traumatic stress related knowledge which included six sections as follow:

1- Section one: Eight (MCQs) about concept of health and childhood mental health.

2- Section two: Eight (MCQs) about the psychological trauma.

3- Section three: Eight (MCQs) about the impacts of psychological trauma.

4- Section four: Eight (MCQs) about Post-traumatic Stress Disorder symptoms.

5- Section five: Eight (MCQs) about DSM-5 Criteria for PTSD.

6- Section six: Eight (MCQs) about protection and resilience factors.

Cut of points for scores for each section: Extremely Low= (0-1), low= (2-3), Intermediate= (4-5), Good= (6-8). Cut of points for scores for total knowledge: Extremely Low= (0-12), low= (13-24), Intermediate= (25-36), Good= (37-48).

This table indicates that all participants of the study are (60) teachers. Their ages are between (30-60) years old. The overall mean age for the participants is [42.40 (SD=7.66)]. The table also reveals that the highest percentage of the sample (53.4%) are in the age group of (30-40) years old, while the lowest percentage of them (18.3%) are at the age group of (51-60) years old. The table also shows that about (51.7%) of the sample are male. On the other hand, the majority of teachers (65%) are married. Regarding teacher’s work experience, the table indicates that (35%; n=21) of the sample are having years of employment ranged between (11-15) years. Finally, the table demonstrates that about (38.3%) of sample are possess an institute degree certificate and approximately (31.7%) are having university degree certificate.

F: Frequency, %: Percent.
This table indicates that the highest percentage of teachers are having low levels of post-traumatic stress disorder related knowledge scores in all sections; section one (F= 48.3%; n= 29); section two (F= 56.7%; n= 34); section three (F= 65%; n= 39); section four (F= 63.3%; n= 38); section five (F=48.3; n= 29); section six (F=50%; n= 30). Concerning the levels of the total knowledge scores, this table shows that the highest percentage of teachers are having low level of knowledge (F= 86.7%; n= 52).

**Discussion**

The limitation that the researchers faced was that there was no related literature and previous studies about such assessment regarding post-traumatic stress disorder among pupils. This study objected to assess teachers’ knowledge in respect to childhood post-traumatic stress disorder (PTSD) at primary schools.

Data analysis revealed that (51.7%) of the sample are male, table (1). Relative to age, the study showed that the highest percentage of the sample (53.4%) are in the age group of (30-40) years old, the overall mean age for the participants is 42.40 (SD=7.66), table [1]. Regarding years of employment, the findings indicated that (35%; n=21) of the sample are having years of employment ranged between (11-15).

In the other hand, the study illustrated that the majority of teachers (65%) are married. Finally, the results demonstrated that about (38.3%) of sample are possess an institute degree certificate and approximately (31.7%) are having bachelor’s degree certificate, table (1).

These results are relatively in agreement with the findings of a previous study done by Al-kraawi (2018). Al-kraawi was applied an education program on primary school teachers regarding their knowledge about Attention deficit-hyperactivity disorder among pupils at primary schools in AL- Najaf city. Al-kraawi assessed teachers’ knowledge toward Attention deficit-hyperactivity disorder among pupils at primary schools. In his mentioned study, Al-kraawi proved that there is a significant lack in teachers’ knowledge towards such common childhood mental health disorder among pupils.

This current study also illustrated that the highest percentage of teachers are having low levels of PTSD related knowledge in all sections, table (2); section one (F= 48.3%; n= 29); section two (F= 56.7%; n= 34); section three (F= 65%; n= 39); section four (F= 63.3%; n= 38); section five (F=48.3; n= 29); section six (F=50%; n= 30). Concerning the levels of the total knowledge scores, this table shows that the highest percentage of teachers are having low level of knowledge (F= 86.7%; n= 52).

Finally, table (2) showed that the total knowledge scores of all post-traumatic stress disorder (PTSD) sections is low among (86.7%) of teachers who participated in the study. Therefore, as results mentioned above, we can say that there is a significant lack in teachers’ knowledge towards childhood post-traumatic stress disorder (PTSD).

**Conclusions**

The study concluded that there is a significant lack in teachers’ knowledge in regard to post-traumatic stress disorder (PTSD).

**Financial Disclosure:** There is no financial disclosure.

**Conflict of Interest:** None to declare.

Predictors of Bone Mass Density in Patients with Chronic Obstructive Pulmonary Disease

Ahmed Hussein Jasim1, Amjed H. Abbas2, Mohanned Mahmood Abbas3
1F.I.B.M.S (resp.), F.I.B.M.S (med.). College of Medicine, University of Babylon, 2 Ph.D. Medical Physiology, Hammurabi College of Medicine, University of Babylon, 3 F.I.C.M.S,M.D. (med.), Al-Hashimiya General Hospital

Abstract

Background and Aim: The low bone mass as presented as osteopenia and osteoporosis represent example of the morbidities that occur in patients with chronic obstructive pulmonary disease (COPD). Predictors of bone mass density include osteopenia and osteoporosis. There is little data from Iraq on the relation between COPD and low bone mass. This study aimed to assess predictors of bone mass density in COPD patients attending Merjan Medical City.

Patients and Methods: The study was performed on patients with COPD patients seen at the Merjan Medical City in the period between January 2018 and June 2019. The study included taking history with physical examination in addition to the needed investigation which included spirometry and dual-energy X-ray absorptiometry (DEXA) scan, osteopenia was defined if the T score was -<1 to <-2.5 and osteoporosis of <-2.5 as according to the WHO guidelines.

Results: The study involved 122 patients with COPD, average age was 61.52±10.01, males were 107 (88.52%) and females were 15 (11.48%), 22 patients (18.03%) had normal bone mass while the remaining 100 (81.97%) had with low bone mass, 64 (52.46%) were osteoporotic and 36 patients (29.51%) had osteopenia. There was also significant relation between T score and FEV1, (P value= 0.000), significant relation between T score and smoking (P value 0.000), in addition there was significant relation between pack year and severity of airways obstruction as assessed by pulmonary function test (P value 0.000).

Conclusions: Our study shows that patients with low bone mass that presented as osteopenia and osteoporosis form high percentage in patients with COPD and greatly related to disease severity and amount of smoking.

Keywords: Chronic obstructive pulmonary disease, osteopenia, osteoporosis.

Introduction

Chronic obstructive pulmonary disease (COPD) is considered as a pulmonary long-standing debilitating disease that has many systemic manifestations. Predictors of bone mineral density include osteoporosis and osteopenia that can be diagnosed by using DEXA scan. Osteopenia, osteoporosis and fragility fractures are examples of the serious systemic manifestations that occurs in COPD patients due to low bone mineral density, in osteoporosis the T-score is below -2.5 while in osteopenia the T-score is between -1.0 and -2.5. The risk factors for causing decrease in bone mass in COPD are age, gender (mostly females), low exercise levels, impaired nutritional status, tobacco smoking and corticosteroids use. The dual-energy X-ray absorptiometry (DEXA) method is the gold standard for measuring bone mineral density (BMD). Many studies showed that osteoporosis and osteopenia commonly occur in patients with COPD and the prevalence in the range of 24-44% is reported. Osteoporosis usually were overlooked and remain undertreated which may be due to that it is a silent disease until it manifests clinically as pathologic fracture. Therefore, the primary focus of physicians in patients with COPD is to improve and maintain lung function without realizing that these patients suffer from low bone mass, which in turn increases the risk of fragility fractures and this could lead to an increase in pain and a worsening of respiratory function. There are few studies about the relation between...
COPD and BMD in Iraq \(^{11-13}\). This study aimed to assess BMD in COPD patients who attended Merjan Medical City and were investigated with a DEXA scan to assess bone mass.

**Patients and methods**

This is a cross-sectional study that was done in Merjan Medical City in the period from November 2018 to July 2019, the study included 120 patients (107 males and 15 females) suffered from COPD.

Demographic data of the patients were taken which included ages of patients, gender, height and weight for calculating body mass index (BMI), duration of the COPD smoking status as assessed by pack years, DEXA scan to assess bone mineral density. Pulmonary function tests were measured by using the computerized spirometer (MIR company, Italy). The forced expiratory volume in first second (FEV1) is a reliable and valid test to assess lung function according to standards of the American Thoracic Society \(^{14}\). The level of COPD severity was determined by The FEV1\% predicted depending on the global initiative of obstructive lung disease (GOLD) \(^{15}\).

**Data analysis**

The Statistical Package for Social Sciences (SPSS) (version 22) was used to analyze the data of this work. Results were presented as means ± standard deviation. Cross tabulation was used to compare between variables. The level of statistical significance was P-values < 0.05.

**Results**

The study involved 120 COPD patients, the mean age was 61.52±10.01 as shown in table (1).

**Table (1): Demographic data**

The study showed that the percentage of osteoporosis was 52.46% while osteopenia was 29.52 % as illustrated in figure (1).
Figure (1): distribution of low bone mass in COPD patients

Figure (2) shows the relation between bone mineral density and BMI, osteoporosis was high in patients with BMI <19 while in normal subjects most of them was in 19-24 BMI, and the relation was significant (p value =0.000)

![Bar Chart](image)

**Fig (2) Relation between T score and BMI**

The study also showed significant relation between T score and FEV1, (P value= 0.000) as illustrated in figure (3)

![Bar Chart](image)

**Fig (3) Relation between T score and severity of pulmonary function**

There was significant relation between T score and smoking (P value= 0.000), as shown in figure (4)
Discussion

The study showed that the percentage of osteoporosis was 52.46% while osteopenia was 29.52% which means that about 82% of our patients had low bone mass and this was slightly similar to a study performed in Saudi Arabia where the percentage of low bone mass was 90% (16). The study also showed that patients who were suffering from osteoporosis were older, had longer COPD duration and lower FEV1. In a study performed by Graat-Verboom et al. (2009) in a review of 13 studies that involved 775 COPD patients, they reported that the prevalence of osteoporosis in COPD varies between 9 and 69% and that of osteopenia between 27% and 67%.

The study revealed significant relation between low bone mass and severity of airways obstruction and there was 26% of patients who had very severe COPD (GOLD stage IV) had osteoporosis and 9.8% in patients who had moderate COPD (GOLD stage II) and this agreed with a study by Alsayad et al. from south region of Saudi Arabia that found that the percentage of osteoporosis was 21.4% (16), while in a study by Tschopp et al. (2002) found 69% of patients with GOLD Stage II had osteoporosis whereas Bolton et al. (2008) found that 20% of patients with GOLD stage II had osteoporosis.

The study also showed significant relation between pack year and T score and the effect was dose-dependent that means increased risk of osteoporosis with increased amount of smoking. There are multiple causes behind this effect. Smoking has adverse effects on enzymes and hormones involved in bone regulation like parathyroid hormone and alkaline phosphatase, it is also a risk factor for ischemic osteonecrosis which is associated with nicotine’s peripheral vasoconstrictor effects.

The study also revealed significant relation between T-score and smoking status.

Conclusion

We conclude from this study that the low bone mass is common in COPD patients which have a relation with the disease severity and smoking. Bone mass index should be investigated in every patient with COPD by DEXA scan in order to be treated accordingly.

1Assistant Lecturer, Department of Nursing, Sulaimania Polytechnic University (SPU), Kurdistan, Iraq, 2Assistant Lecturer, Department of Community Health, Sulaimania Polytechnic University (SPU), Kurdistan, Iraq, 3Lecturer, Department of Community Health, Sulaimania Polytechnic University (SPU), Kurdistan, Iraq, 4 Lecturer, Department of Nursing, Sulaimania Polytechnic University (SPU), Kurdistan, Iraq

Abstract

Fruit juices are especially valued in the human diet as these contain micronutrients, fiber, potassium, vitamin C, which work as antioxidants within the body as well as bio-functional components. The goal of this study is to determine the levels of Iron Fe, Zinc Zn, Magnesium Mg, Sodium Na, Potassium K, Calcium Ca and heavy metal manganese Mn, mercury Hg, Lead Pb as fruit juice consumed largely and will be in raise daily. Sixty-nine samples of different fruit juice were bought from retail markets in Sulaimani city, were analyzed using wet methods. The results obtained showed the ranges of the metals detected in all the of fruit juice were; Iron Fe (0-2), Zinc Zn (0 ), Manganese Mn (0), magnesium Mg (0-0.6), Sodium Na (0-22.9), Potassium K (0-19.2), Calcium Ca (0-29) and heavy metal mercury Hg (0-0.25), Lead Pb (0-4) mg/L. The mean value of Iron Fe, Magnesium Mg, Sodium Na, Potassium K, Calcium Ca and heavy metal mercury Hg, Lead Pb 0.421 , 0.16 , 4.188 , 3.348 , 7.362 ,0.029 , 0.578mg/L) respectively, Zinc and Manganese were not detected in any samples,some of the samples have nutrient value for sodium, potassium and calcium.

Keyword: Heavy metals, fruit juice, public health, flame photometer, toxic metal.

Introduction

Fruit juices are especially valued in the human diet as these contain micronutrients, fiber, potassium, vitamin C, which work as antioxidants within the body as well as bio-functional components (32) carotenoids, minerals (especially Mg, K) and various kinds of antioxidants and dietary fiber (pectin) is protective against degenerative and chronic diseases such as cancer and cardiovascular diseases 8,20. Fruit juice is commonly consumed by our youths not for their nutritional benefits, but to quench thirst during the hot summer, or maybe they think that these soft drinks will help them in digestion, while athletes use energy drinks to keep up their energy during intense physical activity and competitions. The market for these beverages has increased in the past years and although they might be harmless, overdoses or a combination of these with other drinks could be harmful to the health of some consumers in certain circumstances 19. Fruit juices are regularly utilized for culinary and dietary purposes 10. They are made up of chiefly cellulose, heme-cellulose and pectin substances that give them their texture and firmness. Fresh fruits and vegetables are of great importance in the diet because of the presence of vitamins and mineral salts 10. In addition, they contain water, calcium, iron, sulphur and potash 21. They are very important protective foods and quite useful for the maintenance of health and the prevention and treatment of various diseases 7. At higher concentrations, they may be toxic to the biota and could disturb the biochemical process and cause hazards 1. Heavy metal composition of food is of interest because of their essential and toxic nature, for example Fe, Zn, Cu, Cr, Co & Mn are essential while Pb, Cd, Ni & Hg are toxic at certain levels 16. Iron fortification in foods has been increased to tackle the increased incidence of iron deficiency anemia, especially in the western countries 11. Iron deficiency anemia is the most common micronutrient deficiency affecting mostly lower socioeconomic populations of developing countries 23. The non-nutritive toxic metals which are known to have deleterious effects even in small quantities (below 100 ppm) are As, Sb, Cd, F, Pb, Hg, and Se 25,26.
Therefore the manufacture of juices requires special attention in terms of purity and the sources of water and its purification are crucial for maintaining quality and safety and quality control and market watching will be do more monitoring for food especially fruit juice. The aim of present study is to compare the result values with acceptable values were proposed by food administration of American and WHO and the corresponding values of different countries available in the literature.

**Methods and Material**

Sixty-nine samples of commonly consumed fruit juices were analysis to determinate the concentrations of Iron Fe, Zinc Zn, Magnesium Mg, Sodium Na, Potassium K, Calcium Ca and heavy metal manganese Mn, mercury Hg, Lead Pb by using Atomic Absorption Spectrophotometer (AAS) agricultural college, main laboratory research / university of Salahadin. Digestion of Fruit Juices Samples performed at Halabja technical agricultural college in Halabjah city. All glassware’s washed with 1% nitric acid followed by demineralized water. 10 mL of concentration Sulphoric acid (H2SO4) was added to 2 mL of the fruit juice, then added 5 mL of hydrogen peroxide (H2O2), digestion of samples in a Kjeldahl digestion tube, the solution was heated on a Kjeldahl heater for 30 min or higher degree then turn into half and heated for 15 minutes. This was then allowed to cool in room temperature and transfer into a 100 mL volumetric flask and made up to mark with deionized water, which brought from the foundation of Kurdistan for strategic and research, then stored in a Pyrex glass bottle container transport into agriculture college, university of Erbil for analysis of Zn, Mn, Hg, Mg, Fe metal by atomic absorption spectroscopy model Alpha-4 and Na, Ca, K, flame photometer model Jenway PFP-7.

**Result and Discussion**

The results of the determination of the concentrations of metal in the fruit juice are shown in tables 1 , maximum, minimum, mean, and detected percentage of contents represent in table 2 .The mean value of Iron Fe, Zinc Zn, Manganese Mn, Magnesium Mg, Sodium Na, Potassium K, Calcium Ca and heavy metal mercury Hg, Lead Pb 0.421 , 0 ,0, 0.16 , 4.188 , 3.348 , 7.362 ,0.029 , 0.578mg/L) respectively. The ranges of the metals detected in all samples of fruit juice were; Iron Fe (0-2), Zinc Zn (0), Manganese Mn (0), magnesium Mg (0-0.6), Sodium Na (0-22.9), Potassium K (0-19.2), Calcium Ca (0-29) and heavy metal mercury Hg(0-0.25), Lead Pb (0-4) mg/L.

**Mercury (Hg)**

Mercury was detectable in (21.74 %) of samples as shown in table 2 above and has concentration (0 – 0.25 ppm). The maximum value for Hg was found in sample FJ1, FJ13 and 21 was 0.25 ppm, the mean value detected 0.029 ppm. All detectable value was high compared to the maximum permissible limit for mercury is 0.01 ppm according to the national standard of China on Maximum Levels of Contaminants in Foods, a maximum level for mercury in fruits is 0.01 mg/kg (NSCMLCF, 2005). The average daily intake of mercury is reported to be between 0.002-0.02 mg (GMACE, 2001). Mercury is one of the most toxic elements among the studied heavy metals and exposure to high level of this element could permanently damage...
the brain, kidneys and developing fetus.

Sodium (Na)

It detected in 72.69% of samples and the mean of detected was 4.188 mg/dl, the range was (0-22.9 mg/dl).

Lead (Pb)

Lead was detectable in (30.43 %) of samples as shown in table 1 and 2 above and has concentration (0–4 ppm), The maximum value for pb was found in sample FJ7 was 4 ppm, the mean value detected 0.578 ppm. All detectable value was high compared to the maximum permissible limit for lead is 0.01 ppm set by WHO. The mean value was LESS than that reported in Accra Ghana fruit juice 1.59 mg/L.

Iron (Fe)

Iron was detectable in (69.57%) as show in table 1 above and has concentration (0 – 2 mg/L), The maximum value for Fe was found in sample FJ5, 6, 27, 31 was 2 mg/L, the mean value detected 1.34mg/L. The values of iron were lower compared to 0.020 –2.090 mg/L for non-canned and 0.020 – 2.460 mg/L for canned beverages 12, and lower than (3.13-5.48 mg/L) 3 but higher than values (0.11 – 0.28 mg/L reported) 14. All the fruit juice samples had iron concentration higher than the maximum limit permitted by WHO 23 except undetected samples. Iron is important in many biological processes because it is an ideal oxygen carrier and because it can function as a protein-bound redox element. Iron deficiency is common worldwide and in infants can cause severe neurological deficit 17. Minerals play an important role in maintaining proper function and good health in the human body.

Calcium (Ca)

The values of Calcium were higher than 2.763 – 13.143mg/L 5 while lower compared to 0.28 – 262 mg/L [14], Calcium is needed for the formation and maintenance of bones, the development of teeth and healthy gums. It is necessary for blood clotting, stabilizes many body functions and is thought to assist in preventing bowel cancer 2. It has a natural calming and tranquilizing effect and is necessary for maintaining a regular heartbeat and the transmission of nerve impulses. The required amount includes: 1,000 mg/day for people aged 19-50 years and 1,200 mg per day for people over the age of 51 years. The maximum level of calcium is 2.5 g/day 18.

Potassium (K)

The potassium detected in 72.46% of samples and the rang were (0-19.2 mg/dL). The values of potassium were lower compared to 2.0 to 110 mg/L 5. Potassium concentrations of the fruit juices were relatively low compared to the recommended daily intake (RDI) of potassium. The RDI of potassium ranged between 1600 - 5000 mg/day. Potassium is the major intracellular ion, intimately related to sodium movement out of the cell via Na/K ATPase.

Manganese (Mn)

Manganese was not detectable in any samples as shown in table 1 above,deficiency in manganese leads to various health problems, which may include bone malformation, eye and hearing problems, high cholesterol levels, hypertension, infertility, weakness, heart disorders, memory loss, muscle contraction, tremors, seizures. It could also result in decreased learning ability in school-aged children and increase the propensity for violence in adult.

Zinc (Zn)

Zn is one of the important trace elements that play a vital role in the physiological and metabolic process of many organisms. Nevertheless, higher concentrations of Zn can be toxic to the organism. Zinc was not detectable in any samples as shown in table 1 above also the Zn concentration below the limits imposed by USEPA (2008) and WHO. The maximum contaminant limit for zinc is 5.0 ppm . The result was less than that reported 0.301ppm 38 and reported in Accra Ghana fruit juice 3.33 ppm. Zinc is involved in numerous aspects of cellular metabolism. It is required for the catalytic activity of approximately 100 enzymes and it plays a role in immune function, protein synthesis, wound healing, DNA synthesis, and cell division.

Magnesium (Mg)

Manganese is known as trace elements. According to the USDA the daily recommended intake of manganese is 2.3 mg/day for adult males and 1.8 mg/day for female. The consumption of dietary trace-elements will help to prevent free radical damage. According to Olajire and Azeez 15, trace-elements have the ability to scavenge free radicals by inhibiting the initiation step or interrupting the propagation step of oxidation of lipid and as protective antioxidants which slow the rate of
oxidation by several actions.

**Conclusion**

Iron, calcium, zinc and potassium are essential elements needed for the general health. Although their values were low compared to the acceptable total intakes, their presence contributes to the daily iron, calcium, zinc and potassium sources needed in the body. The lead detected in 15 samples (44.11%) were above the MCL of 0.01 mg/L while manganese of fruit juice were not detected in any samples and MCL of manganese is 0.05 mg/L.

A Questionnaire-Based Survey Assessment of Iraqi Dentists Using Repair Versus Replacement of Defective Composite Restoration

Huda M. Al-Badri¹, Zainab Mahmood Mansi¹, Raghad A. Alhashimi²
¹Assistant Lecturer. B.D.S, Ms.c in Conservative Dentistry, Dijlah University,
²Assistant Professor B.D.S, Ms.c, PhD Conservative Dentistry, Baghdad University College of Dentistry

Abstract

Tooth restoration one of the most common procedures in dental practice. The replacement of the entire restoration leads to loss of tooth structure and increase risk of pulp injury; replacement is also time consuming and costly. According to the minimally invasive approach when minimal defects, repair is the better choice than the total replacement of the restoration.

This study aims to evaluate repair rating versus replacement treatment procedure for defective composite fillings among Iraqi dentists.

Material and methodology: A questionnaire survey were designed and distributed to 184 post-graduate dentists in Iraq. The inquiry pertained general information; including their clinical experience in years, their preference in terms of direct composite restoration, repair or replacement of old restorations, whether they taught the indications for repair, and the selection type of composite for repair.

Result of 200 questioner’s disrepute, 184 questionnaires were completed and collected. The data revealed that the respondents with 1-5, 6-15 and 16-25 years of experience were 62 (33.7%), 75 (40.8%), and 47(25.5%) of total respondents, respectively. The total 174 dentists (94.6%) prefer using tooth-colored restorations and 10 (5.4%) dislike this approach. Result clearly indicate that most of the dentists choose replacement for any fractured or discolored restorations. The data showed that 59.2% of dentist are not familiar with repair, and 40.8% dentists are familiar. The result revealed that 82.1% the dentists were not trained on repair during their undergraduate study. Generally, they had no ideal standard to replace or repair depending on their clinical experience. Therefore, clear criteria and guidelines for replacing and repairing should be developed and followed in post-graduate courses.

Key words: Composite restorations, repair or replacement, Iraqi dentists.

Introduction

The requirement for an ideal esthetic material of tooth restoration has resulted in considerable improvements in materials and techniques. Various resin-based composite (RBC) materials have been recently introduced, offering improved esthetic and physical material properties¹.

Direct RBC restorations, as well as other forms of restorations, generally suffer from deterioration due to wear and tear². The restoration of large defects in posterior teeth were tested to the maximum properties. The longevity of RBC materials may be compromised when using unprecise incremental technique³, resulting in higher failure rates⁴.

The clinical traditional management approach of restorations, in tooth exhibiting signs of defective margins (marginal deterioration, secondary caries or discoloration) is usually performed by total restoration replacement⁵. This approach leads to the significant disturbance of healthy tooth structure when the preparation area is enlarged, resulting in negative effect on tooth longevity. Moreover, the possibility of pulp fatal injury is increased ². Approximately 56% of restorations reportedly were refilled rather than restorations for new
lesions of caries\(^6\).

Most defects in restorations, other than those caused by sudden impact fracture, gradually develop with time\(^{(7,8)}\). This providing an opportunity to classify the problems and then undertake minimal intervention to correct the defects.\(^2\) Caries occurring at the margins of a restoration is considered a new lesion rather than recurrent caries. Therefore, localized repair rather than total restoration replacement is needed.\(^{(2,3,8)}\)

When a minimal or localized defect appeared at one restoration region, repair is better option than total replacement of the restoration\(^9\). Repair usually involves partial replacement of a restoration using the same or different restorative materials. Practically repairing consume short operating time, so it can be used for uncooperative patients or those suffering complex medical histories. Furthermore, the repair may be performed without local anaesthesia and complex operative procedures\(^{10}\). RBC restoration repairing may be reduced to refurbishment only. Usually refurbishment involve the refinishing or resurfacing of a restoration with or without recountouring. Refurbishment usually involves refinishing or resurfacing with or without recountouring. Refinishing can be performed only to the margins of the restoration, while resurfacing may involve part or all of the exposed surfaces of restoration\(^3\). Although numerus surface treatment modalities have been introduced, the interface between the aged and repair composite material is considered weak link. However, none of these modalities can been regarded as the golden standard\(^{(11,12)}\).

Owing to the unavailability of practical guidelines, so the decision between replacing or repairing usually depends on judgment of the clinician, according to their clinical experience.\(^{10}\)

The present study aims to survey the preference of Iraqi dentists between repair or replacement in dental restorations.

### Material and Method

A survey questionnaire consisting of eight questions was designed and distributed to 200 post-graduated dentists engaged the public dental service. The respondents were informed that their demographics will be kept confidential. The survey inquired a general information of the participants, including years of clinical experience, their preference among direct composite restoration, repair or replacement of old restorations, and their preference of special composite material for repair. The collected questionnaires results were analyzed. The following percentage results were obtained: (1) Years of experience, (2) Prefer tooth colored restoration, (3) Preferred restoration methods if fractured, (4) Preferred restoration methods if discolored, (5) Familiarity with repair, (6) Trained on repair during under graduate study, (7) Repair decision influence by fillings age, and (8) Selection of special composite.

### Result

The complete questionnaire received from different dental health centers were one hundred eighty-four (N = 184) out of two hundred responded. The data of 184 revealed that dentists had experience of 1-5 years were 62 (33.7%), 6-15 years were 75 (40.8%), 16-25 years were 47 (25.5%). 174 dentists (94.6%) prefer using tooth-colored restorations and 10 (5.4%) dislike table\(^{(1)}\). This table also indicated, that when there is any fracture in the restorations, 66.1% of dentists choosed restoration replacement. 20.2% of dentists their decision varies between replacement or repair according to the case, but 13.7% prefer repairing the defected filling. The data showed 59.2% of dentist not familiar with repair, and 40.8% dentists were familiar. the questioner revealed that 82.1% the dentists were not trained on repair during their undergraduate study while only 17.9% were trained, figure (1).

![Figure (1): Characteristics and responses of selected sample of dentists.](image-url)
The results demonstrated that when there was restoration discoloration, 53.3% of the participants whom familiar with repair preferred replacement over repair and 18.7% preferred repair of the restoration. The trained undergraduate dentists, 48.5% from them prefer replace over repair, while 24.2% their decision was according to the case, table (1)

Discussion

The results revealed that 94.6% of the participants prefer tooth-colored restoration as requirement for aesthetic dental restorations, and the RBC was the restorative material of choice for both anterior and posterior teeth. These results were consistent with those of Valeria V. Gordan Cynthia W. Garvan, Paul K. Blaser, Eduardo Mondragon; Ivar A. Direct composite restorations (tooth-colored, with minimum tooth preparation) exhibited good performance. Thus, these materials are currently used for various purposes. Modern bonding materials and techniques decry polymerization shrinkage, microleakage and the occurrence of secondary caries. Therefore, composite resins are preferred by most practitioners for anterior and posterior restorations.

Given the lack of acknowledgement among dentists about the advantages of repairing resin composite restorations, some dental practitioners are possibly unaware of the repair option. However, others consider the contraindications to repair: patient disinclination to accept a repair, irregular attendance, high risk of caries, presence of caries that undermine restoration, and history of previous repair failure. In this study many participate considered the choice of repair or replacement depending on the restoration case. Therefore, a large percentage of dentists prefer replacement over repair. This finding consistent with the study of Tays et al. who considered that repair is not the standard of care and patchwork dentistry.

The result of this research generally disagreed with those of other workers, which indicated an agreement among academicians in conservative dentistry worldwide in repairing rather than directly replacing resin composite restorations. By contrast, this study revealed that the majority of dentists did not receive didactic information on repair during their undergraduate study. Only 17.9% of dentists claimed that they were taught and trained in composite repair during the BDS study. While 40.8% performed repairs in their practice.

Regarding discoloration of restoration, most dentists prefer replacement. Discoloration may be due to incorrect shade selection in the placement of a composite restoration, which may be managed by resurfacing using a different shade of composite material. If possible, the same restorative material should be used as the composite substrate. However, this condition might be impossible if the restoration was performed by a different practitioner, materials used were not recorded in the patient’s notes, or the previous material is no longer commercially available.

In this research, a high percentage of dentists prefer the replacement of fractured tooth-colored restoration. This preference may be attributed to fracture of tooth.
tissue adjacent to a restoration, which may be occurred due to parafunctional activity or trauma, the subsequent to the damaging effects of polymerization stresses in resin composites at the time of restoration placement. A repair may be indicated when the fracture accurately diagnosed, and the risk for further fracture minimized. This investigation underlines the need for clinical studies on repairs and the requirement for general guidelines of the repair indications and technique options.

Conclusions

The choice between repairing or replacing a defective RBC restoration is multifactorial, and the answer of many participants was based on each case treatment. This study highlighted lack of acknowledgment among dentists about the advantages of repairing RBC. Evidently, most of the participants were unaware of repair indications and techniques similar to those of other countries in the world.

Assessment of the Level of Spirituality among the Patients with Major Depressive Disorder in Sulaimani City

Taha Ahmad Faraj*1, Professor Dr. Salwa Shakir Muhsin 2
1 Lecture at College of Nursing/University of Sulaimani
2 College of Nursing/University of Sulaimani

Abstract

Background: Major depressive disorder has been associated with greater morbidity and mortality. Many researchers have been sought complex association between depressions with spirituality. The levels of severity of such factor can play role in the causes, recovery and predictor of depression.

Objectives: The main objective of this study is to assess the levels of spirituality.

Method: A quantitative descriptive design, conducted at psychiatric clinic in Ali Kamal medical consultation center in Sulaimani City. A non-probability, convenient sampling was recruited of 150 patients with major depressive disorder attending the psychiatric clinic. The data were collected from December, 21st, 2017 to April 1st, 2018 by the researcher of current study through the utilization of structured Face-to-Face interview guided by the questionnaire.

Result: The result shows that the patients with major depressive disorder experience high spirituality value.

Conclusions: The study conclude that high spirituality value on its own the strongest significant factor may represents emotional source and possibly used to handle or cope with depressed mood by the patients.

Keywords: Spirituality, Depression, Patients, Major depressive disorder

Introduction

The World Health Organization, 1946 defined health as state of complete physical, mental and social well-being and not merely the absence of disease or infirmity. However, more recent definitions of health have included emotional and spiritual dimensions. To ignore any of these components would omit significant part of well-being, with equally significant consequences.

Spirtuality is broad concept comprise many perspective in general, it includes a sense of connection to something bigger than ourselves, and it typically involves a search for meaning in life. As such, it is a universal human experience, something that touches us all. Individuals may describe a spirituality experience as sacred or transcendent or simply a deep of aliveness and interconnectedness.

Depression has been studied in relation to spirituality and it appears that spirituality does help people maintain their mental health. Spirituality may play a role in depression prevention and recovery. Some studies indicate that more spirituality involved individuals experience fewer depressive symptoms and faster recovery from a depressive disorder than those with less spirituality involvement. It has been suggested spirituality acts as a coping resource or protective factor against depression.

According to Russell’s model as well-being spirituality is not necessarily religious aspect, but rather an individual’s philosophy; value and meaning of life. It is defined as a personal connectedness with a higher divine nature. Such connectedness may contributes to lessening depression.

18 have assessed the value of the spirituality teaching of 8- week program for adult diagnosed with major depression of mild to moderate, results showed...
significant decreased in severity change, response and remission. Also, reported that spirituality is a significant predictor of depression should be considered on area of study.

The previous studies sought to study depression in terms of spirituality is limited. Furthermore no study has investigated the levels of spirituality in outpatients with major depressive disorder in the psychiatric-mental health nursing in Sulaimani city and even in Iraq.

Today psychiatrists, psychologists and clinicians are increasingly respond to the idea that spirit as integral in the life of the person and believe that spirituality are important in the life of their patients. The American Counseling Association- defining the spirituality as a capacity and tendency that is innate and unique to all people. This spiritual tendency moves the individual toward knowledge, love, meaning, peace, hope, transcendence, connectedness, compassion, wellness, growth and development of a value system. Spirituality encompasses a variety of phenomena, including experiences, beliefs, and practices. Spirituality is approached from a variety of perspectives, including psycho-spiritual, religious and transpersonal, while spirituality is usually expressed through culture.

Individual’s spiritual-health have two characteristics; internal and external. Internally, spiritual health seems to provide the individual with life purpose, ultimate meaning oneness with nature and beauty, a sense of connectedness with other, deep concern for a commitment, peace, hope and fulfillment. Externally, spiritual-health of individuals expresses themselves through trust, honesty, integrity, altruism, compassion and service. In addition, these characteristics regularly communicate with higher power or larger reality that transcends an observable physical reality.

The role of the spirituality in life not optional, it is a response to the need for human wholeness. To not miss an essential part of the person, in the treatment of illness, it is important to attend to the spiritual dimension of a person.

Spirituality and religiosity are related and overall but is not the same. Religiosity is a specific set of beliefs and practices usually within an organized and formal group or it may be a less formal and more individual set of beliefs and practices.

Religion is institutionalized spirituality, thus there are different sets of beliefs, traditions, and doctrines. Spirituality is the common factor in all these religions.

In general, Islamic theory holds that each person emprises four parts; the heart, the intellect, the spirit (Ruh) and the self (Nafs). The spirit contains a template of potential for the person. And the self encompasses the biological and psychic aspects of the individual (our animal nature). The four parts of the person are in harmony through belief, worship and submission to Allah.

Although hospital for psychiatric care appeared in Islamic countries early in the 8th century, Muslims generally may see mental health difficulties as due to spiritual problems or weakness in faith. Islamic counselors working with Islamic clients generally see their spirituality; religion is as a resource that helps guard against problem like depression and suicide, as well as providing coping resources for other types of problem.

view of the spiritual well-being concept that, in addition to desires for pleasure or self-fulfillment, humans have needs for transcendence, “the sense of well-being that we experience when we find purposes to commit ourselves to which involve ultimate meaning for life”. This type of well-being provides integration, harmony, and freedom within the personality and it involves two types; religion well-being which is a vertical relation or well-being in connection to God, and the second type is existential well-being which includes a horizontal relation to the world including a sense of life purpose and satisfaction.

In this regard stated that some major spiritual issue include the fear of death and loss, both of self and others. Spirituality allows one to cope with these feelings by providing a sense of hope and meaning to experience that would otherwise be crippling. Having a spiritual understanding that one’s connection with creation is more than merely physical helps to ease the fear and pain of loss, feeling connected to the divine eases feelings of abandonment, grief, and alienation, as well as promoting a sense of self-acceptance. Spirituality is thought to be a key component in the healing process and an integral part of the client treatments plan.

Spiritual / religious coping is widespread. In a study published by found that 90 percent of Americans
turned to their spiritual belief to cope with stress. This is also true in clinical settings. A study of 330 hospitalized medical patients found that 90 percent reported they used spiritual and religion practices to cope at least a moderate extent, and over 40 percent indicated that their spiritual belief were the most important factor that kept them going 17. Those with mental problems often rely on spirituality resources. 23 found that 80% of patients (406) with persistent mental illness relied on spiritual beliefs to cope. In Australia, 11 found that 79% among 79 psychiatric patients thought their therapist should be aware of their spiritual beliefs and 67% percent indicated that spirituality helped them to cope with psychological pain.

16 examined the relationship between spirituality and mental health, focusing on depression, and reported statistically significant positive associations between spirituality involvement and better health. Spirituality in mental health plays an important role. For many afflicted individuals, their spirituality gives them a powerful sense of hope in the face of an often devastating and chronic illness 7.

Method

A quantitative-descriptive design was used in order to achieve the aim of the study by using assessment technique to describe the studied variables which includes spirituality on community Patient with major depressive disorder. The study was carried out from December, 10th, 2017 to October, 1st, 2018. This study carried out at Psychiatric clinic in Ali Kamal medical Consultation Center which is affiliated to the Teaching Hospital in Sulaimani City in Kurdistan Region of Iraq.

A non-probability, convenient sampling of 150 patients previously diagnosed with major depressive disorder were recruited from consecutively attended the psychiatric department during the period from December 27th, 2017 to March, 21st, 2018.

A questionnaire was developed to measure the variables underlying the present study mainly to assess spirituality among patients diagnosed with major depressive disorder. Spiritual well-being scale (SWBS) (Elison-paluzian, 1982) used in this study. The validity of the questionnaire determined through a panel of 20 experts. Statistical package for social science (SPSS) version 22 is used for data analysis.

Result

Table 1 the significant difference between calculated mean and theoretical mean in spirituality measures for the study sample, using -test

<table>
<thead>
<tr>

<th>theoretical mean</th>
<th>value</th>
<th>Level of significance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Spirituality</td>
<td>150</td>
<td>72.626</td>
<td>11.398</td>
<td>60</td>
<td>13.567</td>
<td>0.001</td>
</tr>
</tbody>
</table>

Table (1) shows statistically significant difference was found between calculated mean ($= 72.626$) and theoretical mean ($x=60$) ($-test = 13.567, ± 11.398$) at <0.001 level in spirituality measure. The results in this table indicate that the difference was in favour of calculated mean which means that the level of spirituality, in general is high among study sample for patients with major depressive disorder.

Table 2 Distribution of sample according to the levels of spirituality

<table>
<thead>
<tr>
<th>Statistical Indicator</th>
<th>Low level (20-40)</th>
<th>Medium level (41-69)</th>
<th>High level (70-100)</th>
<th>Total</th>
</tr>
</thead>

<td>73.64</td>
<td>8.81</td>
<td>1.534</td>
<td>Nonsignificant</td>
</tr>
<tr>
<td>Spirituality</td>
<td>Females</td>
<td>51</td>
<td>70.64</td>
<td>15.12</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The table (3) appears that there was statistically non-significant difference between mean score of spirituality in compare to patient’s gender because p-value was greater than common alpha 0.05 (- test = 1.534). The table reveals that gender factor is not impact factor affecting the spirituality in major depressive disorder among study patients.

Table 5 the significance differences of mean score of spirituality in regard to suicide attempt factor among patients

<table>
<thead>
<tr>
<th>Variables</th>
<th>Suicide attempt</th>
<th>Number</th>
<th>Mean score</th>
<th>Standard Deviation</th>
<th>value</th>
<th>Level of significant</th>

<td></td>
</tr>
<tr>
<td>Spirituality</td>
<td>Yes</td>
<td>48</td>
<td>12.93</td>
<td>4.60</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table (5) shows that there was statistically non-significant difference mean score of spirituality in compare to patients non suicidal and suicidal attempt, because p-value was greater than the common alpha 0.05 (=1.907, at p>0.05). Table 5 reveals that the suicidal attempt is not affecting spirituality, which reveals that spirituality, is self-coping against suicide attempts.

Discussion

The results of the present study showed that the observed (calculated) mean score (72.626) of spirituality was significantly (p<0.001) higher than the theoretical mean score (60) 11.398 and the majority of the study depressed patients (68%) have high spiritual level in comparison to the standards scoring (70-100) of spirituality scale and only few of them (2%) with low level of spirituality. The frequent finding of high spirituality level among depressed patients in the current study was similar to the findings from another study carried out by 15 study in Iran and 4 study in USA. They found that spirituality level was significantly high among patients with major depressive disorder.

The possible explanation of the result of this study that the collaborative relationship that depressed patients have with God may counteract the culture belief of fatalism 4. The findings of this study therefore add evidence that high spirituality level common state experience by the study patient, with major depressive disorder living in the community.

It showed that gender and suicide attempts are non-significant factors affecting spirituality levels. Similarly, 4 showed that gender was non-significant impact factors affecting the differences in spirituality score levels. In contrast to the results of this study 15 identified that the gender as a factor effecting spirituality levels.
Suicidal attempt also is non-significant factors effecting the differences in spirituality levels (p>0.05). found that no support for spiritual mobilization hypothesis during illness or that spirituality/ religious served as protective factor, and also found that distress increases over time and proposed that the strength of religion/ spirituality beliefs prior to the illness and the mobilization of these beliefs in absence of illness a strong base during the crises promoted distress Instead.

**Conclusion**

Most of patients were male, unemployed, living in urban areas, practicing religious activities and their mean of age 37.5 years. They were less admitting to hospital although the long duration of illness ranged from 1-25 years. The patients experience high level spirituality value. The level of spirituality value affected by age, marital status, level of education, residential area, religious status and duration of illness.

Patient religious status is significant factors effecting the variation of studied variable spirituality, but patient suicide attempt and number of attempts are not associated with the spirituality value.

High spirituality value on its own the strongest significant factors may represent emotional source and possibly used to handle or self-cope with depressed mood by the patients.

Isolation and Diagnosis of Some Dermatophytes Using Nitrogen Base Tracking Technique (Sequence)

Saba Kadhim Naser1, Meethaq Staar Abood2

1 MSc. Student, 2Assist. Prof., University of Thi-Qar- College of Education for Pure Sciences, Biology Department, Iraq

Abstract

A total of, 162 Samples of those infects with dermatophytes at Imam Hussein Teaching Hospital in Nasiriyah city for the purpose of diagnosing some samples in a sequential manner , The samples included skin skimmers, nail clippers, hair pieces, Isolation and diagnosis of samples was carried out by conventional methods and then confirmed the diagnosis in a way that follows the nitrogen bases, where 10 samples were diagnosed and recorded in the gene bank , Trichophyton was the more frequent , than Epidermophyton,A number of Candidia yeasts were also diagnosed in the traditional methods of appearance , It was a ratio of T. rubrum (28%) than T. interdigitale (24%), than T. mentagrophytes (21%), and also E. floccosum in the rate of (25%) , There are also ratios for the emergence of types of yeasts as a proportion C. albicans (32%) , Than C. parapsilosis (25%) , Than C. kruzi (22%) , and also C. dubliirensis in the rate of (19%) , Thes samples were collected from different ages and from both sexes .

Key words : Dermatophytes, Nitrogen base tracking technique (Sequence).

Introduction

Dermatophytes are a group of fungi that have the ability to attack keratinized tissues of humans and animals such as skin, hair and nails, causing dermatophytes, Thes fungi comprise three species (Trichophyton Epidermophyton, Microsporu) .

Trichophyton is characterized by the formation of large conidates and small conidaes with a smooth wall and this genus includes a number of species that have the ability to infect the skin, hair and nails .

Skin infections are a common infection in humans for a long time as millions of people in the world are exposed , It causes skin infections known as ringworm(Tinea) or ringwor infection (Tinea) or skin mycosis in humans and animals , It has the advantages of being a keratin-loving keratin (Keratinophilic) and his analyzer (Keratinolytic), but has no ability to penetrate deep tissues below the keratinized layer as most of them are unable to live at high temperature such as body temperature .

The incidence rates vary depending on the location of the infection in the body and age, as the incidence of scalp (Tinea capitis) in younger ages is more than in adults , Asat and his group in 1996 and the researcher (Chin,2000) reported that the relative resistance to infection is due to the long chains of saturated fatty acids found in sebum produced after puberty , ringworm (Tinea corporis) occurs in warm areas of the world and affects more children, especially those in direct contact with animals and adults, especially in those with excessive sweating . While ringworm (Tinea pedis) affects athletes in general because of its spread in swimming pools and clothing strikes, and crowded and public place (such as schools, hospitals, and public parks) are preferred sites for the emergence and wide variety of pathogenic and opportunistic fungi .

There are many laboratory methods used to diagnose skin fungi one of these methods is forming on food circles , There are also special circles used to diagnose skin fungi called Dermatophytes Identification Media (DIM) in these settings, the diagnosis depends on the color variation of the fungal colonies , Diagnosis can also be made based on specific nutritional requirements for the growth of fungi, such as the need for the thymine compound T. violaceum , Currently, the PCR technique is used to diagnose fungi if the fungal colony lacks the diagnostic phenotypic characteristic or
the newly developed fungal colony or if the fungus is dead. 

Materials and Method

Collect samples

About 162 samples (hair pieces, demabrasion, and nails) were collected from patients attending Imam Hussein Teaching Hospital in the Dermatology Consultation Department in Thi-Qar Governorate. (Gender, age, area of residence, injury area as well as the work of the injured person and date of sample collection).

Examination of samples

Direct microscopy of samples The samples were transferred to the college laboratory as they were taken from the affected skin, hair and nails and added drops of potassium hydroxide solution at a concentration of 10% after being placed on a glass slide and left for 5 minutes of time. In microscopic examination using a complex optical microscope and at a power of (40X).

Cultivation of specimens

The remaining part of the samples is planted on the medium of Sabouraud Dextrose Agar with Cycloheximide and Chloramphenicol. The medium of Sabouraud Dextrose Agar added whit Cycloheximide and Chloramphenicol to prevent the growth of opportunistic bacteria and fungi. Prepare the medium by melting 65 g of sabouraud dextrose agar in 1000 ml distilled water, sterilize with anodized and cool to 45°C and add 0.05 of chloramphenicol antibiotic to inhibit bacterial growth and 5.0 cycloheximide to inhibit the growth of unsatisfactory thrush, use this medium to isolate grow and preserve fungal isolates.

Diagnosis

Cultivated dishes were examined five days after transplantation and then left for three weke at 28°C to allow more fungi to grow and appear, the fungi were then isolated from dishes containing SDA medium, the isolates are then purified and transferred from the colonial parts to the slanted media, it was incubated at 25°C and then kept in the refrigerator at 4°C to 6°C until later use. All fungi were laboratory diagnosed based on the cultivative and phenotypic qualities and with the help.

DNA sequencing method

DNA sequencing method was performed for species typing of positive Trichophyton sp. isolates as following step:

1- The PCR product of 18S ribosomal RNA genes were sent to Macrogen Company in Korea in ice bag by DHL for performed the DNA sequencing by AB DNA sequencing system.

2- The DNA sequencing analysis (Phylogenetic tree analysis) was conducted by using Molecular Evolutionary Genetics Analysis version 6.0. (Mega 6.0) and Multiple sequence alignment analysis based ClustalW alignment analysis and The evolutionary distances were computed using the Maximum Composite Likelihood method by phylogenetic tree UPGMA method.

3- The Trichophyton species typing analysis was done by phylogenetic tree analysis between local Trichophyton sp. isolates and NCBI-Blast known Trichophyton species.

4- Finally identified Trichophyton species isolates were submitted into of NCBI-GenBank to get Genbank accession number.

Medium Chrome Agar Candida

Uses to distinguish between the types of Candida, prepare the medium according to the instructions of the manufacturer by adding the powder medium (47 g) slowly to sterile distilled water Balmsdah (1000 ml) with stirring to homogenize the mixture and then heat to 100°C until large bubbles appear then cool to a degree 50°C water bath and poured into Petri dishes, then samples were planned on the surface of the medium and incubated at 37°C and you monitor growth for (24-48) hours and then observed the change in the colors of the colonines growing on this medium.

Results and Discussion

The results of laboratory transplantation on the medium of Sabouraud Dextrose Agar showed the presence of skin fungi in 70 samples of the total samples as shown in Table (1), While the number of samples in which Candida appeared was 40 samples as shown in Table (2), as for the results of the laboratory examination, 30 samples showed dermatophytes, Candida samples were 22, as shown in Table (3).
results of this table indicate that direct microscopic examination is highly sensitive in the diagnosis of skin injuries compared with implantation on the media\(^{19}\). They pointed out that the direct examination as a detection of the presence or absence of fungi, The emergence of negative results, whether in direct microscopy or laboratory transplantation for many reasons, the most important inaccurate diagnosis as the infection is not fungal, but are symptoms of allergic diseases, and also some patients resort to the use of treatments without consulting a doctor, which leads to influence the activity of the fungus causing the infection\(^{20}\), and not grow until transplantation\(^{21}\).

The study showed the diagnosis of three species of the genus Tricchophyton from the samples included in the study which T. mentagrophyte and T. rubrum and T. interdigitale with one species of the genus Epiderophyton which is E. floccosum on the medium of Sabouraud Dextrose Agar added with Cycloheximide and Chloramphenicol, the study also showed the emergence of types of genus Candida, namely C. albicans and C. dubliensis and C. parapsilosis with C. kruzi it was grown on the medium Chrom Agar as shown in the following figures:

Molecular diagnosis using polymerase chain reaction

Nucleic acid was extracted from the isolates under study and the result was the emergence of DNA bundles clearly when imaging with UV light and for all the isolates selected using electrophoresis technique on acarose gel as shown in Figure (1).

The total number of isolated Candida was (62) and the percentage was calculated by the following equation:

\[
\text{Number ÷ Total number × 100)}
\]

Nursing Student’s Satisfaction of Nursing Program in the Euphrates

Dr. Hussein Jassim Mohammed¹, R.N Kadhim Hussein Jassim², Salah Saeed³, Mohammed Abass⁴
¹A. Prof. Community Health Nursing, College of Nursing, University of Babylon, ²Babylon Health directorate/ Iraq, ³BSx Nursing graduate, ⁴BSc Nursing graduate.

Abstract

“In higher education, student satisfaction has been viewed as an indicator of program success, and students with higher satisfaction levels progress well in their intellectual and social development” the nursing student satisfaction has not been sufficiently studied in the world. Identifying which factors affect student satisfaction and expectations is valuable to educators seeking to improve the quality of program outcomes.

Cross-sectional survey study of senior nursing students in a BSN program was conducted during Oct 2016-April 2017 at colleges of middle Euphrates, Iraq. (200) senior nursing students in a BSN program from (4) colleges enrolled in the study selected randomly from the last stage of nursing colleges in middle Euphrates. Instruments were developed and used in order to collect data through self-administration of a questionnaire regarding the study, which analyzed by using SPSS, version 23.0. Descriptive statistics (means and standard deviations) were used for demographic questions and for each of the subscales organized by setting. The study results showed highly scaled issue from the participants regarding nursing program satisfaction. college’s recourses had the corner stone of applying nursing education program for nursing students, just (2) items had the high mean of scale (3.06 and 3.22). The study found that all domains were enhancing students satisfaction with their nursing education program.

Key words: Nursing students, nursing program

Introduction

Nursing philosophy has been an associate in Nursing ‘export industry’ since the start of the skilled era in nursing following the Nightingale reforms within the Europe within the Eighties. Nursing education challenges and health care provider education, namely; pair of competencies to patient and population wants, poor cooperation, persistent gender stratification of skilled standing, slender technical focus while not broader discourse understanding, preponderantly hospital orientation at the expense of medical aid and weak leadership to enhance health system performance. Nursing education is incredibly disagreeable with these aspects. Such a disagreeable education could negatively have an effect on a student’s shallowness

Bachelor’s degree nursing program is that the same all universities in Iraq and has undergone varied reforms over the past decades with the intention of making certain that the data and skills of graduates match the necessities for providing top quality care. Challenges were facing nursing education in Asian countries, as well as lack of faculties, learning resources, impassive information and poor collaboration between institutional education strategies and health agency.

Official approval of the nursing program is an important indicator that offers top quality outcomes to meet standards for education in Republic of Iraq hold student satisfaction; nursing student satisfaction is viewed as an associate degree indicator of nursing program success.

In learning action, learner happiness has been viewed as sign of plan achievement, and learner with upper happiness levels movement well in their academic and public increase.

Nursing education has a lot of development achieved in most countries towards building the capability of nursing and midwifery academic establishments in
terms of developing new programmers and change the
nursing and midwifery curricula, particularly in post-
conflict countries. However, the standard of education
in low-income countries needs additional attention,
significantly in relation to investment in infrastructure,
college development and program management.9

The effectiveness, sufficiency, and quality of the
services provided at the nursery, faculties have an effect
on the success of nursing education programs, quality,
and proficiency of nursing students, and the way the
scholars get pleasure from these services are often
measured by their satisfaction.7

Nurses are important resources for achieving health
policy goals and promoting public health, the academic
atmosphere may be a vital indicator in predicting
educational outcome.8

Central to the CFSE(Curriculum, Faculty, Social
Interaction, and Environment)

“Model is the belief that student satisfaction
evolves in a very active method that’s influenced by
the interaction between the scholar and school and
therefore the teaching and learning environments.
During this model,11 projected that the extent of student
satisfaction with a nursing program is directly laid low
with four major constructs: the content and structure of
syllabus, school teaching methods, social interaction
among students and school, and therefore the learning
surroundings, like a nursing skills laboratory”.11

Research Objectives

The aspire of this revise was to give the facts of BSc
nursing course agreement among nursing students using
a regular dimension in order to identify areas needed
for development in general and what is the relation of
characteristic variables and satisfaction

Research questions

What is the satisfaction level of nursing student’s
education?

Methodology

The design of the study: Cross-sectional study
of senior nursing students in a BSc program was
conducted so as to accomplish the stated objectives
during Oct 2016- April 2017 at colleges of middle
Euphrates, Iraq.

Participants: (200) senior nursing students in a
BSc program from (4) colleges enrolled in the study
selected non random from the last stage of nursing
colleges in middle Euphrates, All participants were well-
versed fully about current revise and its aim and then a
charitable oral consent was obtained from the participant
in order to participate in the study. Besides, it has been
taken into account the confidentiality of information
obtained from students.

Instruments: Tool developed and used in order
to collect data. it includes demographic data and four
validated tools assessed satisfaction among nursing
students. For scoring fulfillment status also four point
Likert scales have been used. The items were none or
little of the time, some of the time, a good part of the time
and most or all the time. The four-point Likert scale type
is scored as (1) for none or little of the time, (2) for some
of the time, and (3) for the better part of the time and (4)
for most or all the time. The elevated score means higher
satisfaction.

Data collection: Data were together through self-
running of opinion poll regarding the study. Participants
provide self-report information across fulfillment among
nursing students, with using a developed and well-
constructed opinion poll.

Data analysis: statistics were analyzed using SPSS,
Descriptive statistics (means and standard deviations)
were used for demographic questions and for each
of the subscales organized by setting (classroom or
clinical). Responses were coded on a scale ranging from
1 (disagree) to 3 (agree). Paired t-tests were used to
compare perceived competence in the classroom versus
clinical experiences for each subscale.

Ethical Considerations: Ethical consent was
obtained from a scientific research commute at the
nursing college and governmental health department
(2016/11).

Discussion

This study agreed with such studies in evaluation of nursing education program, from the student’s point of view, their satisfaction is one methods for evaluation and award accreditation of education in the world, so as, the results of the study

Teaching and learning domain: There were (62.0%) of senior students had satisfied with this domain, in view of the fact that all nursing students from Iraqi universities which had a good history of teaching and learning faculty who were trained in England, as well as had strict rules and regulations in nursing education since 1963.

Kasilingam, et al (2014) who studied this domain and found that a comprehensive assessment of students’ performance within the courses is important in manufacturing graduates who are able to integrate the assumption and apply of the learned courses in some educational activity programs. This issue is important to explain why our student had satisfied, on the other hand, the fact of another researcher about this domain is a positive, high and vital correlation between cognitive-psychomotor learning outcomes and emotive outcomes which often thought to be an indication on the association between these domains (Sonmez, 2017).

Porter, (2006) deliberates that experience with peer ability and education organization strength. The satisfaction level of the good and bad experiences extended towards them by the institute with high student’s satisfactions.

Student evaluation domain: This is the important domain effect on improvement of educational outcome in the higher education, the interpretation of (Remedios and Lieberman, 2008) that “used to determine the manipulation of exams, work, opportunity and objectives on student evaluations of teaching. The results indicated that grades, course complexity, and potentiality did have tiny positive influence on faculty rating, which in turn depended upon the quality of teaching”.

Resources domain: Nursing schools in Iraq supported with enough resources, which reflect the (64.0%) of nursing student that indicate their satisfaction. In “A study of (Dickson, etal, 2015), agreed with the finding and stated that the providing appropriate educational environment, could stimulates students’ thinking and generates their creativity. The results is alike to those of 18, and (Salamonson, et al., 2010), as well as (Wiers-Jenssen, et al. 2002), who found that there is a significant relationship between student academic development (e.g., through intellectually stimulating courses) and overall satisfaction, and a higher satisfaction level when faculty were supposed as sophisticated about the subject matter, set comprehensible goals, and existing quality teaching and a proper workload. The findings are also supported by (Ojeda, et al., 2011), (Row botham, 2010), and (Zafrir and Nissim, 2011), signifying that social relations between faculty and students is fundamental in developing a positive learning environment, which can also lead to student satisfaction. According to AACN’s a statement on 2014-2015 registration and graduation in baccalaureate nursing and postgraduate programs, nursing colleges in the United States turned 68,938 competent applicants of baccalaureate and graduate nursing programs in 2014”.

Conclusion

The study terminates too:

1. Provides student satisfaction of teaching and learning domain, evaluation domain, resources domain, and ensuring fairness as well as intelligibility domain offered in nursing courses which fulfilled within programs in the Middle Euphrates.

2. All domains were enhancing satisfaction for more than half of the respondents, with their nursing education program.

3. The outcome may not be generalized to all nursing programs, or to BSN programs accredited.

4. Nursing faculty members have superior effective teaching in nursing education in spite of their shortage.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the College of Nursing, Iraq and all experiments were carried out in accordance with approved guidelines.

Abstract

Aim of this study: The purpose of this study was to determine the association between nasal septal deviation and the volume of Maxillary sinus in adult population. To analyze the effect of nasal septal deviation on the volume of maxillary sinus. Maxillary sinuses are two spaces, which are filled with air, located in the maxillary bone and can be in various sizes and shapes. Their walls are thin. The apex of the sinuses can extend into the zygomatic process and can occupy the zygomatic bone. We could not demonstrate a statistically significant difference between Groups I–III and Groups II–III, and Group I–II in contra lateral deviation the maxillary sinus volume as the difference were found to be non-significant statistically ($p = 0.965$ and $p = 0.985$, and $p=0.994$ respectively). the mean of (contra lateral side)’s MSV equals to (19.8350) and standard deviation equals to (6.98693) and also the mean of (lateral side)’s MSV equals to (19.5698) and standard deviation equals to (7.69666). Thus, the mean of (contra lateral) for MSV is greater than the mean of (lateral) for MSV. It means that (deviated side) were lower MSV than (contra lateral side) for MSV.

Keywords: Nasal Septum, Effect, Maxillary Sinus Volume

Introduction

The floor formed by the alveolar process, the first, the second and the third molars and the roots of the canines may elevate the sinuses or may perforate their floor. The extent of pneumatisation of the maxillary sinus varies from person to person; its volume is influenced by age, residual dental projections, and alveolar bone height ⁸.

The nasal septum is a midline support structure of the nasal cavity. Deviation of the nasal septum is a common structural cause of nasal obstruction and can arise from dislocation of the quadrangular cartilage from its bony boundaries, or from an intrinsic deformity affecting the vomer, perpendicular plate of ethmoid and/or the quadrilateral cartilage itself ³. Nasal septal deviation can occurred by pressure and expansion during the downward growth of the septum from the ethmoid ossification centers, upward growth of the maxillary crest, and the development of the premaxilla and vomer ⁵. Trauma, particularly which is occurred by injures in infancy and childhood, is a significant factor in the etiology of septal deformity ⁶⁻⁷. The other important etiological factors are irregularity in the growth of the maxilla, asymmetric development of maxillary sinuses and turbinates, thumb-sucking, tongue-pressure habits which cause shifts in the alveolar ridge, genetic and environmental factors ⁵.

High resolution CT of the maxillary sinus has become indispensable in the complete evaluation of the maxillary sinus and its lesions ⁹ and to determine the percentage of pneumatization in the sinus cavity ¹⁰.

Materials and Method

All of the PNS CT scans that were taken in the sulaimania teaching hospital during the last 1 years were used in the study. Head CTs of 50 patients (28 females and 22 males) between 25-30 years’ age. The continuous non-overlapping sections of PNS CT scans were used with acquisition parameters of 1.0-mm slice thickness. The patients with allergic rhinitis, nasal polyposis, cystic fibrosis, asthma, immune deficiency, malignancy, metabolic disease, and those previous underwent maxillofacial
trauma, sinus surgery were excluded in this study.

**Measurement (done by CT scan)**

The nasal septal angle (NSA) was measured as the angle between a line drawn from the superior insertion of the nasal septum at the crista galli to the inferior insertion of the septum at the maxillary crest and another line from the superior insertion of the septum at the crista galli to the maximally deviated point of the convex nasal septum. Patients with NSD were grouped into 3 groups according to the measured nasal septal angle as group I (mild, $<9^\circ$), group II (moderate, $\geq 9^\circ$ and $<15^\circ$), or group III (severe, $\geq 15^\circ$), according to Elahi et al.’s grading system.  

**Measurement of maxillary sinus volume**

Maxillary sinus volume is measure by following equation.

\[
\text{Volume} = (\text{height} \times \text{depth} \times \text{width} \times 0.5).
\]

**Statistical Analysis**

The data were analyzed using IBM SPSS software (version 22, International Business Machines Corp., Armonk, NY, USA), and $p <0.05$ was considered statistically significant.

**Result and discussion:**

A total of 50 young adult, consisting of 31 right-sided and 29 left-sided NSDs, were included in the study. There were 22 males and 28 females, whose mean age was $30.38\pm3.658$ years, ranging from 25 to 35 years. Mean NSA was $10.15\pm4.85$ degrees, ranging from 3.8 to 24.5 degrees.

The deviation angles varied between $5^\circ$ and $24^\circ$. The mild group had 25 cases, the moderate group had 17 cases, and the severe group had 8 cases.

We could not demonstrate a statistically significant difference between Groups I–III and Groups II–III, and Group I–II in contra laterally deviated the maxillary sinus volume as the difference were found to be non-significant statistically ($p = 0.965$ and $p = 0.985$, and $p=0.994$ respectively).

Maxillary sinus volume in deviated side were Groups I and II and Groups I–III and Groups II–III compartments ($p = 0.565$, $p = 0.895$ and $p = 0.944$, respectively). Table 1.(11,12)

**Table 1: statistical description of maxillary sinus volume between each groups with (p value) by using T- test.**

<table>
<thead>
<tr>
<th>Groups</th>
<th>Sig</th>
</tr>
</thead>
<tbody>

<td>6.98693</td>
</tr>
<tr>
<td>deviated</td>
<td>25</td>
<td>19.5698</td>
<td>7.69666</td>
</tr>
</tbody>
</table>

It can be indicated in the table (2) that the mean of (contra lateral side)’s MSV equals to (19.8350) and standard deviation equals to (6.98693) and also the mean of (lateral side)’s MSV equals to (19.5698) and standard deviation equals to (7.69666). Thus, the mean of (contra lateral) for MSV is greater than the mean of (lateral) for MSV. It means that (deviated side) were lower MSV than (contra lateral side) for MSV.

The level of significance at level 0.05  
There is a relationship between the statistical function between the contra lateral and latral

It is noted from Table (3) that there is a statistically significant positive correlation between (A relationship between the contra lateral side and deviated side) which is (0.758) and that the significance value is 0.000 and is less than 0.05. This indicates acceptance of the second hypothesis, A positive correlation between the extent of (A relationship between the contra lateral side and deviate side)\(^{(13,14,15)}\).

Detection of the vaginal microflora in Pregnant and non-pregnant women using culture-independent method

Adnan H. Aubaid¹, Samira R. Gahadeer², Noor M. Jabar²
¹Prof. Dr., ²MSc. Student, College of Medicine, University of Al-Qadisiyah, Dewaniyah, Iraq

Abstract

Background: Bacterial Vaginosis (BV) is a disorder characterized by alterations of the vaginal flora with acquisition of diverse communities of anaerobic and facultative bacteria and depletion of the usually dominant lactobacilli.

Objective: To conduct and characterize the main bacterial players in BV affected pregnant and non-pregnant women.

Method: The BV work included collecting vaginal swabs from 158 women (18-45) years old. The samples were subjected in a laboratory to Amsel’s clinical criteria (ACC) and Nugent score system (NSS). The clinical diagnosis of BV was comprehensive when at least three ACCs were present out of a total four criteria (pH of vaginal secretions (Vss), Vaginal discharge, Clue cells and Wiff (sniff) test).

Results: The findings of the ACC and NSS revealed BV in 32 pregnant women (Pw) and 55 non-pregnant women (Npw). In detail, the ACC identified 39 (15 Pw and 24 Npw) positive samples. On the other hand, NSS unveiled that 48 (17 Pw and 31 Npw) with Vss were positive to BV. The bacterial isolates were distributed over the age categories (18-47 years old) of the Pw and Npw, in all age categories, (18-23, 24-29, 30-35, 36-41, and 42-47) year old, respectively.

Conclusion: The presented work, here, provides beneficial data obtained by using feasible techniques with high degrees of reliability to overcome setbacks generated from the use of cultivation techniques.

Keywords: vaginal microflora, Pregnant, Non-pregnant.

Introduction

Bacterial Vaginosis cause of foul vaginal discharge and is linked to the number of horrible health outcomes in reproductive age of females since has been associated with serious clinical obstetrical and gynecological sequelae, of these are infertility, endometritis, pelvic inflammatory disease (PID), post-abortion sepsis, post-surgical abortion infections, post-hysterectomy infection, and increased risk of HIV and other STIs acquisition¹.

BV is a clinically well-understood health condition manifested by the presence of a pH ≥ 4.5-vaginal discharge with properties of fishy-odor, gray to white, and homogenized adherent thin smear which is highly recognized after intercourse and menses². BV is the most prevalent vaginal disease that happens when useful Lactobacillus spp. decreases and different obligated or facultative anaerobic VBS elevated, which were usually available in very small amounts or absent in non-BV females³. This dysbiosis induces he BV pathological processes predominated by vaginal discharge which is an indicative sign for BV in 20 to 30% of females; however, risk can be higher as 50–60% in some active communities sexual behaviors (4,5).

Culture-dependent methods for BV identification face potential obstacles represented by non-cultivability of a wide range of bacterial members which may affect the reality of the profile of BV causative agents and the functions of bacterial members⁴.
Ecosystem of the vagina include several aerobic and anaerobic microorganisms coexist in a dynamic balance, this homeostasis results from complex interactions and synergies among the host and different microorganisms that colonize the vaginal mucosa.

Studies conducted in Iraq revealed that BV rates were between 28% and 37.5% among both pregnant and non-pregnant women.

The present BV-directed work was conducted aiming at understanding the real bacterial composition of the vaginal tract in pregnant and non-pregnant women (Pw and Npw, respectively) at reproductive age using primary scoring criteria non-cultivating.

Materials and Method

Subjects:

A total of 158 females, aged from (18-45) years old who visiting the outpatient clinics in the Maternity and Pediatrics Teaching Hospital during a period from November 2018 to April 2019 in Al-Diwaniya city, to evaluate of vaginal flora between women with and without bacterial vaginosis. Any participant having any of the following exclusion criteria was excluded from participation: <18 years of age, Diabetes mellitus, Using of antimicrobial agents (orally or suppositories), Females during menses period and Females using intrauterine contraceptives.

Samples collection and preparation:

By guidance of gynecologists, a sterile unlubricated speculum was inserted into the vagina and specimens were collected from the vaginal wall lateral areas and posterior fornix using sterile cotton tipped swabs and were carefully removed to avoid contamination with microflora of the vagina. The swabs were Amies-transport-media inserted and then transported to the designated facility, two swabs were taken from each women were used for gram stain preparation.

Amsel’s Criteria

The clinical diagnosis of BV was comprehensive when at least three ACCs were present out of a total four criteria. These criteria are as follows:

- **PH of vaginal secretions:** With a cotton swab the vaginal discharge were collected then transferred on a narrow range (3.5-6.0) PH strips for determined the PH directly.

- **Vaginal discharge:** During pelvic examination the clinician will evaluate the nature of the vaginal discharge, in BV case the discharge have to be thin, homogenous, and with milky colour.

- **Clue cells:** A high vaginal swab was used to prepare a dry vaginal smear by rolling it along the middle of a glass slide, the smear was air-dried and fixed with methanol then stained by Gram stain. The epithelial cells will be completely covered by the gram variable coccobacilli with indistinct borders due to adherent bacteria.

- **Wiff (sniff) test:** Adropletof 10% potassium hydroxide (KOH) was added to the vaginal discharge on a glass slide and immediately evaluated for the presence of a fishy smell which reveals a positive outcome.

Nugent’s Criteria and Gram Staining

The stained slides were examined under oil immersion objective 1000x magnification and evaluated for the following morphotypes: *Lactobacillus* morphotypes; longrods with Gram-+ve criteria, *G. vaginalis* morphotypes; small rods with Gram-±ve, *Bacteroides* spp. morphotypes; small rods with Gram–ve properties, and *Mobiluncus* spp. morphotypes; small curved rods with Gram–velooking. Morphotypes were counted separately from 0 to 4+ in respect to the single-oil-immersion field morphotype numbers in which 0:nil morphotypes, 1+:˂1 morphotype; 2+: 1-5 morphotypes, 3+: 5-30 morphotypes, and 4+:˃30 morphotypes. These scores added up to yield a final score of (0-7) or more. The score (0-3) is considered as normal, (4-6) is considered intermediate, and the condition of BV is a score of (7-10).

Results & Discussion

Although many BV-directed studies have been done, the picture of knowledge about the real vaginal bacterial composition in BV- or non-BV-affected women is not completely clear. Those studies either were focused on determining the major bacterial players in BV or characterizing the BV as a health condition with multiple bacterial members.

High vaginal swabs were collected from 158 women at different reproductive age groups, (18-45) years old, a total of (53) pregnant women who had abnormal vaginal discharge during the study period.
were recruited. Further than these women with atypical vaginal discharge, and (105)samples were taken from non-
pregnant women complaints of abnormal vaginal discharge, odor, and itching or burning (Figure 1).

![Pie chart showing the distribution of bacterial vaginosis among pregnant and non-pregnant women. The chart indicates that 33.54% of pregnant women and 66.45% of non-pregnant women had bacterial vaginosis.]

Figure (1): Distribution of bacterial vaginosis according to pregnant and non-pregnant women.

Thirty two pregnant women had bacterial vaginosis giving an occurrence rate of (36.78%) these women were positive for bacterial vaginosis using both the clinical criteria and gram stain morphology, 15 (38.46%) were positive by using the Amsels clinical criteria alone while 17 (35.41%) pregnant women had bacterial vaginosis using the Nugent score system only as shown in Table (1), Table (2).

NS: Non-significant difference at p ≥ 0.05
The incidence rate of BV among pregnant women in this study (36.78%) falls within the range of previous studies (17.3 – 67.7%) but is higher than that of another studies which ranged from (3.54 – 25.1%) considering local studies on the subject, the occurrence of (36.78%) is higher than the results reported by Al-Fadul were (13.1%) in pregnant women only.

This differences could be related to the different populations studied and difference in the gestation period, the present study involved pregnant women who presented at reservation during the study period regardless of gestational age, or whether they were symptomatic or not at acceptance.

Nevertheless, bacterial vaginosis incidence during pregnancy has an importance since it was revealed to be related with numerous obstetric sequalae such as preterm labor, still births, postpartum infections, premature rupture of membranes, abortion and low weight infants.

Fifty five non-pregnant women had bacterial vaginosis giving an occurrence rate of (63.21%) these women were positive for bacterial vaginosis using both the gram stain morphology, and Amsels clinical criteria, whereas 31 (64.58%) non-pregnant women had bacterial vaginosis using the Nugent score system (Table 1).

The incidence rate of (63.21%) among non-pregnant women is lower than the reported rate in a previous study were conducted in Iraq (86.9%) (Al-Fadul et al., 2007), but with higher rate reported in a foreign study in Egypt (33%) . Socio-demographic characteristics, sexual activity, reproductive health information, and behavioral or genital hygiene have been identified as causes of variation in the prevalence rates of bacterial vaginosis among non-pregnant women.

In our study, the results of the Amsel’s test shown that 39 (24.68%) subject of infected women gave positive results (15 were pregnant women and twenty four were non-pregnant women) since they matched three of four Amsel's clinical criteria. The most significant criteria for diagnosis of BV are as follows: presence of a thin homogenous discharge, a pH of vaginal fluid greater than 4.5 and a positive KOH 10% test. (Wiff test). The attendance of clue cells in the wet smear upon microscopic examination was reflected, clue cells are a critical component of Amsel’s criteria for BV diagnosis.

The use of Amsels clinical criteria to diagnose BV has the advantage of rapid diagnosis at the point of care but requires assessment of vaginal pH and, more importantly, performance of microscopy of vaginal fluid by a sensibly skilled consultant or laboratory personnel.
The results of vaginal discharge inspection is homogenous, thin, milky and adherent to the vaginal wall that exposed by clinicians or physician women help.

Definitely there is a diverse in the talent of clinicians to remark the vaginal discharge, abnormal discharge commonly associated with other vaginal infections rather than BV such as trichomoniasis and candidiasis, conversely presence of vaginal fluid may be enhanced by numerous factors as well as sexual intercourse, menstruation and douching.

In the present study vaginal pH was measured by using narrow range pH papers, by which the pH value is visually examined through the estimate of the test strip to a standard colour scale with fixed values, i.e. pH persistence rely on the examiner, Hence, there is no specific interpretation number for pH.

Wiff test were used in this study for detection of fishy odor associated with BV, and this test like other Amsel’s criteria, is also subjective and depends on the investigator variation in the ability to detect the characteristic amine odor, infection with T. vaginalis may give positive result for Wiff test, also false positive KOH test can occur in women whose have had sexual intercourse recently, finally, when Wiff test gives a positive result, the sample become without amine odor due to volatility of amines quickly and completely.

The presence of clue cells in stained smears was the most definite criterion among the other Amsels clinical criteria and they have not been detected in any subject without BV.

The overall occurrence rate of bacterial vaginosis in the present study as determined by Gram-stain Nugent scoring criteria was (30.37%), the reported rate of BV was well within the reported range, (8%–75%) in some studies being conducted in Iraq, the occurrence rate of bacterial vaginosis ranged from (37.5%) to (68.7%) by using Nugent's scores as adiagnostic tool (8), but it’s with higher rate reported by another study in India (24.3%).

Detection of **mec A**, **van A** and **van B** genes of *Staphylococcus aureus* Isolated from Patients in Al Muthanna Province Hospitals

Adnan H.Aubaid 1, Ziaoon H. Mahdi 2, Tabarek S. Abd-Alraoof 2, Noor M.Jabbar 2

1Prof. Dr., 2MSc. Student, Department of Medical Microbiology, College of Medicine, Al-Qadisiyah University, Diwaniyah, Iraq

Abstract

**Background:** Infections triggered by methicillin-resistant *Staphylococcus aureus* (MRSA) and onset Resistance to significant anxiety in healthcare environments worldwide from vancomycin-resistant *Staphylococcus aureus* (VRSA).

**Aim:** To discover *Staphylococcus aureus* resistant to methacillin and vancomycin by detecting (Mec A, Van A and Van B) genes by PCR technique.

**Methods:** A total of 250 samples from patients with different clinical cases whom admitted to Hospitals in Al Muthanna province during a period from January 2019 to July 2019. *Staphylococcus aureus* were isolated and identified by using cultural and biochemical tests. The extracted DNA of isolates were amplified by PCR to detect (mecA, vanA, and vanB) genes.

**Results:** The results showed that 72/ 250 of *Staphylococcus aureus* isolates contained mecA gene, indicating that all isolates are Methicillin resistant *S. aureus* (MRSA), only five isolates contained van A gene and only nine isolates contained van B gene.

**Conclusion:** Appropriate monitoring and control measures appear to be crucial to avoid the development and transmission of MRSA and VRSA strains in our nation.

**Key words:** Methicillin resistant Staphylococcus aureus(MRSA); vancomycin resistant Staphylococcus aureus(VRSA); mec A, vanA ,vanB genes.

Introduction

*Staphylococcus aureus* is a human pathogen as well as a commensal bacterium. *Staphylococcus aureus* colonizes about 30 percent of the human population. At the same time, it is a major cause of bacteremia and endocarditis (IE) and osteoarticular, skin and soft tissue, pleuropulmonary, and devicerelated infections. Horizontal transfer of antibiotic resistance genes and production of multiple virulence factors are thought to play a major role in the emergence and persistence of resistant *S. aureus* strains in the hospital environment. *Staphylococcus aureus* possesses several virulence factors that contribute to colonization and invasion of host tissue, evasion of the hosts’ immune systems, and nutrient acquisition. Methicillin resistant *S. aureus* (MRSA) outbreaks have become a serious problem in healthcare settings worldwide. The therapeutic options in MRSA infections are limited to glycopeptides, linezolid, tigecycline, and ceftaroline. Methicillin resistance is mediated by mecA and acquired by horizontal transfer of a mobile genetic element designated staphylococcal cassette chromosome mec (SCCMec). The gene mecA encodes penicillin-binding protein 2a (PBP2a), an enzyme responsible for crosslinking the peptidoglycans.
in the bacterial cell wall. PBP2a has a low affinity for β-lactams, resulting in resistance to this entire class of antibiotics. In addition to the mecA gene, S. aureus carries the mecA regulatory genes mecI and mecR1, which are divergently transcribed regulatory genes located immediately upstream from the mecA promoter. They are similar in molecular organization, structure, function, and mechanism of regulation to Staphylococcal β-lactamase regulatory elements, blaI and blaR1.

Five different types of SCC mec elements, types I to V, have been identified. The type I SCC mec contains the mecA gene as the only resistance element, while the type II and III elements contain, besides mecA, multiple determinants for resistance against non-β-lactam antibiotics. Accordingly, type II and III SCC mec elements are responsible for multidrug resistance in nosocomial MRSA isolates. Type IV SCC mec elements, like type I elements, contain no resistance genes other than mecA, and they are significantly smaller than the type II and III elements. This might serve as an evolutionary advantage, making it easier for these mobile genetic elements to spread across bacterial populations.

During the last decade, S. aureus isolates with decreased susceptibility to vancomycin (vancomycin intermediate S. aureus (VISA) and vancomycin resistant S. aureus (VRSA) have been reported in various parts of the world. These isolates are associated with increased mortality because of the limited therapeutic options remaining.

Vancomycin is a glycopeptide and is very popular and competent antimicrobial drug for treating MRSA infections but unfortunately resistance to vancomycin have also been reported since 1997. This vancomycin resistance is actually due to the presence of Van resistance genes which are acquired from enterococci and are encoded on R-plasmid or chromosome. There are total six genes responsible for vancomycin pyruvate into D-Lactate, ligase that synthesizes D-Alanyl–D-Lactate and a dipeptidase that hydrolyzes D-Alanyl–D-Alanine. The collective action of these three enzymes incorporate DAAlanyl–D-Lactate instead of D-Alanyl–D-Alanine into peptidoglycan which prevents the attachment of vancomycin. The vanA gene contributes higher resistance to vancomycin and teicoplanin both glycopeptides while vanB gene which is also an effective resistant gene encodes resistance to vancomycin only. The vanB gene resistance which includes vanA, vanB, vanC, vanD, vanE and vanG whereas vanA and vanB genes are the most important and prevalent genes.

The examples of resistant strains are vancomycin intermediate S. aureus (VISA), vancomycin resistant S. aureus (VRSA) and heterogeneous VISA (hVISA) strains. The mechanism of resistance for both vanA and vanB genes encompass three sets of enzymes harbored by glycopeptide-producing bacteria. The enzymes are dehydrogenase that reduces clusters (vanB1, vanB2, and vanB3) are generally carried by large elements (90-250 kb) which are transferable by conjugation from one chromosome to another and often contain the transposon Tn1547. Studies have also been conducted on detection of vanB gene in clinical isolates of Staphylococcus aureus strains but a few cases have been reported so far.

**Materials and Method**

A total of 250 samples from different clinical cases (wound, urine, high vaginal, throat, skin, ear, nose and pus swabs) were taken from patients of different ages and gender whom were admitted to Al Hussein Educational Hospital, Children’s Hospital and the women’s Educational, Rumaita General Hospital, El Khidhir General Hospital and Public Health Laboratory in Al Muthanna province. The samples were collected during a period from January 2019 to July 2019. only 72 samples were identified as Staphylococcus aureus by using cultural and biochemical testes.

Genomic DNA was extracted from bacterial isolates by using Genomic DNA Mini Bacteria Kit. The extracted DNA was checked by using Nanodrop (THERMO. USA) that measured DNA concentration (ng/µL) and checked the DNA purity by reading the absorbance at (260 /280 nm). Polymerase chain reaction master mix for each gene was prepared by using (Maxime PCR PreMix kit) and this master mix done according to company instructions. Polymerase chain reaction assay was performed for detection antibiotic resistance genes (mecA, vanA, and vanB gene) in Staphylococcus aureus. Table (1).

Then the Polymerase chain reaction products were visualized in an ethidium bromide-stained 1% agarose gel using a UV Transilluminator.

**Statistical Analysis**

All the results of the present study were analyzed statistically by Social Science Statistics and the Statistical Package For Social Sciences version 23 for Windows Software (Inc., Chicago, IL, USA). Chi-square test (X²) was used for the assessment of differences between the variables studied. The P values less than 0.05 were considered statistically significant and high significant respectively. (14,15).

**Results and Discussion**

**Bacterial Isolation & Identification**

The present study included 72 isolates from *Staphylococcus aureus* which isolated from Urine, High Vaginal Swab, Pus, Wound, Nose, Ear, Throat and Skin Swab. All isolates had the ability to grow on the mannitol salt agar which considered selective and differential media for genus *Staphylococcus* (16). The colonies appeared round, smooth, raised, mucoid and shiny. Consequently, the isolates belong to the genus Staphylococcus.

All isolates had the ability to ferment mannitol and form large golden colonies surrounded by wide yellow zones and turned the colour of the medium from pink to yellow as showed in figure (1).

![Figure 1: Mannitol salt agar medium(A) colonies of *Staphylococcus aureus* ferment mannitol and form large golden colonies surrounded by wide yellow zones (B).](image)

Microscopic examination was applied to the all 72 isolates after staining by Gram stain and the cells appeared as Gram-positive cocci arranged in grape-like irregular cluster. For further identification, the catalase test performed and all 72 isolates gave positive results. A coagulation test was performed to identify bacterial isolates at the species level, and all isolates showed the ability to produce coagulation. Isolates examined for colony characterization after sub culturing on 5% human blood agar and incubated for 24 hrs. at 37°C. The colonies appeared large, round, golden colony surrounded with a halo clear zone of hemolysis. It is often β-hemolysis type on blood agar.

**Screening for resistant genes by Polymerase chain reaction**
Polymerase chain reaction (PCR) was performed for 72 isolates *Staphylococcus aureus* to detect the presence of *mecA* genes (figure 2). The results showed that all 72 isolates contained *mecA* gene, indicating that all isolates are resistant to antibiotic Methicillin (MRSA).

![Figure 2](image)

Figure (2): Agarose gel electrophoresis image that showed PCR product analysis for methicillin antibiotic resistance *mecA* gene in *Staphylococcus aureus* isolates. M (Marker ladder 1500-100bp). Lane (1-10) some positive *mecA* gene *Staphylococcus aureus* isolates at 147bp product size.

Polymerase chain reaction (PCR) was performed for all 72 isolates of *Staphylococcus aureus* to detect the presence of *vanA* gene (figure 3). The results showed that only five isolates contained *vanA* gene, indicating that only five isolates are resistant to antibiotic vancomycin.

![Figure 3](image)

Figure (3): Agarose gel electrophoresis image that showed PCR product analysis for vancomycin antibiotic resistance *vanA* gene in *Staphylococcus aureus* isolates. M (Marker ladder 1500-100bp). Lane (1-4) only positive *vanA* gene *Staphylococcus aureus* isolates at 713bp product size.
Polymerase chain reaction (PCR) was performed for all (72) isolates *Staphylococcus aureus* to detect the presence of van B gene figure(4). The results showed that only nine isolates contained van B gene, this indicate that only nine isolates are resistant to antibiotic Vancomycin

![Agarose gel electrophoresis image](image)

**Figure (4):** Agarose gel electrophoresis image that showed PCR product analysis for vancomycin antibiotic resistance vanB gene in *Staphylococcus aureus* isolates. M (Marker ladder 1500-100bp). Lane (1-7) only positive vanB gene *Staphylococcus aureus* isolates at 430bp product size.

This genetic study included Polymerase chain reaction (PCR) assessment of mecA, vanA and vanB over expression and the results showed that mecA gene was over expressed in 72 (100 %) isolates, vanA gene was only expressed in 5 (6.9 %) and vanB was only expressed in 9 (12.5 %) isolates, as shown in Figure (5).

![Distribution of genes](image)

**Figure( 5):** Distribution of mecA, vanA and vanB genes in *Staphylococcus aureus* isolates.

The results showed that all isolates of *Staphylococcus aureus* are contain mecA gene, this means that all isolates were methicillin resistance *Staphylococcus aureus* (MRSA), our study approach with 17 in Iran, reported that all 46 MRSA isolates harbored mecA gene. However we disagree with 18 in Qadisiyah, who showed that (19%) of isolates were have mecA gene methicillin resistance. 19 in Bangladesh, was disagree with this study, they suggest that prevalence of mecA in the isolates was 72%.
The results showed that five isolates of *Staphylococcus aureus* are contain vanA gene, and this means only (6.9%) isolates were Vancomycin resistance (VRSA) and this approach came with 20 in Egypt , who reported 20.13% of the VRSA emerged contain vanA gene. Also Fasihi et al. 21 in Iran, agreed with the present study, they found that two MRSA isolates were identified as VRSA and both isolates were vanA gene positive.In addition we agree with 22 in Iran, they report that vanA gene was found in two VRSA isolates. However we disagree with the results of 23 in Egypt, they reported the occurrence of vanA gene-negative VRSA in Egypt. Other study done by 24 in Pakistan,who disagree with our results ,they found no vancomycin resistant strain in their setup.

Our results showed that nine isolates of *Staphylococcus aureus* are contain vanB gene, this mean only (12.5 %) isolates were Vancomycin resistance (VRSA) and approach came with 25 in sudan , reported that only three VRSA contained vanB. Also 26 in Bangladesh , found that VRSA strains were positive for the vanB gene but negative for the vanA gene. Although our result disagree with 22 in Iran, who showed that vanB gene was not detected in any VRSA isolates. El-Banna et al. 20 in Egypt, described that VanB gene were not found in any isolates.In conclusion, the *Staphylococcus aureus* isolates have mec A gene, which is characteristic of Methicillin-resistant *Staphylococcus aureus* (MRSA), and only five isolates on the van A gene is proof that they are resistant to vancomycin *S .aureus* (VRSA). Also, only nine isolates possessed the van B gene and are evidence of vancomycin resistance *S .aureus* (VRSA).

Client’s Attitude Regarding Antibiotics Misuse in Primary Health Care Centers

Alia’a Neamah Abo Alshon1, Naji Yaser Almiahi2
1M.Sc. Student, 2Assistant Professor in Family and Community Health Nursing, Babylon University, College of Nursing, Hilla City, Iraq

Abstract

Antibiotics are powerful drugs that fight some infections and can save lives when used properly. It either stops the bacteria from multiplying or destroying them.

Objectives: The study aims to: 1. Evaluate the client’s position regarding the abuse of antibiotics in primary health care centers. 2. Identification of relationships of abuse of antibiotics and social demographics (age, sex, place of residence, level of education, economic status, profession, marital status).

Methods: A descriptive study (quantitative design) was carried out using a cross-sectional design to study the assessment of the client’s position on the misuse of antibiotics in primary health care centers in Diwaniya from July 2018 to July 2019. A sample of 450 female clients and 221 women in primary health care centers in Diwaniyah (Al Jazira Health Center, Al Talea Health Center, Al Taqia Health Center, New Health Center, Al Furat Health Center) The questionnaire was created through a comprehensive review of available literature and related studies.

Results: The results of the study show that the clients do not agree with the negative attitude regarding the misuse of antibiotics. Therefore, the study reveals a relationship between the social demographic and the second part. The result shows that there is a very large relationship between all elements of the second part with age, Educational level, economic status, occupation, social status. While there is little correlation with gender and place of residence.

Keywords: Client’s Attitude, Antibiotics, Primary Health Care Centers

Introduction

Antibiotics are powerful medicines that fight certain infections and can save lives when used properly. They either stop bacteria from reproducing or destroy them. The first antibiotic was penicillin. There are several types of modern antibiotics, and they are usually only available with a prescription in most countries. Topical antibiotics are available in over-the-counter creams and ointments (OTC). There are different types of antibiotic, which work in one of two ways: A bactericidal antibiotic, such as penicillin, kills the bacteria. A bacteriostatic stops bacterium from multiplying.

Antibiotic resistance occurs when bacteria change in some way that reduces or eliminates the effectiveness of drugs, chemicals or other agents designed to cure or prevent the infection. Thus, the bacteria survive and continue to multiply causing more harm. Widespread use of antibiotics promotes the spread of antibiotic resistance (Lu, L., and Gao, M., 2018). Several studies conducted across the globe in low, middle- and high-income countries have revealed inappropriate antibiotic use, which correlates positively with antibiotic resistance development (Rather, I. A., 2017). Antibiotics are appearing to be used not only in excess but also inappropriately and this accounts for 20% to 50% of all antibiotics used (Porter, G., and Grills, N., 2015).

Literature Review

Study’s Imogene King’s goal attainment theory was used as conceptual framework. She defined nursing as “a process of action, reaction and interaction by which nurse and client share information about their perception in a nursing situation” and “a process of human interactions.
between nurse and client whereby each perceives the other and the situation, and through communication, they set goals, explore means, and agree on means to achieve goals (Alligood, M. R., 2017).

Antibiotics are drugs used for treating infections caused by bacteria. Also known as antimicrobial drugs, antibiotics have saved countless lives. Misuse and overuse of these drugs, however, have contributed to a phenomenon known as antibiotic resistance. This resistance develops when potentially harmful bacteria change in a way that reduces or eliminates the effectiveness of antibiotics (Cantavella J., and Martínez, A., 2011).

The six main causes of antibiotic resistance have been linked to: Over-prescription of antibiotics, Patients not finishing the entire antibiotic course, overuse of antibiotics, Poor infection control in health care settings, Poor hygiene and sanitation Absence of new antibiotics being discovered. (Mendelson, M., and Matsoso, M. P., 2015)

### Methodology

#### Design of the Study:

A descriptive study was carried out by using a cross-sectional design to study Client’s Attitude Regarding Antibiotics Misuse in AL-Diwaniya City’s Primary Health Care Centers from July 2018 up to July 2019.

#### Setting of the Study:

The study was conducted primary health care centers in AL-Diwaniya City.

AL- Diwaniya city is one of the rich cities in health care facilities; it contains many primary health care centers (AL- Jazaer Health Center, Al - Tali’ah Health Center, AL-Taqiya Health Center, AL- Jadera Health Center, and Al Furat Health Center).

#### Reliability of the Study Instrument:

To identify the reliability of the study instrument, Alpha Correlation Coefficient (R) was applied for the purpose of measuring the internal consistency of the study instrument by applying of Statistical Package for Social Science Program (IBM SPSS) version 20.0.

#### Table (1): Reliability of pilot study

<table>
<thead>
<tr>
<th>Reliability</th>
<th>Client’s Attitude Regarding Antibiotic Misuse</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alpha Correlation (r)</td>
<td>0.80</td>
</tr>
</tbody>
</table>

#### 3.10. Data Collection

The researcher obtained data from (450) samples of clients within five primary health care centers (AL-Jazaer Health Center, Al - Tali’ah Health Center, AL-Taqiya Health Center, AL- Jadera Health Center, Al Furat Health Center) by using a constructive questionnaire format that was answered through self-report.

### Results

### Discussion

The result of this study shows the majority (39.6%) of the present study are in the last week taking antibiotics, ( 71.6%) of the present study are get the antibiotics prescription from a doctor, (46.0%) of the present study are get the antibiotics prescription from a nurse, (72.9%) of the present study are received advice from a doctor or nurse on how to take antibiotics for 7 days, (70.0%) of the present study are get the antibiotics from Pharmacy, (57.3) of the present study are stop taking antibiotics when you feel better.

These finding agree with the result of 2 who reported that (62.1 %) of the respondents took medication by consulting a physician, and disagree with the same previous study who shown that (17.3%) of the respondents get antibiotics and advice from pharmacist, followed by the finding disagree with the obvious study where 8% of them seeking the advice of family/friend member regarding the source of antibiotics.

The finding is supported by the result of Nawafleh, H., et al., (2016) who reported in their study that the majority of participants (33.7%) were getting information from physician about using the antibiotics, and disagree with the same previous study who stated that (18.2%) of the respondents get antibiotics and advice from pharmacist, while (15.2%) of them get from the Previous experience. But the finding agreed with previous study who shown that (10.4%) of participants getting information from friends.
The result of this study shown that the most of client’s answers are yes in all items of this part, where the item number (4) (level of education can contribute to the misuse of antibiotics especially, patients in our community), this item formed the high percentage (54.2) than the other items in this part. While the items number (9,15) (Patients not finishing the entire antibiotic course— is a major cause of antibiotic resistance, Primary reason for people to indulge in self-medication is the expensive healthcare system) formed the low percentage (50.4) than the other items in this part.

**Conclusion**

Based on the study results, the researcher concludes the following:

- Most of clients were elementary school graduate according to level of education, Regarding place of residence, most of clients (54.7%) were urban
- Most of the clients who misused the antibiotics received it from the pharmacy with an old medical recipe.
- Doctors and pharmacists don’t devote enough time to explain the treatment and side effects.
- The absence of counseling, educational courses and posters by health institutions is one of the most important factors for the misuse of antibiotics
- Client’s negative attitude toward health institutions and around drugs is the most common factor for misuse of antibiotics

Hemostasis in sickle cell disease

Nawal Khalil Ibrahim¹, Awatif Radhi ², Nehaya Mnahi Al-Aubody³
¹Assistant. Prof., ²Lecturer, Physiology Department / College of Medicine/ University of Basrah, Iraq,
³Assistant. Prof., Physiology department / Al- Zhraa medical college / University of Basrah, Iraq

Abstract
Sickle cell disease results in a significant morbidity and mortality related to intra-vascular thrombosis. This study is an attempt to improve our understanding the role of hypercoagulability in the pathogenesis of sickle cell disease. A case group of 20 asymptomatic sickle cell adult patients in a steady-state were compared with a control group of 20 normal adult people, both groups aged (18-50) year and from both sex, to evaluate the process of hemostasis. An investigation has been done for both groups including estimation of hemoglobin, platelets count, bleeding time and clotting time. There is a highly significant increase in the number of platelets with (P<0.01) together with a highly significant decrease in bleeding time with (P<0.01) for a case group in comparison with a control group. There is no significant difference of clotting time between both groups. That may suggest that the platelets aggregation formation activity is significantly increase in patients with sickle cell disease in a steady-state.

Keyword: Sickle cell disease, Platelets, Bleeding time

Introduction
Sickle cell disease (SCD) is an inherited lifelong disorder of genetic abnormality¹. Characterized by sickle (crescent)-shaped red blood cells and chronic anemia caused by excessive destruction of the abnormal red blood cells and multi-organ morbidity.² There is increasing evidence that SCD are usually associated with a hypercaogulable state and the risk of thrombotic complications appears to be higher in SCD patient.³

Hemostasis is a process of prevention the blood loss after vascular injury achieved by formation of clot,⁴ which is a mass formed from platelets and various blood proteins(clotting factors) within a blood vessels to stop bleeding.⁵

Platelets are tiny cell fragments that circulate in the blood stream and they are the first cells to react to blood vessels injury and seal off the wound, preventing more blood from escaping⁶.

The present study was designed to evaluate the platelets plug formation activity by measuring the bleeding time (BT) which is a standard test and basic assessment of how the blood platelets work to form a plug and stop bleeding, normal value is (2-7mints) for unisex and for all age groups.⁷ Also we measured the clotting time(CT),which is the time required for a sample of blood to coagulate in vitro, the normal value is (8-15mints) for unisex and for all age group.⁸ By this test we can evaluate the ability of different clotting factors work to form a clot normally.

Materials and Method
Case group of a total 20 steady-state SCD patients from both sex , aged between (18-50) years old, recruited from Al-Sadder teaching hospital outpatient medical clinic, documented as homozygous for HbS using hemoglobin electrophoresis. Compared with 20 healthy control group from both sex and have the same age. Investigations has been done for both groups including hemoglobin concentration, platelet count, bleeding time and clotting time.

Bleeding time procedure
Pricking a sterilized finger about 4mm depth, at the same time press the stop watch, after 30 sec. we remove the blood ooze from the finger by a filter paper every 30 sec. until the miner bleeding disappear⁹.

Bleeding time is consider as the number of blood spots + 2

DOI Number: 10.37506/ijfmt.v14i2.3039
Clotting time procedure

Pricking a sterilized finger about 4mm depth, filling a capillary tube with blood, at the same time press the stop watch and start to break down the capillary tube every 30 sec. looking for the formation of fibrin thread⁹.

Results and Discussion

The study was in a completely randomized method and the results performed with SPSS statistical software version 20 ANOVA analysis of variation.

Probability value of (P<0.05) considered to be statistically significant.

Table 1: Visualize the mean ± SD of hemoglobin concentration and platelets count

<td>3.38 ± 1.50</td>
</tr>
</tbody>
</table>

*Statistically highly significant decrease of bleeding time (P<0.01)

no significant differences for clotting time.

Sickle cell disease refers to a group of genetic disorders defined by the presence of sickle hemoglobin(HbS) that passed from parents to the children.¹⁰ This study is an attempt to improve our understanding the role of hypercoagulability in the pathogenesis of SCD.

The raised platelets count has previously been reported.¹¹ Platelets stimulation and chronic activation of coagulation is commonly observed in patient with SCD at steady-state compared to healthy control subjects with normal hemoglobin.¹¹ This is evidenced by increased plasma levels of in vivo markers of fibrin generation and thrombin, including fibrinopeptide A,D -dimers and plasmin-antiplasmin complex.¹² One of the most important factor that contribute to platelets activation in SCD, is the abundance of free hemoglobin in the circulation, which is responsible for the alteration of platelets functions by limiting the bioavailability of nitic oxide(NO).¹³ It has been reported that NO play very important role to inhibit platelets aggregations and adhesion to subendothelium matrices/endothelium through the cyclic guanosine monophosphate(GMP) pathway.¹⁴ Furthermore, circulating HbS can potentiate the platelets activation and promote the platelet-thromus formation on subendothelium matrix, also it can bound to glucoprotein (GPIba) and activated the intracellular proteins of Lyn_ERK pathway in the platelets.¹⁵ Increased plasma level of markers of platelets in SCD patients are capable of stimulating endothelial cell activation as demonstrated by the induction of the increased expression of endothelial inflammatory and adhesive proteins.¹⁶ Furthermore, hyper activity of
platelets also found to be more vigorous in SCD painful crises that may suggest a possible therapeutic role of drugs to inhibit the platelets functions.17

Assessment of Primary Schools Teachers’ Knowledge and Attitudes toward Communicable Diseases Prevention and Control at Primary Schools

Mohammed Abbas Hussein1, Muna Abdul Wahab Khalil2

1 M.Sc. Student, in family and community health nursing, College of Nursing, University of Babylon, Hilla City, Iraq. 2 Prof. Dr. in Community Health Nursing Department, College of Nursing, University of Babylon, Hilla City, Iraq

Abstract

Background: Communicable diseases are illnesses that transmitted from a person, animal, or inanimate source to another person either directly or indirectly. Illnesses caused by communicable diseases are common among school students because of overcrowding.

Objectives: The purpose of the study is to assess the knowledge and attitudes of primary school teachers toward communicable diseases prevention and control and to find out the relationship between the primary school teachers’ knowledge and attitudes with their personal and socio-demographic characteristics.

Methodology: A descriptive cross-sectional study design using a simple random sample of (N=400) teachers working in primary schools through the period from October 2018 to June 2019. A questionnaire was created for this purpose. Its composed of (4) parts. The overall items included in the questionnaire are (55) items. A pilot study conducted to determine the reliability of the questionnaire, while the validity is obtained by distribution of the questionnaire through a panel of (15) experts. Statistical package for social sciences (SPSS) version (25) used for the analysis of the data. Appropriate statistical tests were used accordingly.

Statistical analysis used: The data are coded and tested by the application (SPSS) through the descriptive and inferential analysis.

Results: The study findings indicate that most of teachers (65.8%) had good knowledge toward communicable diseases prevention and control, also the highest percentage of teachers had agreed attitudes toward communicable diseases.

Conclusions and recommendations: All teachers working with children may be at risk for getting communicable diseases, especially those with less years of experiences. Therefore, it is necessary to increase their awareness toward communicable diseases prevention and control through collaboration with ministry of health and environment and through education programs about communicable diseases and ways of prevention.

Key words: assessment, teacher, knowledge, attitude, communicable diseases, prevention, control, primary school.

Introduction

A communicable disease is a disease caused by infection (invasion of the body) with specific germs such as viruses, bacteria, funguses, and parasites 1. Communicable diseases are still the major killers in the world, with tuberculosis, malaria and HIV taking a huge annual toll (approximately 4–5 million deaths). They are found particularly in conditions that encourage transmission, such as overcrowding or poor hygiene, so are more common in developing countries 2. Transmission of a communicable disease may occur through one or more of diverse pathways including physical contact with infected individuals.
These agents may be transmitted through liquids, foods, body fluids, contaminated objects, airborne inhalation. Illnesses caused by communicable diseases are common among school children and other childcare settings. Socioeconomic factors can increase the risk of outbreaks among school children in these settings. Health education can improve school population knowledge on communicable diseases and promote the development of appropriate behaviors toward communicable diseases. Health education should be provided for school population to validate positive health-promoting beliefs, intentions, and behaviors. Teachers are in a very powerful position. Their behavior, as a model and their opinions as to what constitutes good health, impact very directly on the concepts of health adopted by their school students. They are concerned in promoting some aspects of health, such as improving the self-esteem of their learners, teaching acceptable ways of relating to others and disease prevention.

School children are the greatest investment of any community and the main basis for its development. They are the biggest promise for the future. Communicable disease can be a major cause of illness among school children and can affect a child’s schooling by causing absenteeism.

Lack of knowledge about prevention and control of diseases lead to high risk of disease spreading causes increasing mortality and morbidity among school children.

### Methodology

The study aims to assess the knowledge and attitudes of primary school teachers regarding communicable diseases prevention and control.

**Study Design:** A descriptive cross-sectional study that conducted during the period of 30/7/2018 to 29/7/2019.

**Setting of the Study:** The study was conducted at the primary schools of Al-Hilla city which include (Hilla city center, Abu-Ghariq district and AL-Kefal district)

**Study Sample:** All primary school teachers (n=400) were included from (27) governmental primary schools who works at Al-Hilla city primary schools.

**Study instrument:** The information of data was collected through a questionnaire used to assess the knowledge and attitudes of primary school teachers toward communicable diseases prevention and control.

**Data Analysis:** The data were coded and tested by the “statistical package of the social sciences (SPSS) (Version 25)”. A descriptive analysis includes frequencies and percentage; inferential data analysis included Chi square test.

" Chi-square observer, Chi-square critical, Df= Degree of freedom, P-value= Probability value, S= significant, NS= non significant, HS= high significant"

This table shows there was insignificantly association between teachers attitudes toward prevention and control of communicable diseases and their socio-demographic and personal characteristics at p-value >0.05.

Discussion

Socio-demographic and Personal Characteristics of Primary School Teachers:

The results in the presented study indicated that (40%) of the teachers were within the second age group (33-43) years old and (32.25%) of them were between (44-54) years old, this results agreed with a study that was carried out in Iraq, the results of this study showed that two thirds of the sample were within (36-44) years old. Regarding gender, results indicated that (80.75%) of the sample under study were females and (19.25%) were males. The findings were in accordance with study which was reported that (78%) of their studied sample were female (Table 1). Also, the results of the present study revealed that the highest percentage of teachers (90%) were living in urban areas. The result disagreed with study conducted who revealed that half of the participants were living in urban areas. Furthermore, the results of the present study found that (24%) of primary school teachers were within (16-20) years of experience. This result agreed with a study revealed that (35.8%) of their studied teachers had (16-more) years of experiences. Concerning teachers education, the study revealed that more than half of them (55.3%) were accounted to be institute graduates. The result agreed with a study which revealed that more than half of their participants were institute graduates. This finding was not unexpected because in Iraq, colleges were not available in all Iraqi provinces prepare primary school teachers.

Relationship Between Teachers’ Knowledge and Their Socio-demographic and Personal Characteristics

(Table 2) indicated that there was no significant relationship between teachers’ general knowledge and
their age group in the study in which both young and old teachers had the same knowledge about communicable diseases. A study emphasized that there was non-significant relationship between teachers’ knowledge and their age groups. The study indicated that there is non-significant relationship between teachers’ knowledge and their gender characteristics in the study. A study found in her study there was non-significant relationship between variables in terms of the gender as they don’t contribute of developing teachers’ knowledge.

With concern to the data study of the insignificant relationship between teachers’ general knowledge and their marital status. The researcher found in that there was non-significant relationship in knowledge (Table 2). This result was inconsistent with a study found that there was non-significant relationship between teachers’ knowledge and marital status.

The study showed that there is insignificant relationship between teachers’ general knowledge and residency. Another study stated in that there was a huge connection between educators’ information and their living area territory. There is no significant relationship between teachers’ general knowledge and their economic status. The result of the study may be due sharing the same knowledge from the health coordinators.

Concerning the relationship between teachers’ general knowledge and their duration of services. The current study showed that there is insignificant relationship. Another study mentioned that if the teacher has five years of experience and more, they will have high level of knowledge about CDs.

Regarding the relationship between teachers’ general knowledge and their educational level. The current study showed that there is insignificant relationship.

Relationship between Teachers’ Attitudes and Their Socio-demographic and Personal Characteristics

The study showed that there is no significant relationship between teachers’ attitudes and their age groups, also study indicated that there is non-significant relationship between teachers’ attitudes and their gender characteristics. With concern to the study data of the significant relationship between teachers’ attitudes and their marital status. As well as study showed that there is insignificant relationship between teachers’ attitudes and residency. There is no significant relationship between teachers’ attitudes and their economic status. Concerning the insignificant relationship between teachers’ attitudes and their duration of services as shown in (Table 3). The study is inconsistent with a study which revealed that activity of teachers try to do it in their classes, the major of them were about personal hygiene, instructions to prevent buying from seller rover and there are less focusing on sexual transmission diseases.

Conclusions

The knowledge of primary school teachers about communicable diseases prevention and control in terms of information were moderately knowledgeable, while teachers knowledge about general information on communicable diseases prevention and control were having good knowledge. Attitudes of primary school teachers upon communicable diseases prevention and control were agreed attitudes.

Developing the Rear Circular Motion According To Auxiliary Device In The Ground Gymnastics

Wahab Abdul Wahhab Abdul Wahid1, Imad Kadem Yasser2

1M.Sc. Student, Directorate of Education al mathnaa, 2Assist. Prof. Physical Education and Sports Sciences / Thi- Qar University,

Abstract
Tests are among the priorities of science that reach us to scientific facts, including the processes of manufacturing devices and tools that are of great importance in the learning process, and in the sport of gymnastics, which has a particular character of the age group associated with the element of fear and anxiety as well as through the difficulty of the skills to be learned. Tools are among the most important factors that contribute to the speed of mastering learning skill while raising the side of anxiety and fear.

The researcher has reached through the conclusions that the designed device is important in the development of the skill to be learned

Keywords: development, circular motion of your gymnastics, by a factory device.

Introduction

The learning process is important in preparing the players from the early stages of childhood and creating the right conditions for them to acquire mental, physical and psychological experiences through different educational and training curricula, as the educational curricula contribute to some extent in the process of organizing and arranging exercises according to the scientific bases studied and the standards followed for Raise the level of achievement in various sports, including gymnastics.

Gymnastic sport is one of the basic sports of the Olympic Games and the tracker of this sport is noted the development of skills varied in terms of difficulty and technical performance on various devices, especially when they master the correct technical foundations through educational and training curricula, this sport is a long self in training and need to start early ages to build A fundamental basis for the learning process because it is a sport with a direct impact that affects the development of their mental, physical, skill and physiological abilities.

The interest of the developed countries in this kind of sport (gymnastics) has two considerations: because it builds the human being properly and soundly, and the second because it has an ample share of decorations equal to twice the medals in group games and other individual games, especially in the Olympic and regional tournaments as a result of the inclusion of multiple devices, and the amount of decorations The country has won 28 gold, silver and bronze medals.

As gymnastics in the world is developing rapidly, we need to keep up This development so as to keep pace with international in this area.

This will only be achieved through scientific research and the use of innovative scientific methods Learning, training and selecting the appropriate methods for the type of performance required in order to raise the level of the player Physically and physically.

Search problem:

Through the follow-up of the researcher for a number of competitions at the level of the country, especially the races of the age group under ten years and through personal interviews of a number of country coaches regarding the age group under (10) years found that it depends on personal experience in the process of learning motor skills in addition to that some trainers Engage the novice player in competitions before the process of mastering learning skills in this game, where the process of mastering skills in the game of gymnastics significantly contribute to determine the level of technical performance of the player and in the case of lack of skill will affect the outcome of the player and
the final team Lack of educational curricula based on the scientific basis to the lack of development in the level as well as to the lack of the player’s ability to develop these skills in the future to difficulty with higher skills.

For this purpose the researcher wanted this study, which investigates the problems of the group of reasons that address the real problem and put it in the hands of workers and trainers to work in the light of the results derived from the research.

Research Objectives

1 - Design auxiliary device for the development of circular motion in ground gymnastics.

2 - Identify the performance time of the circular movement of the members of the research sample.

3 - Recognize the differences in the research sample.

Research hypotheses:

1 - The variation of the period of time to perform circular motion among the members of the research sample.

2 - There are statistically significant differences between the members of the research sample

Research Methodology and Field Procedures:

Methodology and Research Sample

The experimental method was used in a one-group approach to suit the nature of the research problem to be solved. “The experimental method is one of the most efficient means of obtaining reliable knowledge that can be used to solve problems.” Recently to the Specialist Center in Muthanna. The research community consisted of (16) players. The device was applied to the community as a sample of the research experience and the percentage of the sample was (100%). Components of the device: The device consists of a set of parts that serve the performance of this skill.

* - Aluminum rail (2) length of 5 meters
* - Cylinder to move the arm in a circular
* - Iron wheels number (4)
* - Aluminum box length (30 cm and width of 5 cm).
* - Pods
* - Bluetooth device.

* - Circular arm of iron in the form of ()
* - Remote control panel
* - Battery (12) volts.

Machine specifications:

The device works by remote control through synchronization with the movement of the player and the amount of differences in terms of speed and the number of steps in the performance of this skill so that the performance of the jump stage is synchronized with the moment of jumping and controlled by the coach through direct viewing where the work of the inner cylinder in a circular tied to the arm that rotates with the movement of the cylinder and whose task is to lift the center of gravity for the player through a well-installed and tightly incubator, which is a wave towards the most important area to lift the center of gravity is represented by the hip at the end of the thighs from the bottom. This process is carried out through the fixed position of the performance and when Repeat this movement The device is also fixed in the same place of the player and when the repetition of continuous movement of the device works the same mechanism, but the coach is moving the device that works through Bluetooth in the horizontal direction that helps him in the movement is the presence of wheels that run over the aluminum rail and these duplicates The horizontal of the movement is a distance of (5) m length of two rails of aluminum each end at the end of the key to shorten the length of this rail to be easy to carry and transport and is used in more than one place, as shown in the following figure.
Application of the machine:

The goal is to teach players the skill required to learn the movements of the carpet movements of the circular jump in the game of gymnastics, which are basic skills that will be the basis for many other skills.

The researcher started the application on Sunday 6/3/2020 until 6/5/2020 and was carried out after giving the two modules to the research sample and then conduct the pre-tests where for (8) (Consecutive weeks) (3) units of instruction per week, including (24) units and the time of teaching unit (66) minutes in the main section as a special part to learn motor skills were taken into account the graduation in the size of the training where the time of exercise of the players (20) minutes of the device In the first and second week rest periods were 1 ring Ge included an side of my 2 minutes for each device either in the third and fourth week was lifted volume training by reducing the rest periods to half of 30 seconds with the survival of the theoretical side 2 minutes either on the fifth, sixth, seventh and eighth week.

Skill Time Measurement

Video was conducted to measure the skill time of the research sample and on the hall of the Muthanna Sports Club where each player performs two attempts for the skill of the hands jump back and small rear circle.

2.6 Statistical means:

\[ z = \frac{M - \bar{X}}{\frac{SD}{\sqrt{N}}} \]

3-4. View, analyze and discuss the search results:

Table (3): It shows the mean, standard deviation, calculated (T) values, spreadsheet, and type of statistical significance of the results of the pre and post circular motion of the sample

</table>
The reason for the development in the application is due to the auxiliary device in learning this movement as well as the process of transfer of the impact of learning between similar skills, whether in the exciting or in response to a skill, which has helped to learn the new skill. Learning between the parts of the skill in terms of perception and physical attributes and the use of repetitive attempts has a positive impact in increasing learning and development, since repetition forms of mathematical movements is to stabilize the field and dynamics of its progress, and in general be a clear and meaningful direction and to calculate the ability and leadership His hips.

The researcher believes that the application on the device has in addition to the motor performance in addition to the displacement of the factor of fear and anxiety and psychological “This occurs the beginnings of learning in early childhood because the child wants to learn, and this makes learning at this age stage feasible, and the researcher also believes that a good relationship Between the components of the load in terms of experimental size and rest periods have effectively contributed to the process of organizing a timely time so that the players move from one repetition to another in an organizational manner so that players have an understanding of the time of each exercise in learning a skill.

The researcher also states that the gradient in the difficulty of performance and by making the skill run smoothly by the auxiliary device to perform this skill on a straight line and for the purpose of expanding the base of perception of the player as the extension of the joints of the body with one line and make the center of gravity of the body perpendicular to the base makes the skill more consistent And aesthetic in performance, “the coordination and organization between tensile and relaxation in muscle contractions gives the flow of movement”.

Frafel says that “the basis of acceptance of information is subjective and that its integration serves only subjective information and when expanded, is sufficient to arrange the objective sense of motor measurement in other words, the greater the completion of objective information to the athlete and obtained whenever he was able to integrate the technique early”.

Conclusions and Recommendations

Conclusions:

1. The auxiliary apparatus has achieved its purposes and objectives for which it was established by teaching the performance of the skill to be learned properly.

2. The device contributed to the process of stimulation and response led to the transfer of learning between parts of the skill.

3. The use of instructional steps in the skill has a positive effect in improving Level of skill learning and technical performance.

Recommendations:

1. Attention to the stages of age below (10) years as it is essential in the construction of most different sports.

2. The need to use the gradient in teaching skills from easy to difficult of similar skills in the motivator and response for the purpose of benefiting from the transfer of learning from one skill to another skill.

3. Adoption of the device as an aid in educational institutions and training centers for the category of buds since the curriculum has achieved good results in teaching basic skills.

4. Conduct research and studies similar to the basic skills on the rest of the organs in gymnastics Professional.

Conclusion

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Physical Education and Sports Sciences and all experiments were carried out in accordance with approved guidelines.

The Effect of Different Cement Space on the Fracture Strength of Two Different Types Zirconium CAD/CAM Crowns

Dalia Abdalreda Sadiq¹, Lateef Essa Alwan², Abdul Kareem J. Al-Azzawi³
¹M.Sc. Student, Dent. Tech., Collage of Health and Medical Technology, Baghdad, Iraq, ²Prof. Dr., Middle Technical University, Institute of Medical Technology, Baghdad, Iraq, ³Prof. Dr., Al-Rasheed Collage / Dentistry Department, Baghdad, Iraq

Abstract

Objectives: Evaluate and compare the effect of three different cement space (50um, 70um and 90um) on the fracture strength of (vita zirconia crowns and Ips e-max Zir/cad zirconia crowns).

Materials and Methods: An ideal prepared plastic dentoform model of a left maxillary first molar with deep chamfer finish line design was used as a pattern for fabrication master metal die. The model was scanned and the master metal die was milled by CAD/CAM system. Sixty crowns made from two different types of zirconium were fabricated on a metal die and were divided into two major groups (A and B)( 30 crowns for each group) according to the two different types of zirconium being used: Group A: fabricated with vita zirconium crowns ; Group B: fabricated with IPS e-max Zir/CAD crowns. Each group further subdivided into three subgroups (10 crowns constructed with 50 um cement space crowns ), ( 10 crowns constructed with 70 um cement space crowns ) and (10 crowns constructed with 90um cement space crowns).

Results: The results of this study presented that the highest mean value of fracture strength is recorded via Group A1 (3.767± 0.242), followed by GroupA2 (3.266 ± 0.116), Group A3 (2.883 ± 0.085), Group B1 (2.505± 0.155), Group B2 (2 ± 0.141) and Group B3(1.508 ± 0.151) respectively. The data were statistically analyzed using one-way ANOVA and HSD tests which revealed highly significant differences (p<0.01) among groups. independent sample t-test result revealed a statistically highly significant difference between subgroups. Conclusion: Vita zirconium crowns is more resistance to fracture than IPS e-max Zir/CAD. (50um cement space) have higher fracture strength than the others.

Keywords: Cement space, Zirconia, CAD/CAM, Fracture strength.

Introduction

Cement space can be define is the vertical distance between the surface of the die and the inner surface of the restoration ¹. Advantage of using the die spacers permit increased space for the cement between the internal surface of the casting and the tooth surface, decreasing stress areas formed during cementation and thus resulting in better fit to the final restoration ². With the CAD/CAM system digital die spacer is very consistent in thickness regardless to the shape of the die (3, 4).

The overview of the technology of new CAD/CAM milling and new zirconia materials are ready possibilities for manufacture the monolithic zirconia crown ⁵, ⁶. The monolithic crown zirconia is the restoration of a full-contour crown zirconia designed without the addition of porcelain, which was industrialized to overcome the main complications problems of zirconia-based restoration is the veneer cracks ⁷, ⁸.

Zirconia has attracted maximum attention because it has the highest flexural strength and fracture toughness of all the existing ceramics. Natural phase transformation occurs internally in zirconia when an external stress is applied, which prevents crack propagation and tightens the crack tip, resulting in increase in the flexural strength and fracture toughness ¹⁰, ¹¹.

The Fracture strength of all-ceramic restorations is strongly dependent on the support materials. In addition,
cement type, cement thickness and preparation design can be influential factors. The film thickness of the cement affects directly the long-term clinical success. While determining film thickness of the cement, rate, mixing technique and heat are as much important as the clinician’s experience of the material. As a result, in real clinical situations, the actual cement thickness depends on the material used and the experience of the clinician.

**Materials and Method**

**Standardize die**

An ideal prepared plastic maxillary left first molar tooth (Nissin Dental Products, Kyoto Japan) with deep chamfer finishing line of (2 mm) occlusal reduction and axial reduction of (1.5 mm) was used to construction the master metal die.

Several CAD/CAM studies have used master metal dies (14,15,16). Then a metal die was fabricated by using CAD / CAM system to simulate the shape of ideal prepared plastic tooth to receive the zirconium crowns (17, 18).

The plastic prepared die was scanned using white light scanner (DOF, full HD, 2 M pixel , Korea) with stable scan stage method, then the digital model of the die sent to the milling machine (VHF S1, K5 impression machine, Germany) which was loaded with cobalt chromium disc 14mm ( Interdent, Travagliato (BS) Italy) to start dry milling process.

The metal base was flat and cubic in shape with length , width of (20 mm) and height of about (15mm) fabricated by using Computer Numerically controlled machine (CNC) figure (1).

**Sampling grouping**

Sixty crowns were introduced in this study which is divided into two groups according to the two types of zirconium and three different cement space as follows:

**Group A:** 30 crowns were constructed from (VITA Zahnfabrik Zirconia crowns).

**Group B:** 30 crowns were constructed from (IPS e-max Zir CAD Zirconia crowns).

Each group then subdivided into three subgroups of (10 crowns constructed with 50 um cement space crowns ), ( 10 crowns constructed with 70 um cement space crowns ) and (10 crowns constructed with 90um cement space crowns).

**Fabrication of crowns**

All manufacturing procedures containing model scanning, milling and sintering protocols. All procedures have been carried out in accordance with the manufacturer’s instructions for the zirconia and the CAD-CAM system used.

Exocad software (GmbH, Germany) were used to design the crown , the same design is programmed for both types of zirconium CAD/CAM crowns.

In this study three different cement gap thickness of 50 um (0.05mm), 70 um (0.07mm) and 90 um (0.09 mm), and an adhesive space of 1000um (1mm) from the finish line is used, Proximal contact :0 , Minimum occlusal thickness: 2000 um (2mm), Minimum circular thickness: 1500um (1.5mm), and 1000um (1mm) Margin thickness.
fracture strength testing procedure

Single load to failure test was used in the current study to measure the fracture strength of the crowns fabricated with the (vita zirconia crowns and Ips e-max Zir/cad crowns).

A (1 mm) thick piece of rubber was placed between the crown and the occluding rod to prevent peak load pressure on the crown surface and distribute the applied force over a larger area, i.e., homogenous stress distribution.\(^{(20,\ 21)}\) figure (2).

All samples were loaded until fracture and the maximum breaking load of each sample was recorded automatically in kilo Newton (KN) through a computer linked to the loading machine.

The mode of the fracture in this study divided into three types as follow:

Type one: Partial fracture of crowns from margin towards occlusal surface

Type two: Complete fracture of crowns through midline (half of crown displaced or lost (catastrophic failure))

Type three: Chipping at the finishing line.

Statistical Analyses

The data was statistically analyzed using SPSS (statistical package for social science) version 24. One-way ANOVA and Tukey HSD tests for comparing fracture strength among different cement spaces in each group. Independent samples t-test to test any statistically significant difference in the fracture strength between the two groups for each cement space.

Discussion

The Computer aided design/ Computer aided manufacturing system are used in the manipulation of ceramics, such as zirconia or glass ceramics, as well as, this technology have the ability to produce an accurate fit and individual design, simple handling characteristics, and time consuming production processes; in addition to that, the CAD/CAM system demonstrated a variety from the options during scanning, design and during production of restoration. This system also permit the thickness of restoration and simulated die spacer (cement space) to be specified to the wanted thickness 11.

Zirconia fractures do not appear to be a common problem, although ceramics counting zirconia, this referred to as fragile materials 12, if monolithic zirconia crowns look to have adequate fracture resistance, the importance of cement should not be underestimated 5. It has been proven that the supporting materials, like cement and abutment material, will affect the fracture strength of all ceramic crowns 10.

Methodology

Using the Master die

In the current study, an ideal prepared plastic tooth #28 is used for the construction of a master metal die, 18.

The master die of Deep chamfer finishing line was selected because it improved the biomechanical performance of posterior single zirconia crown, which might be attributed to greater thickness and more rounded internal angles between the axial wall and gingival seat 16.

Then a metal die was fabricated by using CAD/ CAM to simulate the shape of an ideal prepared plastic tooth to receive the two types of zirconium crowns 17.
The advantages of using metal die include standardized preparation, better resistance to scratching, destruction or wear under repeated crown seating during fracture strength measuring procedure \( ^{14} \).

**Construction of metal base for the metal die.**

In the present study, the base used for the metal die is made from (cobalt chromium alloy) to allow proper position of the metal die during the test to prevent the fracture of the base \( ^{14} \).

The metal base was fabricated by using Computer Numerically controlled machine (CNC) \( ^{19} \).

**Using the single load.**

The single load to failure test was used to test the fracture strength of the crowns, because this test provides helpful data for comparing between the tested materials without the contribution of confounding variables brought from fatigue testing \( ^{21} \).

**Results**

In this study, Vita zirconium crowns fabricated with (50 um) cement space (Group A₁) showed a mean fracture strength of \( (3.767 \pm 0.242 \text{ KN}) \), while Vita zirconium crowns fabricated with (70 um) cement space (Group A₂) showed a mean fracture strength of \( (3.266 \pm 0.116 \text{ KN}) \) and Vita zirconium crowns fabricated with (90 um) cement space (Group A₃) showed a mean fracture strength of \( (2.883 \pm 0.085 \text{ KN}) \). IPS e-max Zir/CAD crowns fabricated with (50 um) cement space (Group B₁) showed a mean fracture strength of \( (2.505 \pm 0.155 \text{ KN}) \), while IPS e-max Zir/CAD crowns fabricated with (70 um) cement space (Group B₂) showed a mean fracture strength of \( (2.0 \pm 0.141 \text{ KN}) \) and IPS e-max Zir/CAD crowns fabricated with (90 um) cement space (Group B₃) showed a mean fracture strength of \( (1.508 \pm 0.151 \text{ KN}) \).

**Effect of cement space on the fracture strength.**

In this study, the result revealed that the decreased cement space causes increased fracture strength for all the groups (vita zirconia crowns (Group A) and Ips e-max Zir/CAD zirconia crowns (Group B)). This may be attributed to, that increase cement space measurement causes the crown thinner, because the strength required to fracture any crown is straight proportional with thickness of the material. Thus, thicker crowns will required more force to fracture than the thin crown. Therefor (90 um cement space) needed less force to break the crown compared with (50 um and 70 um cement space) . In addition, the increase cement space result in more space between the die and the crown, did not improve crown seating \( ^{0, 21} \).

These results came in agreement with \( ^{3} \) and \( ^{4} \) who found that the increased cement space causes decreased fracture strength.

**The effect of two types zirconium crowns on the fracture strength.**

The result of the current study about the fracture strength measurements of two types zirconium CAD/CAM crowns (Vita and Ips e-max Zir /CAD ) fabricated by three different cement space showed that the differences between the cement space was highly significant .

This coincide with \( ^{8} \) who conclude that the sintering time influenced the density and mechanical properties, they stated that the great sintering temperature and extended sintering period increased the grain size and thus result in a material with decreased mechanical properties.

In this study, restoration of the full-contour zirconia crowns with no ceramics overlay from all groups (A and B) is used to provide the crowns with adequate mechanical strength in order to resist occlusal forces while preserving biocompatible properties and excellent esthetics, Because of multilayered zirconium crown structures having loading capacity and distributions different from stress when compared to the monolithic restorations. Therefore, differences in fracture and mechanical behavior can be expected. In addition, the monolithic zirconia crowns, due to single composition of the anatomical blanks of zirconium material can be milled directly to full anatomical crown without the need for a ceramic veneer, and therefore not subject to an additional firing cycle compared to that of zirconia core materials \( ^{6} \).

**Conclusions**

Within the limitations of this study, the following conclusions can be derived:

1. The highest fracture strength mean value is recorded by crowns fabricated with (50um cement space) whereas the lowest mean value of fracture strength is recorded by fabricated crowns with
Differences were present in the fracture strength between two types of zirconium crowns; that show Vita zirconium crowns is more resistance to fracture than IPS e-max Zir/CAD.

The result of this study about the fracture strength measurements of two types zirconium CAD/CAM crowns (Vita and Ips e-max Zir /CAD ) fabricated by three different cement space showed that the differences between the cement space was highly significant.

Compliance of Hypertensive Patients with Medications at Marjan Teaching Hospital in Babylon Governorate

Nibras.H. Abdel-Hussein1, Gossoon J. Elywy2
1Lecturer, Academic Nursing Specialist, Babylon Director; Ministry of Health,
2Lecturer, College of Nursing/University of Thi-Qar /Iraq

Abstract
Hypertension is a significant problem around the world. As indicated by World Health Organization. Objectives: The aims of this study was to assess the compliance of hypertensive adults with their treatment, and to assess their socio-demographic characteristics in relation to compliance. Methodology: The study was conducted at the medical outpatients’ clinic in a period from 1st November 2018 to 10th march 2019 Marjan Teaching Hospital. Collecting data from simple random sampling total of (50) hypertensive patients who are using antihypertensive treatment and attending the medical outpatients’ clinic at Marjan Teaching Hospital in Babylon Governorate. Results: The majority of the study participants were female who accounted for (64%) of the total participants while male constituted (36%). Most of the study participants (42%) were between ages 60 years old more. Most of the respondents (63%) were diagnosed more than five years ago. (44%) of the sample have poor level of compliance with medications, and (50%) had poor control of blood pressure. Conclusions: There is very low rate of medication compliance, and BP control with strong association between them, that reinforce the relation between them.

Keywords: Compliance, Hypertension patients, Medications at Marjan Teaching Hospital

Introduction
Hypertension is a significant problem around the world. As indicated by World Health Organization, hypertension influences 970 million individual and approximately 68 million adults have hypertension. Globally the overall propagation of hypertension in population between age 25 and more was about 40% in 2008. Hypertension is constitutes a predisposed factor for heart and vascular diseases which results precocious death. Hypertension is known as abnormally high systolic or diastolic blood pressure levels. It means continual systolic blood pressure (SBP) equal to or greater than 140 mmHg and/or continual diastolic blood pressure (DBP) equal to or greater than 90 mmHg. This increasing of (SBP) and (DBP) is well distinguished as an important risk factor for brain stroke coronary heart disease (CHD), (ESKD) and surprising dying.

According to the American Heart Association, (2013) there are several factors influences compliance medication regimen to hypertensive: knowledge of treatment, long period going treatment, level of education, unread and write, and bad association with health care services, attitudes toward medication and adverse effects, psycho social factors, economics status, getting to health care, absence of health insurance, disease without symptoms and inconvenience. Usually treatment non- adherence is linked with progress age, males, poorness, obesity, cigarette smoking, disease embattle, and lower social support.

Based on high prevalence and burden of HT, achieving best control rates of HT is top priority internationally, but control rates still low worldwide. Chow et al. 2013 in a multinational study indicate only 32.5% control rate of HT (Systolic Blood Pressure (SBP) <140 mmHg and Diastolic Blood pressure (DSP) <90 mmHg) and it was 20.7%, 33.6%, 38.5% in Africa, Middle East and North America and Europe respectively.

Compliance is a significant problem in HT and evidence shows that just half of patients who initiate drug therapy are adherent with treatment after 1 year in USA, and poor or noncompliance produce uncontrolled HT
that will lead to worsen condition and higher possibility for developing complications including ischemic heart disease, renal failure and cerebrovascular accidents and others \(^{(5,6)}\). A shortage of knowledge about the severity of the disease and the importance of compliance to the prescribed treatment, may constitute barriers to compliance behavior. Ensuring patients’ compliance with anti-hypertensive medications and lifestyle modifications to prevent complications of hypertension remains a major challenge to public.

Nurses, can play an essential role in facilitating patient adherence to the prescribed treatment regimen. As they responsible to help patients acquire knowledge, skills and change attitude necessary to maintain compliance, they plays an important role on helping the people learn to live with and control his hypertension, to encourage compliance with antihypertensive therapy \(^{7}\).

This study conducted at the medical consultation clinics of Marjan Teaching Hospital in Babylon Governorate. The aims of this study were to assess the compliance of hypertensive adults with their treatment, and to assess their socio-demographic characteristics in relation to compliance.

**Methodology**

A descriptive cross sectional study was conducted at the medical consultation clinics of Marjan Teaching Hospital for adult patients with hypertension that were on follow up as outpatients in clinic of the Hospital in Babylon. Oral consent was taken from each patient before to interview, after a brief explanation on the study and its objectives.

The study was conducted from 1\(^{st}\) November 2018 to 10\(^{th}\) March 2019 Marjan Teaching Hospital in Babylon Governorate.

The study population consisted of (50) adult hypertensive patients on treatment and attending outpatient clinics in the hospital. These patients are followed up in the hospital for regular treatment and checkups depending on high blood pressure control. A structured interview questionnaire that was developed by the researchers according to literature review. It divided into two parts. Part I: Demographic Information Sheet (14 questions). Part II: compliance with medication regimen (8 questions). All the items responses were noted on a 3-point Likert scale. The response options were: every never (1), frequently (2), always(3).

The validity of the questionnaire was confirmed by (10) experts. A self-administered structured questionnaire was used to collect the socio-demographic characteristics of the patient’s respondents, Factors that influence treatment compliance. Data collection from January to February 2019. The data were analysed through Statistical Analysis was done using Statistical Package for Social Sciences (SPSS V 21.0).

**Results**

</table>
The table revealed that the majority of the study participants were female who accounted for (64%) of the total participants while male constituted (36%). Regarding age (42%) were from the age group (60 years and more); (84%) of the patients were married, and (58%) lives in urban area. According occupation (86%) were housewives/ jobless/ retired, (52%) were unlearned (illiterate or read and write), and (90%) were non-smokers, while sleeping pattern (68%) were of them sleeping 8 hours. Regarding number of drugs (80%) were have one drug, (48%) were have not enough monthly income, and (48%) were have normal weight.

According reasons of poor medications the forgetfulness was the first cause of non-compliance to medication (46%), followed by negligence and carelessness of patients (30%), side effect (10%), asymptomatic nature of HT disease (8%), and cost of drug (6%), according to patients opinion was and as shown in Figure 1. And (44%) of the sample have poor level of compliance with medications Figure 2, (50%) had poor control of blood pressure, as shown in Figure 3.

**Discussion**

The present study was carried out to determine the
compliance of patients with hypertension with their treatment regime. The results of the study revealed that the majority of the study participants were women who accounted for (64%) of the total participants while male constituted (36%), the female were more compliant (14%) compared with male (6%). Most of the study participants (42%) were between ages 60 and above years old, the most participants who were (40-59) years of age had good level of treatment compliance compared to those with 60 and above years of age. (84%) of the patients were married, married group has highest percentage of acquiescence toward medication compliance. (52%) of the participants had unlearned. The majority of the participants were (58%) lived in urban. Majority of them (54%) were diagnosed between than (1-5) years.

These results are in conformity with the findings obtained from other studies, who state that high proportion of clients with whole medication compliance corresponded to the female (66.7%), The participated sample were age from (40 – 80) years ,approximately two-third of patients (68.12%) that ages over 60 years , and residual of them 24.63% age between 50 and 59 years (8,9).

This finding was coincided to a study conducted by other researchers stated that medication compliance rates were also significantly higher between ages (45-64) than younger or older age groups. The majority (63%) lived in urban areas while the rest (37%) lived in rural areas. Majority of them (63%) were diagnosed more than five years ago 10.

There are many factor affect the patients drugs treatment compliance, the main cause for poor compliance to medication as the patients indicates was forgetfulness to take medications (46%) (figure 1), they taking medications only when they develop symptoms such as headache and not take medication when they feel comfortably. Poor knowledge of the disease and ignorance of need for long-term treatment was reported as main cause by Busari et al 2010 11 , whereas self-awareness of disease remission was second cause of noncompliance in Dong et al 2013 12.

The results of present study show low rate (20%) of patients with good compliance with medication, whereas the majority of the patients (44%) had poor compliance to medication (figure 2). The low rate of compliance is less than that reported by different researchers that were (70%, 67.1%, 53.4%, 43.5%, 32.1%) respectively 13,14,15,16,17. While it was higher than the 13.24% compliance rate reported by Dosee et al 2009 18. Low BP control (50%) obvious in this study, with the fact of the direct association between better compliance to treatment with higher control rates of blood pressure make it a serious issue (figure 3). This differences in results from different societies could be related to variation in cultures, educational standards, beliefs about disease and treatment, as well health services development but still compliance to medications and control of BP is weak the worldwide.

**Conclusions**

1. There is no significant relationship between social demographic characteristics except gender, no. of drugs, and duration of diagnosis.
2. There is very low level of medication compliance, and low level of BP control with, and there is a strong association between them, that reinforce the relation between them.
3. The main reasons for noncompliance were forgetfulness, followed by negligence then side effect of medications.

**6. Recommendations**

1. Educate the patients about the use of their medication should be done diligently, primarily by the prescriber then health care professional.
2. Educate the patients to avoid high risk complication that threatening life result from poor treatment compliance.
3. Health education programs about hypertension should be campaigns state through the mass media as television and radio, social media, illustrated booklet, and pictures.
4. Health education programs for the healthcare professionals to arise their awareness, attitude and adaptation of the patient as to their own disease.

**Financial Disclosure:** There is no financial disclosure.

**Conflict of Interest:** None to declare.

**Ethical Clearance:** All experimental protocols were approved under the College of Nursing and all experiments were carried out in accordance with approved guidelines.

Immunization Status of Children Under 6 Years Old in Holly Karbala Governorate

Muhsan Sahib Salih Almusawi
Karbala Health Directorate, Iraq

Abstract
A cross-sectional study was carried out among 110 mothers of children to assess the immunization status of the children, they selected by using non probability sampling (convenience sampling). According to study findings, most of children were males (25.7%) and (95.5%) of them from urban resident and most of children have a good immunization status. The study concluded that performance of Iraqi national immunization program is effective. Keywords: Immunization Status, Children Under 6 Years Old.

Keywords: Immunization, Children, Karbala Governorate.

Introduction
Immunization has been described as the first line of defense against disease, and one of the most effective health advantages available to children. It is proven as one of the most cost effective health interventions worldwide, through which a number of childhood diseases have been prevented or eradicated. Immunization against diseases is one of the most important public health interventions with cost effective means to preventing childhood morbidity, mortality and disability. The term dropout refers to children who miss scheduled vaccinations for any reason, including health facility problems such as canceled sessions or vaccine stock outs. Immunization contributes significantly to the achievement of millennium development goal number 4 and is one of the eight elements of primary health care. Effective utilization of immunization services is associated with reduced infections in young children with immature immune system and improved child health outcome. The failure of immunization is result of postponing it until another time, child being ill and hence not brought to the center for immunization, un aware of the need of immunization, place of immunization being too far, no faith in immunization, un aware of the need to return for 2nd and 3rd dose, mother being too busy, fear of side reactions, and wrong ideas about immunization. Improvements in national immunization program performance are necessary to reach and sustain high vaccination coverage to increase protection from vaccine preventable diseases for all persons.

Methodology
Subjects: The study population included (110) mothers of children under 6 years selected by nonprobability sampling method (convenience sampling) in the medical health center of Holly Karbala Governorate. The researcher explain the study and the objective to the sample and take their oral consent to participate in the study, then collect the data about the subject.

Instrument: The researcher using a questionnaire consist of 2 parts: the 1st part contain the general information and the 2nd part contain the Iraqi immunization schedule which contain the vaccination from birth to 6 years. The data was analysis by using the descriptive statistical analysis (frequency and percent).

</tbody>
</table>
This table indicates that according to the immunization schedule of the children age 18 months, (96.4%) of children had receive the BCG vaccine, (80.9%) of them had receive oral polio- zero dose and (79.1%) of them receive hepatitis B viral at period (1-7) days. (78.2%) of them receive Hexaxim vaccine - first dose, (92.7%) of them receive Oral polio - first dose, (83.6%) not receive Rotavirus vaccine - first dose and (55.5%) receive Pneumococcal vaccine - first dose at period 2 month. (83.6%) of them receive Hexaxim vaccine - second dose, (89.1%) receive Oral polio – second dose, (83.6%) not receive Rotavirus vaccine – second dose and (51.8%) not receive Pneumococcal vaccine – second dose at period 4 months. (78.2%) receive Hexaxim vaccine - third dose, (78.2%) receive Oral polio – third dose, and (51.8%) receive Pneumococcal vaccine – third dose at period 6 month. (83.6%) receive Single measles vaccine and (72.7%) take Vitamin A – 100.000. IU at period 9 months. (76.4%) take (MMR) Mixed measles vaccine (measles, rubella, mumps) at period 15 months. (70.9%) take Second pentagon vaccine, (73.6%) take Polio vaccine - first active dose and (60%) take Vitamin A – 200.000. IU at period 18 months. (66.4%) not take The fourth quaternary vaccine, (75.5%) not take Oral polio vaccine - second active dose and (84.5%) not take MMR Mixed measles vaccine at period 4-6 years.

**Conclusion**

The study concluded that the children have a good immunization status through the Iraqi immunization schedule, the children were take most of vaccines and there was some of children dropout of the rotavirus vaccine at the 1st and 2nd dose that may be related to absence of vaccine vial in the health care centers or there was some factor like diseases or so far distance or environmental factor that make the families late to the vaccine date.

**Recommendation**

Using the mass media to encourage family about benefits of vaccine, give the vaccine to the families whom late the date of vaccination and provide the vaccines to the health care center and prevent deficiency.

Spectrophotometric Determination of Isopropamide Iodide based on Ion-pair Complex Formation with Thymol Blue

Wasan Ajam Hannoun1, Khalid Waleed S. Al-Janabi2

1M.Sc. Student, 2Assist. Prof., Chemistry Department, College of Education for Pure Sciences/ Ibn Al-Haitham, University of Baghdad, Baghdad, Iraq; Email: khalid.janabi@gmail.com

Abstract

A simple, accurate, affordable, and rapid spectrophotometric approach has been established for the quantification of the medicinal compound of Isopropamide iodide (ISO) in pharmaceutical preparations. An ion-pair complex which absorbs at 404nm has formed the reaction of the drug and the coloring reagent of Thymol blue (TB) at an acidic medium of pH=4. The calibration curve showed excellent linearity over a quantification range of (1-40 μg/ml) with an excellent coefficient of correlation (r = 0.9993). The examined limit of detection (LOD) was (0.3 μg/ml) for repeatability of (n= 3). The approach witness no interference of the commonly used excipients in such pharmaceutical formulation that contains Isopropamide iodide. Validation of the method was accomplished by calculating the relative standard deviation (RSD %) and found to be in the range of (1.1938-0.5954). While recovery percentage for (n=3) was (97.4 – 101.4%).

The analytical parameters of the method were optimized and were efficaciously applied to the Isopropamide iodide determination in pure form and in the mixture of a tablet form. The approach can be functional for determining other active pharmaceuticals.

Keywords: Isopropamide iodide, spectrophotometry, ion-pair complex, Thymol blue, pharmaceuticals.

Introduction

Isopropamide iodide (ISO), in IUPAC “(4-amino-4-oxo-3,3-diphenylbutyl)-methyl-di(propan-2-yl) azanium;iodide”, an off-white odorless bitter powder with a molar mass of 480.434 g/mol (1,2) as it shown in (Figure 1). Its an anticholinergic medication having long effect duration3. ISO is a wide spectrum pharmaceutical drug used in the treatment of several disease symptoms, not limited to; Assist in gastrointestinal (GI) spasm relief4, the remedy of peptic ulcer, thyroid disorder5, rhinitis redaction, some types of diarrhea, duodenitis spasm, chronic cholelithiasis, biliary dyskinesia, curing of gastritis, rest of spastic colon, disturbance of the urinary tract6 those correlated to the spasm of smooth muscle, and some other disorders7–10.

The Iraqi “State Company For Drugs Industry And Medical Appliances (SDI – Samarra)” produces tablets for the treatment of “irretable bowel syndrome” called Salabid which composed of ISO and trifluperazine hydrochloride11.

A literature survey revealed that ISO has been determined in the presence of other active drugs by derivative spectrometry12,13. Also, it has been extracted from physiological fluids via solid-phase extraction cartridges14 (SPE) followed by the chromatographic analysis of HPLC at 220 nm15,16. Likewise, platforms of electrochemical sensing were used for a simultaneous determination of ISO in a bulk pharmaceutical mixture17.

Fig. 1. The chemical structure of the pharmaceutical molecule of Isopropamide iodide15
A literature survey comes out with different approaches for finding the concentration of ISO in pharmaceutical mixtures. Many spectrophotometric approaches have been described for the quantification of ISO and measurement were accomplished within the ultraviolet (UV) region. A sensitive, rapid, accurate, precise and economical spectrophotometric method based on simultaneous equation method for the simultaneous estimation of isopropamide and trifluoperazine in combined tablet dosage form. Materials and Methods: The method is based on the simultaneous equation and first-order derivative method for analysis of both the drugs using methanol:water in the ratio of 7:3 (v/v). Simultaneous spectrophotometric estimation of ISO in the existence of trifluoperazine as a tranquilizer and its oxidative degradation was reported as well. Frequently, trifluoperazine comes in a dualistic mixture with ISO for their anti-vomiting and anti-convulsive influence. Similarly, derivative spectrometries were reported also since they have the privilege of simultaneous analysis of multi-component systems. Usually, as a subject to second derivative measurement within the UV region in a methanolic medium or in a slightly basic medium of 0.1 N sodium hydroxide followed an extraction step with chloroform. The procedure provides a linear quantification range for the determination of ISO within 20-80 µg/ml. However, complexation with methyl orange or sodium taurodeoxycholate as an ion-pair, or with iodine as a charge-transfer complex were common.

ISO can be formally determined ion-exchange liquid chromatography, or by direct titration with perchloric acid in an organic medium.

The proposed method was built on the reaction of Isopropamide iodide with Thymol blue in an acidic medium at 404 nm. The method proved to be effective for the determination of Isopropamide iodide in pure form and its pharmacological formulation.

Materials and Method

Instrumentation

- Spectrophotometric measurements were made by a UV-Visible Spectrophotometer (T80+ PG Instruments Ltd.).
- Analytical Electronic balance (Sartorius, with four decimals).
- The acidity of the prepared solutions and buffers were adjusted using a digital pH meter (pH/mV Bench Meter, Hanna Instruments) equipped with a combined glass pH electrode.

Material and Reagents

- ISO has been provided freely by “The State Drug Industries and Medical Appliances Company” (SDI), Samarrah, Iraq.
- Solvents and chemicals were of analytical grade.
- Thymol blue (TB), 0.1% (w/v) stock solution: a 0.1 g of the reagent TB was dissolved in 5 ml of methyl alcohol and then diluted with distilled water to 100 ml. While the standard working solutions of TB were prepared freshly by consequent dilutions.
- Hydrochloric acid (0.1M): A 0.83 ml of a concentrated HCl (Sp.gr. 1.18 g/ml, 37% w/w) was diluted into 25 ml of deionized distilled water then adjusted to a 100 ml.
- NaOH (0.1 M): the solution was prepared by dissolving 0.40 g of sodium hydroxide in 100 ml of distilled water.
- Preparation of copper sulfate solution was accomplished by dissolving a 0.25 g of CuSO₄ and 4.5 g of CH₃COONH₄ with the solution of 0.1M acetic acid in a 100ml volumetric flask. Adjustment of acidity was fulfilled using the dilute solutions of HCl and NaOH previously prepared.
- Preparation of ISO stock solution (100 µg/ml): 0.01g of ISO was dissolved in 100ml of distilled water.

Assay procedure of pure ISO

One milliliter of the ISO standard solution (20µg/ml) was moved into a set of 50 ml separatory funnel with a 0.5 ml of pH 4 buffer solution as well as a 0.5 ml of the reagent TB (.). A half milliliter of chloroform was added and the separatory funnel was shaken for one minute. The funnel was kept aside to allow a clear separation of the binary phase. Spectrometric measurement of the yellow organic phase was accomplished at a maximum wavelength of 404 nm against a blank. The calibration curve was built by graphing the absorbance intensity of the organic phase as a function to the medicine concentration.
Analysis of pharmaceutical formulation

Ten tablets of (Salabid tablets, a product of SDI) was ground and weighed accurately. Aliquot of 5mg of the fine powder was transferred quantitatively and dissolved into a 100ml of distilled water. The resulting solution was filtered to avert the presence of any suspended particles. Whereas, the standard working solutions were made by successive dilution.

Results and Discussion

In general, spectrometric procedures are well known as sensitive approaches for the determination of medicinal compositions. Spectrometric ion-pair complexation is commonly used in the determination of the concentration of various pharmaceutical composites.

A series of experimental investigations in buffer mediums have revealed the possibility of ISO compound to react with TB. The resulting yellow ion-pair derivative has been extracted from the aqueous medium by chloroform. The complex was formed in an acidic buffer medium and found to exhibit an absorption peak with a maximum at the wavelength of 404nm as its obvious in (Figure 2).

Fig. 2. The absorption spectrum of the ISO-TB yellow complex

Optimization of experimental variables

Univariable method

The experimental variables affecting the stability and the formation yield of the produced colored complex. They have been specified by the application of different sets of preliminary experiments. These variables include pH, reaction time, shaking time, reagent concentration, the order of addition, and type of the extraction solvent. Thus, the univariable approach was accomplished by modifying one variable at a time while keeping the other variables at constant values. Once the optimum value of the variable gets specified, then another parameter will be chosen for modification while maintaining all the others constant.

Effect of acidity

For the purpose of finding the optimum acidity range, ISO solutions were mixed separately with the coloring reagent of TB in mediums of different pH(s). The acidity of the reaction mediums was adjusted to a value between (2 - 5) via the addition of a few drops of either (0.1M) NaOH or (0.1M) HCl. Maximum absorbance was obtained at pH 4.0 (Figure 3). Therefore, an acidic medium with a pH of 4 was employed in all the subsequent preparations.

Fig. 3. The absorbance intensity for the formation of the ion-pair complex as a function of the pH of the reaction medium

Effect of reaction time

The optimization of the reaction time was accomplished by examining the development of the yellow color of the formed complex at ambient temperature (25 ± 2 °C). The reaction was instant as the colored product reached its maximum intensity with stable absorbance directly after the blending of ISO with the reagent of TB. The color intensity remains stable for the next 24hr (Table 1).

**Effect of reagent mole ratio**

Absorbances were measured when different volumes of the TB solution in the concentration of ( ) were added to 0.5ml of ISO standard solution (20μg/ml). An increment in TB concentration causes a reduction in the absorbance which may be due to the formation of new species (Figure 4).

**Optimization of the extraction shaking duration**

Optimization of the shaking time required to achieve a maximum extract recovery was studied over a time range of 1-5 minutes at ambient room temperature. No significant influence was observed for this parameter (Figure 5). However, a one minute found to be enough as an optimum shaking time for all the upcoming extractions.

**Effect of the extracting solvent**

Various organic solvents; Benzene, carbon tetrachloride, dichloromethane, cyclohexane, and chloroform, were inspected for their extractability ISO colored complex. Chloroform observed to have the most efficient extraction ability (Figure 6). Furthermore, experiments exhibited that a single extraction of a 5ml batch of chloroform was very satisfactory in terms of recovery.

**Influence of the order of addition**

The sequence of addition of the reactants is important and has been tested. The optimum order was by dissolving the ISO drug into the buffer then adding TB reagent to it. Starting with the ISO in the buffer gave a higher absorption (0.257 au) at the wavelength of 404nm than by starting with TB in the buffer (0.141 au).

**Stoichiometry of the complex**

The mole ratio of ISO to TB was established via Job’s method of continuous variation. Two standard solutions of ISO and TB both have the same concentration of were prepared. The reagent TB was added gradually to ISO buffer solution by a 0.1 ml portion so that the total volume of the mixture maintains to 1ml and the
absorption at the wavelength of 404nm is measured with each addition. The resulted graph has exhibited that the ion-pair complex is formed with a mole ratio of 1:1 to ISO:TB (Figure 7). As one positive protonated ISO molecule requires one anion of TB to form an ion-pair complex.

![Fig. 7. Determination of the mole ratio of ISO:TB via Job’s method of continuous variation](image)

**Calibration curve**

A linear calibration curve was built for the colorimetric determination of ISO in a pharmaceutical composition under optimum conditions for the formation of the ion-pair complex of ISO with TB. The resultant calibration curve excellent agreement to beer’s law on the quantification range of 1-40μg/ml with linearity of 0.9993 (Figure 8). Nevertheless, more analytical parameters are listed in (Table 2) below.

**Method validation**

The accurateness of the suggested method was confirmed by three replicate analyses, i.e. n=3. Three different concentrations of ISO were used (10, 20, 30 µg/ml) to calculate the method recovery and the relative error percentage, as shown in (Table 3). The results were satisfactory as indicating the high accuracy of the method. The precision was expressed as a function of the “relative standard deviation” (RSD %) which found to be within the range of (1.1938-0.5954).

Interference studies

Under optimum experimental conditions, the influence of several foreign constituents which may be existing in medicinal products and may have an impact on the reaction of ISO with TB were examined. The tests indicated that common excipients like in the case of glucose, sucrose, lactose, and starch do not interfere with the colorimetric analysis of ISO even when they present in a high concentration of 1000 μg/ml (Table 4).

Conclusion

A spectrometric methodology has been established and validated for the quantification of Isopropamide iodide (ISO) in pure form and as a medicine. The method has a number of privileges over other instrumental techniques of ISO analysis. It is affordable, especially when compared to chromatographic techniques, as well as rapid, and highly accurate. Moreover, common excipients did not interfere with the proposed procedure. For the prementioned, this method is highly recommended for routine analysis of ISO and may apply for other active pharmaceuticals with a similar functional group.

Effects of Sulfonylureas Treatment on Apoptosis, Total Superoxide Dismutase activity and Some Biochemical Parameters in Type 2 Diabetic Patients

Noor Khalid Zaidan¹, Perry H. Saifullah²

¹M.Sc., Student, ²Assist. Prof., Department of Chemistry, College of Sciences for Women, University of Baghdad, Baghdad-Iraq

Abstract

The purpose of this analysis was to evaluate the influence of anti-diabetic drugs (sulfonylureas) in type two diabetic patients and the risk of developing diabetes complications related to kidney disease (Diabetic Nephropathy) compared to healthy subjects by measuring influence of some apoptosis factors (serum Tumor necrosis factor soluble Receptor-1(TNF-R1) and TNF-related apoptosis-inducing ligand receptor-2 (TRAIL-R2)) concentrations, serum Small mothers against decapentaplegic (Smad1) as anew marker of diabetic nephropathy (DN), Superoxide dismutase concentration (SOD), Glycated hemoglobin (HbA1c%), Fasting plasma glucose (FPG), insulin concentration, insulin resistance (IR), urea and creatinine. A samples of convenience composed of 17 type 2 diabetic patients with sulfonylureas monotherapy and 17 normal subjects above the age of 40 years were recruited. Age, duration of disease and body mass index (BMI) was created. The mean levels of Smad1 and TRAIL- R2 in diabetics with sulfonylureas treatment, they were significantly higher compared to control subjects, while the means of SOD have low level in diabetic subjects, and the mean levels of TNF-R1 and IR were non-significant in diabetic with Sulfonylureas treatment compared to control subjects.

Keywords: T2DM, TNF-R1, TRAIL- R2, Smad1, SOD, Sulfonylureas.

Introduction

Diabetes mellitus (DM) was a metabolic disorder in which the body is unable to manufacture or use insulin adequately. Type 2 diabetes (T2DM) is a heterogeneous syndrome that was related to both defective secretion of insulin and insulin resistance(1). Poorly controlled levels of blood glucose usually lead to different complications in microvascular organs, such as nephropathy. (2) Diabetic nephropathy (DN) was a vascular disease risk factor and was widespread among T2DM patients (3). The request for more very reliable sensitive and specific biomarkers was needed for early expectation the progression and beginning of DN (4). Small mothers against decapentaplegic (Smad) signaling was Has been known as a main route of transforming Growth Factor-β (TGF-β) signaling in progressive fibrosis of renal (5). The Smad family of proteins was classified into three classes: Receptor-regulated Smads R-Smad (Smad1, Smad2, Smad3, Smad5, and Smad8), co-Smad (Smad4), and Inhibitor Smads I-Smad (Smad6 and Smad7).(6)

Smad1 was novel biomarkers in serum and urine for kidney injury associated with DN it can be used in the early diagnosis of DN or in the valuation of the treatment to prevent (7). Hyperglycaemia induces increase free radical formation (8). A family of antioxidant enzymes were superoxide dismutase (SOD) that control reactive oxygen species (ROS) levels by catalyzing of the superoxide radical conversion to hydrogen peroxide and oxygen molecule (9). Apoptosis was the natural mechanism of the cell for programmed cell death, it plays a vital role in both growth and homeostasis (10). Apoptosis can be induced by intrinsic pathways that are caused by cellular stress and DNA damage or by extrinsic signals that trigger death receptors on the cell surface. Such as TNF receptor 1 (TNFR-1) and ligand receptor 2 (TRAILR-2) linked to apoptosis-inducing TNF. (11)

Most patients with T2DM ultimately require pharmacologic glucose-lowering therapy, with a goal of decreasing long-term complications.(12)
Sulfonylureas have an excellent blood glucose reducing effect; sulfonylureas was an effective drug for diabetes treatment and hyperglycemia (13). The current study was conducted to investigate the effect of Sulfonylureas as a monotherapy in diabetic patients on the release of soluble death receptor-activated apoptosis (TNFR/R1 and TRAIL/R2), study the effect of Sulfonylureas drugs on activity of Smad1 in serum as a novel biomarker for early detection and evaluation of diabetic nephropathy severity in patients with T2DM (for the first time measured in blood serum) and Study the impact of Sulfonylureas on stress from oxidation by determination the activity of superoxide dismutase (SOD). Thus to explore the effect of this treatment on the risk of developing diabetes complications related to kidney disease.

Materials and method

At the National Diabetes Centre / AL -Mustansiriya University thirty four (34) of T2DM patients and healthy subjects were chosen. The patients samples were divided to two groups. Group1 consists of 17 Sulfonylureas therapy taking patients and the group 2 was consists of 17 apparently healthy individual (control group ). Patients with other diseases, smoking patients and pregnant female patients were excluded from the medical assessment study. Patients that take other than metformin drugs or metformin plus insulin had also been excluded. he blood sample was split into two aliquots; the first aliquot blood was delivered to a tube comprising Ethylene Diamine Tetraactic Acid (EDTA), this blood was gently mixed and then used to measure HbA1c, while the second aliquot was delivered to the gel plain tubes to extract serum. Control and patients subjects were subjected to determination of the tests: serum insulin hormone was measured by ELISA using kit (Sandwich) supplied by Cobas (ROCHE), the Homeostasis Model Assessment (HOMA) assessed insulin resistance (IR), SOD was determined in serum by (riboflavin/NBT method), TNF/R1 was measured using ELISA kit (Sandwich) supplied by Cusabio (USA), serum TRAIL/R2 was measured by using Sandwich ELISA kit provided by Cusabio (USA), serum Smad1 was measured by using ELISA kit (Sandwich) supplied by Mybiosource (CANADA), HbA1C % was measured using the Integrated Sciences (Australia) A1C test system, fasting plasma glucose concentration, serum urea and serum creatinine were estimated by colorimetric method by using a kit supplied by Bio Systems (SPAIN).

Statistical Analysis

Statistics was performed with T-Independent test for difference between two groups, the result were expressed as mean ± SD, different range test at p ≤ 0.05 which was agreed as significant, where as highly significant when p ≤ 0.001, and the range test at p ≥ 0.05 was agreed as non-significant.

Results & Discussion

Demographic data for (17) patients with T2DM and (17) healthy subjects, the result in Table (1) showed that the Mean± SD value for study parameters, and Compare between different groups in current study.

* Significant using ONEWAY-ANOVA at 0.05 level

The results of age have shown that there were highly significant difference among the study groups. These results were due to the duration of the disease for the patient group. Note that all samples and healthy control were chosen above the age of 40 years old. Body mass index BMI showed no significant differences (P=0.203) between patients group, when they were compared to control group.

The statistical distribution of mean for glycaemic state (FPS, HbA1c, Insulin Level, and HOMA IR) were performed on all studied groups generally as shown in Table (1). Results of fasting glucose in plasma (FPG) expressed in mg/dl revealed that there were high significant variations between patients group when compared to healthy control group (P<0.0001). The results of glycated hemoglobin (HbA1c %) levels showed higher significant increasing in patients group (P<0.0001), when compared to the control healthy subjects. In current study, a high level of HbA1c and FPG were found in patients group, which identifies to poorly controlled glycemia in these subjects. These results because of treating with Sulfonylureas he initial excellent response resulted in a loss of active antidiabetic response and induce βcell failure (secondary failure) (14). The results of serum insulin levels (µU/mL) for patient groups showed that there were no significant differences between patients group when compared with control group. The same results have been observed in the insulin resistance levels in studied groups which indicated that there was no significant differences between patients group compared with control healthy subjects. The results of insulin and insulin resistance in our study were connected and intertwined. The results of current study were agreed with previous studies which explained that sulfonylurea drugs, showed some evidence to reduce insulin resistance in addition to its insulin secretory action. (15) Mean± SD for renal function tests (Urea, and Creatinine) were performed on all studied groups as shown in Table (1). The result of urea concentration (mg/dl) significant differences are observed in it is level of patient group compared to control healthy group (P=0.045). All results are within normal values, Previous studies were showed that there was statistically significantly elevated levels of urea with increased levels of blood sugar and a strong connection between blood urea and blood sugar. (16)

Serum creatinine is a more accurate evaluation of renal function than urea, but urea has been increased in renal disease earlier. (17) The results of creatinine concentration (mg/dl) showed no significant differences are found in it is level of patients group compared to control healthy group. Serum urea and creatinine measures have been readily available tests that assist in
early diagnosis and avoidance of diabetic kidney disease and can restrict development to end-stage renal disease. (18) Smad1 were novel reliable biomarkers for each of the classical pathological finding in the beginning periods of DN and were indicator of progressive glomulare filtration rate decline (19). The results of the Serum Smad1 concentration (ng/mL) which was measured for the first time in the blood serum, showed that there were highly significant differences between patients groups and healthy control subjects (P<0.0001). The mean± sd of Smad1 concentration in diabetic patients with sulfonylureas treatment was found to be significantly elevated compared with healthy subjects group, this results revealed that using of sulfonylureas as monotherapy in diabetic patients does not reduce the risk of high Smad1 concentration. The effect of sulfonylureas treatment was not recorded in previous studies, recent studies found The Smad1 is the primary signaling molecule directly concerned in DN and other kidney disease induction and development of glomerulosclerosis (20). The results of the serum total SOD levels (U/mL) in T2DM patients and control groups showed that there were highly significant differences between studied groups (P<0.0001). The mean± sd of SOD concentration in control group (151.91±11.64) was significantly increased compared with patients group (0.844 ± 0.285). This finding was generally consistent with literature data and was a clear indicator of the presence of oxidative stress in people with diabetic. Pervious study showed that hyperglycaemia in diabetes stimulates different biochemical processes leading to an increase superoxide and hydroxyl radical formation, which may lead to reduced n SOD enzyme activity. (21), While some have not documented any changes(22) And in diabetic patients, few researchers found elevated serum SOD enzyme activity(23). Recently it was shown that death receptors can be established in a soluble form in the bloodstream (24). Levels of serum (TNF-R1) concentration (pg/mL) for studied groups showed that there were not significant differences between patients group when compared with control group, so the result of the current study showed that using of Sulfonylureas therapy may reduce TNF-R1 concentration. This finding was consistent with literature data which know that the levels of serum TNF and its receptors were significantly decreased in diabetic patients with Sulfonylureas treatment (25). The results of TRAIL-R2 concentration (pg/mL) showed elevated significant difference between patients groups (P<0.0001), when compared to control groups. This result correspond to study which showed that a high glucose level, characteristic of diabetes was increased serum TRAIL binding to TRAIL-R1 and TRAIL-R2 levels(26). Results of apoptosis factor (TRAIL-R2), and SOD were generally consistent with literature data which showed that sulfonylureas treatment have been reported to accelerate cells apoptosis and stimulated production of reactive oxygen species (ROS) which could result in reduced activity of SOD enzyme. (27) These results may explain the high concentration of serum Smad1 in diabetic patients which indicates that patients with sulfonylureas treatment may exposure risk of developing diabetes complications related to kidney disease (Diabetic Nephropathy).

**Conclusion**

Using of Sulfonylureas as a monotherapy in T2DM patients did not reduce the risk of developing diabetes complications related to kidney disease (Diabetic nephropathy).

An analytical Study of the Maximum Force Variable on the walkway of the (100, 1500 and 5000 m Sprinters For Applicants)

Assist. Prof. Dr. Haider Fayyadh Alamiri
University of Kufa, Physical Education of Sport And Science

Abstract

The Motion analysis is used to solve problems which related to the learning and training. In addition, It diagnoses movements, compares their parts, times and strengths, and compares between good and bad movement, as well as it helps to develop the movement and its performance. There are few studies in of motion analytical for study. The researcher design this study in a scientific procedure by using the scanner device (Gait Analysis) of the German company (Zebris) to read the data in a standardized manner during the test, the researcher selected the sample of the Iraqi champions in the competition of (100 m and 1500 m and 5000 m) Two for each contest in a deliberate way for the heroes of Iraq and the number of them six, two for each contest, for the Time period from 11/9/2018 to 1/12/2018, in the laboratory of physical mechanics in the Faculty of Physical Education and Sports Sciences / University of Kufa. The search variable was chosen maximum force because it has a large role in the movement and transfer of athletic during the race, Concluded researcher to The maximum amount of force distributed on the footprint (front, center and heel) and according to the requirements of the race, and The higher the speed and force.

Keywords: Biomechanical indicators, print foot, analysis

Introduction

Whether using theoretical or applied mathematical sciences or scientific methods and modern techniques, has developed the analysis of the movement of a large extent recently for several reasons, Modern techniques, which have helped to determine the variables of kinetics of athletes accurately, is a dynamic analysis of the important science, which relies primarily on the use of laws and foundations used in the science of biomechanics for the study of free. This development was positively reflected in the level of determining the critical points in performance and in the various sporting events, especially those running short, medium and long distances, which are the activities of athletics, which rely heavily on the level of mechanical performance. Jogging and physical abilities such as strength, speed, lengthening, endurance, explosive force. The natural movements of the person and the athletics competitions is a “set of individual races that include at the same time racing relay. The performance of the members of the team and this is a combination of individual and collective so as to give confidence to the contestant and the viewer alike. The Muscle strength is one of the necessary physical attributes of the various games and motor skills on which the achievement and its requirements depend. It means the ability or tension that the muscle group can produce against resistance at the maximum voluntary contraction. Motion analysis is used to solve problems which related to the learning and training. In addition, It diagnoses movements, compares their parts, times and strengths, and compares between good and bad movement, as well as it helps to develop the movement and its performance. There are few studies in of motion analytical for study. The variable of maximum force between the runners of the races (100 m, 1500 m and 5000 m) in Iraq, for that The researcher design this study in a scientific procedure by using the scanner device (Gait Analysis) of the German company (Zebris) to read the data in a standardized manner during the test. The present study aimed to identifying the variable values of the race (100 m, 1500 m and 5000 m) for the Iraqi champions at a speed of 10 km, 16 km and 22 km and Comparison of these variable values in each competitions for the heroes Iraqi at the speed of (10 km, 16 km and 22 km).
Material and Method

The researcher used descriptive analytical method to process data and information related to the nature of the problem. The method research causality is the research in which the researcher tries to determine the cause of differences in the behavior or condition of a group of individuals, which means that the observed groups vary among themselves in the attribution of some variables\textsuperscript{12, 13}. And the knowledge of similarities and differences requires access to information related to this phenomenon “The purpose of organizing this information and classification is to help the researcher to reach conclusions and generalizations that help us to develop the reality we are studying, the descriptive method which aims to reach conclusions that contribute to understanding this reality and development\textsuperscript{14, 15}. The researcher selected the sample of the Iraqi champions in the competition of (100 m and 1500 m and 5000 m) Two for each contest in a deliberate way. for the heroes of Iraq and the number of them six, two for each contest. for the Time period from 11/9/2018 to 1/12/1018. in the laboratory of physical mechanics in the Faculty of Physical Education and Sports Sciences / University of Kufa. The search variable was chosen maximum force because it has a large role in the movement and transfer of athletic during the race, The test was held at the Bio Mechanical Laboratory on 11/9/2018 at 4:00 pm in the presence of the auxiliary team and the contestants 100m, 1500m and 5000m. The speed at which the test was conducted was determined to the maximum force the runner could play during running. the selected was a speed of 10 km / h on the device for race (5000 m) and the speed of 16 km / h for the race (1500) and the speed of 22 km / h for the distance of race (100 m). The choice of these speeds was in accordance with the times achieved by the contestants in the official competitions, By dividing the total distance on the time to extract the rate of speed (meters / second) and then be multiplied by (3.6) to convert to kilometers, because the speed on the device walking platform dealing with the kilometer, the device of gait analysis has a different speed starting from ( 1 km to 22 km) per hour, as well as that the device is able to extract more than fifty variables for both feet (left And right) so which the use of these variables in the identification of errors and the development of appropriate exercises to them, then the rise of contestants on the gait analysis device,( the platform walking and running) The device doing when the runner up to the speed required for each runner\textsuperscript{16}, then The data is recorded by the cable contact with the platform to the calculator that includes the application of the platform (zebris FDM).Then the recording on device takes 10 seconds to obtain the data during the test.

Results

After extracting the data obtained by the researcher from the test in relation to the variable the maximum force of the contenders for distance (100 m, 1500 m and 5000 m) which related to the research and processing statistically by extracting the mean and standard deviation, then the researcher presented the results reached and Analyze and discuss them and then interpret indicators of achieve

Table 1 shows the arithmetic mean and the standard deviation of the biomechanical variable. The maximum force of the feet (right-left) of the competitors (100 m, 1500 m and 5000 m) of the six runners for each contest two and used three speeds on the gait analysis 10 km for the contestants long competitions and the speed of 16 km for the competitions medium and the speed of 22 km for fast competitions, as the footprint of the contestants are measured for three areas of the foot (forefoot - the midfoot - the heel foot) and the left and right.

The researcher found that attributed the reason for this difference to the nature of the competitions in terms of distance and the mechanical of jogging for the runners on the feet, additionally the nature of the competition imposing the runner to put the foot on the ground, as well as the amount of payment made by the runners so that the impulse force to the runners varies depending on the nature of the competition, as the amount of impulse depends mainly on the maximum force and contact time, the greater the amount of force (impulse force = force + time), and therefore the runner spend force during it exerting and according to the nature of the distance. The difference in the strength of the runners is observed through the analysis of the right and left sides of the footprint and the Values of the force variable as well as forms of force curve schemas in each part of a second, as shown in Figure 1.

![Figure 1: force curves](image)

Table 1 shows that there is a difference between the maximum strength of the front foot and the left and right sides at the same speed for the contestants, whether run (10 km), (16 km) or (22 km). The researcher attributes the difference between the right and the foot left to the same rider is for the presence of a favorite man to the contestant or that the contestant uses a leg more than the other, during the jump or take off, which makes that leg has a greater force than the other it and shows that when running on the gait analysis device so that read the data for the footprint left or right where the difference them it, as shown in Figure 2.
Looking back at Table 1 to analyze the values of the maximum force of the heel of the foot between the speeds of the contestants, as shown in Figure 3.

**Discussion**

The spindle of the foot is the foot joint and therefore the farther of the point of impact of the force from the axis of rotation will increase the torque of the force 17, which explains that the sprinters short distance running dependent on the front of the foot any comb and thus will be the point of impact of the strength of the short distance runner at the farthest point of the front of the foot18, 19, which helps to obtain the torque of a large force as well as generating large torque during the course of pushing the foot from the ground and get a likely background large resulting from the rotational momentum when the center of gravity of the body in front of the so-called focal of back 20, 21, and this weighted will help the work weighted Front with Good standing when the center of gravity of the body behind the focal point 22, 23, which is called the front of built upon.

As for the mid-distance sprinters, they will be after the point of influence of the force on the axis of rotation less than the fast-distance runners because they do not need a great torque to generate to swing the leg faster 24, 25, because for the length of the race distance also will lead to the fatigue of the contestant quickly26.

As well as for the long-distance runners will be after the point of the impact of power on the axis of rotation less than the runners of high-speed and medium because they do not need a great torque to generate a torque to swing the leg faster and for the length of the race distance.
also will lead to the fatigue of the racer quickly 27, 28, Almost runners a full footprint puts on the ground is required for the mechanical performance of jogging long distances.

**Conclusion**

The maximum amount of force exerted by short, medium and long distance runners varies because of the different race distance, and the maximum amount of force distributed on the footprint (front, center and heel) and according to the requirements of the race, and the higher the speed and force, the greater the pressure and the it will less space for the base of the footprint, and the maximum amount of force plays a big role in achieving the achievement for the short, medium and long distance runners and all according to its purpose.

An optimized Retina Recognition Technique Based on PSO Inspired Algorithm

Suhad Fakhri Hussein

Lecturer, Ababil high school-Al-resaffa education, Hai Ur – Baghdad, Iraq; Suhad7242@gmail.com

Abstract

Retina Recognition techniques capture and analyze the vascular patterns on the thin nerve on the backs of an eyeball which process light getting in the pupil. Retinal patterns are extremely distinguishing traits; it cannot be gotten or stolen since there are no two persons have similar patterns of retinal, as well as the features extracted from the retinal image are the most stable and reliable than other biometric features. Therefore, the retina is selected as a robust source in the proposed recognition techniques. In this paper, an optimized technique of retina recognition based on an inspired algorithm is proposed for the authentication purpose in which particle swarm optimization (PSO) inspired algorithm is utilized for extracting features from retinal images. The obtained results from this work declared that the PSO provides an optimized performance with 100% accuracy and 3.5 seconds time-consuming.

Keywords: An Optimized Recognition Technique, Retina Patterns, PSO Inspired Algorithm.

Introduction

The biometric recognition techniques for the purpose of authentication like face detection, retina, iris, and fingerprint scanning are more securely than other traditional authentication techniques like password, PIN, and etc. In these traditional authentication techniques, the users should remember the password unique combination. Furthermore, the password should be confidential since this is the main objective of the system to be secure. Additionally, the password and PIN-based techniques can be attacked by brute force dictionary or by guessing 

Unlike traditional techniques, Biometric authentication techniques give better usability and reliability since it need not be remembered. Generally, there are two types of biometric recognition techniques; physiological like retina scanning, and behavioral like voice, and Handwritten Signature.

Retina authentication is the most promising biometric technique comparing to other biometric techniques. The retina remains unchangeable during the lifespan of the person. Furthermore, retina exists inside the eye that makes it cannot be forged owing to its internal protective position which prevents it from deformation. The blood vessels patterns in the retina have given a high level of security and uniqueness (even in identical twins) which is the foundation of retina recognition. In addition to the blood vessels, the regions of the fovea and optical disk are two essential properties in the retina, figure 1 illustrates the retina regions.

Figure 1: The image of retina regions.

The inspired algorithms have become an essential research field owing to intent to simulate nature for solving the complex real-life issues, especially in optimization. Particle swarm optimization (PSO) inspired algorithm has been utilized in this work for extracting optimal features from human retina image.

This paper is structured as follows; the related works are presented in the next section; Third section explains...
the PSO inspired algorithm; Fourth Section presents the proposed optimized retina recognition technique; Fifth section explains the experimental results; The last section, presents the conclusions of this work, furthermore, it provides suggestions for future work. This technique provides an average identification rate of 92.50. Mahrokh Khakzar and Hossein Pourghassem 4 , presented a retina authentication technique based on extracting the features from the spatial graph of the vessel pattern. The retina images were enhanced utilizing the preprocessing phase, and the retina vessel skeleton of this enhanced image was extracted utilizing the Isotropic undecimated wavelet transform algorithm. For generating a thin vessel and obtaining the bifurcations and vessel ends, the morphological operator has been utilized. The spatial graph adjacency matrix combining with the vessel patterns were generated automatically utilizing the relational mathematical graph (RMG) algorithm. After that, considerable features depending on the theory of spectral graph were used for developing the matching process. The obtained results showed that the proposed technique achieves a 97.14% accuracy rate. A. Saha et al. 9 , presented a multi-modal individual authentication technique based on iris and retina recognition for providing a high degree of distinction, universality, and circumvention. To minimize the main issue related to feature level fusion, the Principal Component Analysis was used. The rate of recognition for this technique was 96.74% and 94.56% for iris and retina recognition respectively.

1. **PSO Inspired Algorithm**

PSO is presented by Kennedy and Elberhart 10, inspired by social behavior of bird flocking or fish schooling. The PSO algorithm searches the space of a fitness function by adjusting the individual agent’s trajectories, named particles, as the piecewise paths created via positional vectors in a quasi-stochastic way. The swarming particle movement includes two main components: stochastic and deterministic components. Every particle is attracted toward the location of the current global best and its own best location in history, but, at the same time it has a tendency for moving randomly. If a particle gets a position which is best than any formerly found positions, updates that position as the new current best for particle 11.

In every iteration, a loop in the program is determined to every agent that another agent was its nearest neighbor, then assigned that agent’s X and Y velocities to the agent in focus. As it is predictable, it has been viewed that solely utilize such a strategy will quickly settle down the swarm on a unanimous, unchanging direction. For avoiding this, a stochastic variable named craziness was presented. In every iteration, several changes were added to randomly chosen X and Y velocities. This presented enough variation into the system to give the simulation a “life-like” appearance. The previous explanation illustrates the most needed features of PSO that refers to its seemingly unalterable nondeterministic nature: incorporation of randomness.

The conception was to allow the birds (agents) to get an unknown favorable location in the search space (food source) via capitalizing on one another’s knowledge. Every agent could remember its best position and knowing the best position of the whole swarm. The extreme of the mathematical function to be optimized can be thought of as the food source. After a sequence of minor alterations and elimination of the ancillary variables, the rules of updating to calculate the next location of a particle were presented as Equation 1 and Equation 2.

\[
\begin{align*}
\mathbf{v}_i &= w \mathbf{v}_i + c_1 \mathbf{r}_1 \cdot (\mathbf{p}_i - \mathbf{x}_i) + c_2 \mathbf{r}_2 \cdot (\mathbf{p}_g - \mathbf{x}_i) \quad \text{(1)} \\
\mathbf{x}_i &= \mathbf{x}_i + \mathbf{v}_i \quad \text{(2)}
\end{align*}
\]

Where \( \mathbf{x}_i \) and \( \mathbf{v}_i \) are the \( i^{\text{th}} \) particle’s position and velocity vector, respectively; \( \mathbf{r}_1 \) and \( \mathbf{r}_2 \) are two random numbers; \( \mathbf{p}_i \) and \( \mathbf{p}_g \) represent the best positions experienced so far by the \( i^{\text{th}} \) particle and the whole swarm, respectively; and \( c_1 \) and \( c_2 \) are two parameters indicating the particle’s confidence in itself (cognition) and in the swarm (social behavior), respectively. These two parameters are among the most important parameters of the algorithm in that they control the balance between exploration and exploration tendencies. A relatively high value of \( c_1 \) will encourage the particles to move toward their local best experiences, while higher values of \( c_2 \) will result in faster convergence to the global best position 12 . PSO inspired algorithm is shown in Algorithm 1.

2. The Proposed Retina Recognition Technique

This section describes the design and implementation of the proposed optimized retina authentication technique using PSO inspired algorithm. This proposed technique includes training and testing phases, every phase includes three processes; Firstly, the preprocessing; Secondly, the feature extraction; And thirdly, the matching. These phases include the same preprocessing and feature extraction processes but differ in the matching process. The general block diagram of the proposed technique for the training and testing sections are shown in figure 2 and figure 3.

Figure 2: Block diagram of the proposed technique training section.

2.1 Preprocessing

This process includes several steps as follows;

Step1: Apply the contrast image enhancement process to the input retina image (as in Algorithm 2) for enhancing the retina image and obtaining additional specifics to the vessel edges. This step improves the objects perceptibility via enhancing the brightness difference between the object and their background.

Algorithm 2: Contrast Image Enhancement Algorithm

Input: Mean_Img //Image after local mean compensation process
Mask_Img///Mask image, H, W /// The image Height & Width, respectively
Output: Con_Img ///Resulting image [0,1]

Figure 3: Block diagram of the proposed technique testing section.
Step1: Calculate mean and standard deviation values (STD)
Set Mean ← 0: STD ← 0: N ← 0 // Initial values
If Mask_i Then Set Mean ← Mean + Mean_Img(x,y)
Set N ← N+1
End If
End For
Set Mean ← Mean/N
If Mask_1 Then
Set STD ← STD+Power((Mean_Img(x,y)- Mean),2)
End For
Set STD ← Sqrt((1/ N) *STD)

Step2: Calculate minimum (Min) and maximum values (Max)
Set alpha1←1.1 ///Predefined value used for computing minimum value
Set alpha2← 0.3 ///Predefined value used for computing maximum value
Set Min ← Mean - (alpha1×STD)
If Min<0 Then Set Min ← 0
Set Max ← Mean +(alpha2×STD)
If Max>255 Then
Set Max ← 255
Set Gam ← 6.5 ///Predefined value
Step3: Calculate new values from old values
For all y,x Do
If Mean_Img(x,y) ← Min Then Set Con
Else If n← Max Then Set
Else Set × ((Mean_Img(x,y) - Min)/(Max - Min))
End If
Else Set Con_Img(x,y) ← 0
End For
For all y,x Do {where m} ///Normalization values
If Con >0 Then Set Con_Img(x,y) ←1
End For
Step4: End

Step2: Apply the canny filter for detecting and recognizing the vessel edges.

Step3: Transform the obtained image from the canny filter using the discrete wavelet transform to get four sub-images (LL, HL, LH, HH). LL is selected to be used in the next process.

2.2 Feature Extraction Process

In this process, a set of distinguished information is extracted from the resulted preprocessed image. This information refers to the required features vector for distinguishing among persons. In the proposed recognition technique, the PSO inspired algorithm is utilized for extracting the features from the retina image.

Feature in the PSO inspired algorithm was extracted according to the movement of bird’s direction. The implemented PSO algorithm for features extraction is explained in the following steps:

Step1: Choose the number of iterations.

Step2: Choose the number of particles.

Step3: Detect the center of the retina to detect the distance of the particle from the center.

Step4: Release the particle to the retina image to find the best position.

Step5: Find the best position by using guide particle.

Step6: Make the guide is the best particle.

Step7: Repeat the process with another iteration.

Step8: Collect all the features with (position (i,j), and the distance of the features from the center of the retina.

Step9: Save the features vector in the PSO database.

Note that for each iteration in the PSO algorithm, there is a new best position will be found by the particle, so, the guide particle will modify itself depending on the new best position. Then the feature will be saved in the PSO database.

2.3 Matching Process

The matching is an essential process for any biometric recognition technique which is utilized for finding the similarity degree between two patterns of the retina, where the distance between the features vector of the template stored in the Database and the tested image is computed. The measure utilized in this proposed technique is the Sum of Squared Difference (SSD).

3. The Experimental Results and Tests

The proposed retina recognition technique was implemented using VB.NET programming language. For testing the performance of the optimized technique, the Digital Retinal Images for Optic Nerve Segmentation Database (DIRONS-DB) has been utilized. This dataset includes 110 images, 100 for training and 10 for testing, each image of size 565×584 of (24 bit/pixel). Figure 4
shows some of the retina image samples belong to the used dataset.

![Figure 4: Some samples of retina images from DIRONS-DB.](image)

The preprocessing gives a certain result that deal with enhancement of the retina image to find the best clear resolution of the blood vessels and optic disc that prepare for feature extraction. In order to detect the blood vessels with high clarity, the contrast filtering must be done. Table 1 shows the effect of contrast filter on retina images.

**Table 1: The effect of Alpha Contrast on some retina images.**

Conclusion

Among different existing biometric techniques, retina recognition is a very secure and stable since the vascular patterns are unique and it is hard to modify or copying it. In this paper, an effective optimized technique is proposed for individual recognition depending on retinal blood vessels. The tests results conducted on the Drions dataset indicated that the performance of the proposed technique is very high with 100% recognition rate.

Role of TNF alpha and IL-6 in Inflammatory Process after Tooth Extract in Children Under 12 Years

Saad Mohammed Sulaiman¹, Ahmad Orkhan Hasan¹, Noora Abdulrazzaq Naji¹
¹MBBS, Kirkuk health Directorate, Kirkuk, Iraq.

Abstract

A cross-sectional study was carried out in Kirkuk city from November 2018 to March 2019. The number of children after tooth extraction under study were 55 children ages were between 5-12 years old. These patients admitted to private clinics of dentists. The control group who were matched to the children with tooth extraction studied, included 35 healthy children. Three ml of blood was collected by vein puncture using Vacutainer tubes from each patient enrolled in this study for determination the level of IL-6 and TNF-α by using ELISA technique. The study showed that the highest mean level of TNF-α was found in children after tooth extraction comparing with healthy control group (36.8±13.4 v.s. 13.5 ±2.9 pg/ml) (P: ≤0.05). The highest mean level of IL-6 was found in children after tooth extraction comparing with control (88.1±15.7 v.s. 21.7±7.13 pg/ml) (P: ≤0.05). The study showed that the highest mean level of TNF-α was found in children after tooth extraction in the first week of after tooth extraction (33.2±9.1 pg/ml) and the level was still decreased to be the lowest level after one month tooth extraction of children (20.18±2.9 pg/ml), the result was significant (P: ≤0.05). The study showed that the highest mean level of IL-6 was found in children in the first week of after tooth extraction (92.1±15.8 pg/ml) and the level was still decreased to be the lowest level was after one month of tooth extraction (67.9±9.81 pg/ml), the result was significant (P: ≤0.05).

Keywords: TNF; IL-6; Tooth extraction; Inflammation.

Introduction

Current clinical practices show that health care providers and parents tend to underestimate children’s pain when compared with children’s self-reports¹. This incongruity results from the inability of young children to fully understand, verbalize, and express their experiences ². in conjunction with adults being unable to adequately detect and identify signs of pain in the pediatric population. Given that pain in children is inherently difficult to assess, pain may be unrecognized or undiagnosed resulting in a mistaken belief that infants and children suffer less than adults or do not feel pain ³. The International Association for the Study of Pain acknowledges that the “inability to communicate verbally does not negate the possibility that an individual is experiencing pain and (is) in need of appropriate pain management.” ¹. Dental extractions of primary teeth have been, and very often still are, carried out without any pain relief medication in the belief that children do not experience significant amounts of pain ⁴. Studies conducted to describe dentists’ knowledge of and attitudes towards procedural pain in children have revealed that dentists downplay procedural pain ⁵. Pain is likely the most significant morbidity associated with dental extractions. ⁶. However, for unknown reasons, the impact of these studies has been slow to permeate into clinical knowledge and translate into clinical intervention. Postoperative pain is often a new experience for young children. The complexity of interpreting and verbalizing pain may be convoluted further by unfamiliar postoperative sensations from general anesthesia (GA), surgical site discomfort, and disorientation. The recovery period after surgery may require formal assessments of pain in this population. Interleukin 6 (IL-6) is a proinflammatory cytokine, which is produced by a number of immune system cells; fibroblasts, macrophages, T and B Lymphocytes, endothelial cells, keratinocytes and tumor cells ⁷. Interleukin 6 (IL-6), as major mediator of the inflammatory response, plays a primary role in the inflammatory reaction ⁸. Based on these data, the inhibition of the IL-6/IL-6 receptor interaction with specific antibodies has been proposed as a support treatment of inflammation after tooth extraction ⁹. The cytokines interleukin-6 (IL-6), tumor
necrosis factor alpha (TNF alpha) and interleukin-1 beta (IL-1beta) are critical mediators of the inflammatory response\textsuperscript{10}. So the aim of the study was to estimate the level of TNF alpha and IL-6 in children after tooth extraction.

**Materials and Method**

A cross-sectional study was carried out in Kirkuk city from November 2018 to March 2019. The number of children after tooth extraction under study were 55 children ages were between 5-12 years old. These patients admitted to private clinics of dentists. The control group who were matched to the children with tooth extraction studied, included 35 healthy children. Three ml of blood was collected by vein puncture using Vacutainer tubes from each patient enrolled in this study for determination the level of IL-6 and TNF-α by using ELISA technique (Koma-biotech USA Co).

**Statistical Analysis**

Computerized statistically analysis was performed using Mintab ver 18.0 statistic program for determination of the $P$. value ($P <0.05$ considered significant).

**Finding**

The study showed that the highest mean level of TNF-α was found in children after tooth extraction comparing with healthy control group (36.8±13.4 v.s. 13.5±2.9 pg/ml) ($P: \leq 0.05$), Table 1.

**Table 1: Level of TNF-α beta in children after tooth extraction and the control group.**

</tr>
</tbody>
</table>

The study showed that the highest mean level of TNF-α was found in children after tooth extraction in the first week of after tooth extraction (33.2±9.1 pg/ml) and the level was still decreased to be the lowest level after one month tooth extraction of children (20.18±2.9 pg/ml), the result was significant ($P: \leq 0.05$). The study showed that the highest mean level of IL-6 was found in children in the first week of after tooth extraction (92.1±15.8 pg/ml) and the level was still decreased to be the lowest level was after one month of tooth extraction (67.9±9.81 pg/ml), the result was significant ($P: \leq 0.05$), Table 3.

Discussion

In this study, serum IL-6 level was evaluated in children after tooth extraction as compared to healthy controls. Interleukin-6 is found to be elevated in various inflammatory and malignant diseases including oral infection and their levels are found to correlate with the extent of the infection \(^9\)\(^-\)\(^1\(^1\)\). It is produced by some types of cancer cells and by normal stromal cells, such as fibroblasts and endothelial cells \(^5\)\(^-\)\(^6\). By acting as growth factor, IL-6 is able to promote tumor cell proliferation through upregulation of anti-apoptotic and angiogenic proteins in tumor cells. Also IL-6, is a major mediator of the inflammatory response, plays a primary role in the pathophysiology of wound infection \(^7\)\(^-\)\(^8\). The study results were in agreement with a recent study made by Rhodus et al \(^1\(^2\)\) carried out on 75 children after tooth extraction patients and 15 healthy controls. He found that serum IL-6 level for the patients was significantly higher than normal children and strongly correlated with disease progression. Also Yazid et al \(^1\(^3\)\) found that serum level of both IL-6 and IL-8 were found to be higher in patients than in healthy volunteers. Some other studies have mentioned that children after tooth extraction have more elevated levels of IL-6 and TNF alpha and their levels were negatively correlated with time after the process \((p < 0.01)\) \(^6\)-\(^8\). It was reported that IL-6 antitumor activity was enhanced by induction of induction of T cell and B cell differentiation, stimulation of cytotoxic T cells and help in producing lymphokineactivated killer cells \(^1\)\(^-\)\(^2\). We thought that This immune response trigger synthesis and release of this cytokine leading to augmentation of its serum level that might be utilized as a marker of immunity status and immune system activation in prognosis and monitoring of the course of infection \(^4\)\(^-\)\(^5\). This immune response might be attenuated with the progression of disease stage and inflammatory overwhelming which reflect decrease in (IL-6) synthesis \(^5\)-\(^6\).

Conclusions

There was a highly significant relation of TNF-α and IL-6 with children after tooth extraction and especially in first week after extraction of disease.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Kirkuk health Directorate and all experiments were carried out in accordance with approved guidelines.

Effect of Psychoeducational Program on Eating Disorder Behaviors and Severity Level of Depression: A Quasi Experimental Study

Shwan Asaad Qadir¹, Salwa Shakir Muhsin²

¹ Assistant Lecturer / Family and Community Nursing Department, College of Nursing, University of Sulaimani, Kurdistan Region, Republic of Iraq, ² Prof. Dr. / Psychiatric Mental Health Department, College of Nursing, University of Sulaimani, Kurdistan Region, Republic of Iraq

Abstract

Background: Major depressive disorder is one of the public health problems with prevalence among worldwide. Major Depression (MD) is the most prevalent comorbid mood disorder in eating disorder (ED) patients, and the severity of depressive symptomatology seems to be related to the ED. Most international clinical practice guidelines recommend psycho-educational intervention as first step in the treatment protocol. This study aimed to find out the effect of the psycho-educational program as the treatment of choice for depression patient with eating disorder.

Methods: A quantitative quasi experimental study with pre-post intervention design used to evaluate the effectiveness of psychoeducation program. A non-probability, purposive sample size of (50) patients with major depressive disorder were recruited to the study from January 10th 2018 till October 1st 2019. Beck depression inventory (BDI) was used for measuring the severity of depression, and Garner eating disorder inventory (G-EDI) was other measure used to assess eating behavior problems. Data of the present study was analyzed through using application of statistical package for social sciences (SPSS) version.

Results: The study indicated a significant difference in Beck depression score in intervention and control group after intervention (P< 0.001). It shows that the mean ranks of the difference (gain in scores) of the experimental group was significantly (p < 0.05) higher than the mean ranks of the difference of the control group for all the parameters of eating disorders.

Conclusion: The findings indicated that the 6-sessions psycho-education program has great impact on the severity of depression and all component of eating disorder in patient diagnosed with depression in associated with eating disorder.

Keywords: Major depressive disorder, eating disorders, psychoeducation program.

Introduction

Major depressive disorder is one of the public health problems, with prevalence 3.6% of global population. Major Depression (MD) is the most prevalent comorbid mood disorder in eating disorder (ED) patients, and the severity of depressive symptomatology seems to be related to the ED one. Lifetime comorbidity between eating disorders and mood disorders has been confirmed by several retrospective study, in anorexia nervosa the prevalence of mood disorders varies from 64.1% and 96% whereas in bulimia nervosa between 50% and more, and current comorbidity varies from 12.7 to 68% in anorexia nervosa and is about 40% in bulimia nervosa, and nearly half of BED patients have a comorbid mood.
It’s normal for people with eating disorders to feel depressed at some point, but most research shows 50-75% of those with eating disorders experience major depressive disorder, which can put them at greater risk for suicide. Depression seems to aggravate the severity of eating disorders. Thus, depression may be an important link between eating disorders and suicide. Most international clinical practice guidelines for the management of depression and feeding and eating disorders recommend psycho-educational intervention as first step in the treatment protocol. The psycho-education often precedes intensive forms of treatment or integrates with the other treatments. Recently, the National Institute for Health and Clinical Excellence (NICE) defined psycho-education as “Any structured group or individual program that addresses an illness from a multidimensional viewpoint including social, biological, familial, and pharmacological perspectives as well as providing service users and carers with information support and management strategies.” This study aimed to find out the effect of the psycho-educational program as the treatment of choice for depression patient with eating disorder.

Methodology

Study design:

A quantitative quasi experimental study with pre-post intervention design used to evaluate the effectiveness of psychoeducation program on eating behavior problems among outpatients with previously diagnosed with major depressive disorder. The study was carried out during the period from January 10th 2018 till October 1st 2019.

Study sample:

A non-probability, purposive sample size of (50) patients with major depressive disorder were recruited from attending Ali Kamal consultation center / psychiatric department in Sulaimani city for treatment and follow up. Patients being older than 18 years old and had drug adherence have been recruited to this study. Any patient was diagnosed with other mental disorders such as drug abuse, and pregnant women or puerperium were excluded from this study.

The study instrument:

The questionnaire includes socio-demographic characteristics such as patient’s age, gender, marital status, and level of education, employment status, residential area, income and BMI. And psychiatric characteristics: such as duration of depression, number of hospitalizations, suicidal attempts and family history of mental illness were part of the questionnaire.

Beck depression inventory (BDI) was used for measuring the severity of depression. It is a (21) multiple choice scale statements that evaluates key symptoms of depression including: feeling of sadness, pessimism, sense of failure, self-dissatisfaction, guilt, punishment, self-dislike, self-accusation, suicidal ideas, crying, irritability, social withdrawal, indecisiveness, body image change, work difficulty, insomnia, fatigability, loss of appetite, weight loss, somatic preoccupation and loss libido.

Measurement and scoring:

Beck depression inventory was 4 Likert scale in term of severity of the symptoms, it was scored from zero to 3. Each item of Beck depression inventory is ranked in terms of severity of the symptoms, and it was scored from absence of a symptom (zero) to an intense level (3). Severity of depression was based on the added scores of all items, and it was categorized to 5 levels, which was Normal range (1-10), Mild mood disturbances (11-16), Minimum depression (17-20), Mild depression (21-30), Moderate depression (31-40), and Severe depression (Over 40).

Eating disorder behaviors scale (G-EDI) is a list of (64) items related to (8) subscales, it is six Likert scale ranging from never to always. Items are scored as (never = 0, very rarely = 1, rarely = 2, occasionally = 3, frequently = 4, always = 5). For each sub-scale, item’s score was added, mean was calculated to find out the severity of the subscale. The higher the mean of score refers to the higher severity of eating disorder behaviors in each subscale.

Validity and reliability:

The face validity of the questionnaire was established through a panel of (13) experts of different specialists related to the field of the present study. The internal consistency of the instrument was determined through the computation of Cronbach’s Alpha test. the Cronbach Alpha test of the reliability of the questionnaire was (0.842).
**Statistical Method**

Data of the present study was analyzed through the application of statistical package for social sciences (SPSS) version (22). Mean and mean rank was calculated for each scale. Mann Whitney, Kruskal Wallis and Wilcoxon signed rank test were used to compare the mean ranks of two groups, test the significant relation of the study variables with scores. The P-value of ≤0.05 was considered statistically significant.

**Results and Discussion**

Table 1 indicated that there is a significant difference in Beck depression score in intervention and control after intervention (P<0.001). In the experimental group there had been marked improvements of the means of Garner scale scores after the intervention which is not true for the control group. It shows that the mean ranks of the difference (gain in scores) of the experimental group was significantly (p < 0.05) higher than the mean ranks of the difference of the control group for all the parameters of eating disorders.

Table (2) presents that the scores of gain in Garner scale after the intervention had been compared according to gender of the patient. The table indicates that the mean rank of difference for bulimia among females was 16.1 which was significantly higher than the mean rank (8.4) of the males (p = 0.009). The mean rank of difference of body dissatisfaction was 16.2 for females which was significantly higher than the mean rank of difference of males which was 8.2 (p = 0.008). On the other hand, regarding the ineffectiveness, the mean rank of difference of males (16.8) was significantly (p = 0.034) higher than that of females (10.5). No significant difference was detected between males and females in the mean ranks of the other subscales.

Regarding the employment status (Table 4), significant mean gains in Garner scale have been seen in drive for thinness, and body dissatisfaction. The mean ranks of drive for thinness of the self-employed and unemployed were significantly higher than those of those employed in governmental and private sectors (p = 0.038). Regarding the body dissatisfaction, the highest mean and mean rank of the difference was for the unemployed (p = 0.017).

Table (5) shows that there was no significant association between the mean ranks of the difference in scores of all eating behaviors and income except for the drive for thinness (p = 0.005), but it is evident here that there is no consistent trend.

In this study, the depression level was assessed through the Beck depression inventory (BDI). The mean and mean rank of the difference in Beck depression inventory scores before and after intervention show that the experimental group gained more points of improvement of depression symptoms (mean=23) than the control group (mean=4). The findings indicated large effect size within experimental group after post-intervention of 6-sessions psycho-education program while the effect size within control group was small over time of re-test assessment (P>0.001). The findings of this study showed that the mean and mean rank scores in the subscale bulimia and body dissatisfaction were significantly higher in females (8.2, 16.1) (14.3, 16.2) compare to males (2.0, 8.4) (4.4, 8.2) respectively, similarly with the results of 14, body dissatisfaction’s mean and mean ranks scores were significantly higher among unemployed subjects compared to other categories of employment status of intervention group. Additionally, the findings could be explained by the escape theory which suggests that some people narrow their level of attention to the current and immediate stimulus environment in order to distract attention from negative affect, for example depression, hence leading to external eating disorder behaviors 14.

Conclusion

The findings indicated that the 6-sessions psycho-education program has great impact on the severity of depression and all component of eating disorder in patient diagnosed with depression in associated with eating disorder. The variance in the effect of this program had seen with difference socioeconomic status.

Effect of High Trace Element Levels in Serum of Women Undergoing Intra-cytoplasmic Sperm Injection (ICSI) on Implantation Rate

Lana Nazar Abdul-Razzaq 1, Khalid Mahdi Salih 2, Bushra Jawad Al-Musawi3.

1Assist. Lecturer, Ministry of Education, Baghdad, Iraq, 2Prof. Dr., Department of biology, College of Science -Al-Mustansiriya University, Baghdad, Iraq, 3Ph.D. Kamal AL-Samarrai hospital/Baghdad, Iraq

Abstract

Objectives: To assess the effects of trace element concentrations in serum on implantation rate in women undergoing ICSI.

Study design: Across-sectional study was conducted between March 2018 to April 2019 in Kamal AL-Samarai Hospital, center of fertility and IVF. One hundred and seventeen women underwent ICSI using GnRH-antagonist protocol were recruited. Concentration E2, P4 and two trace elements (Cu, Zn, and Cu/Zn) were measured in serum specimen. Women's were evaluated in two groups; the study group consisted of patients with successful implantation (n = 21) and women in the second group (n=96) experienced implantation failure.

Results: No significant differences were observed in age or BMI between the groups. Serum copper levels were significantly higher differences (P=0.001) in group of failure (198 ± 107μg/dL) than in group of successful implantation (133 ± 46μg/dL), zinc concentrations in group of successful and failure out of the maximum of normal range (137 ± 40μg/dL versus 135 ± 34μg/ dL respectively) but statistically significant differences were did not observed (P˃0.05). When we calculated the copper/zinc ratio (Cu/Zn), it was significantly higher differences (P=0.001) in group of failure (1.59 ± 1) than in group of successful (1.03 ± 0.4). In conclusion, we observed that high serum copper concentrations and (high Cu/Zn ratio) are a risk factor for implantation failure.

Introduction

The latest proposed definition of implantation failure is defined as a failure to achieve a clinical pregnancy after transfer of 4 or more good-quality embryos in a minimum of 2 in vitro fertilization (IVF) cycles in a woman under the age of 40 1, and caused by inadequate uterine receptivity in two-thirds of cases, and by problems with the embryo in the other third and it is a cause of infertility 2. Cobalt (Co), chromium (Cr), copper (Cu), manganese (Mn), molybdenum (Mo), and zinc (Zn) are essential for normal physiologic function and play significant roles in human and overall mammalian reproduction 3. However, few human data are available to describe the role of essential trace elements in IVF/ICSI, and their impact remains inconclusive.

Zinc is a trace element acts an antioxidant functions through Cu/Zn superoxide dismutase (SOD) and essential in vital functions such as cellular division and differentiation, making it essential for successful embryogenesis 4. It has been estimated that the total amount of zinc retained during pregnancy is ~100 mg 5. Because zinc is transported across the placenta via active transport from the mother to the fetus. Studies have shown that the fetus has notably higher zinc concentrations compared to the mother, even in cases of preeclampsia 6, indicating that the fetus, itself, can maintain adequate zinc homeostasis. Alteration in zinc homeostasis may have devastating effects on pregnancy outcome, including prolonged labor, fetal growth restriction, or embryonic and fetal death 7. On the other hand, copper is a redox-active transition metal and can
participate in single electron reactions and catalyze the formation of free radicals, including undesirable hydroxyl radicals; it could contribute to oxidative stress characteristic of preeclampsia. This illustrates that copper itself appears to be a pro-oxidant, but functions as an antioxidant when associated with Cu / Zn SOD. Cu/Zn SOD known to be expressed in both maternal and fetal tissues. Copper-containing contraceptive devices have been suggested to deposit copper ions in the endometrium, resulting in implantation failure. These findings led to the hypothesis that infertile patients with high serum copper concentrations may have experiences implantation failure due to the excessive accumulation of copper ions. Therefore, the aim of the present study was to investigate whether serum copper and Cu/Zn ratio concentrations are related to the implantation failure of human embryos in women undergoing intra-cytoplasmic injection.

Materials and Method

Subject selection

A cross-sectional study was conducted in a Center of Infertility Diagnosis and Assisted Reproductive Technology / Kamal AL-Samarai Hospital,(between March 2018 and April 2019). Women (n=117) were included in the present study. Patients aged between 20-45 years old with BMI > 29 kg/m² and duration of non-reproductive (2-24 years), out of these, 21 women who were successful implantation and 96 women who were implantation failure were compared. All patients provided written informed consent for the study, because our study involved the use of human data. Patients with gynecological disease such as endometriosis, endometrial polyps, fibroid in uterus and diabetes mellitus were excluded.

Ovarian stimulation and ICSI procedure.

Most of patients underwent ICSI treatment with fresh oocytes and freshly ejaculated spermatozoa. In a controlled-ovarian stimulation, rFSH (Gonal-F; Serono; Switzerland or Menogon; Ferring, GmbH Company; Germany) was injected intramuscularly from 2 nd day of menstruation to 2 days before oocyte retrieval, the dose was adjusted according to each individual case. A GnRH antagonist cetrorelix at 0.25 mg (Cetrotide®, Serono, Switzerland) or orgalutron (Organon company, The Netherlands) was administered when at least one follicle reached >14 mm. When more than two follicles were >18 mm, ovulation was triggered with a subcutaneous injection of recombinant human chorionic gonadotrophin (HCG) (Ovitrelle at 250 μg) (Merck- Serono, Geneva: Switzerland), it was administered 24–28 h after the final FSH administration. Vaginal ultrasound-guided aspiration of oocyte–cumulus complexes was performed 36 h later.

Oocyte denudation and ICSI were performed 3 hours after retrieval, and the in vitro culture was carried out in cleavage Gain medium (Fertipro/Belgium) under mineral oil until day 2 (2–5 cells stage) in automated incubators with 6% CO₂ at 37 °C, the growth of all the embryos from each patient (n=117) was continuously monitored. Embryo quality was assessed before embryo-transfer, and a maximum of three embryos transferred to all patients. Pregnancies were diagnosed by serum positive B-HCG levels (>100 mIU/ml) 14 days after embryo transfer.

Determination of parameters

Ethnicity was Iraqi only. Age, duration of non-reproductive, body mass index (BMI), endometrial thickness, E2 and P4, were assessed as possible confounders. Serum E2 and P4 were assessed using a solid-phase, competitive, enzyme immunoassay (Biomerieux/ France). Copper and zinc concentrations were measured in the day of embryo transfer by a clinical laboratory company (LTA/Italia). The trace elements were determined after digestion with chromogen. Briefly one volume of serum (50 μl) was mixed with two volumes of working reagent and for 5 min and then determined by atomic absorption spectrophotometer (Apel/Japan).

Statistical Analyses

Statistical analysis carried out by using Vassar Stats Web Site for Statistical Computation (Lowry, 2013). Measurable data expressed as (M ± SE). The Student’s t test (non-homogeneity, two-sided) was used for comparisons between two groups. The significance of differences estimated at two-tail P level less than 0.05

Results

Table 1 shows the demographic features and clinical parameters of the two groups. No significant differences (P>0.05) were observed in age, BMI, duration of non-reproductive, endometrial thickness, E2, and P4 between two study groups. Copper concentrations (mean ± standard deviation) were significantly higher
(P=0.001) in group of failure (198 ± 107μg/dL) than in group of successful implantation (133 ± 46μg/dL), while zinc concentrations of successful and failure out of the maximum of normal range (137 ± 40μg/dL versus 135 ± 34μg/dL respectively), but statistically significant differences were did not observed. When we calculated the copper/zinc ratio (Cu/Zn), it was significantly higher (P=0.001) in group of failure (1.59 ± 1) than in group of successful (1.03 ± 0.4) as shown in Table 2.

**Discussion**

Our results suggest, for the first time, that high serum copper (low zinc) concentrations are related to implantation failure in Iraqi women.

In the present study, we found that group with failure implantation had significantly higher Cu concentrations and Cu/Zn ratios than groups of successful these results are consistent with previous studies by Tolunay and coworkers when were found decreased ongoing pregnancy chance with increasing follicular fluid of Cu concentrations. Prior research describes associations between essential trace elements in seminal plasma and semen quality parameters among infertile couples, and so is also likely to impact IVF outcomes. Copper, it is essential trace element, has a role in hemoglobin synthesis and immune function and is a cofactor for Cu/Zn superoxide dismutase (Cu/Zn-SOD) and ceruloplasmin. Copper and zinc are important in restoring or maintaining the oxidant–antioxidant balance in blood and tissues also can provide protection of cells against oxidative stress caused by ROS, which would
lead to damage of DNA or other important structures such as proteins and cell membranes. Studies indicated that an elevated Cu/Zn ratio was associated with increased oxidative stress, and oxidative stress closely associated with inflammation status, and the maintenance of redox balance is known to modulate immune system homeostasis. Chronic inflammation, as indicated by increased level of serum ceruloplasmin, is related to elevated level of C-reactive protein (CRP) and Cu. Changes in plasma levels of Cu and Zn has also been demonstrated for certain diseases, but an imbalance of the Cu/Zn ratio seems to be a better indicator of infection, vascular complications, several cancers including in the uterine endometrium, the pathogenesis of preeclampsia, and prognosis of diseases than Zn or Cu status alone. In addition, a previous study indicated that the Cu/Zn ratio may be a useful inflammatory–nutritional biomarker and predictor of mortality in elderly people. Regarding Zn, studies found higher blood Zn was associated with lower fecund ability in a prospective study of women trying to conceive, though of borderline statistical significance. Moreover, previous investigation reported that Zn deficiency increases the absorption of intestinal Cu and that Cu significantly inhibits the influx of Zn across the intestinal brush border membrane. At the molecular level, Zn increases the expression of Zn-finger protein A20, which can inhibit interleukin-1β (IL-1β), and tumor necrosis factor-α (TNF-α), cytokines associated with inflammation.

Importantly, copper and zinc superoxide dismutase transcripts are present in human and mouse oocytes at germinal vesicle and metaphase II stages. The authors concluded that antral follicles might be more susceptible to Cu overexposure and undergo atresia or produce more corpora lutea as a result of ovulation. Other possible mechanisms for follicular damage include induction of cell apoptosis, vacuolization of the cytoplasm, and detachment of cell membrane from its cell membrane.

Again, Zn and Cu are well-known micronutrients that are important for the function of immune cells and the secretion of cytokines. In addition, higher levels of Cu can significantly decrease the number of circulating neutrophils, antibody titer, CD4/CD8 ratio, and NK cell activity.

ABSTRACT

The results of study showed that Cu nanoparticale at concentration of 5 M caused decreasing in chl.a content of tomato leaves significantly and the treatment of river water with Cu nanopartical at 5 M caused the highest value of chl.a (0.494 mg/g) , Cu nanoparticles of all it concentration caused decreasing in chl.b content of tomato leaves significantly comparing with control also with treatment of magnetic distilled water at 2000 Gauss, the concentrations of almost treatments increased the content of chl.b significantly comparing with control ,the treatment of drainage water(7 mmohs/cm) with magnetic water of 2000 Gauss caused the highest value of chl.b ( 0.695 mg/g). Cu nanoparticale at concentration of 0.5 M with magnetized distilled water caused decreasing in carotenoids of tomato leaves significantly, drainage water (7 mmohs/cm) with Cu nanoparticle at (0.5 and 9 M) caused decreasing in carotenoid comparing with control. The highest value of Cu nanopartical (9M) with drainage water ( 7 mmohs/cm) caused enhancement in carotenoid content (0.157 mg/g) comparing with control and treatment of drainage water at 7 mmohs/cm alone. Cu nanoparticale at concentration of 5 M caused decreasing of total chlorophyll content of tomato leaves significantly.

Introduction

A saline soil have a high concentration of soluble salts, high enough to affect plant growth. Salt stress is one of the major abiotic threats to plant life and significantly reduces crop yield in affected areas. Excessive salt above what plants need limits plant growth and productivity and can lead to plant death. About 20% of all irrigated land is affected by soil salinity, decreasing crop yields1. Salinity posses two major threats to plant growth: osmotic stress and ionic stress 2. Several studies have been conducted to investigate the salinity effect in plant growth and productivity 3. Exposed the castor (*Ricinus communis*) plant to salt stress caused a decrease in surface of leaf chlorophyll content, photosynthesis rate , and reduced plant productivity, noting that these effects increased with increasing salt concentration. It was also found that salt stress limits the growth of cucumber plant (*Cucumis sativus*) and causes dry of leaves 4. 5 had resulted that salinity cause a decrease in dry weight and water content of the rest of the *Vicia faba*. The results of the study 6 showed that the amount of chlorophylls (Chl.a , Chl.b ,Chl.a/b) and carotenoid varied by increasing or decreasing the period of exposure to salt stress in Ricinus plant. Some researcher (7,8) emphasized the increase in chlorophyll plant content in low salinity and its degradation with high salinity.

Nanoparticles are minutes finites with lengths ranging from 1-100 nanometers. They have unique physical and chemical properties. They have a large surface area to their size, making them highly motivating on influencing the growth and development of different types of plants, these effects may be either positive or negative 9.

Copper is one of the essential nutrients for plant growth in low concentrations because it needs very small quantities. Copper is involved in many vital processes to form protein and is the main component in the synthesis of many plant enzymes that activate oxygen reduction reactions such as cytochrome oxides, ascorbic acid oxides and lactase 10. Copper is widely distributed in plant tissues and is essential micronutrient for growth and involved in many physiological processes (11, 12).
It is widely used in agricultural industries, cosmetics, coatings, environmental remediation, fungicides, food industry, chemical industry, textile industries, medical industry, paints, plastics, wastewater treatment, and electronics. Copper as an element converts toxic above a threshold level, which depends on the type of crop plants. The plant content of copper ranges from 2 to 20 ppm in plant dry matter and has the highest concentration of copper in chloroplasts, also it plays an important role in the transmission chain of electrons and contributes to chlorophyll synthesis.

The magnetic field is defined as the magnetic force that arises in the area surrounding the magnetic body or in other words can be described as the area surrounded the magnet and shows the effect (in a given material) the magnetization of matter under the influence of an external magnetic field is due to the alignment of atoms or molecules of matter when the material exposed to the magnetic field becomes dipole of its atoms and its molecules are aligned towards the field used. Water is the most important factor for plant growth, the attempts to increase food and energy production for satisfying growing needs led to intensive development of plant production through the use of chemical additives, which in its turn caused more pollution of soil, water and air. Magnetic treatment of water has been reported to change some of the physical and chemical properties of water, mainly hydrogen bonding, polarity, surface tension, conductivity, pH and solubility of salts. These changes in water properties may be capable of affecting the growth of plants. The seedlings in the greenhouse were grown at a temperature (25±), the seedlings were treated with salt water (0, 2.83, 4, 7 mmohs/cm) and magnetized water (0, 2000, 3000 Gauss) and Cu nanoparticles in concentrations (0, 0.5, 5, 9 M) and interaction experiments between the three factors were treated with salt water and magnetized water by watering, while the nanomaterial was sprayed. The experiment was completed in February 1, 2019, and the leaves were taken at the age of four months of plant, the leaves between the third and fifth of the top of plant taken to determine of chlorophylls a, b, total chlorophyll and carotenoids from fresh samples, the chlorophyll content was determined by dipping a specific weight of (0.25) g in 15 ml of acetone (85%), and the samples were kept in the dark at room temperature 25±2 ºC for a week. Chlorophyll was then estimated by method, and the carotenoids content was estimated by method.

Materials and Method

**Tomato (Lycopersicon esculentum L.)** seedlings class california with two month-old were planted at 2 December, 2018. These seedlings were transferred to plastic pots containing a mixed soil: batmos with a ratio of 1: 1, capacity of 1.5 kg and 144 pots (48 treatments and 3 replicates per treatment). The physical and chemical properties of soil were analyzed (table 1) in the laboratories of the Soil Department / College of Agriculture / Al-Qasim Green University.

Table 5 refers that Cu nanoparticle at concentration of 5 M caused decreasing of total chlorophyll content of tomato leaves significantly. All concentrations of all treatments increased the content of total chlorophyll significantly comparing with control. The treatment of drainage water(7 mmohs/cm) with magnetic water of 2000 Gauss caused the highest value of total chlorophyll (0.978 mg/g).

**Discussion**

The plant growth subjected to high levels of Cu nanoparticle leads to reduce in biomass, chlorotic in leaves as well as decreasing in chlorophyll content, which is resulted from the change in the chloroplast structure lead to increase oxidation fat and then reduces the content of fatty acids. The Cu nanoparticle appears like the normal copper effect, nanoparticles cause many changes morphological and physiological to plants depending on the characteristics of these nanoparticles, may vary the efficiency of nanoparticles by the chemical composition, size and space surface and reactivity as well as the dependent on the type of plant and concentration as it is different from plant to time

**Conclusion**

1- The river water (2.83 mmohs/cm) and drainage water (4 and 7 mmohs/cm) enhanced the chlorophyll content.

2- The copper nanoparticles at different concentrations vary in effects on chlorophylls but these were no change in carotenoids significantly.

3- All the type water in current study which magnetized of 2000 Gauss enhanced the chlorophylls and carotenoid.

4- The interaction between types of water, Cu nanoparticles and magnetized water, all of increased the chlorophyll content comparing with control.

Effectiveness of an Educational Program on Physically-Disabled Fighters’ Quality of Life at Rehabilitation Military Center in Al-Basra City

Mukdad Ali Hamead¹, Hala Saadi Abdul Wahid²

¹ Ph. D. Student, Academic Nurse Specialist, Lieutenant Colonel, Ministry of Defense, Iraq,
² Prof. Dr., Community Health Nursing Department, College of Nursing, University of Baghdad, Iraq

Abstract

Objective(s): The aim of the study is to determine the effectiveness of the education program on physically-disabled fighters’ quality of life, to determine the effectiveness of the education program on physically-disabled fighters’ health status.

Methods: A quasi-experimental, one group test retest design, is carried out in order to achieve the objectives of the study by using the evaluation approach and the implementation of the education program at the Rehabilitation Military Center in Al-Basra City from of January 7th, 2019 to October 31st 2019. Non Probability “purposive” sample of (27) physically disabled fighters’ is selected for the present study. The sample is assigned according to the following criteria: a. Physically disabled who has not participated in any health educational program related quality of life. b. Physically disabled fighters are selected as having disability ratio from 60 to 80 percent. Test-retest reliability and content validity “panel of (18) experts” of the questionnaire are determined through pilot study.

Data are collected through the application of the education program, the use of the questionnaire and the structured interview as means of data collection. Data were analyzed through the use of descriptive statistical data analysis approach of frequency, percentage, mean, mean of scores, total of scores, range and standard deviation and inferential statistical data analysis approach T-test, multiple linear regressions, person correlation coefficient, Chi-Square test, and analysis of variance (ANOVA).

Results: The results of the study depict that the evaluation of physically-disabled fighters’ health status and quality of life is moderate due to the effect of physical disability; the physically disabled fighters’ quality of life domains have been improved due to the effect of the education program; the physically disabled fighters’ health status have been improved due to the effect of the education program; physically disabled fighters’ quality of life is significantly different relative to their age, residency, marital status, level of education, and chronic illness, and a non-significant difference relative to their type of injury and socioeconomic is determined.

Conclusion: The study concluded that the health education Program has produced an effect on the physically-disabled fighters’ health status in the study group post its implementation. So, the study has confirmed that the program is an effective mean for the physically-disabled fighters’ health status in the Rehabilitation Military Center; the Health Education Program has produced an effect on the physically-disabled fighters’ quality of life in the study group post its implementation. Further, the study has confirmed that the program is an effective mean for the enhancement of the physically-disabled fighters’ quality of life in the Rehabilitation Military Center.

Keyword: Educational Program, Quality of Life, Physically-Disabled Fighters’.
**Introduction**

The World Health Organization (WHO) defines a disability as something that impairs, limits activity, or constrains an individual’s participation.

Physical disability is defined as “the loss of motor function of varying degrees or limitation in movements or activities resulting from deformed limbs, body paralysis, or deformity caused by damage to the structure or function of body parts.”

A physical disability is the long-term loss or impairment of part of a person’s body function, resulting in a limitation of physical functioning, mobility, dexterity or stamina. Due to the functional loss the person will experience the inability to perform normal movements of the body, such as walking and mobility, sitting and standing, use of hands and arms, muscle control.

A Physical disability, which are also referred to as orthopedic, neuromotor, or musculoskeletal impairments, are those that prevent normal physical functioning. Examples of physical disabilities include cerebral palsy, a neuromotor disorder resulting from brain injury that impairs movement control, and spinal bifida, a neuromotor impairment of the spinal cord that can limit normal movement and cognitive functioning.

Quality of life is described as a wellness resulting from a combination of physical, functional, emotional and social factors. It is a broad multidimensional concept that includes subjective evaluations of both positive and negative aspects of life. Physical disability can decrease quality of life and limit the community participation. A significant and negative association was found between disability and quality of life.

The disabling nature of the chronic disease can limit the daily activities, restrict the society roles, unemployment and finally lead to drop the quality of life, the quality of life can be affected by disability.

People with physical disability are more likely to have chronic diseases such as cardiovascular disease, diabetes, stroke, arthritis, asthma, high blood pressure, cholesterol, and exposure to bed ulcers. The most common health problems among the physically disabled are obesity, which limits the freedom of movement and work in the environment, and limits the ability of the disabled to work daily activities such as feeding, bathing, and thus limit the ability of the person to rely on him-self.

Physically disabled people experience more restrictions in social activities than healthy people, which are associated with lower level of wellbeing.

The education is effects on people’s earnings and productivity; education helps them in achieving a variety of outcomes that matter for quality of life. Education is one of the most important predictors of one’s health status, Employability and probability of being married, all are well known predictors of quality of life.

Health education can improve quality of life, emotional function and lessen distress. Education improves well-being because it increases access to non-alienated paid work and economic resources that increase the sense of control over life, as well as access to stable social relationships, especially marriage, that increases social support.

Patient education significantly improves quality of life. It is concluded that patient education has a reliable positive impact on the quality of life. Education influences positively health condition and by this quality of life. The educational process passes also knowledge, skills and psycho-emotional motivations, allowing partner interaction between a patient and a teacher. The aims of education are though making patients independent, producing motivation for therapy and counteract fear, depression and frustrations.

**Method**

A quasi-experimental, one group test retest design, is carried out in order to achieve the objectives of the study by using the evaluation approach and the implementation of the educational program at the Rehabilitation Military Center in Al-Basra City from of January 7th, 2019 to October 31st 2019. The present study is conducted on physically disabled fighters at the Rehabilitation Military Center in Al-Basra City. The Military Rehabilitation Center is established on May 7th, 2018. It provides medical and rehabilitative services to physically disabled fighters’ who have disability ratio from 60 to 80 percent. Non Probability “purposive” sample of (27) physically disabled fighters’ has been selected for the present study. The physically disabled group is exposed to the educational program. The sample is assigned according to the following criteria:

a. Physically disabled who has not participated in any health educational program related quality of life.

b. Physically disabled fighters are selected as having disability ratio from 60 to 80 percent.
An educational program is constructed for the purpose of the study. The program is oriented toward the physically-disabled fighters’ quality of life. The program is comprised of (6) lectures. These lectures focus on physically-disabled fighters’ quality of life related issues.

The questionnaire is composed of three main parts as follows:

**Part I:** The Physically Disabled Socio-Demographic Characteristics: This part includes items of age, gender, residency, types of injury, marital status, level of education, chronic diseases, and socioeconomic status which are calculated through use for Socioeconomic Status Scale Low= (less than 59), Moderate= (60-80), and High= (81-100).

**Part II:** The Physically Disabled Fighters’ Health Status Evaluation Tool: This part is comprised of (32) item that measure physically disabled fighters’ health status about physically disabled fighters’. It is measured as High= (2.34-3) it mean poor health status, Moderate= (1.67-2.33) it mean moderate health status, and Low= (1-1.66) that means good health status.

**Part III:** Physically Disabled Fighters’ Quality of Life Evaluation Tool: This part is comprised of (69) item that measure physically disabled fighters’ quality of life about physically disabled fighters’. It is measured as High= (2.34-3), Moderate= (1.67-2.33), and Low= (1-1.66).

Test-retest reliability is employed for the determination of the study instruments stability. Pearson correlation coefficient is computed on responses of (12) physically disabled fighters at the Rehabilitation Military Center in Al-Basra City, determined through a pilot study. The content validity of the program and the study tools are determined through the use of panel of (18) experts.

Data are collected through the application of the education program, the use of the study instruments and the structured interview technique as means of data collection.

The data of the present study are analysed through the use of the Statistical Package of Social Sciences (SPSS) version 20. Through descriptive statistics (frequency, percentage, mean, mean of scores, total of scores, range and standard deviation) and statistical inferential (T-test, multiple linear regressions, person correlation coefficient, Chi-Square test, and analysis of variance ANOVA).

Results were determined as highly significant at (P≤0.01) significant at (P≤0.05) and non-significant at (P>0.05).

This table revealed that there was a high significant relationship between physically disabled fighters’ quality of life and their age in pre-test for study group at (P < 0.05), while in post-test I shows that there was significant relationship between physically disabled fighters’ quality of life and their age at (P < 0.05), and there was a non-significant relationship between physically disabled fighters’ quality of life and their age in post-test II at (P ≥ 0.05). This table shows that there was a significant relationship between physically disabled fighters’ quality of life and their residence in pre-test for study group at (P < 0.05), while in post-test I and post-test II shows that there was non-significant relationship between physically disabled fighters’ quality of life and their residence in post-test II at (P ≥ 0.05). This table shows that there was a significant relationship between physically disabled fighters’ quality of life and their type of injury in pre-test for study group at (P < 0.05), while in post-test I and post-test II shows that there was non-significant relationship between physically disabled fighters’ quality of life and their type of injury at (P ≥ 0.05). This table shows that there was a non-significant relationship between physically disabled fighters’ quality of life and their marital status in pre-test for study group at (P ≥ 0.05), while in post-test I shows that there was a significant relationship between physically disabled fighters’ quality of life and their marital status at (P < 0.05), and there was non-significant relationship between physically disabled fighters’ quality of life and their marital status in post-test II at (P ≥ 0.05). This table shows that there was a significant relationship between physically disabled fighters’ quality of life and their level of education in pre-test for study group at (P < 0.05), and this table shows that non-significant different between physically disabled fighters’ quality of life and their level of education in post-test I and post-test II at (P ≥ 0.05). This table shows that there was a significant relationship between physically disabled fighters’ quality of life and their level of education in post-test II at (P ≥ 0.05).
relationship between physically disabled fighters’ quality of life and their chronic disease in pre-tests for study group at (P < 0.05), and this table shows that non-significant different between quality of life and chronic disease in post-test I and post-test II at (P ≥ 0.05). This table shows that there are no significant among three periods (pre-test, post-test I and post-test II) related to physically disabled fighters’ quality of life and their socio-economic status at (P ≥ 0.05).

Discussion

Part I: Discussion of the Effectiveness of the Education Program on Physically-Disabled Fighters’ Health Status

Analysis of such physically disabled fighters’ health status between the three period (pre-test, post-test I and post-test II) related to physically disabled fighters’ health status, in the present study, have moderate health status before the educational program implementation, and improved health status after educational program implementation (Table 1). This finding provides empirical evidence that these physically disabled fighters’ is perfect candidates to the education program because they experience health related problems and improved physically disabled fighters’ health status after implementation of educational program. Throughout the course of data analysis, the study depicts that physically disabled fighters’ health status has been improved particularly for those in the study group. So, we can confirm that physically disabled fighters’ in the study have benefited out of the education program implementation and the quality of life program can be considered an effective tool to improve physically-disabled fighters’ quality of life in the rehabilitation military center.

This finding is in an agreement with study conduct by Javed and others conduct a study to examine the effect of education on quality of life and well-being. The study depicts that an education influences people’s perception of their quality of life domains and well-being.

Part II: Discussion of the Effectiveness of the Education Program on Physically-Disabled Fighters’ Quality of Life and their Socio-demographic Characteristics

Analysis of such differences reveals that physically-disabled fighters’ quality of life is significant different relative to their age, residency, marital status, level of education, and chronic illness, except that of type of injury, and socioeconomic status which depicts not significant different relative physically disabled fighters’ quality of life (Tables 3).

This finding is in an agreement with that of a study indicate there is a statistically significant difference between quality of life and their: age, marital status, and educational level.

Conclusion

1. Evaluation of physically-disabled fighters’ health status and quality of life is moderate due to the effect of physical disability.
2. The physically disabled fighters’ quality of life domains have been enhanced due to the effect of the education program.

3. The physically disabled fighters’ health status has been improved due to the effect of the education program.

4. Physically disabled fighters’ quality of life and socio-demographic characteristics. Physically-disabled fighters’ quality of life is significant different relative to their age, residency, marital status, level of education, and chronic illness, and a non-significant difference relative to their type of injury and socioeconomic is determined.

Abstract

Objective: The objective of this research is to identify the microscopic Characteristics in plant extraction by detecting effective component and examine of antibacterial vitality.

Procedure: Taraxacum officinale leaf was gathering of Baghdad city. After the prepare the leaf and the preparation and scrub and then dried we extracted by the SOXHLET device where we use 90% ethanol. This pharmacological study includes microscopy and a chemical screening using reagent. Through the diffusion method an antibacterial evaluation of the leaf extract was detected. in this treatise was used diverse bacteria Pseudomonas aeruginosa, Klebsiela pneumonia, Staphylococcus aureus, E. coli, Enterococcus faecalis and Streptococcus spp.

Outcomes: An outcome indicates the presence in the top and down surface of the leaf type of stomata is the stomatal actinocytic while non-glandular trichome is found only above the top surface of the leaf. As the outcome of microscopic screening of the forms of fiber that the indicators for the top area of the leaf was 18%, while the down region was 31% for the leaf. The Initial outcome of chemical plant screening for plant leaf was revealed existence at Tannins, Saponins, Terpenoids and Alkaloids component. The outcome of effectiveness against bacteria in the search was offered showed diverse activity against all bacterial species within search.

Keywords: Taraxacum officinale, stomata, phytochemical screening

Introduction

Dandelion is Perennial herbaceous plant belongs to the family Asteraceae (Compositae) Also called T. officinale, green areas and on the sides of the road, Banks, beaches and areas with moist soil. This plant has been used in herbal medical fields. It was also mentioned specifically in Asia, Europe and North America. For the roots of the plant is very useful for the treatment of problems of the gastrointestinal tract support liver function and digestion while plant leaves are used as diuretic and digestive stimulants. Medicinal plants contain a range of active compounds of great importance and therapeutic properties as most studies indicate the increasing activities of antimicrobial plants by detecting areas targeted by antibiotics by plant extracts against drug-resistant microbial pathogens. The curative Characteristics of plant extracts can be introduced into traditional or folk medicine by interacting with certain species and producing antioxidant activities. Dandelion plant has a protective effect against brain damage caused by lead. The root of the dandelion plant contains some substances that have antioxidant property these substances are inulins, lactones, triterpenes, sterols, flavonoids, and phenolic acids. Through studies in China and America found dandelion plant containing antiperspirants through its inhibition of NO production and cyclooxygenase-2 (COX-2) acts as anti-inflammatory and antinociceptive. In recent years it has increase important to find naturally occurring antioxidants for food safety for the purpose of promoting health and preventing various infections and their high degree of safety in human use and consumer acceptability.
Material and Method

Collection of Plant Material

A leaf of dandelion plant was aggregated of region saydiya in Iraq. After obtaining the leaf of the plant was wash out by distilled water and scour with strainer paper to remove powder and suspended parts and then drying temperature up to 25-30°C for one week and persistent stirring to block the formation of molds. It was then weigh, grind, placed in tight vials and stocked for use in the extraction process. The plant sample was identified and authenticated by national herbarium of ministry of agriculture of Iraq.

Extraction

The plant samples (leaves of plant) were washed dried under shade conditions for 10 days. After drying the leaves were powdered in a mechanical grinder. 300 g of leaves powder was packed in the thimble of Soxhlet apparatus and extracted with 900 ml of aqueous ethanol (ethanol-water 80:20 v/v) for 12 hr. extract was filtered and concentrated under vacuum using rotary evaporator to get a dry residue. 12 g of residue was used in screening the different active compounds.

Preliminary Phytochemical Investigation

Preliminary investigations for the chemical constituents were done using 5% ethanolic potassium hydroxide (KOH) for detect of flavonoids, mayers and dragendroffs reagents for detection of alkaloids and foam test for saponins, 1% lead acetate test, ferric chloride (FeCl3) and alkaline test for tannin.

Macroscopic Examination

Fresh specimens of plant were used to study the morphological characters of the plant such as a shape of leaves, stems and margins.

Microscopic Examination

Powdered Microscopy

Dried leaves were finely powered used for examined the anatomical study and observed the plant tissue component, teeny magnitude of the dust was putted in slide to clarify by few drizzle from the chloral hydrate and wrapped for covering skid for tested under microscope. Different cell components were observed and taken the figures by microscopical camera.

Leaf Microscopy

For determination the type of stomata and type of trichomes used two surface of leaves. The lower and upper epidermal layer of fresh leaf were clarifying by chloral hydrate and heating for many times and observed under a microscope. Determination of the components of leaves (stomata, trichomes and stomatal index) were carried out under microscope. The stomatal index was carried out by using the following equation.

\[
\text{Stomatal index} = \frac{\text{No: of Stomata}}{\text{No: of Stomata} + \text{No: of epidermal cells}} \times 100
\]

Antimicrobial examination

Efficiency is gauged through the essential disc sawing way. All pure culture from bacteria was possessed to the lab of microbiology, basic Science College of dentistry of Mustansiriyah University. Pseudomonas aeruginosa, Klebsiela pneumonia, Staphylococcus aureus, E. coli, Enterococcus faecalis and Streptococcus spp. It was cultivated in a culture medium where each was mixed with a concentration of Taraxacum officinale extract, Inhibition zone were determine through fisher-lilly zone. The concentricity of streptomycin was the measurement was made-up in Three copies.
Outcomes and debate

Macroscopical and Plant Morphological

Dandelion cultivate of Of single and uncomplicated roots, it grow more than approximately 10 stem 7–36 cm long, however occasionally up to 66 cm long. a outcome of the morphological study were referred to the leafs are 3–40 cm long and 2–8 cm broad. The leaf border is usually Lobular and often ruptured or serrated with severe teeth.

Microscopical Examination

Outcome was reference to actinocytic type of stomata was presented on top and down exterior of the leafs, whilst the non-glandular unicellular trichomes offered on top exterior of the leafs. Also the microscopic Outcome was reference to streak form fibers.

Phytochemical Screening

Outcomes from leaves extract were presented and referred to the extract was contain the Tannins, Saponins, Terpenoids and Alkaloids compounds.

Antimicrobial Activity

The plant anatomical results were reference to Anomocytic stomata type in the leaves. Unicellular unbranched covering of trichomes, fibers and starch present in the leaves of the Taraxcum officinale plant (figure 3,4,5,6). The phytochemical profile results of active constitutes were referenced to many active compounds were presented such as tannin, saponins, Tannins, Saponins, Terpenoids and Alkaloids which isolated and purificated Table (2). The pathogenic bacteria which used for investigated the bioactivity of leaves extract of Taraxcum officinale were E coli, pseudomonas aeruginosa, Streptococcus spp., Staphylococcus epidermidis, Enterococcus faecalis, Klebsiella pneumoniae and Staphylococcus aureus. The different concentrations of cardioactive glycosides extract from leaves (1000,500,250,125,63.5µg /ml) were found active for all microorganisms strain in concentration 1000 µg /ml while inactive in 63.5 µg /ml concentration exception Enterococcus faecalis effected in this concentration. The largest inhibition zone found in Enterococcus faecalis in all concentrations while the smallest inhibition zone found in Staphylococcus epidermidis bacteria. In obtained results shown that Taraxcum officinale extract effect for all types of bacteria that mean this extract has good potency against all tested bacteria seen in table (1) and figure (2).

Effect of Different Resin Luting Materials on the Marginal Fit of Lithium Disilicate CAD/CAM Crowns
(A Comparative Study)

Manar M.Alajrash¹, Mohammed Kassim²
¹M.Sc.Student, ²Asist.Prof. (Conservative dentistry Department, College of Dentistry/ Mustansiriyah University, Iraq)

Abstract

Aim of the study: To recognize the effect of using different resin luting materials on the vertical marginal discrepancy of Lithium Disilicate CAD/CAM crowns.

Material and method: A total of 36 intact maxillary first premolars extracted for orthodontic purpose were disinfected in a solution of 1% Thymol for 1 day which utilized to receive a ceramic crown after tooth preparation. Digital impression was made with Omnicam Scanner (Dentsply Sirona) using Cerec Premium Software. Lithium disilicate CAD/CAM crowns made via In-Lab MC XL milling device (Dentsply Sirona) and cemented with different resin luting materials. The marginal discrepancy was measured at three locations on each tooth surface, with optical microscope at 200x magnifications before and after cementation. Statistical analysis was performed with one way ANOVA test to know statistical significance and Turkey’s test (HSD) to compare the mean marginal increase among the three groups (P=0.05).

Statistical analysis: The least amount of marginal increase after cementation was with Gaenial universal flo (flowable composite); with a mean marginal increase of 38.53 ±0.63 mm. Choice2 cement (resin cement) increased the margins by mean 40.55 ±0.95 mm. The highest marginal increase was detected in the Ceramx one sphere TEC (preheated composite) resin group (87.82±1.26 mm).

Conclusion: Cementation of CAD/CAM crowns with preheated composite resin (Ceramx sphere TEC one) cause a marginal increase surpassed the clinically acceptable range of marginal discrepancy.

Keywords: resin cement, flowable, preheated, Lithium Disilicate, Marginal discrepancy, CAD/CAM.

Introduction

The vertical marginal discrepancy considered as an integral part of indirect restoration and this discrepancy increased after cementation and poor marginal fit can lead to microleakage, marginal discoloration, dissolution of cement and secondary caries. Type of cement used can govern the amount of augmentation in discrepancy after cementation, but to which degree computer aided design/ computer assisted manufacture (CAD/CAM) Lithium Disilicate crown affected by different resin cement is unclear. Marginal discrepancy is a perpendicular distances from the margin of a restoration to the-finish-line-of the tooth preparation¹. Although-horizontal discrepancies such as crown overhangs intraorally can be adjusted to some degree; but the vertical marginal-discrepancy can be closed only by the luting cement,-which-is-prone-to-degradation. Therefore, the-vertical marginal-discrepancy- has the-most-clinical significance-and-should-be considered-the more-critical-element in-crown margin-evaluation². Marginal fit considered as a basic factor in the success of indirect restoration. Poor marginal fit may cause cement dissolution which lead microleakage or secondary caries³. Therefore; to-decrease the-incidence-of above mentioned complications minimal marginal discrepancy is-an essential element for long term restoration success. Conflicting studies proposed regarding the clinical acceptable marginal-discrepancy. Some studies recommend a marginal discrepancy of less than 120 μm⁴ and others less than 100 μm⁵. Different brands of luting
cements have been used for the adhesive luting of ceramic crowns, and attitudes vary as to which is the best. Dual-polymerized resin cements have been designated when the ceramic material is too thick or too opaque to allow satisfactory polymerizing light transmission\(^6\). Furthermore, flowable composite resins have been advised for adhesive luting. Barcelheiro et al\(^9\) found similar results when bonding feldspathic porcelain to bovine enamel by using dual polymerized resin cement and a light polymerized flowable composite resin. Their study has been advised clinicians to use flowable composite resins as an appropriate substitute luting agent when bonding porcelain laminate veneers less than 2 mm in thickness.

In addition preheated composite resins have also been used to bond restorations. Preheating composite resin decreases its viscosity and ultimate film thickness, offering the clinician an improved controlling and superior composite resin adaptation to preparation margins, together with an increased degree of polymerization and depth of polymerization\(^10\).

There is no specific cementation protocol for lithium-disilicate restorations can be considered ideal\(^9\). Moreover, researches regarding the influence of luting cement on marginal discrepancy after cementation provide different results\(^10\).

This in vitro study to recognize the effect of using different resin luting materials on the vertical marginal discrepancy of Lithium Disilicate CAD/CAM crowns is proposed.

**Material and Method**

Thirty-six sound human maxillary first premolar teeth of equivalent size and shape extracted for orthodontic purpose from patients with age range 17-22 years had been selected to be used in this in vitro study. Cleaning of teeth has been done carefully from any calculus and soft tissue deposits with air Scaler then disinfected in a solution of 1% Thymol for 1 day.

To avoid dehydration of the specimens during all stages of the study samples has been stored in distilled water at room temperature\(^11\). All teeth samples has been implanted individually in cold cure acrylic resin block up to 2 mm apical to the CEJ to approximate the support of alveolar bone in a healthy tooth then the teeth prepared with high-speed turbine mounted on dental surveyor (Dentauro, Germany) (Fig. 1), with copious water spray under ×4 magnification (Carl Zeiss dental loupe) to receive a ceramic crown according to the following criteria: a planar occlusal surface reduction, 1.0 mm deep chamfer finishing line depth, 6 degree convergence angle and 5 mm height from the occlusal level to the intended finish line both buccally, and palatally (Fig. 2).

**Figure (1): high-speed turbine mounted on dental surveyor**

Direct scanning was done by powder-free Omnicam intraoral scanner (Dentsply Sirona Dental System, Bensheim, Germany) by using CEREC premium software (version 4.5), then In Lab MCXL (Dentsply Sirona Dental Systems, Bensheim, Germany) was used to produce the full ceramic crown using-CEREC in-Lab (version 18.0) software

**Figure (2): Finished prepared tooth**

Results

Statistical analysis was performed with one way ANOVA test to know statistical significance and significant differences were found among the groups (P=.000) and tukey test (HSD) has been performed to compare the mean marginal increase among the three groups. The mean marginal increase after cementation for Gaenial univer-sal flo (flowable composite) was 38.53±0.63 mm. For Choice2 cement (resin cement) was 40.55±0.95 mm and for Ceramx sphere TEC one (preheated composite) group 87.82±1.26 mm (table 3). Representative digital image of the crowns before and after cementation are shown in Figure 3.

Discussion

The Results of this study has been revealed that significant differences among the groups (P=.000). The increase in the marginal discrepancy after adhesive luting of restorations was constant with that of other studies.

Outcomes of the present study demonstrated an increase in marginal discrepancies of 38.53±0.63 μm with flowable composite (Gaenial universal flo), 40.55±0.95 μm with resin cement (choice 2), and 87.82±1.26 μm with preheated composite (ceramx sphere TEC one).

Results have been demonstrated that preheated composite (ceramx sphere TEC) had a meaningfully higher value of marginal increase than flowable composite (Gaenial universal flo) and resin cement (choice 2). These results agree with those of the study by Sampaio et al who stated that preheated restorative composite resin (68_C) had a higher film thickness (300 μm) than flowable resins (150 μm). Results of the current study also agree with those findings by Blalock et al who acknowledged an average film thickness of flowable composite resin (35 μm) and preheated composite resin at 54_C (140 μm). The reported marginal increases after adhesive luting have ranged between 13 and 50 μm. Flowable composite (Gaenial universal flo) and resin cement (choice 2) used in this investigation seemed to meet the International Organization for Standardization requirement which is 50 μm maximum film thickness, because the increase in marginal gaps after cementation was within the recommended limit, where is preheated (ceramx sphere TEC) much higher than recommended and this agree with Stappert et al who found that 20 to 50 μm marginal increase for e.max restorations.
cemented with resin luting cement (Variolink II; Ivoclar Vivadent AG).

In 2013 Sakrana examined the fit of two types of ceramic single crowns and indirect composite resin complete coverage crowns before and after cementation with self-adhesive resin cement and found an increase in the marginal discrepancy after cementation ranging from 24 to 40 mm.

Results of the present study revealed that preheated composite (ceramx sphere TEC) resin caused a large marginal increase (87.82 ±1.26) which is above the required limit, placing results out of the range of marginal increase of previous studies. Therefore, it is not recommended for crown cementation; instead, flowable composite (Gaenial universal flo) are recommended beside the resin cement (choice 2).

The above mentioned facts agree with Mounajjed et al. who identified that the marginal increase of pressed lithium disilicate crowns cemented with preheated composite resin exceeded the clinically acceptable range of marginal discrepancy. Beside that manufacture literature stated that Gaenial Universal Flo represents a simple and efficient solution for the cementation of veneers. This versatile, injectable restorative composite unites easy handling, high physical properties and excellent aesthetics. Generally used as a restorative and liner material, it can also be used for the bonding of veneers and some inlays and onlays where light-curing is possible and considered as good alternative to preheated composite.

Some studies reported a mean increase of the margins of approximately 17 μm. Other study by Pascale et al. stated that luting of inlay, onlay and overlay with preheated restoration composite doesn’t prevent seating accuracy, these results disagree with our findings.

According to Shinkai et al., the rate of flow of luting agent depends largely on the amount and configuration of the filler particles. This is explain that why flowable composite (Gaenial universal flo) has highest flow as it contain 69 % fillers by weight compared to resin cement (choice 2) 75 % fillers by weight and preheated composite (ceramx sphere TEC) 77-79% fillers by weight and regarding to configuration Gaenial universal flo has an ultra-fine spherical particles (strontium glass) which tend to improve fracture strength and increase flow rate.

Masouras et al. stated that in addition to the amount, size, and type of filler material, the coupling of the resin matrix to the filler particles played an important role in the material’s performance, according to manufactured Gaenial universal flo has a new silane surface treatment which is called full coverage silane coating (FSC) technology which makes it possible to homogeneously and densely disperse ultrafine 200 nm fillers. Flexural strength considered as the most important physical properties of luting agent, according to manufactured Gaenial universal flo has very high flexural strength (167 MPa) compared to choice 2 resin cement (124 MPa) and ceramx sphere TEC (146 MPa) thanks to the new filler filler technology which allowed to develop an injectable material that is stronger than most conventional composite.

On the topic of the manufactured, one of exclusive advantages of Gaenial universal flo its viscosity which is carefully balanced in order to provide material that has a thixotropic property which provides easy placement and flow smoothly under pressure.

According to the above mentioned properties and findings, Gaenial universal flo can be considered as a suitable alternative luting agent when bonding lithium disilicate crowns that were less than two millimeter in thickness.

Conclusions

Within the limitations of this in vitro study, the following conclusions:

1. The cementation process increased the marginal discrepancy for the 3 luting cements evaluated.
2. Preheated composite resin (ceramx sphere TEC one) had produced significantly higher marginal discrepancies than flowable composite resin (Gaenial universal flo) or resin cement (Choice 2).

Antibacterial and Antifungal Activities of Centaureabruguierana (Asteraceae) from Iraq

Shaima H. A. ALAbbasi¹, Talib O.H. Al-Khesraji², Sirwan H.Salih³
¹Department of Biology, College of Education, University of Samarra, Iraq, ²Department of Biology, College of Education for Pure Sciences, TikritUniversity, Iraq, ³Department of Biology, College of Education, University of Garmian,Iraq

Abstract

The methanol and aqueous extracts of Centaureabruguierana. (Asteraceae) from Iraq were tested for their biological activity against two Gram positive, two Gram negative bacteria and four fungal species by using agar well diffusion method. The crude methanol extract (100mg/ml) and its dilutions and the crude aqueous extract( 100mg/ml) showed biological activity against all bacteria and fungi studied. Compared with the aqueous extracts, methanol extracts, particularly the crude one, were more bioactive against bacteria and fungi studied. Among the studied microbes, E.coli, Staphylococcus aureus and Microsporum canis were the most sensitive species to C.bruguierana extracts tested. Methanol extract at all concentrations and aqueous extract at high concentrations showed close or more antibacterial activity( except in case of P.auruginosa) than that of the bacterial control ( tetracycline) . The crude methanol extract was more bioactive against all fungi studied than the fungal control ( nystatin ).This is the first report on the antibacterial and antifungal activities of C.bruguierana extracts from Iraq and its bordering countries.

Kew words : Antibacterial, Antifungal, Asteraceae, Centaurea, Iraq.

Introduction

Centaurea is the fourth largest genus in the Asteraceae family, including 300 -700 species[1][2][3][4] with annual, biennial and perennial plants [5] that distributed all around the world especially in Mediterranean sea region and west Asia [1][4]. In Iraq, this genus was represented by more than 30 species [6]. Species of this genus have been used in folk medicine as diuretic , stomachic , tonic, astringent, antimalarial ,antirheumatic, antidandruff, hypoglycemic and antipyretic [2][7][8][9][10]. Many investigations have been indicated the presence of different classes of active compounds in this genus which in many cases are responsible for its biological activity[10][11]. C. bruguierana (DC.)Hand.-Mazz. was reported for the first time from Iraq [12]. Our previous study [13] showed a high flavonoid content in this species. However, there is no reports on the antimicrobial activity of C. bruguierana in the literature .Therefore, this study was conducted to evaluate the effects of the methanol and aqueous extracts of this species in four bacterial species ( two Gram positive and two Gram negative ) and four fungal species .

Materials and Method

Plant materials and extraction method

C.bruguierana samples were collected from Tikrit province/ Salahadin Governorate (north central Iraq) in March 2018 . Plant samples were identified according [14] and confirmed by the Iraqi National Herbarium. Identified samples were kept in the Department of Biology, College of Education for Pure Sciences,TikritUniversity,Iraq . Aerial flowering parts of C.bruguierana were oven dried at 40ºC and then grinded with electrical mill. 40 g of the powdered samples were extracted with 160ml of 95%methanol or hot distilled water for 24 hours, then the liquid was filtered through gauze colth and filter paper Whatman No.1 and the filtrate was concentrated at 40ºC. The solid residue was stored in the fridge until subsequent use . For in vitro assay ,1gm of the solid
residue were dissolved in 10ml of the same solvents (methanol or distilled water) and tested at concentrations 25,50,100mg/ml. These concentrations were evaluated in triplicate for bacteria or fungi tested. Before use, the crude extracts (100mg/ml) were filtered by using Millipore filter with Whatman filter paper No. 0.22 [15][16].

**Microorganisms and antimicrobial assay**

Two Gram positive( *Staphylococcus aureus*, *Bacillus pumilus*) and two Gram negative( *Escherichia coli*, *Pseudomonas aeruginosa*) bacterial species, three fungal species(*Microsporumcanis*, *Trichophytonrubrum*, *Asperrillus terreus*) and one yeast (*Candida albicans*)were used in this study. All bacteria and molds were obtained from the Biology Department, College of Science, Baghdad University and the yeast was supplied from the Department of Biology, College of Science, Tikrit University. Nutritive media used included nutrient agar and MacConkey agar for bacteria and Sabouraud dextrose agar and potato dextrose agar for fungi(all media from Bekasi, Indonesia).抗菌和抗真菌活动被用经过好扩散方法[16][17]。对于抗菌和抗真菌测试,tetracycline和nystatin(100µg/ml for each) were used as positive control while methanol and sterilized distilled water were used as negative control.

**Results and Discussion**

The biological activities of the methanol and aqueous extracts of *C. bruguierana* against bacterial and fungal species tested in this study are presented in Table 1; Fig.s.1,2. The results showed that all C. *bruguierana* extracts exhibited inhibitory activity against all bacterial species studied while these extracts showed some activity on fungi tested. Methanol extracts revealed strong activity against both bacterial and fungal species studied compared with the aqueous extracts. The activity of the studied extracts was directly proportional with their concentrations. As shown in Table 1, *S.aureus*, *E.coli* and *M.canis* were the most sensitive to the extracts tested especially at high concentrations. In case of bacteria(Table 1 and Fig.1), methanol extract of *C. bruguierana* at all concentrations showed inhibition zone diameters (16.1-25mm) very close or greater than the standard antibiotic tetracycline (16.4mm) . Methanol extract only at high concentration (100mg/ml) gave inhibition zones diameter (17-20mm) greater than the antifungal nystatin (15mm). Aqueous extracts except few cases (*B. pumilus* and *P. aeruginosa*) showed inhibition zones close or greater (15.1-25.4mm) than the control etracycline (Table 1 and Fig.2). Aqueous extracts at all concentrations showed lower inhibition zones diameter than the antifungal nystatin. Table 1 revealed that the mean inhibition zone diameters exhibited by the methanol extracts(19.1-23.6mm for bacteria and 14.2-16.7mm for fungi) were greater than those exhibited by the aqueous extracts (3.0-22.6mm). The high flavonoid contents previously reported in *C. bruguierana* [13] may be responsible for the antimicrobial activity of this species [10][11]. According to the literatures, this is the first report on the antimicrobial activity of the *C. bruguierana*. The present study was in agreement with the previous studies on the antimicrobial activity of the other *Centaurea* species, particularly their methanol extracts [3][6][7][8][10][18][19]. However, further studies are needed to evaluate the biological activity of methanol extracts of *C. bruguierana* against other pathogenic bacteria and fungi because their antimicrobial activities are more than that of the of the standard antibiotic tetracycline and antimycoticnystatin.

**Conclusion**

This is the first study on the antimicrobial activities of *C. bruguierana* extracts. This study showed a promising antimicrobial activities of *C. bruguierana* extracts, particularly methanol extracts. Methanol extracts exhibited stronger antibacterial and antifungal activities than the standard antibiotic tetracycline and the antifungal nystatin. This plant species could be a source for antimicrobial drug against pathogenic microorganisms, particularly multiresistant bacteria.

Abstract

A simple, sensitive and precise colorimetric method for uric acid determination was described. The method based on the complexion reaction between uric acid, potassium ferricyanide, and ferric chloride in hydrochloric acid medium to form blue colored charge transfer complex measured at maximum wavelength 752 nm. The optimum conditions obtained were volume 0.3 ml for hydrochloric acid, 1.25 ml for both potassium ferricyanide and ferric chloride solutions, 60°C and 8 minutes as maximum temperature and time of reaction, the order of mixing additives was uric acid, ferric chloride, potassium ferricyanide, and hydrochloric acid. The highly accurate and precise results obtained with RSD%, Recovery%, Ere%, and D.L were (0.755 to 4.376), (99.676 to 97.831), (-0.033 to -2.169), and 0.1569 µg mL⁻¹ respectively, the calibration graphs were linear in the concentration range of (2.0-200µg ml⁻¹), the molar absorptivity (5937.473L mol⁻¹ cm⁻¹) The proposed methods were successfully applied for the determination of uric acid in serum and urine samples for twenty persons.

Keywords: Uric acid, colorimetric, determination, charge transfer complex.

Introduction

Uric acid is a heterocyclic compound of carbon, nitrogen, oxygen, and hydrogen with the formula C₅H₄N₄O₃. It forms ions and salts known as urates and acid urates, such as ammonium acid urate. Systematic IUPAC name is 7,9-Dihydro-1H-purine-2,6,8(3H)-trione(1).

Uric acid is an end product of the breakdown of compound called purine. Purines (adenine and guanine) are chemical compounds plays a critical role in many body biological processes, by producing some important bioactive molecules; these molecules have a major part in genetic materials synthesis, protein synthesis, energy molecules production, and can act as mediators in nervous system(2). The major sources of purines are from diet, body synthesis from non-purine precursors, and turnover of nucleic acid(3).

Many analytical techniques were used for the determination of uric acid including spectrophotometric(4-9), fluromatric(10-13), enzymatic(14, 15), chromatographic(16-19), potentiometric(20-22), amperometric(23-27), and voltammetric (28-30) techniques but these techniques required sophisticated instruments and expensive reagents. Hence, the development of charge transfer complex based on the reaction between uric acid, potassium ferricyanide, and ferric chloride in hydrochloric acid medium was the aim of this study due to its simplicity, accuracy and economy of this method.

Experimental

Apparatus

UV-Visible double beam spectrophotometer (JASCO V-650, Japan), Sensitive balance ± 0.0001 g (Sartorius BL 210 S Scientific balance, Gottingen–Germany), Hot plat (Labtech, Germany), water path (Lab tech, Korea) and centrifuge (Kokusan, Japan) were required in this study.

Reagents and chemical materials

All chemicals used were of analytical reagent...
grade including [uric acid \((C_5H_4N_4O_3)\) sigma aldrich], potassium ferricyanide\(K_3[Fe(CN)_6]\), purity 99%, BDH), ferric chloride \((FeCl_3\), purity 96.8%, BDH) and hydrochloric acid \((HCl, 37\text{%, Carolina})\).

**Preparation of solutions**

Uric acid stock solution \((1000 \mu\text{mole L}^{-1})\):- One hundred milligram of uric acid standard material was dissolved by distilled water in a 100 ml volumetric flask.

Potassium ferricyanide solution \((0.001 \text{mole L}^{-1})\):- 0.326 gram of potassium ferricyanide standard material was dissolved in distilled water in 100 ml volumetric flask, 10 ml of this solution was diluted with 100ml distilled water to produce \((0.001\text{mole L}^{-1})\).

Ferric chloride solution \((0.002 \text{mole L}^{-1})\):- 0.162 gram of Ferric chloride standard material was dissolved in distilled water in 100 ml volumetric flask, 20ml of this solution diluted with 100ml distilled water to produce \((0.002\text{mole L}^{-1})\).

Hydrochloric acid solution \((0.1\text{mole L}^{-1})\):- Transfer 0.826 ml from concentrated Hydrochloric acid \((37 \text{%, specific gravity } 1.184)\) to 100 ml volumetric flask and diluted to the mark with distilled water.

**Recommended procedure**

Batch experiments were conducted by the addition of equal volume \((1.25\text{ml})\) of \((0.001\text{mole L}^{-1})\) potassium ferricyanide and \((0.002\text{mole L}^{-1})\) of Ferric chloride solutions to 5ml volumetric flask. Then 0.2 ml \((4\text{ drops})\) of \((0.1\text{mole/L})\) hydrochloric acid solution with 1ml of uric acid was added. The volume of the mixture was completed to the mark and heated to 50°C for 5 minutes, the absorbance of charge transfer complex formed at range 200-1100 nm was recorded. Various parameters effect experiments were conducted to evaluate the influence of six parameters selected for this study including Hydrochloric acid volume by changing its volume in the range of \((0.25 - 2\text{ml})\), potassium ferricyanide volume by varying its volume in the range of \((0.1 - 0.5\text{ml})\), Ferric chloride volume effect was studied in the range of \((0.25-2\text{ml})\). Also, the effect of temperature on the charge transfer complex formation controlled between \((30-90\text{°C})\) in water bath was studied. The reaction time between \((2-15\text{minutes})\) was evaluated to reach the maximum absorbance. Finally, the sixteen order of four additives \((\text{uric acid, potassium ferricyanide, ferric chloride, and hydrochloric acid})\) were studied by changing with a different order. Standard calibration curve for uric acid was constructed in the range of \((2-260 \mu\text{g mL}^{-1})\) concentrations.

**Determination of uric acid in live samples:**

**Blood serum samples:**- After preparation of standard solutions, the absorbance were recorded at optimum conditions controlled previously for plotting calibration curve, the absorbance of twenty serum samples for gout patients separated by centrifuge at \((3500 \text{cycle/minute})\) for 5 minutes was recorded.

**Urine samples:**- After preparation of standard solutions, the absorbance were recorded at optimum conditions controlled previously for plotting calibration curve, the absorbance of twenty urine samples for gout patients were recorded.

**Results and Discussion**

**Characterization of charge-transfer complex**

Potassium ferricyanide and ferric chloride in hydrochloric acid medium \((\text{figure 1(a)})\) forms a charge transfer complex with uric acid which is measurable spectrophotometrically at \(\lambda_{\text{max}}=752 \text{ nm (figure 1(b))}\).
As can be seen from figure 1 (a and b), the absorbance of yielded charge transfer complex shows the best wavelength is located at $\lambda_{\text{max}}=752$ nm, which shows negligible absorbance at corresponding $\lambda_{\text{max}}$ for the blank.

**Optimization conditions**

Initial experiments were conducted towards the optimization of various conditions involving the volume of potassium ferricyanide, hydrochloric acid, and ferric chloride reagents, temperature and reaction time to establish the maximum sensitivity for the charge transfer complex required for uric acid determination. The experiments were done by varying one parameters at the same time fixing the other parameters and the absorbance was measured at $\lambda_{\text{max}}=752$ nm against reagent blank.

As cited in table 1, the addition of potassium ferricyanide solution increased the absorbance up to 1.25 ml, further addition resulted in a decrease in the absorbance. Therefore, 1.25 ml was chosen for further experiments. The other parameter studied was the volume of hydrochloric acid, it was found that 0.3 ml gives the best absorbance. Thus, 0.3 m was adequate for the maximum absorbance. Ferric chloride solution volume absorbance increased and reached to a plateau between (1.5 and 1.25ml). However, 1.25 ml was selected due the minor difference.

| 2    | 0.625 | 2   | 1.090 |      |       |   |       | 15| 0.125 |

The influence of temperature and reaction time on the charge transfer complex formation was studied within the temperature range 30 to 80 °C as can be seen in table 2, the absorbance increase with increasing temperature up to 60 °C which gave the maximum absorbance. Higher temperature resulted in a decrease in the absorbance. Reaction time is a fundamental parameter for economical uric acid analysis. Consequently, a study over a period of time ranged from 2 to 10 minutes were conducted and can be seen from table 1, 8 minute was sufficient to give the maximum absorbance that was used in all subsequent study. In order to avoid the loss in color intensity, the addition of uric acid followed by the ferric chloride, potassium ferricyanide and hydrochloric acid was followed in all experiments as shown in table 2.

Conclusion

The literatures listed a variety analytical techniques for determination of uric acid, this method were simple, accurate, rapid, precise, sensitive, and don’t needs additional steps or special working conditions. Moreover, charge transfer complex formed owing good stability in the solution.

Acknowledgment: The authors would like to thank Mustansiriyah University-Baghdad-Iraq for its support in the present work.

Ethical approval: This study was permitted by the gout patients and all the experiments were done in compliance with the statements on informed consent by all patients.

Conflicts of Interest: There are no conflicts to declare.

Source of Funding: This work was self-funding.

Abstract

PT. Pelindo III Surabaya is a company engaged in service providers. One of them is loading/unloading services. The results of preliminary observations made at PT. Pelindo III Surabaya shows that container loading/unloading workers do not follow standard operating procedures in the workplace such as not using safety helmets, safety vest, and safety shoes. Neat and dirty workplace conditions can increase potential hazards such as falls and tripping material and damage to the goods. This can threaten the safety and disturb the health of workers loading/unloading containers at PT. Pelindo III Surabaya. This study aims to analyze the risk assessment on loading/unloading work at PT. Pelindo III Surabaya. This research is an observational study with design crossectional. The study population was the workers in the loading/unloading section at PT. PELINDO III Surabaya as many as 20 people. Data that has been obtained from observations and interviews are processed and analyzed descriptively, namely by describing in real terms the object of research and the conditions at the research site. The results of the study show the process of loading/loading PT. PELINDO III Surabaya has 5 types of hazard risks in high-risk categories, 12 types of hazard risk, medium risk categories and 3 types of hazards in low-risk categories. The company is expected to provide and require workers to use body harnesses as additional PPE for workers who are above the container during the process cargo during.

Keywords: risk assessment, loading/unloading

Introduction

Companies that provide loading/unloading services are one of the most important companies in the transportation of goods and services. Unloading/loading services are useful for transporting goods in various places including ports. Transportation services increasingly offer or provide facilities such as container terminals, loading/unloading equipment, and containers themselves.

Data on occupational accidents (including death) that occurred in loading and unloading workers (TKBM) from 2004 to 2007 were 110 people. Details of the incidence of workplace accidents loading and unloading workers (TKBM) are: in 2004 as many as 29 people (4.11%), in 2005 as many as 44 people (5.6%), in 2006 as many as 17 people (2.21%) and in 2007 as many as 20 people (2.65%)¹.

Things that affect the risk include the type of work, job location, potential harm due to hazards in the workplace, potential harm due to contractor activities, simultaneous work by several contractors, duration of work, experience and expertise of contractors².

One of the loading/unloading service providers, including PT. Pelindo III Surabaya which plays a role in carrying out loading/unloading and is one of the largest container companies in Indonesia. Activities loading/unloading occurs increases significant every year where there was an increase of 0.64% in 2013.

The number of workers loading/unloading port of
Tanjung Perak in 2004 as many as 705 people, in 2005 as many as 756 people, in 2006 as many as 796 people and in 2007 as many as 756 people.

One effort that can be done to prevent work accidents is by implementing a Risk Assessment which is a process to evaluate the risks arising from a hazard by considering the adequacy of the controls owned and determining whether the risks are acceptable or not.

The danger of risk assessment needs to be done so that the amount of risk that can occur is known, so that after the hazard is identified a risk assessment is carried out to find out how big the risk is (how big the risk).

Risk assessment is the process of risk analysis and evaluation to determine the level of risk and level of risk and determine whether the risk is acceptable or not. Risk Assessment is an attempt to calculate the amount of risk and determine whether the risk is acceptable or not.

All risks that have been identified and assessed must be controlled, especially if the risks are considered to have a significant impact or cannot be properly controlled in terms of various aspects such as financial, practical, human and other operations.

Based on this, research was conducted with the aim of analyzing risk assessment which included activities to identify hazards at loading/unloading work at PT. Pelindo III Surabaya, analyze risk assessment and analyze risk control at loading/unloading work at PT. Pelindo III Surabaya.

**Methods**

This study was an observational study that was descriptive in nature with design cross-sectional to analyze the risk assessment on loading/unloading work at PT. Pelindo III Surabaya. This research was conducted in December 2014.

The population of this study was unloading/loading workers PT. PELINDO III Surabaya with a total of 20 workers. The sample size taken in the study used a total population of 17 workers, 2 officers of Occupational Safety and Health (K3), and 1 operational supervisor.

The variables examined in this study were hazard identification, risk assessment, and risk control. There are no dependent variables and independent variables because this research is a descriptive study.

Primary data is collected by conducting field observations and interviewing respondents. Observation is carried out by making observations directly by seeing, and recording all the conditions in the workplace both regarding process activities in the loading/unloading section, materials, tools, number of workers, working environment conditions, work methods, control technology, personal protective equipment.

The instruments used for data collection in this study include Form Job Safety Analysis (JSA); Risk assessment matrix sheet; sheet Risk Assessment Table to carry out a risk assessment; Interview guide; Observation sheet.

**Data analysis carried out include:**

Identifying the existing material at the loading/unloading sub-unit of PT. PELINDO III Surabaya using the technique Job Safety Analysis (JSA) that is entered into the risk assessment matrix and observes the hazard for calculation using a risk assessment matrix table.

After identification, the risk assessment calculation is complete, where the hazards that have been classified are assessed based on exposure values, opportunities, and consequences. At the risk assessment stage, there is a perception of equality between researchers and PT. PELINDO III Surabaya in determining exposure events, opportunities, and consequences based on the theory put forward by Suardi (2007), in order to get the results correctly and precisely which has been operationalized by the company. The calculations from each aspect can be seen as follows:

The results of these calculations are combined through a risk level matrix with semi-quantitative risk analysis techniques which will then be obtained the level of risk ranging from low risk to high risk, then evaluated to determine whether the risk is acceptable, accepted by conditions, or not accepted. This study uses a 3D model risk assessment so that the risk value category loading/unloading activities can be seen in Table 4.

* Source: Book of occupational health and safety management systems, Rudi Suardi (2007)

After carrying out the analysis and risk level the next stage is to do risk control and classifying risk control whether it feels sufficient or not fulfilling. Risk control is said to be sufficient if it meets ≥ 2-4 controls, both substitution, technical, administrative and PPE control. Risk control is said to be lacking if it only meets the criteria of one type of control that exists.

Results

General Description of Unloading / Loading at PT. PELINDO III Surabaya

Port of Tanjung Perak is one of the port gates of eastern Indonesia, becoming the center of collectors and distributors of goods to Eastern Indonesia. Its strategic location makes Tanjung Perak Port the center of interinsular shipping in Eastern Indonesia and becomes the second largest port after the Tanjung Priok Port in Jakarta.

Geographically, the location of Tanjung Perak Port in Surabaya is at position 112°44’100” -112°32’40” East Longitude and 7°11’40” -7°13’20” South Latitude precisely located at the North of Surabaya City and with a wide overall, 2,218 ha. Tanjung Perak Port Surabaya has 8 terminals, including Emerald Terminal, Berlin Terminal, Patchouli Terminal, Mirah Terminal, Passenger Terminal, Surabaya Container Terminal, Roro Terminal, Kalimas Terminal.

In total, Surabaya Container Terminal has unloaded/loaded 192,047 Twenty feet Equivalent Units (TEU’s) in early 2014, while in the same period in 2013 there were 153,249 Twenty feet Equivalent Units (TEU’s). For the past four months, domestic loading/unloading services have reached 9,000 Twenty feet Equivalent Units (TEU’s), so that on average 2,000obtained on average Twenty feet Equivalent Units (TEU’s) are.

Hazard Identification in the Container Loading / Unloading Process at PT. PELINDO III

The process of identifying hazards on loading/unloading work container PT. PELINDO III Surabaya is carried out by taking into account the work steps, hazards arising from activities in the loading/unloading process, and the impact resulting from the danger that arises.

Hazard identification results on container loading/unloading work at PT. PELINDO III Surabaya that has been done is shown in Table 5.

Activities to identify hazards include diagnosing and finding hazards in parts of the system and subsystems, the sequence of activities and also calculating the possibility of arising and the consequences that these hazards will produce. Doing hazard identification well will result in good risk management.

**Hazard Risk Analysis at Container Loading / Unloading Work at PT. PELINDO III Surabaya**

The results of the study regarding the risk assessment of hazards at loading/unloading work at PT. PELINDO III Surabaya is shown in Table 6. The results of exposure multiplication, opportunities and consequences are then evaluated using a risk matrix so that it can be concluded that the danger is included in the category of danger with low, medium or high risk.

Risk assessment is the process of risk analysis and evaluation to determine the level of risk and level of risk and determine whether the risk is acceptable or not. (Ramli, 2010). Risk assessment in the loading/unloading section at PT. PELINDO III Surabaya is based on data in the field conducted by observing and distributing questionnaires to all permanent workers.

**Stevedoring**

1.5 risk value is owned by a dripped hazard and stumbles on activities elevator off. The danger of falling container, sandwiched container, container falling and falling container on lift off and stacking value risk 6.

**Receiving / Delivery The**

the danger of falling container and container has a value of risk 6. The danger of collisions between containers is in the low category with a risk value of 1.5.

Activities receiving/delivery of services that activity in the form of work takes a pile of goods / Line I place the accumulation of goods or yard goods and deliver the goods to be composed on the vehicle/conveyance tightly in the dooryard goods ashore or otherwise.
In the process receiving/delivery there is only one job, namely, lift on with a low-risk category with a value of 1.5 and a moderate risk category with a value of 6.

Low risk in the process receiving is due to the low exposure value and the possibility of an accident high. Risk is generally acceptable but still needs to be reviewed.

Hazard of Risk Control in the Unloading / Loading Process at PT. PELINDO III SURABAYA

Potential hazards that will be received by loading and unloading workers (TKBM) have a high-risk level are crushed and pinched containers inactivities elevator on, crushed containers inactivities shift ground and pinned containers and containers fall activities trucking.

Control with PPE that has been carried out by PT. PELINDO III includes procurement of gloves, helmets and safety shoes for workers, especially those who carry out loading/unloading activities above the container or crane.

Risk control implemented by PT. PELINDO III Surabaya is categorized enough because it has made a combination of two hierarchies, namely administrative control, and the use of personal protective equipment (PPE)⁶.

The risks that are known to be large and the potential consequences must be managed appropriately, effectively and in accordance with the capabilities and conditions of the company³.

Risk control using the approach Long Term Gain in Tarwaka’s book (2008) regarding the hierarchical approach to control, namely long-term and permanent oriented control starting from engineering control, isolation or restriction, administration and the most recent is the use of personal protective equipment (PPE)⁷.

Control by procuring PPE has been applied at PT. PELINDO III Surabaya to minimize work accident rates.

Conclusion

The conclusions that can be taken based on the results of this study are:

Potential hazards identified in the loading/unloading section at PT. PELINDO III Surabaya there are 20 types of potential hazards from 6 jobs in 3 loadings/unloading processes.

Potential hazards identified in loading/loading PT. PELINDO III Surabaya found 5 dangers of high-risk categories, 12 hazards of moderate risk categories and 3 hazards of low-risk categories.

Abstract

Introduction: Asthma is one of the most common chronic diseases among children is a global health issue and its rising trend has caused concern about the health system. Therefore, this study was conducted to investigate the effect of multimedia education on the knowledge and self-efficacy of children with asthma in Bushehr.

Method: semi-experimental study. The research community included all children under the age of 12 years with asthma. The samples were selected by available method of 50 people and then divided into two experimental and control groups by simple random method. The data collection tools included questionnaires of demographic data, knowledge and self-efficacy in children with asthma. Validity and reliability of the instruments were measured and then multimedia training was run for the experimental group. Data analysis was performed by SPSS 18 and Mann–Whitney U test.

Findings: the mean scores of knowledge and self-efficacy of the research samples in the experimental group increased after multimedia training, so there was a statistically significant difference between the two groups (p <0.001).

Conclusion: Education of children with asthma through multimedia has led to increasing knowledge and self-efficacy. Therefore, considering the effectiveness of multimedia education in children training with asthma, it is recommended that this educational method are used for other chronic childhood diseases.

Keywords: self-efficacy, knowledge, multimedia, asthma, children

Introduction

Chronic pulmonary diseases are among the commonest diseases causing the death and disablement of human societies which asthma is one of the commonest [1]. According to the statistics, 3-35% of people in the world (300 million individuals) suffer from asthma [2-3] that 100 million more patients may be added to this statistic until 2025 [4-5]. Asthma is the commonest chronic disease during childhood, the first reason of receiving in emergency operation centers and the third reason of hospitalizing children under 15 [6-8]. Furthermore, this disease is the important factor of absence from school among chronic diseases [9]. Children with asthma are more absent from school and more awake during the night [10-15]. The continuation of weak results in treating children with asthma has led to various educational interruptions in order to improve the care, therefore, the need to provide innovative methods to improve asthma care is increasingly felt [15]. Educational media is one of these innovative methods. The most important reasons of using educational media are as follows: “developing effective communication”, “providing motivation for

learning”, “forming faster, deeper, and more stable learning”, “economizing teaching and learning time”, “adapting to multiple intelligences”, and “forming impossible learning experiences”. The term multimedia was proposed since 1950 and it was attempted to combine several mediums to enhance the quality of training [16]. Multimedia training as a new educational method is easily, widely, and attractively performed by transferring educational concepts and contents along with text, voice, image, and video and today, it is widely used in order to transfer concepts during childhood and teenage years [16]. This new educational programme can facilitate the process of decision-making by empowering patients to have an active role in selecting health-based programmes [17].

**Method**

The present study is quasi-experimental and it was conducted on 50 children with asthma in Bushehr. The population included all children with asthma under 12 and sampling was first of convenience type, then samples were divided into two groups of intervention and control using random allocation. The entry criteria to this study include all children with asthma (girl and boy) under 12 with the final diagnosis of a doctor, the tendency of children and their parents to participate in the study, having no history of chronic heart, vascular, liver, and kidney diseases, and being able to participate in the empowerment plan. The exit criteria to this study include the tendency of children and their parents to exit the study, the membership of parents in the health team, and the participation of study samples in similar researches. The sample volume for alpha 0.05 and power of the test (80%), for standard deviation of 10, and detecting the difference of 8 scores between two groups was equal to 25 in each group. The tools of this research include the 15-question questionnaire of demographic information about the child and their parents completed by the child as well as their parents if needed, the 8-question questionnaire of measuring the knowledge of child with asthma, and the 10-question questionnaire of measuring the child’s knowledge about allergens including 3 video questions and the checklist of assessing child’s self-efficacy about using the asthma spray. The validity and reliability of these questionnaires were evaluated in a research aimed at investigating the effect of family-centered empowerment model on the quality of life in school-age children with asthma [4].

This study was conducted through three stages:

A. The stage before Intervention:

When the parents participated, the researcher introduced himself and explained the aims, importance, and method of the study and by giving them written consent based on how to intervene and complete the questionnaires the researcher assured them that the data and information are confidential and obtained parents’ written consent and children’s verbal consent.

b. The Intervention Stage

The research-made CD contained teaching the two essential steps of knowledge increase and self-efficacy increase as well as some information about pathophysiology of disease, physiology, symptoms, environmental and indoor allergens, proper use of spray, nutrition, medicine, etc. Then the CD was granted to some allergy and asthma specialists in order to determine its validity and their viewpoints were evaluated. After the confirmation of allergy and asthma specialists and scientific editing by one of the faculty members of Bushehr school of Nursing and Midwifery, the CD was applied to the samples through two steps.

c. The Stage After Intervention

For measurement, the data was analyzed using spss 18. In this study, descriptive statistics included frequency, frequency percentage, mean, and standard deviation. Moreover, in order to compare the knowledge and self-efficacy scores of studied samples in both intervention and control groups, Non-Parametric Mann-Whitney Test was applied.

**Findings**

The mean (and standard deviation) of children’s age in the test group was 8.80 (and 1.936) years old and in the control group was 8.86 (and 1.406) years old and the mean (and standard deviation) of history of disease in the test group was 3.36 (and 0.810) years and in the control group was 3.36 (and 1.15) years. 72% of children were at the middle stage of disease severity and 28% were at the mild stage. Most children’s families showed the history of asthma (52%), 54% reported that they smoked indoors, and 48% (the highest percentage) had the history of asthma for three years and more. Most children’s fathers in the test group (48%) and control group (36%) were self-employed. Moreover, most children’s mothers in the test group (88%) and control group (96%) were
housewives. Table 1 indicates the mean and standard deviation for the knowledge of children with asthma in the test group and control group before and after the intervention. In this regard, the results of Mann-Whitney Test between test group and control group before the intervention showed no significant statistical difference, however, after the intervention, a significant difference was found (p<0.001). Table 2 indicates the mean and standard deviation for the self-efficacy of children with asthma regarding the use of inhaled spray in the test group and control group before and after the intervention. In this regard, the results of Mann-Whitney Test between test group and control group before the intervention showed no significant statistical difference, however, after the intervention, a significant difference was found (p<0.001). Table 3 indicates the mean and standard deviation for the knowledge of children with asthma regarding the recognition of allergens in the test group and control group before and after the intervention. In this regard, the results of Mann-Whitney Test between test group and control group before the intervention showed no significant statistical difference, however, after the intervention, a significant difference was found (p<0.001).

Discussion

Asthma is one of the commonest chronic diseases in children. Although mortality from asthma has decreased at present, this disease is one of the commonest reasons for hospitalizing children in advanced countries and the recurrence symptoms of asthma have lowered children and their families’ quality of life to a large extent [18]. The results of researches indicate that training programmes of asthma should be considered as a part of routine care in order to improve treatment care, reduce treatment costs, and lessen patients’ unwellness [19]. The results of the present study indicated that there is a significant difference between the mean of child’s knowledge before and after the intervention (p<0.001), therefore, multimedia training increased child’s knowledge in the intervention group after training. In the present research, comparing the scores of quality of general life before and after the intervention in the physical dimension indicated a significant difference in the direction of improving child’s quality of general life (physical dimension) in the intervention group (p<0.001). The knowledge about asthma refers to the ability to differentiate irritants, understand the role of lifesaving treatments, and develop programmes to manage this disease when intensifies [20]. The results of researches around the world indicate that patients with asthma have little knowledge about their disease. In the study conducted by Gibson (as cited in Sharifi), it was concluded that knowledge about asthma is little among students and teachers [21]. On the other hand, the findings of researches indicate that using new educational methods for training children with asthma can increase their knowledge [8]. For example, in a research conducted by Keulers et al., the results showed that the scores of patients’ knowledge were increased significantly after training using a computer-based programme (p= 0.001). Their results also indicated that training through computer is an excellent method to increase the knowledge about the disease and treatment [22]. In another study conducted by Krishna et al. on children with asthma, they found that using multimedia technology in training children with asthma improves the consequences of health in the intervention group [9]. By comparing the mean difference of children’s self-efficacy scores regarding the use of inhaled spray between test group and control group before and after the intervention, the results showed that there is a significant statistical difference in the direction of enhancing the self-efficacy of children with asthma in the test group (p<0.001). The low levels of self-efficacy lead to more hospitalization [20], however, using modern methods such as multimedia in training can enhance self-efficacy and performance [23]. According to Bandura, self-efficacy is related to previous successes in similar situations or experiencing other people’s successes [24] and based on the theory of social learning, the knowledge and skill obtained in simulated environments are transferable to real situations and multimedia has the special capacity and potential to transfer the information for these patients [25]. Self-efficacy in relation to asthma refers to the self-confidence to interpret the disease and its symptoms exactly as well as following appropriate care programmes [26] and in our study, self-efficacy
refers to children’s empowerment to identify different environmental and indoor allergens, choosing good food, exercise, and medicine, in fact, the most important aspect emphasized in this study is how to use the inhaled spray accurately. Using the tool and spraying it accurately to release aerosol into airways is crucial. The results of studies indicate that usually the accurate technique of inhaling even after training children is often lower than the desired level [18]. The results of our study showed that multimedia training could motivate children with asthma to use the inhaled spray accurately. Furthermore, in a research conducted by Chenge et al. on children with asthma, it was found that children who participate in asthma training programmes can improve their physical and social activities that lead to the enhancement of self-efficacy and self-management. In addition, according to their findings, training can reduce the symptoms of this disease and improve the quality of life [12]. In the research conducted by Robin et al., it was indicated that a computer-based educational programme enhances patients’ performance and behavior, which is effective in reducing the number of visiting treatment centers [25]. Generally, asthma has a deep effect on patients’ life and performance and influences their group activities and social performance [11], however, children who participate in asthma training programmes can improve their social activities that lead to the enhancement of self-efficacy [12].

Conclusion

Regarding the modern, effective, and simple multimedia training in learning as well as its attraction for children and parents, performing this model in order to improve the results of other chronic diseases in childhood by means of multimedia training is recommended.

Determination of Safe Level of Benzene Concentration in Mechanics Workshop “X” Tembalang Semarang

Aisy Rahmania1, Abdul Rohim Tualeka1
1Department of Occupational Health and Safety, Public Health Faculty, Airlangga University, Surabaya

Abstract

Vehicles are used in community in a large number and being repaired in motorbike repair shops. The repaired motorbike at the workshop has the potential to provide benzene exposure to the mechanic, so the mechanic was also at risk of experiencing health problems due to benzene exposure. This study aimed to determine the safe concentration of benzene in Workshop X Tembalang, Semarang. This study was a descriptive research. The population in this study were mechanics at Locations 1 and 2, totally 18 people. The results of this study were quantitatively analyzed to determine the safe concentration of benzene for workers obtained from the benzene concentrations in the workplace, worker height, worker weight, rats weight, worker respiration rate, length of work, worker body surface area, mice body surface area, highest dose of toxin without effect on experimental animals (NOAEL), Km factor in animals (Animal Km), Km factors in workers (Human Km), and safe limit dose for workers (RIC). The measurement of benzene concentration at Location 1 was 0.28 ppm and Location 2 was 0.19 ppm, which means that the benzene concentration was still below the Threshold Value according to Minister of Manpower Regulation Number 13 in 2011 amounting to 0.5 ppm. This research showed that the safe limit value was 0.023 ppm. Based on the minimum risk level, the concentration of benzene everyday that can cause acute effects was 0.009 ppm and that can cause chronic effects was 0.003 ppm. These standards indicate that the concentration of benzene in the workshop has the potential to have a negative impact on the health of workers. Recommendations to workshop owners and mechanics are to periodically monitor benzene levels in the air, use personal protective equipment by all mechanics and if needed the workshop owner can conduct a health check-up for all mechanics.

Keywords : Benzene, safe level, mechanics workshop

Introduction

Motorcycles were widely used in community and increased every year in Indonesia. Data from AISI (Asosiasi Industri Sepeda Motor Indonesia) in 2015 stated that motorcycle sales in 2014 reached 7,926,104 million units1. The large number of motorbike uses can provide opportunities for motorcycle workshops to provide automotive needs services that include repair and maintenance processes that carried out by workshop mechanical workers2. Workshop mechanics often referred to as mechanics or engineers who works to repair, install, or modify the vehicles which in the work process was very high risk of exposure to hazardous chemicals3.

Benzene was a chemical that was dangerous and carcinogenic for workers which found in fuel oil4,5. The limit levels of benzene exposure according to several world organizations are 1 ppm (National Institute for Occupational Safety and Health6 and Occupational Health and Safety Assessment Series7) and 0.5 ppm (the American Conference of Governmental Industrial Hygienists8).

In Indonesia, the limit of exposure benzene in the work environment was stipulated in the threshold value (NAB) of benzene at 0.5 ppm according to the Regulation and maintenance processes that carried out by workshop mechanical workers2. Workshop mechanics often referred to as mechanics or engineers who works to repair, install, or modify the vehicles which in the work process was very high risk of exposure to hazardous chemicals3.

Benzene was a chemical that was dangerous and carcinogenic for workers which found in fuel oil4,5. The limit levels of benzene exposure according to several world organizations are 1 ppm (National Institute for Occupational Safety and Health6 and Occupational Health and Safety Assessment Series7) and 0.5 ppm (the American Conference of Governmental Industrial Hygienists8).

In Indonesia, the limit of exposure benzene in the work environment was stipulated in the threshold value (NAB) of benzene at 0.5 ppm according to the Regulation.
of the Minister of Manpower and Transmigration PER/13/MEN/X/2011 about Factor Threshold Values Physics and Chemistry at Work9.

Some research show that the concentration of benzene in the air below the normal limit, which still have negative effects such as headaches and tremors10. Determination of safe limits of benzene concentration in the work environment involves knowledge of worker breathing rate (BR), reference concentration (RfC), work-hours/day (tE), weight (Wb) and the average cancer year (70 years) and non-cancer (30 years)11.

This study aims to determine the level of safe concentration of benzene in Bengkel X in Tembalang Semarang so that it can provide recommendations to workshop owners so they can determine safe actions and protect workers from benzene exposure.

**Material and Method**

This study was a descriptive study that aims to determine the magnitude of the environmental health risk of benzene exposure to workers in Workshop X Tembalang Semarang using an environmental health risk analysis approach. The population in this study was a mechanic totaling 18 people.

The design of the research was to collect initial data, the work process, and the number of workers. Furthermore, collecting primary data was the concentration of benzene in the workplace air, length of work time, and worker weight. Secondary data collection was also carried out on experimental animals, the weight of white mice. The type of data in this study was primary data, obtained through questionnaires and observations as well as measurements of benzene in the air of the workers’ workplace.

The variables in this study were benzene concentration in the workplace, worker height, worker weight, rats weight, worker respiration rate, length of work, worker body surface area, mice body surface area, highest dose of toxin without effect on experimental animals (NOAEL), Km factor in animals (Animal Km), Km factors in workers (Human Km), and safe limit dose (RfC), and benzene concentration in safe air for workers (C safe).

Data analysis in this study was carried out by using quantitative data analysis manually to determine the safe concentration of benzene for workers in the work environment in Workshop X Tembalang Semarang.

**Findings**

1. **Characteristics and Surface Area of Animals Experiments**

Toxicity can be interpreted as the ability of poisons to cause damage if it enters the body and the location of organs susceptible to it. Toxicity was very diverse for various organisms, depending on various factors such as test species, the way poisons enter the body, the frequency and length of exposure, concentration of exposure agents, and the vulnerability of various species to pollutants. In this study, the implementation of a toxicity experimental test in white mice. This study was done considering the human response to toxicity qualitatively was the same as the response of animals, so this fact was the base of extrapolation from animal to human data.

The following are characteristic data of experimental animals.

**Table 1. Characteristics of Animal Experiments**

<table>
<thead>
<tr>
<th>Animal Experiments</th>
<th>W (kg)</th>
<th>BSA (m²)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>0.1405</td>
<td>0.024165</td>
</tr>
<tr>
<td>2</td>

<tr>
<td>6</td>
<td>0.1415</td>
<td>0.024165</td>
</tr>
</tbody>
</table>

Based on these data, it can be calculated the body surface area of white mice with :

Animal BSA = 0.09 x \( W^{0.67} \)

Description:

BSA : Body Surface Area (m²)

W : Weight (kg)

2. **Characteristics, Body Surface Area, and Respiratory Rate of The Workers**
In this study, worker characteristics include weight and duration work-time. The sample in this study were 18 mechanic in Workshop X Tembalang Semarang.

Based on data on worker weight and worker height, workers’ body surface area and respiration rate can be calculated using the following formula.

**A. The Workers’ Surface Area**

$$\text{BSA Human} = \frac{W \cdot h}{3600}$$

**Description:**

BSA: Body surface area (m²)

W : Weight (kg)

h : Height (cm)

**B. Workers’ Respiratory Rate**

$$\text{BR} = \frac{5.3(\ln W) - 6.9}{24}$$

**Description:**

BR : Breathing rate (m³/h)

W : Weight (kg)

Based on Table 2, it was known that the highest body weight of workers in the Workshop X Tembalang Semarang was 74 kg, while the lowest weight was 45 kg. The length of work in a day was all 8 hours and height uses the average value of Indonesian adult male height which was 160 cm.

From the calculation of the body surface area and the respiratory rate of workers it was known that the average body surface area (BSA) of workers was 1.60 m² and the average respiration rate of workers was 0.60 m³/hour.

3. Benzene Concentration

The measurement of benzene concentration at two points in Workshop X showed that the measurement results at location 1 were 0.28 ppm and at location 2 was 0.19 ppm.

**Table 3. Benzene Concentration**

<table>
<thead>
<tr>
<th>Location</th>
<th>Benzene Concentration (ppm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Location 1</td>
<td>0.28</td>
</tr>
<tr>
<td>Location 2</td>
<td>0.19</td>
</tr>
</tbody>
</table>

The results of measurements, it was known that benzene concentration in Workshop X Tembalang Semarang Location 1 was 0.28 ppm and Location 2 was 0.19 ppm. Based on the Minister of Manpower and Transmigration Regulation Number 13 in 2011 concerning the threshold value of physical factors and chemical factors in the workplace for a concentration of Benzene of 0.5 ppm so that the concentration of benzene in this workplace was still below the NAB. However, the concentration of benzene was above the Minimum risk Level (MRL), the level of benzene inhalation exposure determined by ATSDR, for acute exposure (≤14 days) = 0.009 ppm, moderate exposure (15-364 days) = 0.006 ppm, and chronic exposure (≥365 days) = 0.003 ppm.

4. Animal Km and Human Km

A. Animal Km

$$\text{AnimalKm} = \frac{W_{\text{Animal}}}{\text{BSA}_{\text{Animal}}}$$
Table 4. Animal Calculation Results Km on Animal Experiments

</tbody>
</table>

The Human Km calculation shown in table 5. Average of Human Km workers at Workshop X Tembalang Semarang was 36,15.

5. NOAEL

NOAEL was the highest dose of a substance in statistical or biological chronic or subchronic toxicity studies that do not show detrimental effects on test animals. Toxicology testing can be used to calculate No Observed Adverse Effect Level (NOAEL) and was useful for clinical trials. To determine the safe limit of concentration of a chemical begins with the toxicity test No Observed Adverse Effect Level (NOAEL).

Swaen (2010) states that benzene NOAEL was 3.0 mg/m³ (0.022 mg/kg).

\[
NOAEL_{\text{benzene}} = \frac{3 \times 0.00013 \times 8}{0.1405}
\]

\[
= 0.022 \text{ mg / kg}
\]
6. **Safe Human Dose**

\[ RfC = \frac{NOAEL}{\frac{AnimalKm}{HumanKm}} \]

Description:

RfC: Safe human dose (m/kg)
Animal Km : Km factor in animals
Human Km : Factor Km in Human

Based on these equations, the calculation of RfC obtained was:

\[ RfC = 0.003 \text{ mg/kg} \]

7. **Safe Limit of Benzene Concentration**

Determination of safe limits of benzene concentration in Workshop X Tembalang Semarang uses formulas (William, 1985; Soemirat, 2003; Davwas, 1991) the following:

\[ C_{safe} = \frac{(SHD)(W)}{(\delta)(BR)(t)} \text{ mg/m}^3 \]

To convert units of mg/m³ to ppm:

\[ C_{safe} = \frac{mg}{m^3} \times 24.5 \text{ ppm} \]

Description:

C safe : safe concentration in the air for workers (mg/m³)
RfC: Safe Human Dose (mg/kg)
W : Weight (kg)
δ :% of substances absorbed by the lung
BR : Human respiratory rate (m³/hour)
t : Duration of working time (hours)
MW : Molecular Weight

Based on the above equation, the calculation results of the concentration of safe concentration of benzene in Workshop X was:

\[ C_{man} = \frac{(0.003)(58.56)}{(50\%)(0.60)(8)} = 0.073 \text{ mg/m}^3 \]

\[ C_{man} = \frac{0.073 \times 24.45}{78.11} = 0.023 \text{ ppm} \]

The calculation of the concentration of safe levels of benzene in the air for workers above can be used to predict the concentration of toxins in the air a safe work environment for workers and to be compared with the NAB established by various institutions either by Indonesian statute, National Standardization Agency, ACGIH, NIOSH and OSHA.

**Discussion**

Benzene in a motorbike repair shop environment needs to be identified to determine the level of exposure that can cause a negative effect to the mechanics. This study measured 2 locations which were considered to have the most exposure to benzene from exhaust gases from motorcycles, Locations 1 and 2 in Workshop X Tembalang Semarang. The results of the measurement of benzene concentrations in these two locations differ because of several things such as the number of repaired motors and the levels of benzene produced by vehicles’ combustion. The more the number of motors was repaired, the higher the exhaust gas from the exhaust of the motor, the higher the concentration of benzene in that location.

Exposure time was the total work time per day. From the research conducted, it was known that the mechanic’s working hours in the motorcycle workshop are 8 hours per day. This result was in accordance with normal working hours according to Labor Law No. 13 in 2003 which states normally, the length of work permitted to each worker was no more than 8 hours/day.

The concentration of benzene exposure in Tembalang X Workshop Semarang was influenced by several factors, but one of the most influential was the condition of the air at the work site (benzene concentration in the air). From the results of the calculation of the safe concentration of benzene, the value of safe C was 0.073 mg/m³ or 0.023 ppm.
What can be done to reduce exposure to benzene in workers was the installation of exhaust fans, the use of PPE such as masks, especially during the process of repairing the motorbike. Another approach was taken by eating foods rich in detoxification enzymes, especially GSH which was usually found in most vegetables such as asparagus, spinach, broccoli, garlic, and onions.

Prevention of benzene exposure requires an active role from both mechanics and workshop owners. It can be done to reduce levels of benzene exposure in the work environment by installing an exhaust fan as a vent in the workspace. Ventilation was the process of providing clean outdoor air which was naturally exchanged with indoor air. The main function of ventilation as an exchange of outside air with the room was also intended to control the air temperature so that it wasn’t hot and stuffy so that it increases the intake of benzene exposure. According to Minister of Health Regulation RI 1077/MENKES/PER/2011 concerning guidelines for air sanitation in a well ventilated room was to meet the criteria for extensive ventilation >10% of the floor area at the workplace.

Conflicts of Interest: All of Authors have no conflicts of interest to declare.

Source of Funding: This article “Determination of Safe Level of Benzene Concentration in Mechanics Workshop “X” Tembalang Semarang” was funded by the Author.

Ethical Clearance: The study was approved by the institutional Ethical Board of Faculty of Public Health, Airlangga University.

All of subjects were fully informed about the procedures and objectives of the study then each subject signed an informed consent form.

Conclusion

The results of measuring the concentration of benzene in Workshop X in Location 1 was 0.28 ppm and Location 2 was 0.19 ppm. Based on Minister of Manpower and Transmigration Regulation Number 13 in 2011, the threshold value of benzene was 0.5 ppm. From the results of measurements in this study when compared with the threshold value then it was still below the set threshold value.

Based on the minimum risk level (MRL) of ATSDR 2007, the concentration of benzene every day that can cause acute effects was 0.009 ppm and that can cause chronic effects was 0.003 ppm. From these standards, it can be seen that the concentration of benzene in this workplace has the potential to have a negative impact on the health of mechanics.

Control measures are needed to minimize the risk of health problems that can be experienced by workers due to benzene exposure. The recommendation given to Semarang Tembalang X Workshop was to periodically monitor benzene levels in the air, use personal protective equipment properly by mechanics and if necessary a health check-up can be done at Workshop X Tembalang Semarang.

Andrographolide and its Attributes Against Triple-Negative Breast Cancer: A Review of the Literature

Alhakam A. Aljarrah1, Norliza Nik2, Siti Norasikin M Nafi2
1Msc. Biomedicine, 2Ph.D. (Human Genetics), 2Ph.D. (Molecular Medicine), University Sains Malaysia, Kelantan 16150, Malaysia.

Abstract

Breast Cancer is associated with high incidents and mortality rates and considered to be the second most frequent type of cancer among women worldwide. One of its invasive modalities is the Triple-Negative subtype. Lacking the expression of ER/PR and HER2 contributes to its severity. Current treatment strategies for TNBC diagnosed patients are believed to be hazardous and do not improve the disease-free survival (DFS) neither the overall survival (OS). Thus, scientist and researchers are seeking alternative remedies that have little or no consequences on the patients. Andrographis paniculata with its remarkable active constituent Andrographolide are attracting the world’s attention due to its pharmacological activities against metabolic maladies especially hyperlipidemia, obesity, and diabetes as well as its attribute as an anti-cancer compound. Here, we review the effect of Andrographolide on Triple-Negative Breast Cancer.

Keywords: Andrographolide; Breast Cancer; Triple-Negative Breast Cancer; Alternative and Complementary Treatment; Andrographis paniculata.

Introduction

Estrogen, progesterone, and HER2 are the hallmark for the presence of a Breast Tumor, it serves by mimicking the receptors found in the normal breast tissues and sends signals to cells permitting its growth. Nearly 50% of Breast tumors express ER, PR, and HER2 but not in case of the TNBC, in which the expression of the biomarkers is idle 26. TNBC severity exceeds the positive BC. It has a high risk of re-occurrence and death 20 and can metastasize visceroally to other organs (lymph nodes, bilateral lungs, and the liver) 26. Metastatic TNBC has a low life expectancy rate and it does not exceed 12 months in spite of the response to chemotherapy 8. Annually, from 1.3 million Breast Cancer patients 15-20% will be identified as Triple-Negative Breast Cancer subtype 2. The survival rate of TNBC varies depending on the stage of the disease. Stage 0 and 1 have a 100% chance of survival, stage 2 and 3 have 93%, 72% survival rate respectively. Metastatic TNBC patients have 22% 9.

A. paniculata is part of Acanthaceae family, a herbal plant natively found in Sri Lanka and India and it is also found in the southeast of Asian, America, and China 16. A. paniculata has been used traditionally in treating various types of diseases like fever, dysentery, diabetes, and malaria 12. Andrographolide is the major active constituent of in A. paniculata, it belongs to the labdane diterpenoid chemical class. Andrographolide possess many pharmacological properties, it has anti-inflammatory, antihyperglycemic, antimicrobial, antiparasitic and anticancer effects 12.

Current treatment strategies for Triple-Negative Breast Cancer (TNBC)

Chemotherapy (CT) remains the standard strategy for treating TNBC 13. Despite the fact that TNBC is aggressive in nature, yet, it shows a higher vulnerability to Chemotherapy than any other types of Breast Cancers 25. Neoadjuvant systemic treatment (NST) chemotherapy is used for those who are at the early stages of TNBC and willing to undergo BCS 17. frequently used neoadjuvant agents are anthracycline alone or in combination with taxane (anthracycline-taxane CT) 23. In adjuvant settings, anthracycline-taxane regiments show small but important improvement in disease-free survival (DFS) 6.

Breast Conservative surgery is advised for patients with early stage of TNBC alongside adjuvant RT 10. One of its advantages is the low rate of local recurrence, but, it does not imply on all types of Breast Cancer. 25. Mastectomy is wanting to BC because of the better outcomes of BCS, in terms of overall and disease-free
survival rates.

Radiotherapy, as reported by Langlands et al., has little influence on TNBC and can withstand it. Although most of TNBC tumors are associated with BRCA1/2 mutations which means it carries DNA repair defects, however, it showed no significant sensitivity to RT. A contrasting study suggested otherwise, in which RT can enhance survival outcomes if implemented with surgery and it could provide ideal tumor management with trivial side effects.

Targeted therapies have shown its efficacy in targeting the tumor’s cell cycle, gene defects, and growth factors. Affecting cell cycle regulators (CDK4/6) can be tricky in the case of TNBCs since not all express cell cycle regulators. But, a different study tested palbociclib (CDK inhibitor) on Luminal Androgen Receptor (LAR) a subtype of TNBC and exhibited high sensitivity towards it (in vitro and in vivo) 3.

Another potential targeted therapy candidate is the tumor suppressor gene (p53) through checkpoint kinase 1 (CHK1). Since the majority of TNBCs are Basal-Like tumors that carry gene defects in P53 24, Bryant et al., reported that TNBC cell line can be inhibited through arresting cell cycle at the S and G2/M phases mainly by inhibiting CHK1 through the activation of P53 11.

Targeting growth factors such as FGFR, EGFGR, and VEGFR can beneficial in eliminating TNBC since they are the causative agent for the overgrowth of the tumor 4. Drugs such as cetuximab (anti-EGFR antibody), PD173074 (anti-FGFR inhibitor) and bevacizumab as a VEGFR inhibitor currently being tested on TNBC 21.

**Andrographis paniculata**

*Andrographis paniculata* is part of Acanthaceae family, a herbal plant natively found in Sri Lanka and India and it is also found in the southeast of Asian, America, and China. *A. paniculata* is a herbal grows annually and extend about half to a meter above the soil, it is known for its bitter taste hence the name King of Bitter 16. *A. paniculata* has been used traditionally to cure diseases like fever, dysentery, diabetes, and malaria. In Asia, the roots and the aerial parts have been used to treat inflammation, pyrexia, intermittent fevers and stomachaches. The essence of leaves is used to treat fever, infectious diseases, colic pain and diarrhea, the aerial part of the plant is used in Malaysia to treat snakebites and malaria 16.

The active compounds are distributed throughout the parts of the plant for instance terpenoids. The most isolated terpenoid from the plant is Andrographolide in terms of quantity and occurrence. Andrographolide after it is isolated, it appears crystalline and colorless and has a bitter taste. Apart from Andrographolide, neoAndrographolide and deoxyAndrographolide are also common terpenoids isolated from the aerial parts and the roots.

Flavonoids such as Flavone-1, 2’methylether, 7-O-methylwogonin and flavone-1, 2’-O-glucoside are found in the whole body, roots and the aerials of *A. paniculata*.

**Andrographolide**

Andrographolide is the major active constituent found in *A. paniculata*, it belongs to the labdane diterpenoid chemical class. Andrographolide is the causative agents for the extremely bitter taste of *A. paniculata*. Andrographolide must be harvested after cultivating the plant for 110 days or just before the flowering of the plant. It can be found in several parts of the plant including the roots, leaves, stem, the aerial parts or in the whole plant. As for the process of isolation, it can be achieved through extraction by solvents like ethanol (EtOH), methanol (MeOH), acetone, dichloromethane and chloroform (CHCl3). *A. paniculata* synthesizes Andrographolide through two pathways, the mevalonic acid pathway or through deoxyxylulose pathway (DXP). Andrographolide possess many pharmacological properties, it has anti-inflammatory, antihyperglycemic, antimicrobial, antiparasitic and anticancer effects.

Anti-Cancer Effect of Andrographolide on TNBC cell lines

Anti-proliferative and viability effect

Several studies suggested that among all TNBC cell lines, MDA-MB-231 was the most susceptible type of TNBC cell line towards Andrographolide. Weber et al., proposed that 39.6μg/mL of Andrographolide was capable of eliminating 50% of cells, meanwhile, a higher dose of Andrographolide (77.6μg/mL) was able to inhibit MDA-MB-468 population. A different report was done by M Banerjee et al, where they implemented Andrographolide on multiple BC cell lines (MCF-7, MDA-MB-231, and T-47D), and used MCF-10A (normal breast tissue cell line) to examine its effect on the normal breast epithelia. The pattern of exposure
to Andrographolide was in both time and concentration-dependent manners. MDA-MB-231 cell line was found to be the most vulnerable amongst the other cell lines, and the exposure to the treatment introduced inhibitory effect on both viability and propagation of cells. The IC\textsubscript{50} was estimated to be 51.98μM at 24 hrs. and 30.28μM at 48 hrs. Worth mentioning that these values did not cause any effect on the MCF-10A, however, to introduce an effect the needed concentrations must be 3-5 folds higher. Similar outcomes were reported by Peng et al., in which approximately 50μM of Andrographolide eliminated MDA-MB-231 population.  

The induction of cell cycle arrest  

Andrographolide has the ability to induce cell cycle arrest as reported by several studies. Increase in cellular population was reported by M Banerjee et al., at S phase and a decrease occurred at G1/G0 accompanied by the formation of Reactive Oxygen Species (ROS), the increase in ROS was proportional to a longer time of exposure and might indicate that the inhibition was due to ROS accumulation. Different results were suggested by another study, the increase in population happened at the G1 and the decrease was noticed at the S phase. Downregulation in the levels of P27 (G1 phase inhibitor) and CDK6 were detected, and no accumulation in ROS was observed. While in a study done by Alqouqa et al., the arrest occurred at G\textsubscript{2}/M phase, followed by downregulation of Cyclin D1, CDK4, Cyclin E and P-cdc2, and upregulation of P21, Cyclin B1 and Waf1/Cip (cell cycle regulators proteins).  

The introduction of cellular and nuclear morphological modifications  

Nuclear morphological modifications were described as well, nuclear pyknosis, chromatin condensation, irregular edges and body fragments formation occurred during the time of exposure.  

Mitochondrial and apoptotic effects  

Release of cytosolic cytochrome c from the mitochondria of MDA-MB-231 was recorded. The release might be caused by the changes in the ratio of apoptotic and anti-apoptotic proteins (Bax/Bcl-2), whereas Andrographolide elevated their expression. In the same fashion, Peng et al. detected the translocation of cytochrome c from the intermembrane to the cytosol. Bcl-2, Bax and cleaved caspase-3/9 were spotted after 24 hrs. dosage of Andrographolide. Caspase-3/9 activation correlates with the finding of M Banerjee et al.  

Conclusion and Future Directions  

Breast Cancer still remains a threat to women around the world. Despite technological advancement and the increase in awareness, many patients are not transitioning from ill to healthy. The undeniable fact that the current treatments (Radiation Therapy (RT), Chemotherapy (CT) and Adjuvant Endocrine) have proved its effectiveness. But, its complications on the patients are treacherous and the medical community is due to overcome it. Andrographolide affects TNBC cells through multiple pathways such as the arresting of the cell cycle, inducement of cellular and nuclear morphological changes, upregulation apoptotic and anti-apoptotic proteins (Bax/Bcl-2). Involving Andrographolide in animal or human trials could elucidate its potential as an anti-cancer agent and provide knowledge and assessment for the future references.

Cortisol And Psychological Factors in Etiology of Lichen Planus

Alhakam Ibrahim¹, Hajer Ibrahim ¹, Shakir J. Al-Saedy²

¹ Department of Oral Medicine, College of Dentistry, Al-Mustansiriya University, Baghdad, Iraq
² Department of Dermatology & Venereology, Al-Kindy Teaching Hospital, Baghdad, Iraq

Abstract

Background and Objectives: Lichen planus is a common chronic inflammatory disease of oral mucosa and skin, whose exact pathogenic mechanisms have not been understood. Cortisol, has been used as an indicator in various psychological evaluation studies. Salivary cortisol measurement is an indicator of free cortisol in human serum and provides noninvasive and easy technique.

Aims, evaluation of cortisol levels and psycho-immunity profile in lichen planus patients was done. Using case-control method.

Materials and Method: 145 participants were admitted which had been done at dermatological outpatient clinic at Al-Yarmook Teaching Hospital. 32 patients were clinically proven cases of LP, 113 subjects along with age and sex-matched healthy controls. DASS Score questionnaire was administered to evaluate the psychiatric status (depression, anxiety and stress), Saliva samples were collected, and analyzed for cortisol level by using ELISA in study group and 46 of control group. The serum test were examined in 32 for each group using enhanced lanthanide fluoroimmunoassay technique for cortisol.

Results: The mean serum and Salivary cortisol level of the LP group showed a very highly significant difference (p=0.001) from the controls in multivariate statistic. The mean of DASS scores and the depression derangement specifically showed a very highly significant difference (p=0.001) from the controls. The stress and anxiety derangement showed high difference but it failed to reach to significant difference from the controls. There is an important association between serum and salivary cortisol concentration.

Conclusion: the cortisol and psychiatric factors play a vital role in the pathogenesis of LP and saliva cortisol could be a possible indicator instead of serum cortisol

Key Words: Lichen Planus, Cortisol, DASS, Stress, Depression, Anxiety

Introduction

Lichen planus is a chronic inflammatory mucocutaneous disorder, which can manifest in the oral mucosa. Oral lichen planus affects 0.1-4% of various populations. The disease usually affects middle-aged to elderly females. Currently the precise cause of lichen planus is unclear. Stress, depression and anxiety are the most common psychological factors, which causes alteration of the body tissues in general and oral in specific⁴. The world health organization classified OLP into several clinical forms: Reticular, papular, plaque – like, atrophic, erosive, ulcerative and bullous. The most often affected areas are the posterior buccal mucosa and tongue, the non-erosive form is often asymptomatic. The erosive forms are commonly sensitive or painful and affect the quality of life⁵.

Stress alters the regulation of both sympathetic and parasympathetic branches of autonomic nervous system, with consequential alteration in hypothalamic control of endocrine response controlled by the pituitary gland, autonomic activation and elevation of hormones, including those produced by hypothemic-pituitary – adrenal axis, play pivotal roles in regulation immune surveillance mechanism, including production of
Cytokines that control the inflammatory process (3).

Cortisol is a 21-carbon glucocorticoid secreted by the adrenal cortex that regulates carbohydrate, protein, fat and water metabolism, maintains vascular reactivity, affects the sensitivity of the nervous system, regulates blood cell numbers, and affects the human stress response (4). Cortisol levels can be measured in urine, and saliva. This approach has several methodological advantages, including the noninvasive collection of samples, reduced stress and repeatable sampling unlike blood. Cortisol in saliva is a useful index for investigations of chronic and acute stress reflected in HPA axis activity (5).

The objectives of this study are: Estimate serum and unbounded salivary cortisol level in Lichen Planus patient, evaluate the psychological disorders (depression, anxiety and stress) levels using Depression Anxiety Stress scale in Lichen Planus patient, and evaluate correlation between serum and salivary unbounded cortisol in Lichen Planus patient.

Patient selections: A total of thirty-two patient with Lichen Planus seen in the dermatological clinic at Al Yarmmok Hospital. Questionnaires: is including name, complete history, Depression Anxiety Stress Scales - DASS21 (the DASS is a set of three self-report scales designed to measure the negative emotional states of depression, anxiety, and stress), Salivary cortisol: A-Reagents supplied in unbounded salivary cortisol kit, and Serum cortisol kit: Vidas cortisol kit: Is used to determine cortisol on serum.

Method

DASS questionnaires: All case-control subjects are asked to use 4-point severity/frequency scales to rate the extent to which they have experienced each state over the past week.

Salivary and Serological laboratory tests: Collecting Saliva: The participants gave 5 minutes to collect saliva in the plain tube. The time of collection was between (9:30 am-12:00 pm) to pool saliva and refrigerate samples within 30 minutes and freeze at or below -20°C within 4 hours after collection. The Serological measurements were done in Teaching Laboratories at Al Yarmook Hospital for each group.

Statistical Analysis: Data were translated into a computerized database structure. A multiple linear regression model was used to study the net and independent effect of a set of explanatory variable on a quantitative outcome (dependent) variable like salivary cortisol concentration. The model provides the following parameters: P (model), Unstandardized partial regression coefficient, P for regression coefficient, and R². A multiple logistic regression model was used to assess the net role of a set of explanatory variables in predicting Lichen Planus cases differentiating them from healthy controls, the model provides the following parameters: P-value for the model, The overall predictive power, Adjusted OR, and P-value for OR.

Cases Distribution: 32 patient included in the study were distributed into 21 females and 11 males, the female to male ratio was 1.9:1. While the control group consisted of 113 divided into 57 females and 56 males. The female ratio was almost 1:1. For the Lichen Planus group their ages were ranged between (16-60) with a mean ±SD 41.6 ±13.2 years. Compare to (19-67) years in control groups with a mean± SD are 41.8 ±11.4 years. The differences failed to reach the level of statistical significant 0.1{NS}. The age difference between study groups is not an important confounder.

Table 3 a multiple logistic regression model was used. After adjusting for the confounding effect of age, gender, magnitude of psychiatric derangement and serum immunoglobulins, it was found that serum cortisol concentration was significantly higher among cases with Lichen Planus. Depression score was the most affected among the 3 measures of psychiatric derangement.

Table 5 The mean salivary cortisol was lowest (0.079) among cases with lowest concentration of serum cortisol (first tertile) and increase to reach its highest mean concentration (119) among cases with highest concentration of serum cortisol (third tertile). The differences observed in mean salivary cortisol were statistically significant. There was a moderately strong positive (direct) linear correlation between serum and salivary cortisol concentration (r=0.54 , P=0.001).

Table 6 a multiple linear regression model was used to assess the net and independent effect of a set of explanatory variables on the magnitude of salivary cortisol concentration. Only serum cortisol had a statistically significant association with salivary cortisol concentration after adjusting for age and gender, the 3 psychiatric scores and group membership (Lichen Planus Vs controls).
Conclusion: There is an important association between serum and salivary cortisol concentration.

Lichen Planus (LP) is a chronic inflammatory, autoimmune disease, affecting a wide variety of sites, including skin and mucous membranes. (6).

Anxiety, stress, depression and other psychological aspects of humans and their association with disease status were the domain of extensive research. Chronic conditions like Lichen Planus deserve special attention in this respect. (7).

Cortisol hormone is well established in medical literature as the stress hormone. Its direct relation to psychology is a known fact (8). The current study is the first of its kind in Iraq, its importance was reflected by exploring the association between psychology and cortisol both serum and salivary.

Three important domains of psychological abnormality in human were studied in the present work: stress, anxiety and depression.

Measurement of depression and its association with Lichen Planus was done by several scales. Wu XH, 2011 used self-rating depression scale (SDS), Hamilton depression scale (HAMD) (9).

Measurement of anxiety and its association with Lichen Planus was done by several scales. Two published articles by Maryam Rabiei (10), and Koray M, 2003 used Spielberger’s State-Trait Anxiety Inventory. EL Tawil M use Taylor manifest anxiety (11).

Measurement of stress and its association with Lichen Planus was done by several scales and indices in published articles. Farhad Mollashahi Leila, used Stress Life Event Questionnaires (12).

The current study used an updated psychology scale, which can measure the magnitude of anxiety, stress and depression as an independent entity with only 7 questions per domain.

DASS as a measure of psychology and its association with Lichen Planus or Cortisol Lichen Plan us Cortisol was used to a great extent in recently published articles. Singh R used DASS in measuring stress and its effect on cortisol level in medical students (13). Madhumita Premkumar also used DASS in measuring changes in mood and assessed the correlation with cortisol (14).

The current study showed a statistically significant positive association between psychiatric derangement and Lichen Planus. The mean DASS score was significantly higher in Lichen Planus cases compared to healthy control group. Depression was the almost affected to Lichen Planus.

The current study showed that the mean of serum and salivary cortisol was obviously higher with LP compared to control group.

A list of published case-control studies reported similar positive association between salivary cortisol and Lichen Planus. Maryam Rabie (10), Carla Girardi (15), Sanjib Kumar Khataniar (16), and Bina Shah (17), measured
salivary cortisol detected by ELISA. They concluded that patients with oral Lichen Planus exhibited greater salivary cortisol than the controls.

The current study showed a strong direct correlation between serum and free unbound salivary cortisol in patients with Lichen Planus.

Published articles agreed with the previous conclusion. Elisabeth Aardal (18) and Vining RF (19), studied the relation between free salivary cortisol and serum cortisol in healthy volunteers. They concluded that the relation between the cortisol concentrations in serum and saliva was positive.

Two published articles showed that salivary cortisol in critically ill patients may be a better laboratory indicator of cortisol levels than serum total cortisol. Rômulo Carvalho compared the performance of salivary and serum total cortisol in patients with severe sepsis (20). Aardal-Eriksson showed that CRH stimulation induced a more pronounced cortisol response in saliva than in serum, having a closer correlation with ACTH hormone over serum cortisol. The study suggested that salivary cortisol measurement may be used as an alternative parameter in dynamic endocrine tests (21).

**Conclusion**

1. The mean of salivary and serum cortisol was higher difference in Lichen Planus than control subjects, the mean DASS and the special depression Derangement also higher in LP patient compared to control subjects (p<0.001).

2. The current study showed a strong direct correlation between serum and free unbound salivary cortisol in patients with lichen planus. Salivary cortisol in critically ill patients may be a better laboratory indicator of cortisol levels than serum total cortisol.

**Suggestion**

1. As the present study is pioneering in Iraq, we recommend that further studies should be carried out with increasing the sample of patients for more accuracy and confirmation of results. Also we recommend for using psychiatric drug along with routine LP treatment to determine the efficacy of drug therapy of psychiatric disorders in lichen planus.

**Ethical Clearance** A consent form has been signed by each participant and the agreement of the ethical committee at the Department of Oral Medicine was taken.

Purification of L-Glutaminase from *Bacillus sp. B12* and study its properties

Alyaa Abdelhameed, Rana Alqaysi, Hiba Ali Hilal, and Nada Alharbi

1Biotechnology department - College of Science - University of Diyala – Iraq, 2Microbiology department - College of Veterinary medicine – University of Diyala – Iraq, 3Biology department, College of Science - University of Princess Nourah bint Abdulrahman - Saudi Arabia

Abstract

L-glutaminase is an enzyme that catalyses the conversion L-glutamine to glutamic acid and ammonia. The important application of the L-glutaminase is a chemotherapy agent. In this study a novel strain, *Bacillus B12*, that isolated from Diyala soil was explored for production of extracellular L-glutaminase. The enzyme has been purified 23.9-fold from cell-free extract with 45.4% recovery (specific activity 76.6 U/mg protein). Enzyme has molecular weight of 199 kDa, and pH 8 and stable in pH range 6-9.5. Temperature optimum is 40 °C and completely stable between 25-45 °C. The kinetics studies revealed that the km and Vmax of purified L-glutaminase were estimated in 0.4mmol/L and 0.133mmol/min, respectively. The result showed that, the enzyme was active when incubated with 10 mM of Mn2+, Mg2+, Ca2+ and Na+. Whereas, K+, Co2+, and Ni2+ show no effect. However, Hg2+, Cu2+, Fe2+ and Zn2+ decreased L-glutaminase activity. The 10mM of DEAE, PMSF, and sodium azide did not show a clear effect against the enzyme activity. Higher decrease in enzyme activity was observed by using Cysteine and 2-Mercaptoethanol (30 and 25%, respectively).

Keywords: *Bacillus sp. B12*, L-glutaminase, purification, Ion exchange, pH, and Thermostability.

Introduction

Microbial communities are an important biological component of soil function, and all organisms in an ecosystem rely on the activity of microorganisms for their role in improving soil quality and regulating nutrient availability [1]. Producing extracellular enzymes which are needed to break down organic material for sustainable soil productivity. L-glutaminase plays a major role in the nitrogen metabolism of both prokaryotes and eukaryotes [2]. It is an important enzyme therapy for a variety disease of the lymphatic system especially acute lymphocytic leukemia [3].

The enzyme has also been applied in the treatment of Hodgkin’s disease, lymphosarcoma, and acute myelocytic leukemia [4]. L-glutamine is not an essential amino acid for the animal cell, and the neoplastic cells are not able to induce the synthesis of glutamine synthetize. However, they are dependent on the extracellular level of L-glutamine to protein synthesis [5]. As L-glutamine is withdrawn from plasma by L-glutaminase, this amino acid leads to inhibit the growth in neoplastic cells [6]. There is a great demand to produce chemotherapy, a variety of nutritional and physiochemical factors influences the production of enzymes. For this reason, this enzyme has been developed to use as therapy to tumor cells [7]. Nowadays optimization of different production parameter would enhance the quality and quantity of enzyme production, and turn in turn influence enzyme synthesis and cell yield [8]. The microbial source is very common for L-glutaminase, because of easily cultured, extraction, and purification for the industrial scale production. The most used microorganisms to produce L-glutaminase *E.coli*, *Actinomycetes*, *Pseudomonas sp.*, *Erwinia carotovora sp.* [9]. Because of the continuous need to screen newer strains that capable to produce high yield of L-glutaminase, this paper deals with the purification, kinetics properties, and biochemical characterization of L-glutaminase from *Bacillus B12*.

Method

Bacterial strain, culture condition and enzyme purification

Bacterial strain *Bacillus sp*.B12 (Genbank accession
no.:SAMN12069785) was used. The strain was grown on nutrient agar at 30 °C for 24 h.

**L-glutaminase purification**

All purification steps were carried out at 4°C. *Bacillus sp. B12* L-glutaminase was purified by a modification of the method of Boyd and Philips [10].

**L-glutaminase assay**

The enzyme was assayed by direct nesslerization method according to Imada et.al [11].

Estimation of protein content

The protein concentration was determined using Lawry method [12]. A calibration curve was made by using bovine serum albumin (BSA) as standard.

**Molecular weight determination**

Molecular weight of the purified L-glutaminase was estimated by Sephadx G-100 performed as described above using standard proteins (BSA, trypsin, pepsin, and catalase) and proteins standard curve [13].

**Effect of pH on enzyme activity and stability**

The optimum pH for enzyme activity and stability was determined. The enzyme was incubated for 1 hr at various pH values (4-11).

**Effect of temperature on enzyme activity and stability**

The optimum temperature for enzyme activity and stability were determined. The enzyme was incubated in different temperature values (10°C to 60°C).

**Influence of different effectors on L-glutaminase activity**

The enzyme activity was determined in the presence of different metal salts and other compounds (10mM). Under the standard assay conditions, the enzyme was incubated for 60-min at 35°C with the each effector. The relative activities were determined by considering 100% activity of enzyme in the absence of additives.

**Kinetics parameters**

Kinetic parameters were determined using the hydrolysis the substrate L-glutamine (0-20mmol/L) under standard assay conditions. The Michaelis-Menten (km) constant and maximum velocity (Vmax). The reaction mixture was 0.02M tris-HCL buffer, pH 8.6. The values of Km and Vmax were then determining from line weaver-Burk plot [14].

**Results and Discussion**

**Purification of L-glutaminase and molecular mass estimation**

L-glutaminase from *Bacillus* sp.B12 was purified 23.9 folds, with yield of 45.4 (Table1) after sulfate fractionation (68%). Fast column chromatography was performed through the Ion exchange DEAE-Cellulose followed by Sephadex G-100 (Fig.1.) These results were in the agreement with L-glutaminase activity from *Bacillus* sp. LKG-01 was purified to 49-fold with 25% recovery with specific activity 584.2 U/mg protein [15].

Characterization of purified L-glutaminase

Determination the molecular weight

The molecular homogeneity of purified L-glutaminase revealed a specific activity of 73.6 U/mg, and the molecular weight was estimated as 199 KDa (Fig.1). There has been wide variation in the molecular weight of L-glutaminase produced from different sources, for instance the strain Pseudomonas aurantiaca produced 148 kDa [16]. Also, Elshafei et al (2014) demonstrated that an intracellular L-glutaminase from Penicillium brevicompactum NRC829 showed molecular mass 71kDa [17].

While, the purified L-glutaminase from Pseudomonas aeruginosa 50071 presented the molecular weight 160kDa [18]. Similarly, the partially purified enzyme from Bacillus cereus MTCC 1305 showed an approximate molecular weight 140 kDa [19]. Most of the L-glutaminase are monomers; however, the enzyme of Erwinia carotovora exists in the form dimer with molecular weight 40.2kDa [20].

C: Native molecular mass estimation by gel filtration. Standard markers: Trypsin (23.3 kDa) Pepsin (34.5 kDa), BSA (66.4 kDa), Catalase (57.3 kDa). The molecular weight size marker (b), molecular mass determination for enzyme (b).

Figure 1. L-glutaminase purification and characterization.

Effect of pH and temperature on the activity and stability on the purified L-glutaminase

L-glutaminase is one of the amidases that are generally active and stable at neutral and alkaline pH. Figure 4 revealed that pH. 8 was the optimal for L-glutaminase activity (3U/ml) (Fig.2). In agreement with our results, Elshafei et al [17] reported that, pH. 8.5 to be the optimum pH for amidase activity. Continuously, an optimum pH range of 7.5 to 9 was found for L-glutaminase production from Pseudomonas aeruginosa [21].
The purified L-glutaminase from *Bacillus* sp. B12 was more stable in alkaline pH more than acidic one; it returns more than 75% of the total activity in the pH range 6-10. Our results also demonstrated that L-glutaminase retained about 50% of its activity after storage at pH 11 (Fig.2). Ohshima reported that, pH from 9.5 to 10 seems to be the most suitable pH for the storage this enzyme [22].

**Effect of temperature and thermal stability behaviour**

As far as the temperature dependence activity is concerned, many of the L-glutaminases reported to have both optimal and stable temperature of around 40°C to 50 °C. Based on the results, the purified L-glutaminase from *Bacillus* sp. B12 was active over a wide range temperature from 25°C to 50 °C (Fig.3). L-glutaminase kept about 75% if initial activity after incubation at 40 °C. A notable decrease in enzyme activity was observed at higher temperature above this value, at 60°C only 25% of L-glutaminase activity was still present. In this concern, Singh and Banik (2013) recorded that the purified L-glutaminase enzyme produced from *Bacillus cereus* MTCC 1305 showed greatest activity at 35°C.

The results of temperature effect on enzyme stability indicated that no significant enzyme activity was lost when it was pre-incubated at 55 °C for 60 min (Fig.3). In contrast with our result, Elshafei et al (2014) reported that the purified L-glutaminase from *Penicillium brevicompactum* NRC829 showed stability in range temperature from 50°C to 60°C [17].
Determination of the kinetic parameters $K_m$ and $V_{max}$

The kinetics parameters for L-glutaminase towards substrate was determined from the Lineweaver-Burk Plot. The affinity of the purified L-glutaminase to L-glutamine as substrate, with an apparent $K_m$ and $V_{max}$ values 0.4mmol/L and 0.133mmol/min, respectively (Fig.4). The low values of kinetic parameters ($K_m$ and $V_{max}$) indicated high affinity of the enzyme to glutamine meaning that the rate will approach $V_{max}$ more quickly [23]. The results were in agreement with that reported by Singh and Banik (2013), they revealed that Bacillus cereus MTCC 1305 L-glutaminase has the high affinity to L-glutamine and presents a small $K_m$ (0.129 mmol)[19]. Also, Elshafei et al [17] recorded the highest activity of Penicillum brevicompactum NRC829 L-glutaminase towards L-glutaminase, with $K_m$ value of 0.13 mmol.

Effect of metal ions and inhibitors on the activity and stability on the purified L-glutaminase

The impact of various inhibitors and activators on prepare L-glutaminase was evaluated by pre incubation of the enzyme with each compound for 60 min without substrate. Results in Table 2 demonstrated a variation in enzyme activity, the presence of Ca$^{2+}$, Na$^{+}$, Mn$^{2+}$, and Mg$^{2+}$ enhanced the enzyme activity (Table 2). Also, the enzyme retained more than 90% of the total activity in presence of K$^+$, Ni$^{2+}$, and Co$^{2+}$. However, a considerable loss of activity was observed with the Sn$^{2+}$, Zn$^{2+}$, Cu$^{2+}$, Fe$^{2+}$, Hg$^{2+}$, Fe$^{2+}$ and they inhibit more than 50% of the purified L-glutaminase activity (Table 2). Constantly with our results, Singh and Banik (2013), reported that Na$^+$, K$^+$ and phosphate ion activated the Bacillus cereus MTCC 1305 L-glutaminase; while, divalent cations Mn$^{2+}$, Mg$^{2+}$, Zn$^{2+}$, Pb$^{2+}$, Ca$^{2+}$, Co$^{2+}$, Hg$^{2+}$, Cd$^{2+}$, and Cu$^{2+}$ inhibited its activity[19]. The Mn$^{2+}$ (2mmol) acted as activator for L-asparaginase from Rhizomucor miehei [24].

</tbody>
</table>

Moreover, the presence of 2-Mercaptoethanol and Cystein (10mM) acted as inhibitors of L-glutaminase activity, the activity was reduced to around 70% of the total activity. On the other hand, PMSF and EDTA kept more than 90% of the enzyme activity. While, Sodium azid has no effect on the enzyme activity, which indicates that L-glutaminase might not be metalloenzyme (Table 2). Inhibition in the presence of thiol group blocking reagents indicates that the enzyme has thiol group(s) in the catalytic site of the enzyme.

Histopathology, Hilla City, Babylon Province, Iraq, 2 Medical Department, Hammurabi faculty of Medicine, University of Babylon, Assistance Professor, F.I.B.M.S pathology, Hilla city, Babylon province, Iraq, 3 Pathology Department, College of Medicine, University of Babylon, Assistance Professor, F.I.B.M.S Pathology, Hilla City, Babylon Province, Iraq

Abstract

Purposes of study: to evaluate clinical parameters and histopathological features of Colorectal carcinoma (CRC) and its association with BRAF mutation as immunohistochemical markers in Babylon province.

Methods: This research is prospective study. The total patients are 42 Manual IHC staining procedure were done. Staining intensity were scored as: 0 (negative), 1 (weak diffuse staining in comparing to background staining), 2 (moderate diffuse staining), and 3 (strong diffuse staining). IHC scoring was regarding as positive when there was diffuse, homogenous and more than 80% of cytoplasmic staining area of cancer cells. Negative cases when there were absent staining or nuclear staining or weak isolated staining cells. Score 0 and 1 were consider negative and score 2 and 3 were positive. Results: Positive IHC staining of BRAF mutation was presenting more in older age group (65 ±15.23 years), male gender (60%) and left sided colon (60%) but there were insignificant association of these above parameters. Grade 2 and grade 3 of CRC was the highest frequency of positive BRAF cases (40%). Positive IHC staining for BRAF mutation expression is more frequency in T3, N1-2, and M0 stage, and stage III that shows 60%, 80%, 100%, 80% respectively. There were no significant association between BRAF IHC with TMN staging and grading systems. Conclusion: the current study found to be predominant in older age (> 65 years old), high grade (G2-3) and high stage (III). Parameters of high grade & stage associated with poor prognosis & high mortality outcome. BRAF gene IHC expression could be consider an independent bad prognostic factor for patients with CRC.

Key words: Colorectal carcinoma, BRAF gene, immunohistochemistry method.

Introduction

Colorectal carcinoma (CRC) is 3rd common malignancy in world(1) and one of leading cause of mortality in Western area of world(2). Tumor-node-metastasis (TNM) staging system is remain as prognostic parameter for this cancer(3).

The distribution of this tumor is equal regarding sex and mean affecting age is between 6th and 7th decades of life(4).

Both chronic inflammatory bowel diseases and Schistosoma mansoni infection are causes of CRC (3).

BRAF gene (v-Raf murine sarcoma viral oncogene homolog B) is an oncogene, undergo mutation, and found about 10%-15% of CRC(5,6). The common mutation in BRAF gene is V600E and account for about 80% (7), and found in colorectal adenocarcinoma (5%-15%), papillary type of thyroid cancer (45%), melanomas (40%-60%), serous type of ovarian cancer (35%), lung cancer (1%-3%) and other cancers(8).

CRC with BRAF oncogene mutation have recurrent association with poorly differentiation mucinous cancer and higher TNM staging system(9), and so, it can predict an essential role in treatment of CRC(10), and this BRAF mutation can distinguish between CRC of sporadic type
from hereditary non-polyposis type/Lynch syndrome\cite{11}.

Study aim was to evaluate clinical parameters and histopathological features of CRC and its association with BRAF as immunohistochemical markers in Babylon province.

**Method**

**Patients samples**

This research is prospective study. The patients with diagnosed CRC underwent clinical evaluation about age ,sex, metastasized CRC or not, if patients were taking chemotherapy or not, duration of CRC, and lastly, biopsy or total (or partial) colectomy.

These patients were selected from Al-Hilla Surgical Teaching Hospital, private Teeba Hospital, many private histopathological laboratory, and the specimens of CRC were partial or total colectomy, reported its large intestine site, and selected before chemotherapy. The paraffin embedded blocks of cancer were reviewed by two pathologists to ensure the diagnoses of CRC and were classified according to TNM staging system (8th edition, 2017)\cite{12} and WHO grading system (2000)\cite{13}.

The total patients (42) were collected between February/2017 to April/2019, 25 men and 17 women, and age ranged between 35-83 years old (median age 64).

**Immunohistochemistry (IHC)**

The BRAF V600E kit protocol was Bio SB, Inc., USA, BRAF VE1 antibody is Rabbit Monoclonal antibody (isotype IgG) that shows cellular cytoplasmic staining, Clone RM8, and Catalog No. BSB 2824.

IHC scoring of BRAF V600E was depend on percentage and intensity of staining. Staining intensity were scored as : 0 (negative), 1 (weak diffuse staining in comparing to background staining ), 2 (moderate diffuse staining), and 3 (strong diffuse staining) . Positive control ( melanoma cancer has BRAF mutation) and negative control ( usually making by removing primary antibodies ) were used with each run of IHC procedure.

IHC scoring was regarding as positive when there was diffuse, homogenous and more than 80% of cytoplasmic staining area of cancer cells. Negative cases when there were absent staining or nuclear staining or weak isolated staining cells. Score 0 and 1 were consider negative and score 2 and 3 were positive \cite{14,15}

**Statistical Analysis**

SPSS software (version 22) was statistical program. Categories data were indicated as frequency and percentage and were assessment by using Pearson’s chi. Continuous data represented as range , median, mean ± SD, and were measured by Independent T Test if the data is normal distributed . \( P \text{ value} < 0.05 \) was significant difference between two parameters.

**Results**

A total 42 patients with CRC ( adenocarcinoma type ), 25 men and 17 women, mean age±SD ( 63.36±12.21), and were assessment by using IHC staining of BRAF mutation. General clinicopathological features of present study are illustrated in Table 1.

IHC staining procedure show 8 cases with BRAF staining and remaining 36 show no staining, 8 cases include strong intensity 2 cases, moderate intensity 3 cases, weak intensity 3 cases, and the staining percentage of these cases were between 80%-95%. So, positive expression of BRAF IHC in CRC were represented always moderate to strong staining (5 cases). While, negative cases were including weak and no staining cases.

Positive IHC staining of BRAF mutation was presenting more in older age group (65 ±15.23 years), male gender (60%) and left sided colon (60%) but there were insignificant association of these above parameters as in Table 2.

Grade 2 and grade 3 of CRC was the highest frequency of positive BRAF cases (40%). Positive IHC staining for BRAF mutation expression is more frequency in T3, N1-2, and M0 stage, and stage III that shows 60%, 80%, 100%, 80% respectively.

There were no significant association between BRAF IHC with TMN staging and grading systems as in Table 3.

FIG. 1 : BRAF IHC staining in the CRC. (A) It is showing negative staining at10X. (B) It is diffuse cytoplasmic and weak staining (10X), (C) and It is diffuse and moderate staining (X10) , (D) and (E) It has diffuse and strong staining at 10X and 40x respectively.

**Discussion**

The main objective of this study is to evaluate BRAF gene mutation prevalence by utilizing monoclonal VE1 AB in colorectal carcinoma & compare the outcomes with different clinical & histopathological features. Many previous studies of BRAF gene showed good compatibility between IHC technique and genotype sequencing methods regarding many cancer types \(^{(16-23)}\), but Adackapara et al\(^{(24)}\) showed less compatibility (71% sensitivity and 74% specificity), this might be due to using manual IHC method with incubation overnight of IHC antibodies\(^{(25)}\).
BRAF mutation investigation is used as mandatory in practical laboratory\(^{26}\). Also, polymerase chain reaction technique required more time, need special structures, affected by method of preservation of formalin fixed paraffin tissue and tissue heterogeneity\(^{20}\), while, IHC is usually done in most pathological laboratories, less costly, and less complex procedure in compare to genotype procedure, lastly, genetic procedure for BRAF mutation can be regarded as critical method only when there are an equivocal IHC BRAF cases to confirm or exclude their positivity\(^{27}\).

Also, Sinicrope et al\(^{(15)}\) used BRAF scoring as negative when there are nuclear staining or weak separated cancer cells with cytoplasmic staining, and positive scoring when there are 100% homogenous cytoplasmic staining area of cancer cells in 75% of patients or more than 70% of stained cells from total cases as scoring standard as in our research.

In the present study, there were 5 positive cases for VE1 (11.9%) most of them in older age and commonly in age group 55-74 years, male gender, and left side of colon (tumor site), TNM stage (T3, N1-2, M0), tumor grade (G2-3), however; no significant association between all these parameters and BRAF IHC results were observed.

Christian et al \(^{28}\) (cohort 1) demonstrated that positive IHC BRAF cases (13.5%) were more in older age, female gender, left sided colon cancer, TNM stage (T3-T4, N0, and M0), and tumor grade (G1-2), All these factors (gender, tumor site, TNM tumor stage, and tumor grade) showed insignificant association with BRAF IHC.

Fiona et al \(^{29}\) demonstrate that positive BRAF IHC (13.2%) expressed higher in female, right colon cancer, tumor grade 3, and tumor stage II-III.

Several studies of BRAF IHC showed result positivity more in older age, female sex, righted sided CRC, and more advanced tumor stage\(^{30-33}\).

In conclusion, the current study is the first Iraqi study provide new information about the BRAF V600 gene mutation prevalence among Iraqi patients with CRC utilizing IHC technique, it found to be predominant in older age (> 65 years old), high grade (G2-3) and high stage (III). Parameters of high grade & stage associated with poor prognosis & high mortality outcome, then BRAF gene IHC expression could be consider an independent bad prognostic factor for those patients with CRC.

Abstract

The research was performed to examine the efficacy of *Zingiber officinale* L. as feed additives on growth performance and biochemical parameters in common carp *Cyprinus carpio* L. Used (80) fish and divided into 4 groups 10 fish per aquaria, two replicates were maintained for each treatment. Ginger powder mixed directly with basal diet of fish. It was incorporated in the four diets treatments. The control group diet had no ginger additive (C), while the three supplemented diets contained ginger at 1% (T1), 1.5 (T2) and 2 % (T3). After 35 days’ growth was calculated as weight gain, daily weight gain, relative growth ratio, feed conversion ratio, feed efficiency percent and protein efficiency ratio with evaluate total proteins, albumin, globulin, cholesterol and triglycerides. The results of present study were weight gain of T2 and T3 groups showed significant difference comparison with the C. Daily weight gain showed significant difference between C, T2 and T3. Relative growth rate there were no significant difference between C and T1 but there was significant difference between T2 and T3. Feed conversion ratio showed no significant difference between control group and T1. Feed efficiency ratio there were no significant difference between T1, T2 and C. Protein efficiency ratio results showed that decrease in T3 and T2 compared to the C. The results of total protein, albumin, and triglycerides did not show any significant difference between treatments compared with the C. Globulin showed increase in T3 compared to C. While the cholesterol showed significant difference in T3 compared with C, T1 and T2. The results of present study propose that ginger feed additives at the concentration 2% for 35 days can be improvement growth and some serum biochemical parameters.

**Keywords:** *Zingiber officinale* L., growth performance, biochemical parameters, *Cyprinus carpio* L

Introduction

Feed additives used to improve the growth and health of aquaculture species. Extensive use of antibiotics and biocides in aquaculture lead to antibiotic-resistant and generation of toxicants which may cause risks to the environment \(^[1]\). Consequently, The need of safe and effective alternatives to antibiotics is required, increasing attention to the use of natural alternative feed additives as supplementing ginger in fish diet \(^[2]\).

*Zingiber officinale* L. has been used as a spice for over 2000 years \(^[3]\). It is also called “The Great Medicament” in Ayurvedic medicines \(^[4]\) and is generally considered as a safe herbal medicine \(^[5]\). Fresh ginger contains 80.9% moisture, 2.3% protein, 0.9% fat, 1.2% minerals, 2.4% fiber and 12.3% carbohydrates.

Ginger contain natural organic materials for control disease in aquaculture by increasing the non-specific and specific immune mechanisms \(^[6]\). Supplementing diets ginger was reported to enhance the growth of tilapia (Oreochromis mossambicus) \(^[7,8]\). The digestive enzyme activity significantly increased with ginger enrichment \(^[9]\). \(^[10]\) reported *Zingiber officinale* in diet of koi carps increase its production and enhance growth. Ginger has been reported to possess a broad-spectrum of prophylactic and therapeutic activities \(^[11,12,13]\). Serum total proteins are indicator of the biochemical nutritional and health status of the fish \(^[14]\). The use of ginger powder as supplemented diet can cause the increase of total protein in Lates calcarifer \(^[15]\). Studies have reported increase in serum albumin and globulin with work relating to fish fed with ginger diet \(^[10]\). The aim
of the study was to assessment the effects of ginger as a feed additive in the diets of common carp Cyprinus carpio L. on growth and serum biochemical parameters.

**Materials and Method**

A total of (80) healthy fish of Cyprinus carpio L. average weight (75 ± 2 g) were obtained from a carp farm at Aljadera - Diyala (Iraq) were used in the experimental study. They were stocked in a two path through (150 x 80 x 50 cm) then the fish were selected randomly and dispersed in to the 8 glass aquaria 10 fish per aquarium for each treatment. The ginger was mixed directly with basal diet of fish. It was incorporated in the four diets treatments. The control diet had no ginger additive, while the three supplemented diets contained ginger at 1% (T1), 1.5 (T2) and 2 % (T3). All fish were fed 3% of their body weight two times daily for 35 days. Growth performance parameters calculated via the following equation: Body weight gain (WG) = final fish weight (g) – initial fish weight (g) [16]. Daily body weight gain (DG) = Gain (g) / time (day) [17]. Relative growth ratio (RGR%): final fish weight (g) – initial fish weight (g) / time (day) X 100 [18]. Feed conversion ratio (FCR) = feed intake (g) / Weight gain (g) [17]. Feed efficiency percent (FER %) = Weight gain (g) X 100 / feed intake [19]. Protein efficiency ratio (PER) = Weight gain (g) / Protein intake (g) [19]. At the end of the experiment, blood was drawn from caudal vessels using a non-heparinized syringe and collected in plastic gel tube. The evaluate of serum total proteins was carried by colorimetric method described by [20]. While estimation of albumin was carried according to [21]. Globulin content was calculated by subtracting albumin value from serum total protein value. Cholesterol and triglycerides were carried by using laboratory diagnostic kits.

**Statistical Analysis**

The statistical analysis system [22] program was used to show the effect of different treatments in study parameters. Least significant difference –LSD test and ANOVA were used to show the significant differences and compare between means in this study.

**Result**

The mean body weight gain (BW), Daily body weight gain (DG), Relative growth ratio (RGR). Food conversion rate (FCR), Food conversion efficiency (FCE) and Protein Efficiency ratio % (PER) were reported in Table (1). The body Weight gain (g/fish) of T2 and T3 groups showed significant difference at (P≥0.05) (4.81±1.121, 7.99±1.00) respectively with the control group (0.72±0.15) and T1(1.42±0.23) on the other hand there were statistically significant difference between T2 and T3. Daily weight gain showed significant difference at (P≥0.05) between T2, T3, C and T1 were (0.24±0.033, 0.66±0.070) and (0.03±0.005, 0.07±0.019) respectively. Relative growth% there were no statistically significant difference at (P≥0.05) between control and T1 (10.03±0.30, 11.86±0.52) respectively but there was statistically significant difference at (P≥0.05) between T2 and T3 (14±0.61, 17.39±0.86) respectively. Feed conversion Ratio (FCR) showed no significant difference at (P≥0.05) between control group and T1 (18.55±0.54, 17.2±1.03) respectively but there were significant difference between T3 and C, T1, T2 with low FCR in T2 and T3 (15.57±0.93 and 11.57±0.63) respectively. Feed efficiency ratio % there were no statistically significant difference at (P≥0.05) between control group, T1 and T2 was (1.85±0.30, 1.52±0.21, 3.08±0.47) respectively while T3 (6.16±1.05) showed the greatest value and were statistically significant difference at (P≥0.05) with C, T1 and T2. Protein efficiency ratio % results showed that decrease in T3 and T2 values in fish fed ginger diet (P<0.05) compared to the control and T1 (1.12±0.007, 2.25±0.08 and (5.17±0.12, 5.37±0.31) respectively.

The total protein, albumin, and triglycerides did not show any significant difference between treatments compared with the control group (P≥0.05). Globulin showed significant increase in T3 (0.47±0.04) compare to C (0.28±0.03). While the cholesterol showed significantly reduces in T3 (71.16±3.70) compare with C1, T1, T2 (83.66±3.79, 82 ±2.63, 73.16±5.28) respectively (Table 2).

Discussion

Highest supplementation of ginger in T3(2%) achieved the best significant final average body weight followed by fish groups fed on diet contained (1.5% - 1% mg /kg) ginger respectively, while the lowest values were in control group similar results observed that beluga fed diet with ginger powder significantly increased growth performance [23]. These results clearly showed that the ginger stimulated fish growth may be respond to ginger supplementation in a dose dependent manner. These results are also in accordance with [24] who suggesting highest supplementation of ginger was most favorable for the growth and survival. Also, [25] administration of ginger in grouper enhanced innate immune defenses. The enhanced growth response indicated by gainer supplementation stimulates protein synthesis by enzymatic system [27,26] and agreement with [28] who reported that goldfish fed ginger supplemented diets, enhanced growth. The result of the FCR low in T2 and T3 (15.57±0.93 and 11.57±0.63) respectively it is in contrast with that of [29] who reported that there was a significant difference in Feed conversion ratio in shrimp fed ginger supplemented. These values are also observed in other teleosts [30] and tilapia [31]. Previous study significantly increased albumin and globulin are vital elements for maintaining a healthy immune system [32]. This is in agreement with finding of [33, 34] an increase in serum protein levels as an indication of strong innate immune response in fish, likewise [35] showed higher levels of albumin and globulin. Ginger had no significant difference on triglyceride compared with the control (Table 2). In the present study, total protein and albumin was not change after feeding with different doses of ginger at the end of 35 days and globulin had significant difference in fish fed diet containing ginger when compared with the control.

Conclusion

The research concluded that ginger supplemented diet at the concentration 2% for 35 days improved growth and higher levels of globulin with reduce in both cholesterol and triglyceride in blood serum analyzer. Further research is needed to clarify the action mechanism of ginger and feeding period in common carp.

The Infestation Study of *Oestrus ovis* L. 1761 in Sheep of Al-Amara Region, Maysan Province, South of Iraq

Hussain A. Mhouse Alsaady¹, Aswan Al-Abboodi², Ayat Awdaa³, Mohammed Rshak³

¹Assist Professor, ²Lecturer, ³B.SC, Department of Biology, College of Science, University of Misan, Maysan, Iraq.

Abstract

362 heads of sheep obtained (in multiple visits) from the central slaughterhouse and the sheep abattoir at Al-Amara region (Maysan, South of Iraq) between November 2016 and March 2017 were examined for the detection of *Oestrus ovis* larvae for the first time in this region. Sheep heads were examined by dissecting them longitudinally, the sheep were of local breed. Of the 362 heads, 296 (81.8%) were infested with *O. ovis* larvae. *O. ovis* larvae were observed recorded in both sexes and all age groups in different temperature ranges (low, medium and high) during the research period. A total of 985 larvae were collected. The overall infestation intensity (IN) was 5.443% L/H with a range of 2-8 larvae per infested head of sheep (L/Hs). The infestation of larval in the infested sheep was 54.14% in low-temperature weather, while 100% in relatively high-temperature weather. March showed the highest infection intensity, while January showed the lowest infection intensity. The novelty of the current study is to conduct the research in an area that totally different from what has been studied before in Iraq in regards to the geographical location and the climate conditions.

Keywords: *Oestrus ovis*, Oestrosis, infestation, sheep.

Introduction

*Oestrus ovis* (Linne 1761, Diptera: Oestridae) the sheep nasal bot fly, is a well-known parasite of the cavities and adjoining sinuses in sheep and goats[1]. *O. ovis* has a worldwide distribution and is connected with a severe parasitosis of small ruminants, with emphasis particularly in the Mediterranean regions and Middle East. The growth of larvae in the nasal sinus cavities may guide to serious clinical signs that together with the irritation caused by the larvae of bot fly may result into severe economic losses[1]. Moreover, *O. ovis* infestation may be considered a zoonotic parasite[2] as it may cause ophthalmyiasis in human as reported in many parts of the world including Libya[3] and other Middle Eastern countries such as Jordan, southern Iran, northern Iraq, Saudi Arabia and Libya[4,5,6,7,8]. The pathogenicity of *O. ovis* larvae has frequently been clarified to cause mechanical and traumatic harm to the nasal mucus by the oral hooks and cuticular spines of the larvae that leads to inflammation and induces secondary infection[1].

Oestrosis causes nasal discharge that affects breathing especially in Iraq due to hot and dry weather and it may migrate from the nasal cavities and sinuses into brain causing false gid[9]. The sheep bot fly larva of *Oestrus ovis* is a mammalian parasite of the skin, nose, ears, and eyes[2]. When the larvae infest and feed on the external parts of the eye, the case is called ophthalmomyiasis. A number of cases of ophthalmitis or nasal/pharyngeal myiasis in humans caused by the oestrosis larvae have been reported with high infestation from numerous regions all over the world[3].

Several studies on *O. ovis* have been reported from the northern cities in Iraq[10] and in some Arabic countries[4,11,12]. In addition to some neighbor countries such as Iran[13], Turkey[14,15]. The infestation of *O. ovis* in sheep in Europe varies from 21.9% to 93.7%[16], 28.4% in France[1], and 45% in Spain[17].

To the best of our knowledge, there is no information on the intensity and incidence of *O. ovis* infestation available to the sheep in Southern Iraq despite the popularity of sheep breeding, therefore, this study was undertaken to investigate the infestation and intensity of infestation by *O. ovis* in sheep in Maysan Province/ southern of Iraq, in order to plan a cooperation with the
Ministry of Agriculture to get rid of this parasite.

**Materials and Method**

**Animals and study area:** 362 heads of sheep were slaughtered and examined for *O. ovis* infection from November 2016 to March 2017 at the slaughterhouse and abattoirs located in the Maysan province. The area lies north-east of Basra city and south of Baghdad (the capital city of Iraq) and located on longitude 31.8496° N and attitude 47.1460° E.

**Examination procedure:** Individual heads of the slaughtered animals were separated from the carcasses, all information such as the date of sampling, the cod number of the head, the result of the examination and the number of larvae in each head were recorded. The heads were cut along their longitudinal and sagittal axes using dissecting equipment with assisting of the butchers. After slaughter, the heads were put separately into nylon bags and transported to the laboratory for examination. All nasal cavity (the nasal passage, septum, middle meatus, and conchae) and paranasal sinus (frontal and maxillary) of each head were carefully examined. The larvae of insect *O. ovis* was isolated and collected into vials and transferred to the laboratory. After collection of the larvae, 1% hydrogen peroxide (H$_2$O$_2$) was injected through the breathing hole of the larvae and was preserved in 70% ethanol as described by[18]. The larvae were counted and recognized according to[19]. The intensity of the infestation (IN) was calculated based on number of larvae/ number of infested animal heads (L/Hs).

**Statistical analysis:** The collected data were analyzed statistically using the chi-square test, standard deviation, percentage, and F-test using the Statistical Package for Social Sciences (SPSS). All data was rested for normal distribution and submitted to one-way ANOVA.

**Results and Discussion**

The *Oestrus ovis* fly had been known to be epidemic in Iraq for long time ago; however, only a limited data on its infestation is available and have been reported from the Northern Iraqi Provinces[10,20,21,24]. Hence, this study was conducted for the first time to calculate the incidence of this parasite in Southern of Iraq which is totally dissimilar to the above studies in regards to the geographical location and the climate conditions[22]. The activity of this parasite is strongly influenced by the climatic factors[23].

The investigation for *O. ovis* larvae had been made during the months of November, December, January, February, and March (2016/2017) (Table 1). Out of the examined 362 sheep heads, around 81.8% were found to be infested with *O. ovis* larvae (Figure 1). This prevalence of infestation rate of sheep was higher than those recorded in Northern of Iraq[10,20,21,24,25]. These recorded rates are also higher than to what have been conducted in other regions of the world[4,12,13,14,15,26,27,28,29,30,31,32]. This might be due to differences in geographical location, livestock breeding, animal race, animal age, host resistance, size of sheep flock, veterinary care and previous treatment with drugs, and environmental condition[4,21,23].

The current study showed the monthly prevalence of infestation ranged from 58.1% in January to 100.0% in March (Table 1) the total monthly results revealed high significant differences in the *O. ovis* infestation among the months of study (F= 11.773; p< 0.001). Temperature degrees[22] in the studied area showed in (Table 2).

During summer, the activity of the adult *O. ovis* fly increases[32], while during winter, the larvae suffer diapause periods, and decrease in their growth rate[1]. These findings coincided with previous reports[15,26]. In addition, the recorded larvae numbers actually return to an older formation (few months ago) due to the life cycle of such parasites. It was confirmed that 20 °C was the minimum temperature for the parasite activity, while most favorable temperature appears to range between 26 °C and 28 °C[23]. Consequently, the temperature were optimal for the parasite during February and March.

The morphological characteristics of the larval stage were displayed in Figure 2 and the most frequent larvae sizes were displayed in Figure 3. The present study showed that all larval instars were recovered (L1,L2and L3 instars which were detected clearly, but the L2 and L3 instars were the most recovered larvae (Table 3 and Figure 4). Many prior reports had provided similar observation in Iraq[21,24], and other countries[4,14,15,28]. It was observed that sheep, over two years old, has acquired immunity against *O. ovis* larvae as a result of repeated exposure to infestation while lambs remain more susceptible to infestation[31]. The small size of L1 larvae made them disappear in small places such as the ethmoid bone, during the examination period[28]. A proportion of *O. ovis* L1 larvae may develop inside the nasal cavities.
in the cold months, this explains the disappearance of the adult stage at this time with probability that expelled larvae either die or winters as pupal diapauses[32]. Therefore, the *O. ovis* adjusted its life cycle according to the surrounding local climate[15,28].

The mean of infestation intensity of infested sheep (IN) was 5.433 larvae per infested sheep head (L/SH) (Table 3). These results might return to the same factors that affected the distribution of this fly which explained by[4,21,23].

Conclusion

The infestation of oestrosis in the sheep at Southern Iraq has been determined for the first time and *O. ovis* larvae were detected in 81.8% of the sheep examined. Infection by *O. ovis* is considered to be an important problem in sheep in Maysan province and is expected to be of importance for animal production and welfare. In order to estimate the economic significance of oestrosis, the efficiency of control measures and determines the precise infestation of *O. ovis* infestation in this province, further examinations are required including more animals and determining more risk factors. Finally, in order to lower the infestation rate of oestrosis it would be essential to use an effective and persistent drug against *O. ovis* in order to achieve eradication of the disease. In conclusion, it is possible to state that more than a few annual generations of adult flies may arise in the region. Novel studies will be essential to assess the impact of oestrosis in sheep production, as well the most excellent strategies of prophylaxis.

Acknowledgment: we would like to thank the staff at the main slaughterhouse at Maysan Province for helping us collection the sheep heads.

Financial Support and Sponsorship: Nil.

Conflict of Interest: There are no conflicts of interest.

Ethical Clearance: Permission to conduct this study was issued by the Health institutional and the main slaughterhouse authorities. Heads collection was carried out under veterinary public health technician supervision.

Abstract

This practical studying involved preparation and development of new medical derivatives of ciprofloxacin drug via series of chemical reactions to preparation new derivatives to resist types of bacteria in hospitals and environment. Various chemical routes have been used to prepare ciprofloxacin derivatives, then all these derivatives reconnoitered with many spectral chemical techniques for instance (FT.IR, H.NMR, C.NMR) – spectrophotometric, then studying of their effects on bacterial pollution.

Keywords: Pollution, Bacteria, Ciprofloxacin, Environment.

Introduction

Ciprofloxacin is cyclopropyl-6-fluoro-4-oxo-7-(piperazin-1-yl)-quinoline-3-carboxylic acid as chemical name[1] while the brand names are (Cipro, Ciprobay, Ciproxan, Ciprinol), its formula(C₁₇H₁₈FN₃O₃), it is solid(Zhanel et al 2006., Heidelbagh and Holmster. 2013) [1,2] powder has faint to light yellow colour with melting [3,4] point (255-257 °C)[5].

![Ciprofloxacin](Fig.1:Ciprofloxacin Drug)

Ciprofloxacin medication is a broad-variety fluoroquinolone antibiotic[5, 6] secondhand in the dealing of a wide series(Oliphant C and Green. 2002) of slight to reasonable gram-(positive & negative) toxicities., which is used to indulgence or inhibit(Stevens et al 2005., Osmon et al 2013) certain infections affected through bacteria like gonorrhea; pneumonia[8-11] and toxicities(Vardakas K et al 2008., Donaldson P et al 1994) or infection of the skin, bone, joint, stomach[12-16] region, and( Karageorgopoulos et al 2008., Chow et al 2012., Stephenson et al 2013)

Prostate ciprofloxacin treatment is likewise used to delight or avoid and inhibit a serious infection that may be extent on tenacity[17-22] (Corrao G et al 2006., Liu X et al 2017) as portion of a bioterror round) and mouthful[23-27] (Bolhuis et al 2001., Pommier et al 2010., Goossens et al 2007) anthrax[28].

Experimental Part

Ciprofloxacin derivatives were inspected and identified thru: FT-IR spectra (FT-IR 8300 Shimadzu) in the range (400-4000) cm⁻¹ as KBr discs., H.NMR–Spectra and C.NMR in DMSO–solvent, in addition to resistance of ciprofloxacin derivatives against microbial pollution in hospitals and environment to improve their effect.
Preparation of Ciprofloxacin drug derivative

Preparation and development of Ciprofloxacin drug derivative\{1\}:

Ciprofloxacin drug developed by this paper thru preparation of its derivative\{1\} via three components reaction by following many chemical reactions like condensation reactions according to procedures\[29-33\] (Nagham 2016 .,Nagham et al 2015)to vintage precipitation, filtered ,dried and re crystallized to provide ciprofloxacin derivative\{1\}.

Preparation and development of Ciprofloxacin drug derivative\{2\}:

Ciprofloxacin drug developed to new drug by this study thru synthesis of its derivative\{2\} via azotation reaction,amination reaction ,then formazanation reaction by following many steps according\[29,30\] to procedures(Nagham et al 2015.,Intisar and Nagham 2018)to format precipitation, filtered ,dried and re crystallized to provide ciprofloxacin derivative\{2\}.

Preparation and development of Ciprofloxacin drug derivative\{3\}:

Ciprofloxacin drug developed via this work thru preparation of its derivative\{3\} via three components reaction, cyclization reaction, azotation ,amination reaction ,then formazanation step by following\[29,30\] procedures(Nagham et al 2015.,Intisar and Nagham 2018)to yield precipitation, filtered ,dried and re crystallized to provide ciprofloxacin derivative\{3\}.

Preparation and development of Ciprofloxacin drug derivative\{4\}:

Ciprofloxacin drug developed to derivative\{4\} via imination with formazanation reaction ,then three components reaction with triazole derivative according\[29,30\] to procedures(Nagham et al 2015.,Intisar and Nagham 2018)to give precipitation\[35\],filtered ,dried and re crystallized to produce ciprofloxacin derivative\{4\}.

Preparation and development of Ciprofloxacin drug derivative\{5\}:

Ciprofloxacin drug developed by this paper thru preparation of its derivative\{5\} via three components reaction, esterification, cyclization, imination reaction by following many chemical reactions like condensation reactions according\[34-36\] to procedures (Nagham 2016 .,Nagham et al 2015)to vintage precipitation, filtered ,dried and re crystallized to produce ciprofloxacin derivative\{5\}.

Results and Discussion

The developed ciprofloxacin derivatives studied and identified with multiplicity spectral techniques represented by (FT.IR ,H.NMR ,C.NMR) spectra with microbial tests and bacterial resistance studying:

Identification via Spectral Techniques :

FT.IR-Spectra of Ciprofloxacin Derivatives:

**1H.NMR-Spectra of Ciprofloxacin Derivatives:**

Our spectra provided new signals point to prepared drug derivatives and formatted functional groups(Nagham et al 2015.,Intisar and Nagham 2018) in this work, the spectra of all derivatives appeared signal at (2.5) for solvent (DMSO), novel derivative{1} appeared many signals at Illegal signal (COOH) Protons of carboxyl group:12.10 .,(NH)proton of amine:5.01 ..Protons of aromatic ring:(6.68-7.24)., (N-CH2-N) protons:3.64 .,(N-CH2-CH2-N) protons: (2.95-3.46) ..(CH=CH) proton of chalcone: (5.49).,(CH=CH-CH) protons of three membered ring:(0.83-1.46), but derivative{2} appeared many signals at Illegal signal (COOH) Protons of carboxyl group:11.59 .,(NH)proton of amine:5.12 ..Protons of aromatic ring: (6.93-7.78) ..,(N-CH2-CH2-N) protons: (2.61-3.54) ..(CH=C-CO) proton of chalcone: (5.56).,(CH2=CH2-CH) protons of three membered ring:(0.64-1.52), while derivative{3} appeared many signals at Illegal signal (COOH) Protons of carboxyl group:5.07 ..Protons of aromatic ring:(6.88-7.58), (N-CH2-CH2-N) protons: (2.75-3.41) ..(CH=C-CO) proton of chalcone: (5.67).,(CH2=CH2-CH) protons of three membered ring:(0.73-1.89).,(N-CH2-N) protons:3. 82 ..derivative{4} appeared many signals at Illegal signal (NH)proton of amine:5.12 ..Protons of aromatic ring: (6.93-7.78) ..,(N-CH2-CH2-N) protons: (2.61-3.54) ..(CH=C-CO) proton of chalcone: (5.56).,(CH2=CH2-CH) protons of three membered ring:(0.64-1.52), while derivative{3} appeared many signals at Illegal signal (COOH) Protons of carboxyl group:5.07 ..Protons of aromatic ring:(6.88-7.58), (N-CH2-CH2-N) protons: (2.75-3.41) ..(CH=C-CO) proton of chalcone: (5.67).,(CH2=CH2-CH) protons of three membered ring:(0.73-1.89).,(N-CH2-N) protons:3. 82 ..derivative{4} appeared many signals at Illegal signal (NH)proton of amine:5.12 ..Protons of aromatic ring: (6.93-7.78) ..,(N-CH2-CH2-N) protons: (2.61-3.54) ..(CH=C-CO) proton of chalcone: (5.56).,(CH2=CH2-CH) protons of three membered ring:(0.64-1.52), while derivative{3} appeared many signals at Illegal signal (COOH) Protons of carboxyl group:5.07 ..Protons of aromatic ring:(6.88-7.58), (N-CH2-CH2-N) protons: (2.75-3.41) ..(CH=C-CO) proton of chalcone: (5.67).,(CH2=CH2-CH) protons of three membered ring:(0.73-1.89).,(N-CH2-N) protons:3.90.

**The 13C.NMR spectral of Derivatives:**

Our spectra provided new signals point to prepared drug derivatives and formatted functional groups in this work., at the spectra of all derivatives appeared signal at (40.0) for solvent (DMSO), novel derivative{1} appeared many signals at (172.5) for (C ,carboxyl group COOH), (114.9-148.4) for (C ,Aromatic ring), (193.0) for (C ,carbonyl of Chalcone CO), (100.0 , 107.3) for (C ,carbons of alkene in chalcone C=CH) , (68.4–73.0) carbons of (N-CH2-CH2-N) ,(CH2=CH2-CH-) carbons of cycle: (23.0-20.1) , 42.1: carbon of (N-CH2-N) ,but derivative{2} appeared many signals at (154.09) for (C , Imine group C=N), (110.1-132.91) for (C ,Aromatic ring), (190.0) for (C ,carbonyl of Chalcone CO) , (102.1 , 104.7) for (C ,carbons of alkene in chalcone C=CH) ,(60.2–73.0) carbons of (N-CH2-CH2-N),(CH2=CH2-CH) carbons of cycle: (19.0-30.9) , 44.1: carbon of (N-CH2-N) ,While derivative{3} appeared many signals at (159.12) for (C , Imine group C=N), (113.4-124.25) for (C , Aromatic ring), (196.4 ) for (C ,carbonyl of Chalcone CO), (101.9 , 104.3) for (C ,carbons of alkene in chalcone C=CH) ,(65.2–71.5) carbons of (N-CH2-CH2-N),(CH2=CH2-CH) carbons of cycle: (15.6-29.3) ,also derivative{4} appeared many signals at (158.7) for (C , Imine group C=N), (113.4 -130.76) for (C , Aromatic ring), (191.5) for (C ,carbonyl of Chalcone CO) ,(100.6 , 105.2) for (C ,carbons of alkene in chalcone C=CH) ,(63.8–78.04) carbons of (N-CH2-CH2-N),(CH2=CH2-CH) carbons of cycle:(16.08-31.21) , 53.81: carbon of (S-CH2-N) ,and the last derivative{5} appeared at (157.22) for (C , Imine group C=N), (117.43-136.08) for (C , Aromatic ring), (188.91) for (C , carbonyl of Chalcone CO) , (101.17 , 103.45) for (C , carbons of alkene in chalcone C=CH) , (69.78–74.27) carbons of (N-CH2-CH2-N),(CH2=CH2-CH) carbons of cycle: (18.66-30.85) , 55.61: carbon of (N-CH2-N).

**Selected Bacteria:**

_Pseudomonas aeruginosa_ is a common encapsulated, Gram-negative, rod-shaped bacterium that canister source of disease in plants and wildlife, involving humans. A species of considerable medical status, _P. aeruginosa_ is a multidrug resistant pathogen renowned for its ubiquity, its intrinsically innovative antibiotic resistance mechanisms, and its connotation with grave infections–hospital-acquired infections like ventilator-associated pneumonia and numerous sepsis syndromes.
Staphylococcus aureus is a Gram-positive, round-shaped bacterium that is a member of the Firmicutes, also it is a usual associate\cite{31,32} of the microbe\cite{Nagham et al 2015.,Intisar and Nagham 2018} of the frame, regularly institute in the upper respiratory tract and on the skin. It is repeatedly positive for catalase and nitrate reduction and is a facultative anaerobe that can cultivate without the requirement for oxygen.

Klebsiella pneumoniae is a Gram-negative, non-motile, encapsulated, lactose-fermenting, facultative anaerobic, rod-shaped bacterium. It seems as a mucoid lactose fermenter on MacConkey agar.

Escherichia coli: also known as (E. coli) is a Gram-negative, facultative anaerobic, rod-shaped, coliform bacterium of the genus Escherichia that is normally originate in the inferior intestine of warm-blooded organisms. The bacterium raises immensely in additional fecal matter below aerobic situations for 3 days, but its facts failure gradually later.

Microbial Resistance Assay\cite{35,36};

Microbial tests for prepared ciprofloxacin derivatives have been screened for their antibacterial activities thru agar via following procedures\cite{35-40} (Nagham et al 2015.,Intisar and Nagham 2018) The test of bacterial inhibition were done at (three concentrations) (10,15,20 micro gram) concentrations in (DMSO) with bacteria:(K. Pneuomona ,S. aureus ,P. aeruginosa ,E- Coli). These bacterial strains were incubated for (24 hr) at temperature (37°C).

The test of resistance of the bacteria\cite{40-44} ,which included kinds of bacteria to curtain the biotic activity of confident derivatives against bacteria.,Tables(1 and 2) appears the diameter of inhibition zone(mm) for vehicles chemical considered towards the bacteria.

The grades in this work appeared that the sensitivity of ciprofloxacin derivatives\(^{5,3}\) is higher than other derivatives in the inhibition of kind from selected bacteria, thiadiazole ring, formazan group (N=N-C=N) gave high resistance activity to these derivatives against selected bacteria. Ciprofloxacin derivatives are broadly recycled for the cure of numerous types of bacterial pollutions and infection. General, these antibacterial mediators can be measured safe and well accepted drugs. Relative studies have estimated the practice of quinolones in old and younger inhabitants.

There is no recognized cross-resistance among ciprofloxacin and other modules of antimicrobials. Especially the drug has 100 times higher attraction for bacterial DNA gyrase than for mammalian and prevents bacterial DNA gyrase, an enzyme important for DNA replication. The mechanisms of resistance are known by decreasing their binding affinity to quinolones, decreasing the drugs’ effectiveness.

**Conclusions**

All ciprofloxacin derivatives appeared good resistance towered bacteria and the sensitivity of ciprofloxacin derivatives\(^{5,3}\) is higher than other derivatives in the inhibition of kind from selected bacteria.

**Conflict of Interest:** There is no any Conflict of Interest

Abstract

Over the last few years many surgeons have begun to utilize the LigaSure device or Harmonic scalpel to perform thyroid surgery. Several papers have demonstrated the benefits of these devices over traditional hand-tying techniques. The purpose of this study was to examine our institution’s experience with the LigaSure device and Harmonic scalpel during thyroid surgery and to compare mean operative times and complications associated with each device. The aim of the study was to compare surgical time, postoperative complications and other parameters between ligasure device and harmonic scalpel in the open thyroidectomy procedure. We choose to examine our institution’s experience with the LigaSure and Harmonic scalpel during total/near total thyroidectomy.

Key Words: Thyroid, Harmonic Scalpel, Ligasure

Introduction

With blood supply from four to five vessels, the thyroid gland represents one of the most vascularized organs of the human body. Its close proximity to neighboring structures, especially the recurrent laryngeal nerves (RLN) and the parathyroid glands, leaves limited room for surgical manipulation. Therefore hemostasis and injury to neighboring structures are of concern (Peter CA and Dirk 2016).[3]

Surgery is one of the standard therapies for numerous thyroid diseases. A total of 80,000 thyroidectomies per year are performed in the United States alone (Bhattacharyya and Fried 2002).[4] The thyroid is the highly vascularized gland and hemostasis is one of the key limiting factors in morbidity and mortality in thyroid surgery.[5] Similar to bleeding, other possible sources of postoperative morbidity include dysphonia and dysphagia due to recurrent and/or superior laryngeal nerve injury, hypocalcemia due to parathyroid ischemia or unintended deprivation, postsurgical hemorrhage, wound infection and postoperative pain. However, the risk of perioperative mortality or major disability[6, 7] is extremely low (Chiang et al 2004., Shindo et al 2000). Harmonic scalpel is manufactures and marketed by Ethicon. The HS is a high power system which works at a frequency of 55.5 KHz or 55,500 vibrations/sec. Dissection by ultrasonic is called ultracision[8,9] . The ultrasound (US) transducer located in the handpiece is composed of piezoelectric crystal sandwiched under pressure among metal cylinders. The US generator converts ultrasonic energy into mechanical[10] energy (Slakey 2008). The sealing of the vessels is achieved due to denatured protein coagulum which occurs due to tamponade and coaptation. It can coagulate[11,12] vessels up to 5 mm(Meurisse et al 2000., Macario et al 2008).

Patients and Method

The study was carried out between 1/10/2015 and 30/8/2017, in which 120 patients having various thyroid diseases were operated in our institution, all were scheduled for total / near total thyroidectomy for different indications they were divided into two groups according to the hemostatic techniques.

One hundred twenty patients were enrolled in this study, 55 patients (54.2%) using ligasure vessel-sealing system (LVSS), 65 (45.8 %) patients using harmonic scalpel (HS). All the operations were performed by surgical teams after consent the patients.
To eliminate confounding factors the following exclusion criteria adopted.

**Those are patients:**
1. with preoperative low serum ca.
2. with vocal cord palsy on preoperative assessment.
3. with need for cervical lymph node dissection.
4. with previous thyroid surgery (recurrence, completion thyroideectomy).
5. with history of neck irradiation.
6. with coagulopathy and bleeding disorders.
7. Pendred ‘s syndrome.

**The study domains were:**
1. Operative time in minutes.
2. Postoperative hoarseness.
3. Post-operative bleeding (drainage volume in ml).
4. Recurrent laryngeal nerve (RLN) status.
5. Total serum calcium level.

**In addition to the baseline pre-operative work up , patients were investigated for:**
1. Thyroid function test (T3, T4, and TSH).
2. Pre-operative indirect laryngoscopy for vocal cords assessment.
3. Pre-operative total serum calcium.
5. Fine needle aspiration for cytology.

All hypothyroid and thyrotoxic patients, including those with Graves' disease, were treated pharmacologically until they became euthyroid (TSH, T3, T4 levels were within normal ranges), after which they were cleared for surgery. Routinely, patients underwent total/near total thyroidectomy for benign thyroid disease, with a focus on recognition and preservation of the laryngeal nerves, along with at least 3 parathyroid glands. The patients had general anesthesia with endotracheal intubation with collar incision 2-3 cm above suprasternal notch. We used ligasure small jaw sealer (Covidien, L 1212 A) (fig.1) was used in one group and for the other group, harmonic scalpel (Ethicon: Johnson & Johnson) for cutting and coagulation where the generator machine can be adjusted from level 1 to 4 to increase cutting speed and decrease coagulation by increasing the blade’s lateral excursion. Closed suction system (Redivac) drain was used to drain post-operative blood over next 24-48 hrs. Vocal cords were checked during recovery by the anesthetist and if any kind of immobility or malfunction was found, the patient was followed up at 1 monthly intervals till 6 months. Patients were assessed for complaint of paresthesia, perioral tingling, examined for chvostek’s sign, trousseau’s sign and Serum calcium was measured during the first and second post-operative days. A level of 8 mg/dl (2mmol/l) was considered as a cutoff value for hypocalcemia. If it was found, the patient would be given calcium and vitamin D3 preparations. Hypocalcemia and RLN palsy were regarded transient if resolved within first 6 months and permanent if they continued after 6 months.

Quantitative domains (serum calcium, operative time and postoperative bleeding volume were expressed as mean ± Standard deviation (SD) and qualitative domains (gender, diagnosis, RLN palsy, transient hoarseness) was given as frequency and percentage. Statistical significance between the two devices for qualitative domains, was assessed using Fischer's Exact test while for quantitative domains, simple descriptive statistic tests were used. The data were entered, coded and analyzed using SPSS version 22 and p-value of 0.05 was considered significant.
Results

A total of 120 patients were enrolled in this study, 95 females (79.2%) & 25 males (20.8%) (Table 1). ♀:♂ (3.8:1). The mean age at surgery 43.89±11.17 (minimum 22 and maximum 66 years). Hemostasis achieved by harmonic device in 65 patients (54.2%) and by LigaSure vessel-sealing system in 55 patients (45.8%). Of the harmonic group 12 out of 65 patients were male, while in ligasure group 13 out of 55 patients were male. Various thyroid pathologies included in our study sample were diagnosis confirmed by histopathological examination (Table 1).

The patients were matched for age and gender (male, female), no statistically significant difference between the two groups were detected as reported in table (p-value 0.35, 0.51, 0.32 respectively). The mean surgical time with harmonic hemostasis was shorter (56.6 ± 5.8 min) than in LigaSure hemostasis (70.3 ± 5.4 min). Statistically the difference was highly significant (P-value 0.001). When complications rate were examined there was no significant differences in the mean volume of post-operative blood loss between harmonic device (102.8 ± 16.5 ml) and ligasure (101.5 ± 16.4 ml), the p-value was (0.63). The average serum calcium for patients operated with HS was 8.78 and with ligasure 8.81. Postoperative hypocalcemia was observed in (12/65) patients which represent 18.46% of harmonic scalpel group and (11/55) patients which represent 20% of LigaSure group, the result was statistically non significant (p-value 0.78). 4 out of 12 (6.1%) patients continue to have hypocalcaemia beyond 6 months in harmonic group and 3 out of 11 (5.4%) patients in ligasure group (p-value 0.70), (Table 2).

Discussion

Total thyroidectomy is a very delicate procedure requiring extreme care to avoid injury to neighboring anatomical structures. Strict hemostatic control is fundamental for limiting the risk of serious complications, including recurrent laryngeal nerve and parathyroid gland injuries, and for decreasing the incidence of other postoperative complications.  

Given the importance of optimizing hemostatic control, the use of devices to dissect and close vessels during thyroidectomy is not uncommon. The aim of study was to provide a direct comparison of clinical outcomes associated with each of two hemostatic techniques used for total thyroidectomy: LigaSure, and Harmonic device.

The mean surgical time in total thyroidectomy with harmonic hemostasis was shorter (56.6±5.8) than in ligaSure hemostasis (70.3±5.4). Statistically the difference was highly significant (P-value 0.001). Our result consistent with that of Arun Upadhyaya et al who reported that the surgical time was significantly decreased in the HS group compared with the LS instrument group, and in agreement with that of McNally et al which was a retrospective analysis of prospectively maintained database, they compare the effectiveness and safety of ultrasonic dissection (UD) and electronic vessel sealing (EVS) in patients undergoing thyroidectomy between January 1, 2007 and January 25, 2008.
found significantly decreased operative time with UD versus EVS. Contin et al published\[14\] a systematic review and meta-analysis comparing HS, LS and a conventional technique in 2013. The study compared HS and LS with the conventional technique, and HS and LS separately. The study concluded that HS and LS were significantly different when compared to conventional hemostasis in terms of shorter surgical time. It also concluded that HS was faster in comparison to LS. This was contrary to study by Kwak HY et al to evaluate the safety and efficacy of thyroidectomy using the Harmonic scalpel (HS) or the LigaSure Precise (LS) instrument in 320 patients (HS group, N=164; LS instrument group, N=156) who demonstrate no statistically significant differences in the operative times between the two techniques. Our result was inconsistent with that of Macario et al who\[18\] reported that the operation time of LigaSure electro surgical bipolar sealing system is less than that of the ultrasonic device. The HS is unique in the fact that it combines hemostasis and cutting in a single instrument, thus avoiding the loss of time when associated with the manipulation of several instruments. By contrast, the LS instrument can only be used for hemostasis, and sectioning was performed with another instruments such as scissors after withdrawal of the device. The shorter operative time may be attributed to the fact that LS is a more time-consuming multiple-sealing approach at the same vessel but HS divides the tissue at the same time of coagulation. Regarding RLN palsy, we found a statistically significant differences between\[15\] the two techniques where incidence was higher with harmonic, which inconsistent with the fact that LigaSure had a range of 2 to 3 mm for thermal injury; the Harmonic scalpel had safety measure of 2 mm for thermal injury. Our result contrary to many studies which reveal that HS has less damage to nearby vital structures like the RLN and the parathyroid glands (Obonna and Mishra 2014)[17].

On 2016 Dequanter et al investigated the extent of heat injury, ultrasonic dissection did not cause any immediate damage of the nerve even close to the RLN (1 mm away from the RLN). They concluded that the use of harmonic scalpel for thyroid surgery is safe for the surrounding structures (nerves). Careful tissue applications of the device near the RLN and the parathyroid glands (Obonna and Mishra 2014)[17].

On 2016 Dequanter et al investigated the extent of heat injury, ultrasonic dissection did not cause any immediate damage of the nerve even close to the RLN (1 mm away from the RLN). They concluded that the use of harmonic scalpel for thyroid surgery is safe for the surrounding structures (nerves). Careful tissue applications of the device near the RLN and the parathyroid glands (Obonna and Mishra 2014)[17].

Conclusions

In this study, there was no difference in the rate of complications between the two devices except for RLN palsy. However, the use of the Harmonic
scalpel significantly decreased operative time for thyroidectomies when compared to the LigaSure device. They are safe and effective advantageous for sealing medium-sized vessels, however a scrupulous and careful care of the surgical technique and hemostasis should always be observed.

Abstract

Background: Manufacture of paints using benzene in large quantities in the products they produce. Workers in the paint industry may face an increased risk of high health complications. The purpose of this study was to determine the levels of safe concentration of benzene for workers in the Paint Manufacturing Industry in Sidoarjo East Java, Indonesia. Methods: This research was conducted using a cross sectional method. The sample in this study were 24 respondents. The variables that became the data of this study included benzene concentration (C) time of daily exposure (tE), frequency of annual exposure (fE), duration of exposure (Dt), height (cm), weight (kg), age, respiration rate (BR), body surface area, weight of white rat, body surface of white rat, highest dose of toxin without effect on experimental animals (NOAEL), Km factor in animal (Animal Km), Km factor on workers (Human Km), safe limits for toxin doses for workers (SHD), and benzene concentrations in safe air for workers (C is safe). Data analysis in this study was carried out by using quantitative data analysis manually to determine the safe concentration of benzene for workers in the Paint Manufacturing Industry in Sidoarjo East Java, Indonesia. Results: Based on the results of measurements carried out, the concentration of benzene in the work environment of the Sidoarjo Paint Industry in the mixing solvent section is 2 ppm and in the packing section is 0.4 ppm, the safe concentration is 0.028 ppm. Conclusion: The recommended safe concentration of benzene exposure is 0.028 ppm. The safe concentration value exceeds the set value of 0.009 ppm daily for acute effects and 0.003 ppm daily for chronic effects, so control measures are needed to protect against the adverse effects of benzene on the health of workers. Control recommendations are to provide a good exhaust ventilation system at the paint manufacturing.

Keywords: Benzene Exposure, Safe Concentration, Paint Manufacturing

Introduction

The Paint manufacturing industry uses benzene in the products they produce in large quantities. Workers in the paint industry may overcome high health problems. Paint manufacturers usually use three main components in the manufacture of their products consisting of coloring agents, binding agents, and solvents that allow other components to remain in liquid form. Solvents are widely used in industries such as benzene. Using benzene as a solvent agent allows manufacturers to use materials that are cheaper and easier to obtain in their products to make high quality, inexpensive effective products to obtain. Individuals who work in cat-making facilities, either make products or service equipment used to produce products, according to the highest needs of long-term Benzene. Other individuals working in facilities are also at risk because benzene can enter the air during the manufacturing process.

Many industrial sectors use organic solvents. Organic solvents such as benzene can result in damage to the nervous system (central and peripheral), kidney damage, and liver, adverse reproductive effects, such as sperm changes and infertility, skin lesions, and cancer. In paint production, solvent vapor is removed during the manufacturing process. If these emissions are left uncontrolled, high concentrations of organic solvents can accumulate in the work area, which endangers the health and safety of workers. Removing volatile organic
solvents into the atmosphere can cause increased tropospheric ozone levels, pollutants that cause negative health effects on the human lung system. Appropriate exhaust ventilation applications are used to remove contaminants produced by operations to maintain a healthy work environment.

The Threshold Limit Value (TLV) of benzene chemicals in the workplace is the maximum allowable value is 0.5 ppm and is certainly included as a carcinogenic group in humans (A1 = Confirmed Human Carcinogen). The recommended exposure limit for 8 working hours is 0.1 ppm. In Indonesia, TLV benzene is 0.5 ppm. Whereas based on the Minimum Risk Level (MRL) set for benzene is 0.009 ppm daily can have an acute effect and 0.003 ppm every day has a chronic effect. The aim of this study was to determine the level of safe concentration of benzene for workers in the Paint Manufacturing in Sidoarjo, East Java, Indonesia.

**Methods and Materials**

This research was conducted in the Paint Manufacturing in Sidoarjo, East Java, Indonesia. This research was conducted using a cross sectional method. The sample in this study were 24 respondents. Data was taken including measuring the concentration of benzene, filling in questionnaires and interviewing workers, while also collecting primary data in experimental animals namely the weight of white rats. Data on the concentration of benzene in the air was obtained by direct measurement using Coconut shell charcoal and analyzed by Gas Chromatography (GC), referring to the NIOSH 1501 method.

The variables in this study include benzene concentration (C) daily exposure time (tE), frequency of annual exposure (fE), duration of exposure (Dt), height (cm), weight (kg), age, rate respiration (BR), body surface area of workers, weight of white mice, body surface area of rats, highest dose of toxin without effect on experimental animals (NOAEL), Km factor in animals (Animal Km), Km factor in workers (Human Km), safe limit of toxin dosage for workers (SHD), and benzene concentration in safe air for workers (safe consentration).

Based on the data of white rat body weight, the body surface of the white mouse can be calculated using the following formula:

\[ BSA_{Animal} = 0.09 W^{0.67} \]

**Description:**

BSA : Body Surface Area (m²)
W : Body Weight (kg)

Based on data weight and height of workers, the body surface area and the rate of respiration of workers can be calculated using the following formula.

\[ BSA = \sqrt[3]{W.h/3600} \]

**Description:**

BSA : Body Surface Area (m2)
W : Body Weight (kg)
h : Height (cm)

Respiratory rate of workers

\[ BR = 5.3 \ln W - 6.9 / 24 \]

**Description:**

BR : Breathing Rate (m³/jam)
W : Body Weight (kg)

Determination of safe limits of toxic doses for workers begins first by calculating Animal Km and Human Km.

Animal Km:

\[ \text{Animal Km} = \frac{W_{animal}}{BSA_{animal}} \]

**Description:**

Animal Km : Km factor in animals
W : Experimental animal weight (white mouse)
BSA : Body Surface Area of experimental animals (White mice)

Human Km:

\[ \text{Human Km} = \frac{W_{human}}{BSA_{human}} \]

**Description:**
Human Km : Km factor in humans / workers
W : Worker weight
BSA : Body Surface Area of worker

One of the objectives of research activities in the field of toxicology is to be able to evaluate the safety of a substance. To determine the safe limit of the concentration of a chemical begins with a toxicity test determining the highest dose without causing effects on experimental animals or No Observed Adverse Effect Level (NOAEL).

The safe limit of dosage of toxins for workers or Safe Human Dose (SHD) is found to begin by using the following formula:

\[ SHD = \frac{\text{Animal Km}}{\text{Human Km}} \text{ NOAEL} \]

Description:
SHD : Safe Human Dose (mg/kg)
Animal Km : Km factor in animals
Human Km : Km factor in humans / workers

Determining the safe limit of benzene concentration in the work environment uses the following formula:

\[ \text{Safe Concentration} = \frac{(SHD)(W)}{(\delta)(BR)(t)} \text{g/m}^3 \]

To convert units of mg / m3 to ppm the following formula is used:

\[ \text{Safe Concentration} = \frac{\# \text{ mg/m}^3 \times 24.5 \text{ ppm}}{(MW)} \]

Description:
Safe Concentration : toxic concentration in safe air for workers (mg/m3)
SHD : Safe Human Dose (mg/kg)
W : Body Weight (kg)
\( \delta \) : % of substances absorbed by the lungs
BR : Human respiratory rate (m3/jam)
t : Working time (hour)

MW : Molecular Weight

FINDINGS

Distribution of Characteristics of Workers

Figure 1. Distribution of Characteristics of Workers

Figure 1. Obtained average weight data (W) of respondents is 60.71 kg, the average height (H) of respondents is 159 cm, the average length of work (Dt) of respondents is 13 years. The duration of working a day (tE) is 7 hours, the number of workdays in a year (fE) is 240. The results of the analysis of calculation of body surface area and worker respiratory rate according to table 2 show that the average body surface area of workers (BSA) is 1.63 m2 and the average respiration rate of workers (BR) is 0.62 m3 / hour.

Table 2. The results of the Animal Km calculation are shown in table 2, with Animal Km averages of 5.81.

Human Km

Figure 2. Results of Human Km Calculation on Workers

Figure 2. The results of the Human Km calculation are shown in table 2, with a Human Km average of 36.94.

No Observed Adverse Effect Level (NOAEL)

Benzene NOAEL is 3.0 mg / m³ or equivalent to 0.022 mg / kg obtained from the calculation of the formula as follows:\(^9\):

\[
\text{NOAEL} = \frac{3 \times 0.002}{3 \times 0.003 \times 8} = 0.003 \text{mg/kg}
\]

Safe Human Dose

Based on the formula from Shaw et al., The calculation of SHD obtained from the NOAEL value, the average animal Km, and the average human Km is 0.003 mg / kg based on the calculation below:

\[
\text{SHD} = \frac{0.022 \text{mg/kg}}{\frac{5.81}{36.94}} = 0.003 \text{mg/kg}
\]

Safe Concentration of Benzene

Calculation of safe concentration of benzene in the Paint Manufacturing Industry in Sidoarjo is 0.028 ppm obtained from the calculation below:

\[
\text{Safe Concentration} = \frac{0.003 \times 60.71}{(50\%)(0.6)(7)} = 0.008 \text{mg/m}^3
\]

\[
\text{Safe Concentration} = \frac{0.008 \text{mg/m}^3 \times 24.45}{78.11} = 0.028 \text{ppm}
\]

Discussion

Concentrations of Benzene Exposure

Based on the results of the measurements made, the concentration of benzene in the work environment of the Paint Manufacturing Industry in Sidoarjo at the mixing solvent section is 2 ppm and in the packing section is 0.4 ppm. The benzene concentration in the mixing solvent section is above the Threshold Value (NAB) while the benzene concentration in the packing section is below the Threshold Value (NAB) of 0.5 ppm\(^7\). However, the concentration of benzene is above the Minimum Risk Level (MRL), the level of exposure to benzene inhalation is determined namely for acute exposure (≤14 days) = 0.009 ppm, moderate exposure (15-364 days) = 0.006 ppm, and chronic exposure (≥365 days) = 0.003 ppm\(^8\).

Safe Concentration to Workers

Research shows that safe concentration for workers in the Sidoarjo paint industry is 0.028 ppm. Benzene is carcinogenic in humans and concentrated air benzene is associated with excessive lifetime risk resulting in leukemia\(^10\). The minimum risk level of benzene at a concentration of 0.009 ppm has been reduced for the duration of exposure to acute inhalation (14 days or less), the minimum risk level of 0.006 ppm benzene concentration has been lowered for medium duration inhalation exposure (15-364 days) and minimum risk level of benzene 0.003 ppm reduced for chronic duration inhalation exposure (364 days or more)\(^8\).

Benzene can enter the body through the digestive tract, lungs or skin (EPA). When exposed to high
levels of benzene, about half of the benzene inhaled passes through the lining of the lungs and enters the bloodstream. With high concentrations of benzene in short exposures in the range of hundreds of ppm can cause confusion, tremor, headaches, and unconsciousness. While continuous exposure to low concentrations can cause blood-related diseases such as excessive bleeding, anemia, and decreased immune response. In addition, benzene can also cause acute blood cancer or myeloid anemia because it is carcinogenic. This research can contribute as one of the studies on the topic of risk assessment which is still limited in Indonesia, especially focusing on the standard benzene concentration in the paint manufacturing industry. This research is also limited in a number of sampling, requiring improvements in method design (not only cross-sectional but also in case-control, cohort design or experiments), and further research is needed to recognize the risk assessment of benzene in the paint industry. Control recommendations are to provide a good exhaust ventilation system at the paint manufacturing plant, consume CYP2E1 enzymes contained in beef liver which serve to reduce the level of benzene in the body, use of appropriate Personal Protective Equipment.

**Conclusion**

Workers in the Mixing Solvent section at the Indonesian Paint Industry in Sidoarjo showed benzene exposure concentrations of 2 ppm, which was above the threshold value of 0.5 ppm according to the Minister of Manpower and Transmigration Regulation No. 13 of 2011, included in the health risk category. Unsafe concentration for workers. The recommended safe concentration of benzene exposure is 0.028 ppm. The safe concentration value if according to the Minimum Risk Level (MRL) exceeds that which is set at 0.009 ppm daily for acute effects and 0.003 ppm daily for chronic effects, so that control efforts are needed to be protected from the adverse effects of benzene on the health of workers. Control recommendations are to provide a good exhaust ventilation system in the paint manufacturing industry.

Abstract

Benzene is a natural component of crude oil and gasoline. Benzene occurs naturally in crude oil at levels of up to 4 g /l and benzene has been classified as a group carcinogen. This research was conducted in oil and gas mining companies, West Java, Indonesia. This research was conducted using a cross sectional method. The sample in this study were 30 respondents. The variables that became the data of this study included benzene concentration (C) daily exposure time (tE), frequency of annual exposure (fE), duration of exposure (Dt), height, weight, age, respiration rate (BR), and urine of workers.

The results showed an average measurement of benzene concentration in oil and gas mining companies, West Java, Indonesia on the KPC portion of 0.1 ppm and in the laboratory section at 0.2 ppm, which means it is still below the Threshold Value (NAB) which is equal to 0.5 ppm5. Obtained the highest effective dose to be consumed by respondents in the KPC unit for beef liver is 6x10 -4 kg at a cost of IDR 33,31046813, chicken 3x10-4 kg at a cost of IDR 13,1251,9985, and avocado is 4x10 -6 kg at a cost of IDR 0,16206628, while the highest effective dose to be consumed by respondents in the laboratory unit for beef liver is 1x10-2 kg at a cost of IDR 12,14687477, chicken 6x10-4 kg at a cost of IDR 22,14504841, and avocado is 6x10-6 kg at a cost of IDR 0, 27344083. Control recommendations are to adopt a lifestyle that can minimize exposure to poisons and improve detoxification pathways.

Keywords: Costs Effective, Dose Effective , Detoxification, Benzene

Introduction

Benzene is a natural component of crude oil and gasoline. Benzene exposure results in health-related effects and diseases such as cancer. Exposure can occur as a result of the use of petroleum products which contain benzene in it. Benzene occurs naturally in crude oil at levels of up to 4 g /l. These activities include the processing of petroleum products, coal coke, the production of toluene, xylene, and other aromatic compounds. The presence of benzene in gasoline and as a widely used industrial solvent can result in significant exposure and broad emissions to the environment1.

Long-term exposure to benzene can cause leukemia, and benzene has been classified as a group 1 carcinogen2. The dominant pathway for exposure to benzene in humans through inhalation. Detoxification is a process to remove these persistent and potentially dangerous chemicals from the human body for disease prevention and health recovery3.

The body is an extraordinary system that has an innate mechanism to convert harmful substances into non-toxic compounds that can be removed from the body. This detoxification process, called the detoxification metabolic pathway, involves a series of complex biochemical reactions in cells that are just beginning to be understood by modern science. Briefly, there are two phases in this metabolic pathway. In phase I, a group of enzymes collectively known as cytochrome P450 is responsible for the biotransformation of poisons which are mostly fat-soluble into molecules that are more water-soluble.4 It should be noted that intermediates produced in phase I can be more toxic than original poisons because they are more reactive and can increase oxidative pressure in cells. These substances must be
quickly processed through phase II reactions to prevent damage to cells.

In phase II, various conjugate reactions that differ between a second series of enzymes called conjugates and toxic intermediates from phase I occur. These conjugations attach molecules such as glucuronic acid, sulfate, glutathione, glycine, taurine, or methyl groups to toxic intermediates to make them more soluble in water and unreactive, effectively “detoxifying” these toxic intermediates. These poisons which are converted biotransformation through two phases can then be removed from the cell and released through bile (into feces), urine, or sweat. While the human body has the innate ability to detox, there are many factors that can affect the activity of enzymes involved in this process. Diet, lifestyle, environment, genetics, age, gender, disease, and influence of drugs. Among these factors, there are things that can be controlled, namely the diet. The purpose of this study was to determine the effective health costs in accordance with the effective dosage of benzene and the types of foods that can detoxify benzene in the blood of workers in oil and gas mining companies, West Java, Indonesia, including beef liver, chicken and avocado. environment, while maintaining optimal detoxification capabilities through diet and lifestyle to prevent disease.

**Methods and Materials**

This research was conducted in oil and gas mining companies, West Java, Indonesia. This research was conducted using a cross sectional method. Urine examination to determine levels of benzene exposure to workers. Workers who are sampled must meet the specified criteria (Inclusion). The inclusion criteria that must be fulfilled are the age of the worker > 20 years and the working period > 5 years. The sample in this study were 30 respondents namely 15 people in the Laboratory section and 15 people in the KPC section.

Benzene inhalation sampling was carried out using a personal sampling pump that charcoal tubes had been installed which referred to NIOSH 1501 and sampling and measurement of phenol levels in workers’ urine was carried out based on NIOSH 8305. Measurements of environmental physics parameters were carried out to know the working environment conditions and were used in calculating exposure concentrations benzene.

The benzene dose measured at the time of the study was an intake through inhalation. Because this study will know the chronic effects of benzene exposure, the value of Chronic Daily Intake (CDI) will be calculated.

Then, look for intake (formula) with the formula as below:

\[
\text{Intake} = \frac{C \times \text{IR} \times tE \times fE \times Dt}{Wb \times 70 \times 365}
\]

\[
C = \text{benzene concentration (mg / ml)}
\]

\[
\text{IR} = \text{Inhalation rate (m\(^3\)/days)},
\]

\[
tE = \text{work time / day (hours)}
\]

\[
fE = \text{work time / week (days)}
\]

\[
Dt = \text{working time (years)}
\]

\[
Wb = \text{weight (kg)}
\]

Calculate the effective dose per day with the results of calculating the intake above, using the formula below:

\[
\text{Effective dose of food} = \frac{\text{intake toxin/day} \times \text{Mr toxin/food}}{\text{Mr toxin}}
\]

The last is to calculate the cost of intake of each food using the formula as below:

\[
\text{Cost of intake} = \text{Effective dose of food} \times \text{price per Kg of food}
\]

RESULT

Distribution of Characteristics of Workers

Figure 1. Distribution of Characteristics of Workers

Figure 1. Obtained the average weight data (W) of respondents is 64 kg, the average height (H) of respondents is 165 cm, the average length of work (Dt) of respondents is 5 years. The duration of work in a day is 8 hours both for workers in KCP units and laboratory workers and the number of working days in a year (Dt) is 274.

Distribution of benzene concentration in the workplace

Figure 2. Distribution of benzene concentration in the workplace

Figure 2. Obtained results The average concentration of benzene in oil and gas mining companies, West Java, Indonesia in the KPC section is 0.191 mg / m³ or 0.1 ppm and in the laboratory part is 0.466 mg / m³ or 0.2 ppm. Based on the Minister of Manpower and Transmigration Regulation No. PER.13 / MEN / X / 2011 of 2011 concerning the Threshold Value of Physical and Chemical Factors in the Workplace, benzene NAB recommended to prevent the occurrence of health impacts is 0.5 ppm.

Comparison Weight and Benzene Concentration

Figure 3. Comparison Weight and Benzene concentration

Figure 3. The highest benzene concentration in the KPC unit was 0.2 ppm (respondent 13) with a body weight of 63 kg, while the smallest benzene concentration in the KCP unit was 0.0013 ppm with a body weight of 68 kg (respondent 7). The biggest weight in the Kcp unit respondents was 68 kg (respondents 7 and 12), while the smallest was 60 kg. The highest concentration in laboratory units was 0.3 ppm (respondents 17) with a body weight of 67, while the lowest was 0.21 ppm (respondents 46-51). the largest weight in laboratory units was 68 (respondents 20 and 26), while the smallest was 60 kg (respondents 18 and 23).

Table 2. Obtained the highest effective dose that must be consumed by respondents in the KPC unit for beef liver is $6 \times 10^{-4}$ kg at a cost of IDR 33,31046813, chicken $3 \times 10^{-4}$ kg at a cost of IDR 13,12519985, and avocado is $4 \times 10^{-6}$ kg at a cost of IDR 0.16206628, while the highest effective dose to be consumed by respondents in the Laboratory unit for beef liver is $1 \times 10^{-2}$ kg at a cost of IDR 12,14687477, chicken $6 \times 10^{-4}$ kg at a cost of IDR 22,14504841, and avocado is $6 \times 10^{-6}$ kg at a cost IDR 0.27344083.

Discussion

Threshold Limit Value (TLV), Weight, and Benzene Concentration

The results showed an average measurement of benzene concentration in oil and gas mining companies, West Java, Indonesia on the KPC portion of 0.1 ppm and in the laboratory section at 0.2 ppm, which means it is still below the Threshold Value (NAB) which is equal to 0.5 ppm\(^5\). The comparative diagram analysis between the concentration of benzene and the weight of the respondents showed that the respondents with the greatest weight did not have the highest concentration of benzene, and it was similar to the respondents with the smallest weight not having the lowest toluene concentration. This research is not in accordance with Mukono’s research, that BTX has a mass of small molecules that are easily soluble in fat\(^6\). It is assumed that toxins with high solubility in fat (adipose) show low concentration in the body. This can be considered a protection mechanism. So, it was concluded that there was low benzene toxicity in obese people rather than lean people.

Detoxification of Benzene by Foods Rich in CYP2E1 Enzyme, Sulfation, and Glutation

YP2E1, Sulfation, and glutathione are enzymes that work in stage 2 of biotransformation\(^7\). Sulfation is one of a number of liver detoxification pathways, specifically phase II detoxification. Detoxification sulfate poison, it is a powerful antioxidant compound and detoxifying agent that is produced in the cytoplasm of every cell of the human body\(^8,9\). Antioxidant enzymes related to glutathione are involved in the metabolism and detoxification of cytotoxic and carcinogenic compounds and reactive oxygen species \(^10\).

The best approach to detoxification must be to adopt a complete, healthy, complete, complete diet \(^11\). Various fruits and vegetables, best for including vegetables, coriander, garlic, and citrus fruits, fats and oils with medium - Chain fatty acids (Avocados, coconuts, olive oil), Proteins from lean meat, eggs, and vegetable sources (for example tofu, tempeh), complex carbohydrates from seeds such as brown rice, quinoa, millet, soba, legumes such as peas, beans, and lentils, which are rich in soluble and insoluble fiber.

Phase 1 and 2 of the detox system are complex processes and vegetables, fruits, grains, soybeans, garlic, rooibos tea and turmeric have been reported to maintain and support the detoxification phase that occurs in the liver, making it easier to work\(^7\). The two additional nutrients needed by the liver are zinc and choline. Zinc, which can be found in food and contains the most pork, crab, beef and oysters, has been shown to help detoxify the body from alcohol. Choline is needed to make phosphatidylcholine which is used by the liver to produce VLDL cholesterol types. Choline can be found in wheat germ, chicken, beef liver, and eggs\(^12\).

Avocados contain various healthy nutrients such as vitamin A, vitamin C, vitamin E, vitamin K1, folate, vitamin B-6, niacin, pantothenic acid, and bioactive phytochemicals, such as carotenoids, terpenoids, and D-mannoheptulose, which have been reported to help fight cancer\(^13\). Avocados are rich in monounsaturated fatty acids (MUFA), which increase the bioavailability (absorption) of nutrients and phytochemicals. A study published in the American Journal of Clinical Nutrition, consuming high amounts of monosaturated fatty acids was found to reduce LDL cholesterol (‘bad’ cholesterol) by 14% and reduce the risk of cardiovascular disease\(^14\). Avocados also contain glutathione, an important factor in protecting against toxicity and disease\(^15\).

Conclusion

Intake of foods containing the enzyme CYP2E1 (beef liver), sulfation (chicken), and glutathione (avocado) is expected to increase detoxification of benzene. Each individual has a different amount of cost per individual. This depends on the effective dose, benzene concentration, weight, and duration of work. In addition to diet, adopting a lifestyle that can minimize exposure to poisons and improve detoxification pathways is equally important. These lifestyle components include: Avoid environmental toxins, such as heavy metals, persistent organic pollutants, and electromagnetic radiation, mobilize and eliminate toxins through weight loss, use
of saunas, exercise, and chelating supplements such as Chlorella. Maintain optimal intestinal health through diet and probiotics, drink enough water to maintain optimal hydration, reduce emotional stress and maintain healthy relationships, ensure adequate sleep and relaxation.

Relationship of Hot Work Climate with Employee Blood Pressure in Binat Installation, Dr. Sardjito

Charles Kimura1, Ledita Sartika Goddess2, Zikri Fathur Rahman1, Abdul Rohim Tualeka1
1Department of Occupational Health and Safety, Faculty of Public Health, Airlangga University, Indonesia, 2Department of Public Health, Faculty of Health Sciences, Muhammadiyah Surakarta University, Indonesia

Abstract
Blood pressure in each individual varies, and depends on age and daily activities such as when blood pressure activity will rise and when the remaining blood pressure will drop. Laundry installations are workplaces where there is a physical hazard in the work process in the form of a hot working climate. In a hot working climate, the body regulates its temperature by accelerating the evaporation of sweat by widening (vasodilation) of blood vessels which results in increased blood circulation and increased capillaries accompanied by physiological responses, such as increased pulse and blood pressure. This study aims to analyze the relationship between the work of heat and blood pressure of workers in the Laundry Installation of RSUP Dr. Sardjito Yogyakarta. This study uses quantitative research design using a cross sectional approach. The population in this study were Laundry Installation workers with a sample of 35 respondents taken with total sampling. Data analysis using Chi-Square. The results showed that there was a relationship between the hot work climate and workers’ blood pressure (p = 0.03) and there was a relationship between the hot working climate and diastolic blood pressure of workers in the Laundry in RSUP Installation. Sardjito Yogyakarta (p = 0.01).

Keywords: Hot Work Climate, Blood Pressure

Introduction
Hospitals as a means of improving health efforts that carry out health services, turned out to have positive and negative impacts on the surrounding environment. Hospitals in the implementation of inpatient care, emergency services, medical and non-medical services use technology that can affect the surrounding environment1. Hazard factors that exist in hospitals can cause workplace accidents or work-related illnesses, not only to the direct perpetrators who work in hospitals, but also to patients and visitors to hospitals who have the potential to experience the risk of workplace accidents and work-related illnesses2.

Dr. Hospital Sardjito is a Type A Hospital that is managed by the Ministry of Health which is a reference for the Special Province of Yogyakarta (DIY) and southern Central Java. Dr. Hospital Sardjito, there are 29 installations, each of which has the potential for physical, biological, chemical, psychological and ergonomic hazards which can cause work accidents or work-related illnesses, one of which is a Laundry Installation. Laundry Installation at Dr. RSUP Sardjito Yogyakarta has a risk of danger, one of which is a physical factor which is a hot working climate caused by the machines used during the work process, which take place from the washing process to drying, ironing, folding to being redistributed. Hot work climate is one of the physical factors that has the potential to cause harm and health problems when working in extreme hot and cold conditions with levels that exceed the Threshold Limit Value (NAV)3.

Hot work climate can affect health, one of them is increase in blood pressure. Blood pressure is a pressure produced by the blood from the circulatory system or the vascular system against blood vessel walls4. Based on the results of a preliminary survey conducted on September 13, 2017 at the Laundry Installation of RSUP Dr. Sardjito Yogyakarta, the result of measurement of hot work climate based on hospital data carried out on previous measurements was carried out 2 times, namely in December 2016 the ISBB results were 31°C and in June 2017 the ISBB was 36°C. The government has policies related to the workplace...
climate, which is about the Physical Factor Threshold Value and Chemical Factors in the Workplace, with the ISBB light category workload not exceeding the NAB of 31 °C. From the results of interviews with 7 workers from 35 work workers, grievances were felt at the place, often feeling excessive headaches, dizzy eyes, feeling tired, uncomfortable and sweating easily. Based on the description above, the researcher is interested in analyzing the relationship between the hot working climate and the blood pressure of workers at the Laundry Installation of RSUP Dr. Sardjito Yogyakarta.

**Research Method**

This type of research is a quantitative design, using cross sectional approach, where the independent variables (hot work climate) and dependent variables (blood pressure) are observed only once at the same time. This research was conducted on February 27, 2018, and was carried out at the Laundry Installation of Dr. RSUP Sardjito Yogyakarta. The number of workers in the Laundry Installation as many as 35 people with samples taken from the entire population of workers in the Laundry Installation. The variable hot working climate uses the appropriate category <31°C and does not match ≥ 31°C for the blood pressure dependent variable using the category of increase and decrease. The analysis used is univariate and bivariate analysis with the provisions of the test Chi-Square. If \( p \) value <0.05, then \( H_0 \) is rejected and if \( p \) value > 0.05, then \( H_0 \) is accepted by

**Finding**

**Characteristics of Respondents**

Based on the results of data collection of workers in the Laundry Installation, the respondent’s age is at least 19 years and maximum age is 57 years. And it was found that some age groups more than 80% experienced an increase in blood pressure systolic in the early adult group, late adult, early elderly and late elderly. And almost all age groups experience an increase in blood pressure diastolic by 100% for late adolescents, late adults and early elderly. Based on gender distribution in the Laundry Installation section, all male workers experience increased pressure, both systolic blood pressure and blood pressure diastolic by 100%. Meanwhile, some more than 70% of women also experience an increase in systolic blood pressure and blood pressure diastolic.

The history of blood pressure showed that the majority in the category did not have a history of blood pressure which many experienced an increase in systolic blood pressure and blood pressure diastolic by 87%. And in the category that has a history of blood pressure most also experienced an increase in systolic blood pressure and blood pressure diastolic by 75% and 100%. And more than 80% of workers who work with a light workload also experience an increase in systolic blood pressure and blood pressure diastolic by 85.8% and 88.6%.

**Hot Work Climate**

Based on table 4. statistical test results Chi-Square show Sign for 0.03 < 0.05 which means that Ho is rejected so that there is a relationship between the hot work climate and blood pressure systolic and in table 5. Sign 0.01 < 0.05, which means that Ho is rejected so there is a relationship between the hot work climate and blood pressure diastolic. Workers who work in points II and III, namely workplaces that do not comply with the NAB, have experienced an increase in blood pressure, both systolic blood pressure and blood pressure diastolic.
Discussion

The measurement of hot working climate in the Laundry Installation section is carried out at 3 points, namely point I (administrative space) where there are 4 workers at that point, point II (dirty area) there are 6 workers, and point III (clean area) there are 25 the worker. Point I for employees of Laundry Installation staff, while point II and point III are places where workers do work, where workers also work close to machines. At the time of conducting research the measurement of the hot working climate that was felt when entering into the room was heat because the machines were adjacent to the activities of the workers and the rooms were not so wide. The results of the measurement of hot work climate obtained at point I is 25°C, at point II of 33°C and at point III of 35°C.

According to the Minister of Manpower and Transmigration Regulation based on the calculation of workload obtained is a light workload with hours working 8 hours, the hot working climate must not exceed the Threshold Limit Value (NAB) which is equal to ≥31°C. Based on these regulations the work climate is hot in the Laundry Installation section of Dr. RSUP Sardjito has 2 points that exceed the Threshold Value (NAB), which is point II (dirty area) and point III (clean area). At point I (administration room) in accordance with the Threshold Value (NAB) because the room is an air-conditioned room for employees of Laundry Installation staff.

Blood pressure measurements were carried out on 35 respondents, of which 35 respondents spread over 3 points, namely point I there were 4 workers, point II Based on the results of the Statistics test Chi-Square, a hot working climate with blood pressure systolic workers at the Laundry Installation RSUP Dr. Sardjito obtained a significance value of 0.03 (P <0.05) so that Ho was rejected, which means there is a relationship between the hot work climate and blood pressure systolic in workers at the Laundry Installation of RSUP Dr. Sardjito. This research is in line with the research conducted by Jaswin (2004), which shows that there is a relationship between heat pressure and blood pressure systolic in the production workforce of PT. Tjokro Bersaudara with a sig value of 0.03 <0.05 and there is a relationship between heat pressure and blood pressure diastolic in the production workforce of PT. Tjokro Bersaudara with a sig value of 0.04 <0.05. This shows that there is a relationship between the hot working climate and the blood pressure of workers in the Laundry Installation section of Dr. RSUP Sardjito Yogyakarta and point III there are 31 workers, where point I and point II have a hot work climate that exceeds NAB. In addition, the results of the measurements also showed that workers who worked in that place experienced a lot of increased blood pressure both systolic blood pressure and blood pressure diastolic which was equal to 90.3% and 93.5%. Meanwhile, those who experienced a decrease in systolic blood pressure and blood pressure diastolic only 9.7% and 6.4%. Furthermore, at point I workplaces that have a work climate in accordance with the NAB there are 4 workers, of which 2 (50%) workers have increased systolic blood pressure and blood pressure diastolic due to other factors, one of which is a history of blood pressure. Whereas, who experienced a decrease in systolic blood pressure or blood pressure diastolic there were 2 (50%) respondents.

Conclusion

Measurement of hot working climate in the Laundry Installation section of Dr. RSUP Sardjito is done at 3 points, namely point I (administrative space) 25°C, point II (dirty area) 33°C, and point III (clean area) 35°C, where the highest measurement results at point II and point III value >31°C exceeds the Threshold Value (NAB). Blood pressure measurement in the respondent of the Laundry Installation of RSUP Dr. Sardjito majority experienced an increase in systolic blood pressure and blood pressure diastolic by 90.3% and 93.5%. The statistical test results obtained the relationship between hot work climate and blood pressure systolic in workers in the Laundry Installation obtained a significance value of 0.03 (P <0.05) and the relationship between hot work climate with blood pressure diastolic in workers on the Laundry Installation and obtained a significance value of 0.01 (P <0.05).

Analysis of Worker’s Level of Knowledge on Handling Chemicals in Oil and Gas Industry Laboratory of Pt “X” Indonesia

Dani Nasirul Haqi¹, Putri Ayuni Alayyannur¹

¹Department of Occupational Safety and Health, Faculty of Public Health, Universitas Airlangga, Surabaya, 60115 East Java, Indonesia

Abstract

The oil and gas industry is one of a large-scale industry, which is when carrying out the production process, they contain several hazard posed that can threaten labor, assets, and other people in industrial environment such as chemical hazards. The chemical groups have special characteristics in disturbing and threatening labor. Knowledge is one of the important factors in preventing work accidents and work-related diseases due to chemicals. This study is a descriptive study, and the data was collected by observational. The object of research in this study is knowledge of workers on handling chemicals. The sample is a total population of 28 workers. The results of the research obtained were that most workers already had adequate knowledge regarding handling chemicals in the laboratory. The highest concentration of chemicals in the laboratory is Benzene (19.1 ppm), Toluene (30.56 ppm) and Xylene (20.48 ppm). The conclusion of this study is that knowledge is a very important domain for the formation of a person’s behavior. In this case, it is related to the handling of chemicals found in the laboratory. If the level of knowledge of the workers is high, the handling of chemicals in the workplace can be carried out maximally, so that workplace accidents can be prevented and the safety of workers can be maintained.

Keywords: chemicals, workers’ knowledge, laboratory.

Introduction

OHS (Occupational Health and Safety) is a program created by workers and employers as an effort to prevent accidents and occupational diseases (OD). Based on Article 86 paragraph (1) letter a of Law Number 13 of 2003 concerning Labor, every worker has the right to obtain protection for Occupational Health and Safety. The lack of care of the company towards OHS is reflected in the high rate of work accidents and the less optimal detection of OD¹.

The International Labor Organization (ILO) stated that 160 workers experienced work-related illness every 15 seconds². Workplace accidents and OD are a health and economic burden in Indonesia because not only do they need services and health costs, but they also reduce the productivity. Occupational Disease is a disease caused by work or work environment that will result in partial or total disability. Part of the defect is the loss or non-functioning of some members of the body of labor forever. Whereas total disability is a state of labor without being able to work at all forever³.

In general, the causes of OD can be grouped into five groups, namely the physical group: noise, radiation, temperature, very high pressure, vibration, poor lighting. Chemical group: chemicals used in work processes, as well as those found in the work environment, can be in the form of dust, steam, gas, solution, clouds or fog. Biological group: bacteria, viruses or fungi. Physiological group: usually caused by workplace arrangement and work methods. Psycho-social group: stressful work environment.

The chemical group has special characteristics in disturbing and threatening the safety and health of...
workers. This can happen because some chemicals have physical and chemical properties like invisible color, odor that does not smell. Therefore handling and knowledge of chemicals in the workplace is very important. Knowledge is one of the important factors in preventing work accidents and work-related diseases due to chemicals. Through good knowledge, the workforce can take the right actions at work.

The oil and gas industry is a large-scale industry with labor intensive and capital intensive. In carrying out the production process, there are several dangers posed that can threaten human. Some of these hazards are noise due to work processes, extreme temperatures, and lighting in the workplace. Chemical hazards such as benzene, toluene, xylene and H₂S. Biological hazards such as the presence of wild animals, bacterial, viruses or fungus contamination. Before being marketed, all the oil and gas that has been produced will be tested in the laboratory. This shows that workers in the laboratory are also exposed to chemicals hazards.

**Material and Method**

This study is a descriptive study, with observational to collecting some data. Based on the method of retrieval of data, this research is observational, because the data obtained through observation and not being treated on the object of research.

The object of research in this study is the workers’ knowledge on handling chemicals. The population was 28 workers in the oil and gas industry laboratory. The sample is a total population of 28 workers.

The data collected is primary data and secondary data. Primary data obtained from interviews are workers ‘s knowledge regarding chemicals. This data includes the workers ‘s knowledge on the identification of chemicals, how to handle products, regarding the use of RPE, regarding maintenance of Respiratory Protective Equipment (RPE) and regarding management support. Secondary data is obtained from data recorded in the oil and gas industry, such as: industrial profile data, and data on the number of workers.

**Findings**

Data collection was conducted on 28 respondents who worked in oil and gas industry laboratory of PT “X” Indonesia by distributing questionnaires and conducting interviews directly.

A. Overview of Air Chemical Concentration in the PT “X” Indonesia Oil and Gas Laboratory

Based on the chart above, it can be seen that the highest concentration of chemicals in oil and gas laboratory of PT “X” Indonesia in the form of Benzene is 19.1 ppm, the highest concentration of Toluene is 30.56 ppm, and the concentration of Xylene is 20.84 ppm, while the concentration of NH₃, H₂S, CO and H₂SO₄ in the laboratory is still not detected which is 0.00. Although the concentration of these chemicals has not exceeded the TLV (Threshold Limit Value) that has been determined based on the Minister of Manpower and Transmigration Regulation of the Republic of Indonesia Number PER.5 / MEN / X / 2018 concerning occupational health and safety and work environment, it still needs to be watched out for the effect the exposure caused can affect the health and safety of workers.

B. Questionnaire Result of Oil and Gas Laboratory of PT “X” Indonesia

1. Workers’ Knowledge Level on Identifying Chemical Products

   Based on the results of the questionnaire, it was found that 100% of workers knew the identification of chemical products containing hazardous materials in their workplaces (BTX, caustic soda, DMDS), and 100% of workers knew the source of information regarding chemical products in the workplace.

2. Level of Worker Knowledge on How to Handle Products

   Based on the results of the questionnaire 71% of workers stated that there were measurements of gas testing in their workplaces. 100% of workers know the type of respiratory protective equipment that must be used in handling the hazard products they encounter at work.
3. Workers’ Knowledge Level regarding the Use of RPE

Based on the results of the questionnaires, 100% of workers know the health effects of chemical products in their workplaces, workers also know the type of respiratory protective equipment they use, know how to use the correct RPE, know the disposable RPE, know that disposable RPE can only be used once, knowing that reusable RPE cannot be used alternately, knowing the function of the RPE they use, and 43% of workers stating that there are no complaints when using RPE.

4. Maintenance of Respiratory Protective Equipment (RPE)

Based on the results of the questionnaire, it was found that 79% of workers stated that there was an RPE maintenance procedure at their place of work. 68% stated that treatment performed on RPE can affect the effectiveness of RPE function. 71% of workers stated that they knew the condition of the RPE that needed cleaning. 96% of workers stated that they kept RPE in clean and sealed plastic before putting it in a locker. 79% of workers stated that they had checked the RPE condition before using it. 79% of workers stated that they knew how the RPE could be used.

5. Level of Knowledge regarding Management Support

Based on the results of the questionnaire, it was found that 100% of workers had received RPE-related training, 100% of workers stated that the RPE they received was in accordance with their type of work, and 100% of workers stated that there had never been cases of shortness of workers when wearing RPE.

Chemicals in the Laboratory

Benzene, Toluene and Xylene or commonly known as BTX are several types of air pollutants which are Polycyclic Aromatic Hydrocarbon (PAH) compounds. PAHs are formed due to incomplete combustion of organic matter, spread to the environment and in mixed form. The main sources of exposure of PAH to humans come from the work environment, passive and active smokers, food and water and air pollution\(^4\).

BTX is a chemical including chemicals that are toxic to health, both carcinogenic and trigger cancer and increase oxidative and non-carcinogenic stresses such as affecting the hematopoietic system, central nervous system and reproductive system\(^5\).

1. Benzene

Exposure to benzene on humans through inhalation is carcinogenic. The presence of benzene exposure in the work environment has been associated with an increased incidence of acute and chronic myeloid myeloblastic or erythroblastic leukemia and lymphoid leukemia in workers.

The Indonesian National Standard 2005 which refers to Minister of Manpower Regulation No. 13 of 2011 contains the Threshold Value (TLV) of the time weighted average of chemicals in the workplace air, with the number of hours worked 8 hours per day or 40 hours per week, stating that benzene included in group A2 (chemicals that are estimated to be carcinogens for humans) have NAB of 10 ppm or 32 mg/m\(^3\) of benzene in the air\(^6\).

In contrast to xylene and toluene, benzene is a material that is proven to be carcinogenic which can interact with RNA, proteins or other molecular compounds that can trigger carcinogenic effects without being directly related to exposure concentration\(^7\).

The health effects of benzene exposure at low levels can cause dizziness or drowsiness, a rapid heartbeat, headaches, tremors, and confusion. At a higher level can cause unconsciousness or even death. Long-term exposure can have serious health consequences, especially in the bone marrow, or through loss of red blood cells, which can cause anemia. This can disrupt the immune system, and make patients vulnerable to other diseases, benzene can also cause cancer, especially leukemia and other cancers in the blood.

2. Toluene

Toluene is one of the aromatic hydrocarbon compounds, colorless substances, flammable liquid with a distinctive aroma, not corrosive, explosive vapor, insoluble in water but soluble in ketones, alcohols, esters and other aromatic hydrocarbon compounds\(^8\).
### Effect of toluene toxin:

</tbody>
</table>

### Xylene

Xylene is a colorless, flammable, volatile and sweet-scented liquid\(^9\). Xylene is naturally found in kerosene, coal and forest fire processes or through the process of automation of petroleum hydrocarbons. On an industrial scale, xylene is produced through the heating process of organic compounds and catalyst processes for kerosene products\(^10\).

Xylene exposure can also occur through inhalation (breathing), ingestion, eye contact and in some rare cases, xylene can be absorbed in small amounts on the skin, which is the main effect that can arise from xylene exposure is a result of breathing in xylene vapor\(^10\).

The negative impact that can be caused from xylene exposure is depression in the central nervous system, with symptoms such as headache, dizziness, nausea and vomiting. Like benzene, xylene can also cause a decrease in red blood cells (anemia)\(^11\).

Xylene which is ingested into the body can cause stomach problems and cause toxic effects on the liver. Exposure to high concentrations of xylene vapors that occur acutely can cause impaired function and swelling and bleeding\(^11\).

Xylene concentrations below 200 ppm will irritate the eyes and membranes of the lenses, while at high concentrations xylene can cause narcotic effects. Estimated LD50 orally in humans is 50 mg / kg\(^12\).

### The Importance of Knowledge

Knowledge is the result of knowing, and this happens to someone who does sensing a particular object. Most human knowledge is obtained through the eyes and ears. Knowledge is a very important domain for the formation of one’s behavior. Besides knowledge or cognitive is a domain that is very important for the formation of one’s actions (Overt Behavior).
Some studies that have been conducted also show that a conclusion is obtained that there is a relationship between knowledge and attitude with the use of personal protective equipment\textsuperscript{13}.

Knowledge of the characteristics of chemicals in the workplace can provide facts and information related to handling the chemicals and take actions when the problems occur. One important knowledge must be possessed while in the laboratory and direct exposure to chemicals including: Knowledge of the identification of chemicals, Knowledge of how to handle products, Knowledge of how to use and maintain RPE, and Knowledge of Management Support.

Hazard identification is an effort to prevent and reduce the occurrence of workplace accidents that occur in the company, and avoid and minimize risks in the right way by avoiding and reducing the risk of workplace accidents and their control in carrying out repair and maintenance activities so that the process is safe. Hazard identification includes identification of aspects of the Company’s environmental impacts on the environment and surrounding residents in the Company’s area\textsuperscript{14}.

Knowledge of how to use and maintain respiratory protective equipment (RPE) is very important because it is a device that can protect workers from exposure to hazardous substances. The use of respiratory protectors prevents workers from directly inhaling contaminants in the work area.

Respiratory Protective Equipment according to Regulation of the Minister of Labour and Transmigration Number 8; 2010 concerning Personal Protective Equipment is a protective device that serves to protect respiratory organs by channeling clean and healthy air and / or filtering out contamination of chemicals, micro-organisms, particles in the form of: dust, fog (aerosol), steam, smoke, gas / fume and so on\textsuperscript{15}.

Based on its function, RPE is divided into: Respirator which functions to purify the air (air purifying respirator), respirator which functions to supply oxygen or air (water supplying respirator), respirator with a canister containing chemicals, mechanical respirator (mechanical respirator), filter combination respirator and chemicals, respirators with suppliers of air or oxygen.

**Conclusion**

From the research that has been done, some conclusions can be drawn as follows.

1. Most workers already have adequate knowledge regarding handling chemicals in the oil and gas laboratory of PT “X” Indonesia in accordance with procedures that have been included in the OHS norms in the workplace.

2. The highest concentration of chemicals in the oil and gas industry laboratory of PT “X” Indonesia is Benzene (19.1 ppm), Toluene (30.56 ppm) and Xylene (20.48 ppm).

3. Knowledge is a very important domain for the formation of a person’s behavior, in this case is related to the handling of chemicals found in the oil and gas industry laboratory of PT “X” Indonesia.

4. If the level of knowledge of the workers is good, then the handling of chemicals in the workplace can be done to the maximum, so that work accidents can be prevented and the safety of workers can be maintained.

Climate Relationship Work with Fatigue Employees Working in Laundry Plant Dr. Sardjito

Dyah Ayu Kusuman Ningrum¹, Anggita Kurniawati², Abdul Rohim Tualeka¹
¹Department of Occupational Health and Safety, Faculty of Public Health, Airlangga University, Indonesia, ²Department of Public Health, Faculty of Health Sciences, University of Muhammadiyah Surakarta, Indonesia

Abstract
Laundry Installation is one of 29 installations in Hospital Dr. Sardjito. Laundry installation has 35 employees who have worked with exposure to high temperatures up to 35°C. The hot working climate be the cause of fatigue on employees. The purpose of this study was to Determine the relationship between the work climate in employees with work fatigue Hospital Dr. Laundry Installation Sardjito Yogyakata. The study design used is cross sectional. The population in this study as many as 35 people. The sampling technique used is total sampling the entire population of employees that numbered 35 people. The results of the study with the statistical tests Man Whitney p value 0.022 Obtained value <0.05 the which means that Ho refused so that there is work climate relationship with work fatigue of employees working in the department of Dr. Laundry Installation Sardjito. The advice given to the installation related to that with the addition of appropriate ventilation in the standard installation space doing laundry and job rotation system working parts so that employees do not feel monotonous with the work performed.

Keywords: Climate Work, work fatigue, workers of Installation Laundry

Introduction
The incidence of cases of occupational diseases continues to increase each year, one of occupational diseases in the hospital. The hospital has a variety of installations that have high hazard potential, ranging from the installation of the laundry, pharmacy, nutrition installation, forensic medicine laboratory, steam boilers, and warehouse B3. Laundry installations cited as one part of a hospital where a high risk that this installation has a temperate working environment hot work. Working climate itself becomes part of the physical factors that potentially dangerous health problems both hot and cold taupon with levels that exceed the Threshold Limit Value (TLV)¹. Work climate that meets the health requirements will affect the optimal working efficiency².

General Hospital Dr. Sardjito a regional referral hospital for the province of Yogyakarta (DIY) as well as the southern part of Central Java. Hospital Dr. Sardjito has 29 installations, which of the various installations that have a high hazard potential, one Installation Laundry. Installation laundry (Laudry) consists of three parts, namely the work area clean room area, dirty room area, and the administrative staff room. Dirty room clean room area and the area carry out activities ranging from separation, washing, drying, folding and ironing linen up until ready to be distributed back. While the administrative staff conducting space-related administrative office Laundry Installation.

Based on the preliminary survey performed at the laundry, all the employees working in the work environment with a hot working environment that does not meet (NAB). Based on data from the Hospital of climate measurement results has been done before as many as 2 times the last measurement in December 2016 obtained results Wet and Ball Temperature Index (WBGT) equal to 31C and in June 2017 WBGT result of 36C. When compared with the standard working
climate in Indonesia established by Permenakertrans No. Per.13 / MEN / X / 2011 Threshold Limit Values for the working climate that is 31°C with a light workload, the results exceeded the NAB³.

Based on initial observations showed that the researchers feel the heat directly working climate that is in Installation Laundry. It was marked with only a few minutes of being in the room already felt hot and hot. As for the initial interview conducted on 10 employees all complained of feeling tired, weak, and thirst. Results of research conducted Sari⁴ concluded that there is significant influence among the working climate to dehydration and heat exhaustion in labor work in the boiler section Albasia Sejahtera Mandiri PT. The results of another study that is conducted by⁵ concludes that there are climatic influences hot work against fatigue in metal smelting section Batur Jaya Ceper cooperative, Klaten. The purpose of this study was to determine the relationship of the working climate with job burnout in employees cleaning installations RSU Dr. Sardjito

**Research Method**

This type of research used in this research is quantitative research design with observational and cross-sectional approach. The population in this study were all employees of the department Dr. Laundry Installation Sardjito totaling 35 people. The number of samples in this study were 35 taken with total sampling sampling techniques.

The independent variable in this study is the work climate, the dependent variable in this study were fatigue, and variable spam is measured in this study were age, gender, and workload while confounding variables that are not measured in this study is the noise, vibration and length of employment. Measurement of working climate with Heat Stress Monitor brands Area Quest 10 and Fatigue Temp work using a questionnaire fatigue. Implementation of measurements were carried out at 09.30 am.

Based on Table 1. The frequency distribution and percentage of employees Installation unknown Laundry most banyaj employee age is 46-55 years older initial total of 11 people (31.4%). As for the age is at least 17-25 years late teens totaling 3 (8.6%). While the frequency distribution and percentage of employees Installation gender Laundry Hospital Dr. Sardjito are males were 18 people (51.4%) and women were 17 people (48.6%). The frequency distribution and percentage of employees' workload Laundry Installing Hospital Dr. Sardjito is a light workload, as many as 35 people or as much as 100% of employees received workload during work including light workload.

Then the measurement results with fatigue life of employees working at Hospital Laundry Installation Dr. Sardjito is known that at the end of the adolescent age category all employees experience job burnout Low totaling 3 (100%), for the end of the adult age categories experienced job burnout mostly lower, amounting to 5 people (71.4%), adult age categories end of most experienced job burnout were amounting to 6 people (75%), older age categories beginning mostly experienced job burnout were amounting to 5 people (45.4%) and for the age category final elderly employees who experienced job burnout low 2 (33.3%), fatigue was 2 JV (33.3%) and high job burnout 2 (33.2%).

The measurement results sex with job burnout of employees known that male employees mostly experienced job burnout were a total of 11 people (61.1%), whereas women employees working mostly mild fatigue, amounting to 7 people (41.1%). Based on the measurement results of the workload with employee fatigue LaundryInstalling Hospital Dr. Sardjito known to all employees, amounting to 35 people suffered light workload, with a light workload of employees who experienced job burnout lower categories numbered 13 persons (37.1%), fatigue moderate category amounted to 17 (48.6%) and fatigue higher category of work of 5 people (14.3%).

Based on the results of climate measurements known to work with job burnout at work climate <NAB all employees of the department Dr. Laundry Installation Sardjito experiencing job burnout light category as many as 4 people (100%), while the working climate ≥NAB most employees experienced job burnout were as many as 17 people (29.03%). As for the Man Whitney statistical test showed p value of 0.012 <0.05, which means that Ho refused.

Discussion

Based on the results of climate measurements of work done in the three measurement points which point one in the dirty room area, two points in the clean room area and a point in the space of three administrative staff is known that the measurement results indicate there are two categories of work climate that is <NAB and ≥NAB. To point one and point two results are ≥NAB 31C and three point <NAB 31c. According to the regulations of the Minister of Manpower and Transmigration No. PER.13 / MEN / X / 2011 on the threshold values for the physical factors of climate hot working with the type of work that has a workload of light category which worked continuously (8 hours per day) with working time regulations (75%) and time off (25%) should not exceed 31C WBGT. Based on these regulations Installation work climate at Dr. Hospital Laundry Sardjito exceeding the threshold value set so high risk for employees. The measurement results on employee job burnout Laundry Installation Hospital Dr. Sardjito shows that the average value of fatigue is 25.03 categorized as moderate job burnout, as many as 13 people experiencing job burnout lower category (37.1%), as many as 17 people (48.6%) experiencing job burnout medium category, and as many as five people (14.3%) experienced fatigue high category. Based on the results of these measurements in the highest percentage of job burnout category being. Fatigue experienced by employees of the department Dr. Laundry Installation Sardjito still a complaint because it is still a category fatigue was not until the decline in work performance characterized by weakening physical condition of workers The measurement results working climate with fatigue at the point of the room dirty area and a colon in the clean area where there are 31 employees who worked as 6 people in the room dirty area and 25 in the clean area known to result > NAB. In addition the measurement results also showed that employees who work in these places experiencing fatigue. For low work fatigue were 9 people (29.03%), job burnout were as many as 17 people (54.83%), and high work fatigue as much as 5 people (16.12%).

Based on the results of Man Whitney statistical test between the hot working environment with job burnout in employees cleaning installation Hospital Dr. Sardjito obtained p value 0.012 <0.05, then Ho is rejected means that there is a relationship between the working climate
with job burnout in employees Laundry Installation Hospital Dr. Sardjito. This study is in line with research Sari (2014), that there is influence between the hot working climate with dehydration and fatigue on the part of labor boiler with p value = 0.023 and p value = 0.000 which means ≤ 0.05. However, these studies are not consistent with research conducted Ristiyanto because the test results obtained statistical p value 0.111> 0, 05 then the test results stated insignificant or no employment relationship hot climate with job burnout in the boiler unit labor PT. Tiga Pilar Sejahtera Food Tbk Village Sepat, Masaran, Sragen, because due to the factors that affect the statistical test that health status, age and acclimatization.

The results of the research work climate with job burnout in employees Laundry Installation Hospital Dr. Sardjito is no relationship between the work climate at work fatigue as evidenced by the observation of a work environment where employees do laundry Installation work exposed to heat, where the heat source is derived from a washing machine, a dryer, and ironing machine. Although the condition of the room dirty area and a clean room area is equipped with a fan and exhauster which is quite a lot, which exhauster can suck the hot air from inside the room and throw it out at the same time sucking fresh air from outside into the room. However, lack of ventilation also be one of the causes of climate gets hot.

**Conclusion**

According to the research performed at the Hospital Dr. Laundry Sardjito daapat concluded that the measurement of WBGT at three measurement points which point one in the lounge area dirty 33c, colons in the clean room area of 35˚C, and the point in the space of three administrative staff 25˚C while the measurement results obtained job burnout employees who experience fatigue with mild fatigue criteria categories numbered 13 employees (37.1%), fatigue was amounted to some 17 employees (48.6%), and high fatigue amounted to 5 employees (14.3%). In addition, by Man Whitney statistical test between the working climate with job burnout show 0,012 p value <0.05, which means that there is a relationship between the working climate with job burnout in employees Laundry Installation Hospital Dr. Sardjito.

Abstract

Noise is a major problem in modern industrial activities. The use of machines in industry and inseparable design of work between humans and machines makes workers exposed to noise as one of the physical hazards in the work environment. Noise can cause physiological reactions such as systolic and diastolic blood pressure disorders. However, systolic blood pressure response is more sensitive to changes. The systolic pressure after loading is normally up (20 mmHg), the rest is considered abnormal and is considered one of the risk factors for cardiovascular disease. Blood pressure is a multifactorial health indicator. In addition to noise, blood pressure is also influenced by the physical workload that workers receive as one of the factors of workload. The purpose of this study is to examine the relationship of noise and physical workload to an increase in systolic blood pressure. This is a cross sectional design and observational analytical study with statistical tests using spearman. Respondents were determined through simple random sampling technique that results in a sample of 36 ceramics industry workers in the production line section. The results showed the value of the noise relationship (r = 0.581) towards the increase in systolic blood pressure. Physical workload showed a relationship value of (r = 0.666) towards the increase in systolic blood pressure. The direction of the relationship between the independent variable and the dependent variable is positive, which means that the higher the noise level and physical workload, the higher the risk of abnormal systolic blood pressure.

Keywords: noise, physical workload, systolic pressure

Introduction

The main problem of occupational health in industrialized countries is noise. According to WHO in 1995 it was estimated that 14% of the workforce in the industrial country was exposed to noise of more than 90 dB. At least 7 million people or 35% of the total population in America and Europe were exposed to noisy 85 dB or more. In Poland it was estimated that 600,000 of the 5 million industrial workers had the risk of being exposed to noise. This illustrates the noise in the work environment has been a major problem that threatens the health of workers(1).

Noise is all the unwanted noise that comes from the tools of the production process or work tools which at a certain level can cause hearing loss. Noise is one of the important aspects in industrial hygiene and noise exposure is a form of hazard that can be controlled so as to reduce the impact caused. Noise exposure caused 54.7% of the workforce to experience non-auditory problems and only 18.7% of the workforce experienced auditory problems. Based on the study noise exposure has a greater non-auditory risk than that of auditory(2). Non-auditory effects due to noise in workers can be physiological, psychological and communication disorders. One of the non-auditory effects of noise exposure is a disturbance in cardiovascular and circulatory system caused by excessive production of adrenaline hormone, resulting in an increase in the frequency of heart rate and blood pressure(3). The production machine produces a noise level above the set threshold value of 85 dB. This noise is produced from production machines such as the GF
Box Feeder for the extruder stage which is used to check mass density so that the product is not easily broken and the crusher machine used to destroy ceramics that fails to pass the quality control stage.

Increased blood pressure is one factor in the occurrence of cardiovascular disease. According to WHO data, 31% of the 56.6 million deaths worldwide were caused by cardiovascular disease in 2012. In Indonesia cardiovascular disease recorded in Indonesian Basic Health Research was the highest cause of death by 1.5%\(^{(4)}\). Factors that affect blood pressure increase in workers are multifactorial. In addition to the danger that comes from the work environment in the form of noise, physical workload is also a factor that influences the risk of increased blood pressure. The physical workload can be in the form of lifting, running and carrying activities.

Physical work produces energy that meets energy consumption needs. Assessment of physical workload can be measured by an objective method of measuring the pulse during work. The higher the pulse count measured the higher the physical workload received by the worker. Pulse is one system that runs synergistically with blood pressure. Thus, the higher the burden of physical works, the higher the increase in blood pressure\(^{(5)}\). In accordance with the results of preliminary observations made by the researchers, the works in the ceramics industry is highly dependent on physical activities. Activities in the ceramics production process includes elevating the arrangement of ceramics to be assessed by quality control and preceded with packing process to ensure all ceramic surfaces get the perfect glazing process and arranging the ceramics on the pallet to be stored in the warehouse.

Based on the explanation, this study aims to analyse the relationship of work environment factors in the form of noise exposure and occupational factors in the form of physical workload to an increase in systolic blood pressure to workers in the ceramic production line.

Material and Method

This study aims to analyze the relationship between noise exposure and physical workload to increase systolic blood pressure in ceramic industry workers in the production line section. This is an observational analytic study because the researcher did not provide an intervention and only looked for the relationship of the variables studied. In terms of time, this is a cross sectional study because observations were made at one time. The study period was conducted in May 2019. The study population was 40 people and the sample was taken using the simple random sampling method with the Slovin formula which resulted in 36 research samples.

The independent variables tested were noise exposure and physical workload, while the dependent variable was systolic blood pressure. All variables were obtained through measurements as explained below.

1. Noise Measurement

The measurement of noise intensity was carried out at three points of the line production area of forming, glazing and packing & loading. Measurements were made using the Sound Level Meter (SLM) of Svantek type and carried out by the operator of the Occupational Safety Technical Unit of the East Java Province Manpower and Transmigration Office. Test method is based on SNI 7231: 2009 concerning Noise.

2. Measurement of Physical Workload

The measurement of physical workload uses the 10 pulse method to determine the Work Pulse Rate which is then classified based on the Cardiovascular Load formula (% CVL). Measurement was made using palpation method on the worker’s pulse by medical personnel of nurse. The measurement technique begins by pressing the on button on the stopwatch along with the first pulse and turning off the stopwatch on the 10th pulse. The number of seconds produced was then recorded. The pulse measurement was carried out four times by 8:30 a.m., 9:30 a.m., 10:30 a.m. and 11:30 p.m. to find out the average pulse rate at work.

\[
%CVL = \frac{100 \times (\text{Working pulse} - \text{Resting pulse})}{\text{Max pulse} - \text{Resting pulse}}
\]

3. Measurement of Systolic Blood Pressure

Blood pressure measurement was carried out by medical staff of a nurse prior to working at 07:45 WIB and after working at 12:00 WIB. Measurements were performed using a manual sphygmomanometer and stethoscope.

Data collected from research results are processed in several stages. First, the data was coded numerically to maintain data privacy and facilitate data input activities. The data analysis activity aims to find the significance of the relationship, the strength of the relationship and the direction of the relationship between the independent variable and the dependent variable. The significance in the spearman test can be seen from the presence of two stars (***) on the strength of the relationship. The strength of the relationship can be seen from the value of the correlation coefficient (r). The correlation coefficient is between 1 and -1. Positive and negative signs indicate the direction of the relationship.

Finding

1. Measurement Results from Noise in the Production Line Area

Noise measurement in the ceramic industry is divided into three points on the line production section, measuring with Sound Level Meter (SLM) with the following results.
Table 3. Measurement Results from the Noise Point in the Production Line

<table>

<td>&gt; NAB</td>
</tr>
</tbody>
</table>

Noise measurement was carried out at each sound source in the PT KIA Ceramic MAS, Gresik line production area. The highest noise was generated from the forming area. The source of noise in this area was caused by the use of GF Box Feeder machines or extruder machines. The measurement of noise intensity in units with continuous noise types was carried out once with a distance of one meter from each sound source, the average noise intensity in each unit was then calculated.

Based on the table, the point of forming and packing and loading has a noise intensity above the threshold value of 85 dB. The highest noise point in the forming area was 85.9 dB.

2. Results of Measurement of Physical Workloads

The physical workload was measured by calculating the 10 pulse method which was then calculated using the calculation of the cardiovascular load (CVL) percentage.

2.1 DNI data were taken by measuring resting pulse before workers begin their work.

2.2 DNK data were taken by measuring the pulse when the workers start doing their work, this include:
   a. DNK Measurement 1 at 08.30 WIB
   b. DNK Measurement 2 at 09.30 WIB
   c. DNK 3 Measurement at 10.30 WIB
   d. DNK 4 Measurement at 11.30 WIB

The results of the measurement of the average time of the 10 pulse workers were included in the 10 pulse method equation that the workers’ pulse per minute was obtained. After this calculation, the physical workload was calculated by the cardiovascular load (CVL) method as shown below:

<table>
<thead>
<tr>
<th>Physical Workload Levels</th>
<th>Frequency (n)</th>
<th>Percentage (%)</th>
</tr>
</thead>
<tbody>

<tr>
<td>Very heavy</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Total</td>
<td>36</td>
<td>100</td>
</tr>
</tbody>
</table>

The distribution shows that the highest category is moderate physical workload by 25 (69%) workers.

3. Results of Systolic Blood Pressure Measurement

The average systolic blood pressure before working and after working increased, but the categorization of an increase in blood pressure is based on a normal increase and an abnormal increase. Increased systolic blood pressure is in the normal category if the increase is 20 mmHg from the initial measurement. If the increase
exceeds 20 mmHg it is categorized as an abnormal increase.

**Table 5. Distribution of Respondents based on Increased Systolic Blood Pressure of Workers**

<table>

</tr>
<tr>
<td>Total</td>
<td>36</td>
<td>100</td>
</tr>
</tbody>
</table>

A total of 26 (72%) line production workers experienced an increase in systolic blood pressure in the abnormal category before and during work.

4. Relationship of Noise Intensity and Physical Workload to Systolic Blood Pressure

Analysis of the relationship between the intensity of noise and physical workload to an increase in systolic blood pressure was carried out by the following table:

**Table 6. Correlation between noise, physical workload to systolic blood pressure**

<table>

</tbody>
</table>

. Based on table 6, 25 (86%) of workers exposed to noise experienced an increase in systolic pressure, while 1 (14%) worker from the group of workers who were not exposed to noise experienced an increase in systolic pressure.

The results of data analysis using the Spearman rho test (Coefficient Correlation) showed a value of 0.581, which means that noise exposure has a strong relationship and a positive relationship with systolic blood pressure. Therefore, the higher the exposure the higher the risk of increasing systolic blood pressure in the abnormal category. Relationship of noise and systolic blood pressure in ceramics industry workers is significant.

This research is in line with the theory of the mechanism of noise stimulation and blood pressure. The theory states that mechanism of vascular disorders in noisy stimulation can be explained as follows. The noisy stimulated organ has an increased task to continue excitement to the centre. This increase requires energy obtained from glucose metabolic processes. This
metabolic process requires oxygen. Every increase in metabolism in tissue cells is always accompanied by an acute increase in blood flow to the tissues. As a result, there is a reduction in active tone in the vascular wall muscles and contractile properties of the capillary endothelium which cause vasodilation of arteriole, venule, metarteriole, pre-capillary and capillary sphincter(6).

Noise has a stronger relationship to the increase in systole than diastole because systolic pressure tends to be more sensitive to noise than diastolic pressure. Noisy is captured as a stressor by the body which then activates the hypothalamus and then controls the endocrine system, the sympathetic system and the adrenal cortex. Activation of various organs and smooth muscles that are in the control of the sympathetic nervous system such as increasing heart rate is a form of response from the sympathetic nervous system to the impulse of the hypothalamus. The sympathetic nervous system also gives impulses to the adrenal medulla to release epinephrine and norepinephrine to the bloodstream. Both of these hormones have vasoconstrictive effects on blood vessels, causing the heart to pump blood more strongly and an increase in blood pressure in workers. Both of these hormones only affect systolic blood pressure while diastole tends to remain.

Based on table 6, 23 (92%) workers from the physical workload group were experiencing an increase in systolic pressure. A total of 3 (27%) workers from the group with light physical workload experienced an increase in systolic pressure.

The results of data analysis using the Spearman rho test (Coefficient Correlation) showed a value of 0.666 which means that the physical workload relationship has a strong relationship and positive relationship direction to systolic blood pressure. Therefore, the higher the physical workload the higher the risk of increasing systolic blood pressure in the abnormal category. The relationship between physical workload and systolic blood pressure in ceramics industry workers is significant.

The results of this study are in line with the theory stated by Rodahl (1999) in the Tarwaka book (2014) that the higher the category of physical workload the higher the pulse counts. Pulse has a work that is synergistic with blood pressure so that an increase in blood pressure is more likely to occur in workers who have a moderate to high physical workload.(5)

**Conclusion**

Noise above the threshold value allowed in the ceramic production line section occurs at the point of forming and loading packing. Noise exposure has a significant relationship to increased systolic blood pressure. The relationship is strong and positive, so that the higher the noise exposure, the greater the likelihood of an abnormal increase in systolic blood pressure. Most workers have a moderate workload of physical work. Physical workload has a significant relationship to an increase in systolic blood pressure. Relationships that appear are strong and positive. The higher the physical workload the higher the possibility of an increase in systolic blood pressure.

Abstract

The larval form of Echinococcus granulosus, hydatid cyst is an important parasitic zoonosis commonly seen in animals and humans. The aim of this study was to investigate the efficacy of oxidative stress on the pathogenesis of cystic echinococcosis with antioxidant / oxidant status in sheep sera. The material of the study was composed of sheep infected with hydatid cyst and healthy cut in slaughterhouse in Van province. The general health status of the sheep before slaughtering was checked by physical examination and blood samples were taken. After slaughtering, cyst hydatid examination was performed in different organs of the animals. The control group consisted of 25 sheep study cases with positive (fertil cyst) and 15 sheep without any pathological lesion on organ examinations and healthy on physical examination. Blood samples taken from animals infected with healthy and hydatid cysts were transported to the laboratory under appropriate conditions and centrifuged. Total antioxidant / oxidant status, paraoxonase and arylesterase activities were measured by using commercial kits. Compared with cystic echinococcosis group and healthy group, the importance was calculated on the TAS, PON1 activities (P <0.01), TOS, ARES activities differences (P <0.001), It decreases. This may cause tissue necrosis and increased inflammation. Decrease in antioxidant reserves; excessive free radical formation in the ewes with cystic echinococcosis causes deterioration of the normal histological structure of the organ in the cyst.

Key words: Cystic Echinococcosis, sheep, PON1, ARES, TAS, TOS,

Introduction

Echinococcus granulosus (E. Granulosus) emerged with cystic echinococcosis the larval development of intermediate hosts to settle in Turkey and the world, is a parasite that threaten human and animal health and zoonoses. In our country, cystic echinococcosis shows a wide spread due to the different distribution of animal species in the regions, climatic conditions and socio-economic development level of the society.

E. Granulosus eggs thrown from the feces which contain adult parasites, cause infection in different types of animals such as sheep, goats and cattle. The disease are known to settle such as organs, especially the liver; kidney, spleen, brain, bone, heart1,2.

For the maintenance of vital and biochemical functions, the balance between pro-oxidants and antioxidants is very important. The deterioration of this balance in favor of pro-oxidants (oxidative stress) can lead to oxidative damage3. However, measuring these markers separately is both time consuming and costly 4. Therefore, total oxidant status (TOS) and total antioxidant status (TAS) are measured and oxidative stress index (OSI) is calculated in recent years5-7.

Paraoxonase 1 (PON1, EC.3.1.8.1) and arylesterase are enzymes encoded by the same gene and have similar active centers. Although the natural substrate of both enzymes is different, the PON1 enzyme has the ability to show both arylesterase and paraoxonase activity by
hydrolyzing phenylacetine, the substrate of arylesterase. In addition, plasma high-density lipoprotein (HDL)-dependent antioxidant enzyme PON1 has been reported to protect low-density lipoprotein (LDL) and HDL against oxidation caused by free radicals and to reduce oxidative stress.

Oxidative stress plays a role in the pathogenesis of various diseases. In parasitic infections, the host creates a reaction mechanism to parasites by free radicals, which cause oxidative stress. There are many studies that show that oxidative stress has occurred in animals infected with parasites.

Significant changes have been reported in blood parameters and host biochemistry of animals exposed to parasitic invasion. In studies conducted with endoparasites infected animals, serum protein, serum globulin, cerulo-plasmin, vitamin A, C, E and B12 and some enzyme and mineral level changes were observed.

This project, total oxidant / antioxidant status, oxidative stress index levels, paraoxonase, arylesterase enzyme activities were investigated in the animals infected with hydatid cyst and the effects of oxidative stress on the pathogenesis of cystic echinococcosis were investigated.

In this project, total oxidant / antioxidant status, oxidative stress index levels, paraoxonase, arylesterase enzyme activities were investigated in the animals infected with hydatid cyst and the effects of oxidative stress on the pathogenesis of cystic echinococcosis were also evaluated.

**Materials and Methods**

**Material**

The material of the study was composed of 2-3 aged Morkaraman sheep brought to Özalp slaughterhouse in Van province. The pre-cut sheep’s general health conditions were checked by physical examination and blood samples were taken. After harvesting, cyst hydatid examination was performed in different organs of the animals. The experimental group of the 25 sheep study, positive for the protoscolex (fertile cyst), the control group consisted of 15 sheep who had no pathological lesion in their organ examination and who were healthy in physical examination. Blood samples were transferred to the laboratory at + 4°C and their sera were removed by centrifugation at 3000 rpm and + 4°C for 10 minutes.

**Method**

Total antioxidant status in serum samples of sheep blood, total oxidant status levels, and paraoxonase, arylesterase, activities “Rel Assay Diagnostics-Bursa / Turkey” brand autoanalyzer using commercial kits (Selectra proxl Clinical Chemistry System-The Netherlands) were determined.

**Statistical Analysis**

SPSS 16.0 Windows program (SPSS Inc., Chicago, IL) was used for statistical analysis of the data. Independent t test was used to determine the differences between the groups and the results were given as mean ± SE (standard error). P <0.05 was considered significant for statistical significance.

**Results & Discussion**

At the completion of the project, the averages of the measured values were tabulated and evaluated statistically. The difference between the control and cystic groups’ mean values of TAS and PON1 (p≤ 0.01), TOS and ARES levels (p≤ 0.001) were found to be significant.

Cystic echinococcosis is a parasitic disease that causes significant economic losses in animal husbandry. This disease is more prevalent in human...
and animals in developing and underdeveloped countries, which are engaged in agriculture and animal husbandry, environmental health and preventive medicine services are inadequate\(^{18}\). In our country, due to reasons such as the fact that slaughtering of slaughtered animals cannot be controlled under strict rules, cyst hydatic continues to be an important parasitic infection affecting both animal and human health\(^{19}\).

Hydatid cyst causes phagocytic cell activation in the immune defense system of the host organism and as a result, reactive oxygen products and reactive nitrogen products are released by macrophages and leukocytes of the host organism in response to cyst pathogenicity, and reactive nitrogen products are released\(^{20}\).

There are many indicators for the evaluation of oxidative stress and antioxidant status and different methods of measuring them. However, measuring these markers separately is both time consuming and costly\(^{4}\). Therefore, total oxidant status (TOS) and total antioxidant status (TAS) are measured and oxidative stress index (OSI) is calculated in recent years\(^{6-7}\).

Bakır et al.,\(^{21}\) reported that oxidative stress increased in patients with hydatid cyst. In the same study, serum total antioxidant status, total oxidant status levels and oxidative stress index levels were found to be significantly higher in hydatid cyst patients compared to control, whereas paraoxonase and arylesterase activities were significantly lower in hydatid cyst patients compared to control. In this study, it was found that the difference between TAS, TOS, PON1 and ARES levels of cystic echinococcosis and healthy sheep in terms of TAS, PON1 (P <0.01), TOS and ARES levels (P <0.001) was found to be significant and these findings were consistent with the results reported in the literature.

As a result, paraoxonase and arylesterase activities are decreased due to increased oxidative stress in sheep infected with hydatid cyst. This may cause tissue necrosis and increased inflammation. Decrease in antioxidant reserves causes the formation of excessive free radicals in sheep with cystic echinococcosis and deterioration of the normal histological structure of the organ with cyst.

Abstract

Type 2 Diabetes Mellitus (T2DM) has significant adverse effects on health-related quality of life. PROLANIS program is a system of governance of health services and health education for social health insurance participants who suffer from type 2 diabetes mellitus to achieve the optimal quality of life independently. This research aims to measure quality of life in T2DM patient. The research was an analytical non-experimental study according to the patient’s perspective using prospective data collection techniques. The subjects are PROLANIS patient T2DM who comply inclusion and exclusion criteria. The data were collected by using the European Quality of Life 5 Dimensions 5 Levels (EQ-5D-5L) Indonesian questionnaire. Data analysis using EQ-5D preference weight for each health state using Indonesian EQ-5D-5L Value Set. Furthermore, the percentage of the patients’ problems, EQ-5D index (utility) and EQ-5D VAS were calculated. A total of 220 patients were included. Seventy-two different EQ-5D index values were described by the patients. Obtained 37 subjects (16.82%) had no problems. The EQ-5D index value highest is 1.000 ($n = 32$, 14.54%) and EQ-5D index value lowest is -0.384 ($n = 1$, 0.45%). EQ-5D index value has an average is 0.57 (SD 0.32) and EQ VAS value has an average is 72.19 (SD 14.73). This study also confirmed that T2DM remains a critical predictor of health outcomes among patients. Results from this study could be constructive in clinical practice, particularly in the early treatment of T2DM patients where improving HRQoL is still possible.

Keywords: Type 2 Diabetes Mellitus, PROLANIS, Quality of life, EQ-5D-5L

Introduction

World Health Organization (WHO) defines Diabetes mellitus as a chronic disease caused by inherited and/or acquired deficiency in production of insulin by the pancreas, or by the ineffectiveness of the insulin produced.[1] The International Diabetes Federation (IDF) has estimated that approximately 592 million adults in worldwide will have diabetes in 2035.[2] Diabetes has an adverse effect on quality of life. Most patients suffer from a variety of long-term complications including micro-vascular complications (e.g. neuropathy, nephropathy and retinopathy) and macro-vascular complications (e.g. myocardial infarction, angina pectoris, stroke and amputation). [3] Besides, the trouble of taking oral antidiabetic agents several times a day, the fear of subcutaneous injection of insulin, and incidents of hypoglycaemia might depress diabetic patients and further reduce Health-Related Quality of Life (HRQoL). [4]

HRQoL is depicted as an individual’s perceived quality of life, demonstrating satisfaction in the domains that are influenced by health status.[5] The concept of HRQoL is frequently used in clinical research for assessing pharmaceutical care and treatment outcomes. Moreover, the literature reports HRQoL as a predictor of optimal health care service utilization.[6–8] HRQoL is a multidimensional construct highlighting a person’s physical, cognitive, emotional, psychological and spiritual eminence towards the current health status.[9, 10] Today, evaluation of the patients’ HRQoL is recognized
as an important area of scientific knowledge, since the concept is related to the notion of health, satisfaction and well-being in the physical, psychological, socioeconomic and cultural spheres.[11]

The EQ-5D-5L is a widely used generic preference based HRQoL questionnaire.[12] It consists of 5 dimensions (mobility, self-care, usual activities, pain or discomfort, and anxiety or depression), equipped with five possible levels of problem. Health states can be described with a 5-digit number, where the first number is the answer of the first question, the second number is the answer of the second question, accordingly. Given that EQ-5D is a preference-based questionnaire, these health states can be converted into a utility index by applying the appropriate formula. This instrument also includes a Visual Analog Scale (VAS) with a range from 0 (worst imaginable health state) to 100 (best imaginable health state).

In Indonesia, one of the new strategies cultivated is the management program of chronic diseases (PROLANIS). PROLANIS was initiated by Social Insurance Administration Organization (BPJS). The main objective of PROLANIS is to diminish the risk of complications and attain a better quality of life by using of effective cost and rational measures. The PROLANIS program is a system of governance of health services and health education for social health insurance members who suffer from hypertension and type 2 diabetes mellitus to accomplish the optimal quality of life independently.[13] Activities in PROLANIS include medical /educational consulting activities, home visit, reminder, club activities and health status monitoring. [14] The aim of the present study was to assessment of HRQoL among PROLANIST2DM.

Materials and Method

Study design, settings and recruitment of subjects

A questionnaire-based cross-sectional survey was carried out to assess the HRQoL of Patient Chronic Disease Management Program (PROLANIS)T2DM who comply inclusion and exclusion criteria attending primary health care Antang, Batua, Jongaya, Tamalanrea, primary health care Makassar City, Indonesia, in August 2017 – January 2018.

Inclusion and exclusion criteria

Patients enrolled in the PROLANIS program, adult patients aging 20 years and above, fasting blood sugar levels of patients> 126 mg/dL for 3 consecutive months, patients have been treated for at least 3 months, with a confirmed diagnosis of T2DM and willing to follow the research by signing the informed consent were included in the study. Patients with irregular or non-routine control schedules (not every month of control), patients with incomplete medical record data, patients in circumstances where it is not possible to fill in questionnaires (unable to speak, see and hear) were excluded from this study.

Ethical considerations

The study protocol was approved by the Health Research Ethics Committee of the Faculty of Medicine, Hasanuddin University No. 146/H4.8.4.5.31/PP36-KOMETIK/2017. Prior to data collection, patients who agreed to participate were explained nature and the objectives of the study and were assured of the confidentiality of the information. Written consent was also taken from the patients prior to data collection.

Instrument/QoL measurement

To measure HRQoL, we chose the EQ-5D instrument, which was developed in 1987 by EuroQol15 research groups and is widely used in domestic studies. [15] EQ-5D is applicable to a wide range of health index values for health status. We used the official EQ-5D-5L Bahasa Indonesia version provided by the EuroQol Group. This translation of EQ-5D-5L was produced using a standardized translation protocol that followed international recommendations.[16]

Data collection

The EQ-5D-5L assesses health status across five dimensions (mobility, self-care, usual activities, pain/discomfort and anxiety/depression) each with five response levels (none, slight, moderate, severe and extreme/unable). For example, state ‘11111’ indicates ‘no problems on any of the five dimensions’, while state ‘54321’ indicates ‘unable to walk about, severe problems washing or dressing, moderate problems doing usual activities, slight pain or discomfort, and no anxiety or depression’. [17] The Indonesian value set index ranges from −0.865 to 1, where 1 represents preferred health, 0 represents death and a score of less than 0 represents health states worse than death.[18] The second part of the EQ-5D consists of a 20 cm visual analogue scale (VAS) with endpoints of 0, representing the worst imaginable health state and 100, representing the best imaginable health state.
state, and 100, representing the best. This is used to record the participant’s perception of his or her quality of life.

**Data Analysis**

Descriptive statistics were used to investigate the distribution of variables among PROLANIS T2DM patients. Continuous EQ-5D preference weight for each health state using Indonesian EQ-5D-5L Value Set. Furthermore, the percentage of the patients’ problems, EQ-5D index (utility) and EQ-5D VAS were calculated.

**Result**

Patient’s demographics

Two hundred and twenty T2DM patients were included in the study. The description of sociodemographic variables and frequency distribution of the respondents are summarized in Table 1.

RMS: Regional Minimum Salary, IDR: Indonesian Rupiah
A sample of 220 T2DM patients were investigated in this study. Table 1 shows the socio-demographic and clinical characteristics of these respondents. The average age of the respondents was 57.71 ± 5.6 years, and 64.09% of respondents were female. Most patients had only graduated from elementary (46.36%), were married (88.18%), were working (72.27%), and had an average monthly household income above the regional minimum salary (53.18%). Most respondents (51.82%) were diagnosed with diabetes over 5 years prior to participation and 62.72% diagnosed with hypertension.

**EQ-5D health status**

Seventy-two different EQ-5D index values were described by the patients. The EQ-5D index value highest is 1.000 (n = 32, 14.54%) and EQ-5D index value lowest is -0.384 (n = 1, 0.45%). The EQ-5D index value has an average is 0.567. Within 72 different health states, the majority (n=32, 14.54%) started no problems /difficulties in the first, second, third, fourth and fifth domain respectively (mobility, self-care, usual activities, pain/discomfort and anxiety/depression) of HRQoL.

In 220 patients the average EQ-5D utility index score was 0.54 (SD 0.32). The highest EQ VAS value is 100 (n 20, 9.09%) and EQ VAS values lowest is 50 (n 22, 10%). The EQ VAS value has an average is 72.19 SD ± 14.73 as presented in Table 2.

**Discussion**

HRQoL is a multidimensional construct referring to an individual’s perception of their position in life in the context of the culture and value systems in which they live and in relation to their goals, expectations, standards, and concerns. It was revealed that the patients with diabetes had generally a negative impact on the QoL. These findings are in line to the studies whereby HRQoL decreased with disease progression and complications.[19] Another study supposed that diabetes has an adverse effect on quality of life. Most patients suffer from a variety of long-term complications as well as micro-vascular complications and macro-vascular complications. In addition, a decreased HRQoL was reported by patients of other chronic diseases from various areas of Indonesia which further augments that chronic diseases have a negative impact of the HRQoL of the patients.

As part of strategies developed to encounter chronic diseases in Indonesia, PROLANIS has main objective to reduce the risk of complications and achieve a better quality of life with the use of cost-effective and rational. In this study, it was found that PROLANIS members are dissatisfied and has negative impact on the QoL proven by the results of assessment on health status of patients rated EQ-5D index score 0.54 (SD 0.32) and EQVAS values is 60 (n 31, 14.09%). Hence, it indicates that PROLANIS has not been functioned optimally in the primary healthcare. Furthermore, a previous study by Perwitasari et al (2017) in Indonesian T2DM outpatients (n = 86) reported that the EQ-5D index score was 0.75 (SD 0.22) (20). Moreover, on clinical condition, Perwitasari et al (2017) also found that T2DM complications were indeed aligned with decreases in EQ-5D index scores.
Notably, despite the similarities, Perwitasari et al (2017) utilized dissimilar methods to calculate and analyze the data, i.e., the EQ-5D-3L instrument and the Thailand TTO value set, which complicates comparison.[20]

Based on a report from BPJS in 2016, the number of PROLANIS DMT2 members in 2016 in primary health care Makassar city was 1,165 patients. Even though they have joined as PROLANIS members, they were still not able to be serviced on primary health care. It happened as it lacks of socialization about the importance of PROLANIS services so that patients felt this program was useless for them. In addition, the maximum home visit program, drug information services and counselling are not running well due to time constraints. It was also found that some PROLANIS members only see a doctor and take medication without taking part in gymnastics and education. In addition, the factors that trigger a patient’s quality of life to be low may be due to the patient’s lack of controlled lifestyle. Moreover, there is no family or party monitoring it. Most PROLANIS members whose conditions are uncontrolled are those who are old enough and have no relatives or family who can take them to visit the primary health care.

**Conclusion**

The findings concluded that T2DM has a negative effect on HRQoL. From total of 220 patients, obtained 37 subjects (16.82%) had no problems. EQ-5D index value has an average of 0.57(SD 0.32) and EQ VAS value has an average of 72.19. This study also confirmed that T2DM remains a critical predictor of health outcomes among patients. Results from this study could be constructive in clinical practice, particularly in the early treatment of T2DM patients where improving HRQoL is still possible.

Health Costs for Detoxification Benzene Exposure Workers in the Mining Oil and Gas Pt. A Balikpapan

Farhana Syahrotun NS1, Suherdin1, Tedi Levinrarian1, Bella Oktavia1, Abdul Rohim Tualeka1
1Department of Occupational Health and Safety, Public Health Faculty, Airlangga University, Surabaya

Abstract

Benzene (C6H6) is a liquid aromatic hydrocarbon volatile, colorless, flammable. Benzene is a carcinogen nature makes very harmful for health. The purpose of this study was to calculate and determine the cost of detoxification due to exposure to benzene in the Mining and Oil and gas workers Earth PT. A Balikpapan. Based on the consumption of foods rich in enzyme CYP2E1, Sulfation, and Glutathione. The variable in this study is the intake of the effective dose required by each individual to calculate the weight, length of employment (years), worked on average each day (hour), and the working time in a week (days) of the respondents, as well as the measurement of the concentration benzene. The highest food costs to be paid by the respondent for liver detoxification use is 883,872.51 IDR, using egg 3,513.18 £, and use avocado Rp3,475.01 $. Every individual has a number of different costs. It’s dependent on the characteristics of workers, the concentration of benzene in the work environment, and the intake of benzene by workers.

Keywords: Benzene, Detoxification, CYP2E1, Glutathione, Sulfation

Introduction

Benzene is known as carcinogen compound, with physical and chemical properties sweet-smelling, volatile and slightly soluble in water. According to the Agency for Toxic Substances and Disease Registry (ATSDR), dangerous chemicals and toxic contained in the oil content is Benzene, Toluene, Ethylene, Xylene (BTEX), TPH (Total Petroleum Hydrocarbon) and Polycyclic Aromatic Hydrocarbon (PAHs). Of the six chemicals benzene exposure is very serious impact on health1.

Exposure to Benzene is one of the causes of disease aplastic anemia. The incidence of this disease varies between 2 to 6 cases per 1 million population depends on the risk of occupational, geographic variation and environmental influences2. According to Aksoy (1991) Benzene exposure of the body can result in depression of the bone marrow (bone marrow) there by inhibiting the production of blood cells causing anemia (a decrease in red cells), leukopenia (decreased WBCs), and thrombocytopenia or decreased platelets3.

If the exposure benzene cannot be controlled by way of the elimination of the working environment, it takes an effort to eliminate or reduce the effects of benzene exposure at the worker’s body. In order to reduce or eliminate the concentration of toxins in the body needed workers exposed to benzene biotransformation process. The purpose of the biotransformation is to transform toxic non-polar (soluble in fats) into polar (solvent-soluble compounds). Then, was changed to the hydrophilic (soluble in water) that can be excreted from the body. Biotransforms substances or chemicals in the body can occur with the help of enzymes that are specific to a particular compound participate4.

Process biotransforms benzene phase 2 involves a variety of enzymes, such as CYP2E1, Glutathione and Sulfation. The enzyme-enzym many times in many different types of food. CYP2E1 enzyme-rich foods are beef liver, cow’s brain, and salmon. Foods that are rich in content sulfation are eggs, chicken, beef and tuna. While diet foods rich in glutathione are avocado, asparagus, carrots, tomatoes, oranges, and broccoli5.
Enzyme-rich food source for benzene detoxification in the body is widely recognized. But in fact obstacles, one of which is the assumption that states bring managerial providing food for detoxification benzene exposure is relatively expensive.

Based on the exposure, the study aims to calculate the cost required for detoxification purposes of benzene exposure for each worker in Mining and Oil and Gas PT. A Balikpapan.

**Methods and Materials**

This research is an observational descriptive with quantitative approach, To calculate and illustrate the data collected. The calculations in this research are done by using the application number crunchers.

The research location is in mining Oil and Gas PT. A Balipapan. The study population was all employees of chemicals totaling 22. Sampling technique using the total sample, The variable in this study was effective dose intake needed by each individual to calculate the weight, length of employment (years), worked on average each day (hour), and the working time in a week (days) of the respondents, as well as the measurement of the concentration benzene. Measurement of weight using the weighing scale manual method body. Working length measurement, the average work every day, and time work week obtained through in-depth interviews with respondents. As for the measurement of benzene in the work environment using NIOSH 1501 method of measurement with activated carbon charcoal pipe using gas chromatographic techniques.

The formula for calculating the intake of benzene to the worker:

\[
C = \frac{R \times TE \times fe \times dt}{wb}
\]

Then calculate the effective dose per day with the calculation results of non-carcinogen intake (intake) above, using the formula below:

\[
\text{Cost of intake} = \text{Effective dose} \times \text{price per Kg of food}
\]

Price information (in Indonesia):

- 1 Kg liver = £ 50,000
- 1 Kg egg = £ 24,000
- 1 Kg avocado = £ 45,000

Food prices above are approximate prices beef liver, eggs and avocado per kilogram on the market, so: \(\text{BP benzene} = (\text{m liver} \times \text{USD} / \text{kg liver}) + (\text{m eggs} \times £ / \text{kg eggs}) + (\text{m avocado} \times \text{Rp} / \text{Kg avocado})\).

**Findings**

Based on the results of measurements of the concentration of benzene in the mining Oil and Gas PT. A as follows:

**Table 1. Concentrations of Benzene**

In Table 3, the highest food costs to be paid by the respondent for liver detoxification use is 883,872.51 IDR, using egg 3,513.18 £, and use avocado 3,475.01 £.

**Discussion**

Enzymes are proteins that function as catalysts (plunger) all metabolic activity of chemicals in the body, nothing is done without the use of enzymes as the body of vital elements. There are thousands of enzymes that humans need to survive. One of the activities of the body is known most often spend reserves are detoxification enzymes. Detoxification is the process of draining piles of toxins in the body.
Toxic fat-soluble cannot be excreted without metabolic transformation (detoxification) in the liver so it can be dissolved in water. Liver cells have sophisticated mechanisms to break down toxic substances. These include endogenous substances (produced by the body) and exogenous (obtained from the environment; for example xenobiotics). Each chemical is broken down or metabolized via detoxification pathways in the liver called “phase 1” and “Phase 2” 10.

An enzyme that plays a role in metabolic transformation (detoxification) of them were CYP2E1, Sulfation and Glutathione. CYP2E1 in this study obtained from beef liver, Sulfation obtained from the eggs and Glutathione obtained from avocado.

CYP2E1 plays an important role in the metabolic activation of chemicals such as acetaminophen (APAP), acetone, halothane, ethanol, including benzene. Benzene is metabolized into epoxy benzene by CYP2E1, which spontaneously formed phenol. Phenol later becomes hydroquinone and catechol catalyzed by CYP2E1, which is more toxic than phenol. Oxidation of benzene by CYP2E1 become reactive intermediates is a prerequisite cellular toxicity. Sheets and Carlson observed a decrease in CYP2E1 activity and reduced risk of benzene-induced hematotoxicisitas11,

Sulfation one liver detoxification pathways, especially the phase II detoxification. Sulfation system is important in detoxifying several drugs, food additives, and environmental contaminants12,

Glutathione is the most powerful antioxidant in the body and is the most abundant antioxidant in the liver and is also the main detoxifying agent in the body. If the body does not have enough amino acids and cofactors required to produce glutathione, the toxins accumulate in the fatty tissues, brain and nerve sheaths13,

Glutathione is also needed in many complex steps required to perform the immune response, with reserves that reduced glutathione, the liver cannot effectively detoxify toxins. If you have a low glutathione levels, we do not have cysteine containing sulfur that is adequate for the sulfation process13,

Based on the calculation shows that each individual has a different spending. This is because each individual has a different dose food effect. The effective dose can also be dependent on the amount of inhaled benzene concentration, weight, and length of work. The higher the concentration of benzene in the body, the greater the mass of detoxification for the food it needs. It is in line with previous research which states that the greater the concentration of benzene and duration of exposure, the greater the period of detoxifying substances. This means that the greater the expenditure required to buy food containing the enzyme CYP2E1, Sulfation, and Glutathione14.

**Conclusion**

The researcher concludes that the average concentration of benzene in the workplace is 5.82 mg / m3. The highest dose effects which should be consumed by the respondent for beef liver is 16.0704935 Kg (rounding = 16:07 kg), eggs and avocado 0.086875306 0.143395237 kg kg.

The highest food costs to be paid by the respondent for liver detoxification use is 883,872.51 IDR, using egg 3,513.18 £, and use avocado 3,475.01 £.

Consumption of foods containing enzymes CYP2E1, Sulfation, and Glutathione with the right dose is expected to reduce or even eliminate benzene compounds into the worker’s body.

Every individual has a number of different costs. Case It depends on the characteristics of workers, the concentration of benzene in the work environment, and the intake of benzene by workers15.

Levels of Interleukin-10 in Iraqi Childhood Acute Lymphoblastic Leukemia after Chemotherapy

Fatima Mallalah Mohammed¹, Morooj Ali Fahd², Nabaa Ali Jassim²
¹Biochemistry/ Lecturer, ²Lecturer, Middle Technical University – Technical Institute – Baqubah – Department of Community Health Technique

Abstract

Background:- Acute Lymphoblastic Leukemia (ALL) is a group of heterogeneous lymphoid disturbance that results from a monoclonal proliferation and expansion of immature T or B lymphocyte ancestor in the blood, bone marrow, and other organs, Interleukin-10 (IL-10) is a pleiotropic cytokine produced by type 2 helper cells (Th2), as well as macrophages and monocytes and neoplastic B lymphocytes and normal.

Aim of this Study: - The aim of this study is to estimate the level of IL-10, and its role as an indication of response to chemotherapy treatment.

Experimental part: - A probable group study carry on out at Unit of Oncology / Child Center Teaching Hospital / AL-Iskan / Baghdad city during the period from October 2017 to June 2018. 25 patients with newly diagnosis of ALL. IL-10 levels were measured utilize serological methods included the enzyme-linked immunosorbet assay before and after chemotherapy treatment.

Result: - This study was carried out on (25) children patients (11 male, and 13 female) newly diagnosed with ALL. The age rang (1.2 years – 12 years), the mean of age was (5.3±3.3 years). A significant decrease in total serum protein and interlukine-10 was observed after chemotherapy (p<0.001, 0.001 respectively), and significant increase in GOT, GPT was observed after chemotherapy (P=0.012, 1.001 respectively).

Conclusion: - The results of our study offering the promising clinical utility of IL-10 as markers of response to chemotherapy.

Keywords: patients, chemotherapy, lymphoma, acute Lymphoblastic

Introduction

Interleukin-10 (IL-10) is a pleiotropic cytokine produced by type 2 helper cells (Th2), as well as macrophages and monocytes, and neoplastic B lymphocytes and normal. It is highly symmetric to an open reading frame of EBV called BCRF1, and EBV infection of B cells up regulates IL-10 production. IL-10 production has powerful immunosuppressive effects by inhibition of Th1 type cytokines, inclusive interferon-gamma and interleukin-2¹. IL-10 has a strong stimulating effect on B cells, inclusive proliferation, and differentiation. Interestingly, in cell lines derived from B-cell lymphomas, IL-10 has been set up to serve as an anticrime growth factor²,³. Serum IL-10 levels have been set up to be substantial forecast factors for Hodgkin lymphoma and when assays that discover both human and viral IL-10 are employed, for NHLs⁴.

Childhood acute leukemia is the generally common cancer in children appears 31% of all cancers and about 3250 new situations per year in the US⁵. Numerous breakthroughs in the past 50 years have increased the survivability of the disease to greatest than 80%, but survivor face long term morbidities⁶.
Acute leukemia is the generally popular cancer in children but the causes of the disease in the plurality of situation are not known. About 80% are the precursor B cell in origin (CD19+, CD10+), and this immunophenotype has increased in happening over the past several contracts in the Western world. ALL is a group of heterogeneous lymphoid defect that results from a monoclonal proliferation and widening of immature B or T lymphocyte progenitor in the blood, bone marrow, and other organs. Proliferation and accumulation of leukemic cells outcome in the repression of normal hematopoiesis and include different particularly the lymph nodes, liver, extramedullary sites, spleen, central nervous system, thymus and gonads. The genetic and epigenetic deviation frequent in the childhood leukemia’s are often significant prognostic index and coincidence of several of these are climacteric to modern disease rating protocols.

Many studies have shown unprompted IL-10 gene expression and synthesis in a diversity of bone marrow-derived leukemic cells or peripheral blood. These involve B-cells derived from different lymph proliferative disturbance. Since little is known related IL-10 levels in leukemic before and after chemotherapy treatment, we studied clinical samples of patients with childhood acute Lymphoblastic leukemia (cALL) for IL-10 levels before and after chemotherapy treatment.

**Experimental part**

**Subjects**

The study was carried out on (25) children patients (11 male, and 13 female) newly diagnosed with ALL. The age rang (1.2 years – 12 years), the mean of age was (5.3±3.3 years), and BMI range was (17.87±7.57 kg/m²).

The selected patients were diagnosed and treated in Unit of Oncology / Child Center Teaching Hospital / AL-Iskan / Baghdad city during the period from October 2017 to June 2018 under the supervision of specialist in pediatric/oncologist doctors.

**Anthropometric indices measurements:**

**Determination of Body Mass Index (BMI)**

Determined the Body mass index by dividing body weight in kilogram by the square of her height in meter. The equation used in medicine produce a unit of measure of kg/m².

**Laboratory methods**

**Assay of Total Serum Protein (Biuret method)**

Modified Biuret method was used to determine total serum protein using bovine serum albumin as standard.

**Determination of Some Enzyme Markers:**

Determination of Alkaline Phosphatase (ALP Activity), GOT, and GPT by using (Kit leaner).

**Determination of serum interlikin-10:** measurement of IL-10 by used ELISA kit (IBL company, Germany.

**Results**

The mean age as (5.3±3.3 years), 54% of them were less than 5 years of age, as shown in Table (1).

**Table (1): Demographic characteristics of leukemic children**

1- Family history and clinical complications:

Only 5 (20.8%) leukemic children had positive family history of leukemia. The associated clinical problems were distributed as followings: 40% of patients have no associated problems, 28% have fever, 16% have headache, 12% have fever & headache and 4% have anemia, as shown in Figures (1, 2).
2- Anthropometric indexes:

The weight of leukemic children was significantly decreased after chemotherapy (p<0.001). There was a highly significant decrease in BMI of leukemic children after chemotherapy (p<0.001) (Table 2):

Discussion

1: Anthropometric indexes

The current study showed that weight and BMI of leukemic children was significantly decreased after chemotherapy (p<0.001)(table2). This is comparable to results of previous American study which announced that median 6% weight loss after chemotherapy treatment is reveal among leukemic children\textsuperscript{13}. Our finding is maladjusted with results of Atkinson et.al, study which present that weight and BMI of leukemic children increased after chemotherapy\textsuperscript{14}. Other studies have expounded that children after ALL chemotherapy treatment have a slope to be overweight. However, the generality of the authors confirms the requirement for many surveillance for the developmental disorder of childhood after ALL chemotherapy\textsuperscript{15}. Another study acupest out that also a short-term time of monitoring does not permit for a whole estimate of the danger of obesity-related disturbance in children after chemotherapy treatment\textsuperscript{16}

2: Total serum protein

Serum total protein is a biochemical examination for measured the quantity of total protein in serum. It’s using for treatment and diagnosis of types for diseases including the liver, kidney, or bone marrow, as well as other nutritional or metabolic disorders\textsuperscript{17}.

Our study showed significantly lower levels of total serum protein in leukemic children after chemotherapy (p<0.001) (table 3). This finding is compatible with results by Oleiwi et.al, study who found that total serum protein of leukemic children was significantly reduced at baseline after chemotherapy in comparison to healthy controls\textsuperscript{18}. Toxic injury in the liver may be proliferating in practice any known style of injury, including necrosis, cholestasis, steatosis, vascular injury, and fibrosis. During chemotherapy, liver injury may do not be inverted hepatotoxic anticancer agent; the physician should also look response to Antiemetic’s, analgesics, antibiotics, or other medications. Pre-existing medicinal problems, tumor, hepatitis viruses, immunosuppression, and other infections, and total parenteral nutrition or nutritional deficiencies; all may be affect a host’s ability to liver injury. Therefore In cancer chemotherapy, the liver injury to a toxic reaction is difficult; however, resolution of dosing is oftentimes made instituted on limit toxicity. So basically hepatotoxicity is of major concern and increase non-hepatic toxicity probably caused by altering hepatic rescue. And so on, systematic information for the hepatotoxic effects of chemotherapy is light, and the technique of injury is decided for a few factors\textsuperscript{19}.

In several types of ALL, total serum protein showed within L1 group patients, no significant differences in the mean levels of total serum protein after 1st and 2\textsuperscript{nd} months of treatment when compared with baseline level, also, within L2 group patients, no significant differences in the mean levels for total serum protein after 1st, 2nd, and 3rd months of treatment when compared with baseline level\textsuperscript{18}.While, a study showed that significant reduction in total serum protein is due to the effect of disease and low intake of protein\textsuperscript{20}. However, some studies inconsistent with the current study which showed that the level of total serum protein not affected or there were a slight decrease in its level due to the effect of corticosteroid which cause increase food intake and metabolism alteration\textsuperscript{21, 22}. Other study show decrease in serum total protein concentrations was observed during the ALL induction therapy\textsuperscript{23}.
levels of interleukine-10:

This study has seen that serum levels of IL-10 changed during chemotherapy treatment and are capable to be inverted well the path of disease. Serum IL-10 ratios were found higher in active stages of cancer (at diagnosis), while the opposite results with decreased IL-10 was seen after chemotherapy treatment (P=0.001) (Table3). These findings indicate that sequent determinations of serum IL-10 in children with acute lymphoblastic leukemia could support to estimate more exactly the stage of disease and response to therapy in personal patients. As far as we know, this study is the only study to compare the levels of IL-10 before and after chemotherapy in Iraqi children with acute lymphoblastic leukemia.

other study showed level of serum IL-10 has been found to essential prognosis factor in some hematologic malignancies24. That elevated in the level of IL-10 may be because its resulting by various cells or by malignant cells of the immune system, inclusive monocytes, B and T lymphocytes, and , macrophages25.

The reasons and the kind of noteworthy variation in serum IL-10 concentration shown between the stage of cancer growth active and the stage of cancer stillness are complicated. The elevated of serum IL-10 before the inception of treatment and in patients who recrudesce able reflect tumor volume, and illness advancement. Other study in previously the IL-10 is releasing by the cells of many cancer kind26,27. On the other hand the surgical excision of the gastrointestinal cancers and colorectal resulted in a significant decreasing of serum IL-1028. On the other hand yet a powerful body of guide that IL-10 sport an important Immune-suppressive role29, letting malignant cells to shun immune monitoring30, and enhance cancer growth and diffusion26.

Conclusion

In this study we noted significant decrease in levels of IL-10 after chemotherapy treatment compare with before chemotherapy, this will be clinical advantage for IL-10 as indication of response to chemotherapy treatment. However, it must be confirm that the patients were not sampled at random. The sample collection was chosen very accurately. We recommend that you study the increase of study samples in addition to the study of factors affecting the activation of immunity.

Correlation of Standing Work Position and Musculoskeletal Disorders (MSDs) Complaints on Rack Frame Bending Section Workers in Informal Industry of Rack Making in Surabaya, Indonesia

Genduk Lintang Rusmawarda¹, Endang Dwiyanti²

¹Department of Occupational Safety and Health, Faculty of Public Health, Airlangga University, 60155 Surabaya, East Java, Indonesia; ²Department of Occupational Safety and Health, Faculty of Public Health, Airlangga University, 60155 Surabaya, East Java, Indonesia

Abstract

This research was conducted to analyze the correlation between standing work position and complaints of musculoskeletal disorders on rack frame bending workers in the informal industry of rack making in Surabaya, Indonesia. When doing rack bending, standing work position was affected by work position. The jobs forced workers to work with non-ergonomic standing work position. This caused workers to experience complaints on the skeletal system (MSDs) faster. This research was an observational research with cross sectional design. The sample used a total population of 5 workers. Data obtained by interview, measurement of height and weight and observation of work position. The data analysis method used was descriptive statistics. It was known that due to non-ergonomic standing work position, 40% of rack frame bending workers had a moderate and high MSDs risk category while 20% of other workers were in the low category. In addition, it was known that 40% of workers had low and moderate MSDs complaints category and 20% of other workers had high MSDs complaints category. Based on the results, the standing work position on the rack frame bending workers had a strong and positive correlation with a correlation coefficient of 0.655. In addition to the work position, there was a strong correlation between age, working period, and BMI with MSDs complaints of rack frame bending workers. It was recommended that the employer adjust the frame size on each bending machine and provide seat for workers to rest.

Keywords: standing work position, musculoskeletal disorders complaints, REBA, NBM

Introduction

Musculoskeletal complaints are complaints of skeletal muscle parts that are felt by a person starting from a complaint of bearable to unbearable pain. Complaints to this disorder are usually termed musculoskeletal disorders³. According to Peter Vi, there were several factors that can cause musculoskeletal disorders (MSDs) such as excessive muscle stretching, repetitive movements, unnatural working attitudes, secondary causes, and combination factors⁴.

According to the European Survey on Working Condition in 2005, around 24.7% of European workers complained back pain, 22.8% complained muscle pain, and about 45.5% of workers reported working with fatigue while 35% were assigned to handle heavy loads in their work⁵. In Europe, this occupational disease affected millions of workers and can spend billions of euros to fund treatment for workers. Whereas in chronic cases, MSDs can even caused disability which can caused workers to stop working⁶.

Workers in the rack frame bending section in the informal rack making industry in Surabaya, Indonesia, worked with standing work position. This section required workers to work with changing work position while standing, that was stooping and twisting their waist to press and lift the lever so that the rack frame can be bent. The working process of the rack frame bending section was carried out for 7 working hours/day or >50% work shift. Based on observations, it was known that the frequency of repetitive motion in rack frame bending section every 30 seconds was 6 times, and there were
workers who’s complaining pain in some of their limbs.

According to previous research on welders with standing work position, showed that there was a correlation between standing work position and MSDs complaints especially on the neck, back, and shoulders, also the risk of MSDs was included in the moderate category. In addition, based on the results of research conducted on weaving workers at PT. Delta Merlin Textile, Kebakkramat, Karanganyar, known that there was a very strong correlation between standing work position and musculoskeletal complaints and a positive direction of correlation.

Thus, the purpose of this research was to learn the direction and strength of the correlation between working position and musculoskeletal disorders complaints in rack frame bending section workers in the informal industry of rack making in Surabaya, Indonesia.

Material and Method

Based on the data collection method, this research was observational, data obtained by observing without giving any treatment to the objects of research during the research. Based on the analysis, this research was descriptive statistics, which described the process by analyzing the strength and direction of correlation between variables.

The population of this research were all workers in the rack frame bending section in the informal industry of rack making in Surabaya Indonesia, with total of 5 people. Sampling of this research used the total sampling method, namely the sample used in this research were all members of the population. Variables in this research were age, working period, Body Mass Index (BMI), work position and musculoskeletal disorders complaints. The data collected in this research were only primary data obtained by interviews, measurements of height and weight and observation of work position.

Findings

The research results of workers data collection about the workers age, working period, Body Mass Index (BMI), work position and musculoskeletal disorders complaints were obtained by different methods. Age and working period obtained by interview method, while BMI obtained by calculating using formulas related to measurement of height and weight.

Assessment of work position were done using the Rapid Entire Body Assessment (REBA) method. The application of REBA method is intended to prevent the risk of injury to the musculoskeletal system muscle.

Table 1. Frequency Distribution of MSDs Risk Category on Rack Frame Bending Section Workers Using REBA Method

<table>

<td>100%</td>
</tr>
</tbody>
</table>

The risk level of MSDs is divided into several categories, namely very low, low, moderate, high and very high risk but in this research there were no workers with very low and very high MSDs risk categories. Therefore, based on Table 1, it was known that the majority of 40% of workers had moderate and high MSDs risk category and 20% of other workers had low MSDs risk category.

For example, the risk level of MSDs on one of the rack frame bending section workers was known in the high category because it got a final score of 10 (high category final score = 8-10). The final score was obtained from the position score of the position of the neck, body, legs, upper arm, forearm, wrist, type of coupling, type of muscle activity (repetitive movements, significant changes in body posture, and unstable body posture during work) and load or workers force which were of course also significant (the position is becoming flexion-extension or getting more non ergonomic). The risk level of high MSDs category certainly required action to improve work posture as soon as possible to minimize and prevent the occurrence of higher musculoskeletal complaints in workers.

The assessment of musculoskeletal complaints in this research used the Nordic Body Map (NBM) method. Nordic Body Map is a method used to assess the severity of the disruption of the musculoskeletal system. This method can be used to know the level of complaints felt by workers on 28 limbs ranging from feeling bearable to unbearable pain. Determining the level of MSDs complaints can be done by seeing the result of the workers’ body map analysis.
Table 2. Frequency Distribution of MSDs Complaint Levels on Rack Frame Bending Section Workers Using NBM Method

<table>
<thead>

</tr>
<tr>
<td>High</td>
<td>1</td>
<td>20%</td>
</tr>
<tr>
<td>Total</td>
<td>5</td>
<td>100%</td>
</tr>
</tbody>
</table>

The level of MSDs complaints was divided into 4 categories, namely low, moderate, high and very high, but in this research there were no workers with very high MSDs complaints. Based on Table 2, the majority of 40% workers had low and moderate MSDs complaints, while 20% of other workers have a higher level of MSDs complaints.

Table 3. Correlation between MSDs Risk Category and Complaints Level on Rack Frame Bending Section Workers

<td>50%</td>
</tr>
</tbody>
</table>

The correlation between standing work position and MSDs complaints can be seen in Table 3. Based on the results of data analysis that produced the table above, it was known that all workers who had a low MSDs risk category had a moderate MSDs complaints. In addition, it was known that the association coefficient value was 0.655 which means that there was a strong and positive direction of correlation that means the higher the risk of musculoskeletal disorders (the risk of work position), the level of musculoskeletal disorders complaints on rack frame bending section workers will also becomes higher. This was in line with research carried out on plywood making that there was a correlation between standing work position and musculoskeletal complaints on plywood makin in Ketapang, Kendal (p=0.001)\textsuperscript{10}

Research result about workers age, working period and Body Mass Index (BMI) with MSDs complaints can be found in the tables below.
Table 4. Correlation between Age and MSDs Complaints Level on Rack Frame Bending Section

<table>
<thead>
<tr>
<th>Age</th>
<th>MSDs Complaints Level</th>

<td>0 0%</td>
</tr>
<tr>
<td>Total</td>
<td>2 40%</td>
<td>2 40%</td>
<td>1 20%</td>
</tr>
</tbody>
</table>

Based on the table above, the results showed that all workers (100%) aged 20-24 years were at a high level of MSDs complaints. In that age group was dominant productive age to work, because workers in this age group will try to work for a long time to get bigger salary. According to Oborne (1995) stated that age is the main cause of complaints on muscle, because as we get older or age increases than the muscle strength decreases. Supported by a research stated that MSDs are the most common and symptomatic health problems in middle and old age. The results of the research revealed that the age group with the highest rate of back pain and muscle fatigue was aged 20-24 years for men.

According to the data analysis that has been done, the age and MSDs complaints level on rack frame bending workers had a strong correlation and a positive or same direction of correlation that seen from the association coefficient of two variables by 0.756.

Table 5. Correlation between Working period and MSDs Complaints Level on Rack Frame Bending Section

| Working period | MSDs Complaints Level | Total | Association Coefficient |
|               | Low (%)               | Moderate (%) | High (%) | N (%) |
| <6 years      | 1 50%                 | 0 0%   | 1 50%                    | 2 100% |
| 6-10 years    | 1 33%                 | 2 67%  | 0 0%                    | 3 100% |
| Total         | 2 40%                 | 2 40%  | 1 20%                   | 5 100% |

Based on the table above it was known that workers whose 6-10 working period were mostly 67% of workers with moderate levels of MSDs complaints. According to the data analysis that has been done, working period and the level of MSDs complaints on rack frame bending workers had a strong correlation and a positive or same direction of correlation that seen from the association coefficient of the two variables by 0.607.

This was not in line with the theory which states that when a muscle receives excessive workload that is carried out repeatedly for a long time, complaints will arise due to damage in joints, ligaments and tendons.
So based on this theory, the working period was directly correlated to MSDs complaints. However, based on the results of the data analysis, it was known that the working period of the worker had a strong and positive direction of correlation or in line with the level of MSDs complaints. In accordance with research conducted on informal workers, that there was a relation between working period and MSDs complaints. Based on the results of the research, it was known that workers who experience high MSDs complaints were workers with <5 years working period not workers with a working period of > 5 years.

**Table 6. Relation Between Body Mass Index (BMI) and MSDs Complaints Level on Rack Frame Bending Section Workers**

<table>
<thead>
<tr>
<th>BMI</th>
<th>MSDs Complaints Level</th>
<th>Total</th>
<th>Association coefficient</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Low (%)</td>
<td>Moderate (%)</td>
<td>High (%)</td>
</tr>
<tr>
<td>Thin</td>
<td>1 (50%)</td>
<td>0 (0%)</td>
<td>1 (50%)</td>
</tr>
<tr>
<td>Normal</td>
<td>1 (33%)</td>
<td>2 (67%)</td>
<td>0 (0%)</td>
</tr>
<tr>
<td>Total</td>
<td>2 (40%)</td>
<td>2 (40%)</td>
<td>1 (20%)</td>
</tr>
</tbody>
</table>

Based on the table above, it was known that workers included in the thin BMI category had complaints of low and high MSDs around 50% each, whereas in the normal BMI category, the majority of workers around 67% had moderate MSDs and the remaining 33% have low MSDs. According to a research, it was said that height, strength, and body mass were also considered could increase the risk of MSDs but the evidence is far from convincing. But based on the results of other studies conducted at maintenance workers PT. Antam Tbk 2014 UBPE, Pongkor, stated that there was a significant relation between BMI and MSDs complaints.

According to the data analysis that has been done, BMI and MSDs complaints level of workers in rack frame bending section have strong and a positive direction of correlation that can be seen from the association coefficient of both second variables by 0.607.

**Conclusion**

The existence of a strong degree of correlation between working position with MSDs complaints on rack frame bending section workers. In addition, the strong and same direction of the correlation (positive) between the characteristics of workers which are age, tenure, and body mass index (BMI) with MSDs complaint level. The advice given to the company is the company should be evaluating the work station that is usually occupied by rack frame bending section workers. If reshaping the work station to minimize the risk of MSDs requires a large amount of money, the employer can adjust the size of the bending machine lever to the size of the rack that is about to be bend by workers (specialization of frame size on each bending machine) to reduce workers to work with hunchback positions that are too low. In addition to reduce MSDs complaints on workers in standing work position, the employer can provide seats for rack frame bending section workers around the bending machine area so that workers can rest to relax tired limbs after work in a standing work position.

**Conflict of Interest:** All authors have no conflicts of interest to declare.

**Source of Funding:** This is an article “Correlation of Standing Work Position and Musculoskeletal Disorders (MSDs) Complaints on Rack Frame Bending Section Workers in Informal Industry of Rack Making, Surabaya, Indonesia” of Occupational Safety and Health Department that was supported by Activity Budget Plans 2019, Faculty of Public Health, Airlangga University.
Ethical Clearance: The research was approved by the institutional Ethical Board of the Public Health Faculty, Airlangga University.

Evaluation of Quality of Nursing Documentation in Surgical Wards at Baghdad Teaching Hospitals

Haider M. Majeed1, Tahseen R. Mohammed 2, Raja I. Abid 3

1Assistant instructor; 2Instructor; 3Assistant Professor, Fundamentals of Nursing Department, College of Nursing-University of Baghdad

Background: Nursing documentation has been one of the most important functions of nurses. Objectives: To evaluate quality of nursing documents for nursing care at surgical ward and to find out the relationship between demographic characteristic with nursing documents.

Methodology: A descriptive design study was conducted in the period of 1st January 2017 to 15th August 2017. Utilizing a stratified random sampling method (60) nurses working in surgical ward at Baghdad teaching hospitals.

Results: The majority of the study participants were female who accounted for (58.3%) of the total participants while male constituted (41.7%) making a female male ratio of 1.5:1. Most of the study participants (46.7%) were between ages 18 and 27 years old. (71.7) of the nurses were married and the remainder was single. (45%) of the participants had institute graduate. Majority of them (31.7%) were employee (1-5) years in surgical wards, and finally most of nurses (66.7%) have training session in the nursing documentation.

Conclusions: The study showed that nurses have poor nursing documentation in surgical ward and there is no significant association between the nursing documentation with some demographic characters of selected nurses but significant association between the nursing documentation with training course.

Keywords: Evaluation, Quality of Nursing Documentation, Nursing care, Surgical Wards

Introduction

Nursing documentation is considered as an important indicator to develop nursing care. According to patient safety law, nurses have to document nursing interventions[1]. Nursing documented has jointly practical and legal embodiment in client care thus kind documentation and true notify are fundamental to improve efficiency in client care. In any case of the way used to document, the client’s health-care register is a solemn, legal records is client’s patronage specifics[2,3]. Nurse’s ability to script in a pure brief, fair and legally precise way can safely decrease the danger of misunderstanding and passive patient result concerning to bad communication[4, 5]. Nurses have accepted that registration isn’t dismissing from nursing care and it is not permissive.

Methodology and Materials

A descriptive design study carried out to evaluate quality of nursing documentation in surgical wards at Baghdad teaching hospitals. The study was carried out during the period extended from 1st January 2017 to 15th August 2017. The study population included all nursing staff in four selected hospitals. Inclusion criteria for
nurses were having at least 12 month clinical experience and having any educational level degree in nursing. The sample size estimated 70 nurses with pilot study. Then, these nurses selected to participate with stratified random sampling, according to the number of nursing staff employed in each hospital. Then, for evaluate of each nurse’s documents, in four parts of nursing documents, was selected randomly and analyzed. The demographic data of self fill reporting. For evaluate of nursing documents for nursing care four observational checklists were used. These checklists were evaluate four parts of nursing documents including recording vital sign assessment (4 items), recording wound care (dressing) (11 items), recording medication treatment (4 items) and recording intake and output (I & O) of fluids (10 items). The validity of checklists was determined by content validity and after receiving commends from 10 nursing member checklists were revised. The content validity of the instrument was established through a panel of (15) experts. Test- Coefficients for (29) items of nursing documentation for nursing care were(r= 0.83**) . Data were collected between 8.30am to12.30 pm. The data is analyzed by using SPSS version 20.0.

**Results**

This table revealed that (58.3%) of the study samples were females, and most of them were age group (18-27) years old, a high percentage of them were institute graduate (45%), most of them(71.7%) were married, (31.7%) were for (1-5) years were employment in nursing. Majority of them (31.7%) were employee (1-5) years in surgical wards, and finally most of nurses(66.7%) have training session in the nursing documentation.

</table>

This table indicates that there is no significant association between nurse’s documentation for nursing care score and the demographic characteristics (age, gender, level of education, years of experience in surgical ward and years of employed in hospital).
Discussion

Throughout the course of the data analysis of the current study, the findings show the majority of the study were female who accounted for (60%) of the total participants while male constituted (40%). Most of the study participants (46%) were ages group (18-27) years old, the level of education represented that most of them (38%) were from institute graduate, most of them(74%) were married, (38%) for (1-5) years were employment in nursing, most of nurses(70%) have training special session in the nursing documentation. Majority of them (34%) were employee (1-5) years in surgical ward, and finally

These findings are in line with study done by other researcher who reported that the average age of nurses was 32.40+ 5.58 years and they have a 6.40+ 3.58 years clinical experience .of all, 147(86.8%) nurses were female and 168 (98.8%) of them has a BS degree in nursing.83 (48.8%) nurses working in medical wards and 87(51.2%) were working in surgical wards [8].

These findings agreed with findings obtained from other study, who stated that the majority of participation nurses were female142 (87.6%) ,most of them 104(61.2%) were married their mean of age group was 31.38 years,majority of them (51.2%) were working in surgical wards and almost of them (98.8%) had bachelor of science degree in nursing[9].

Twenty nine questions to assess nurses documentation for nursing care in surgical ward, in order to response to first question of the study table five. This table shows the nursing documentation in four selected parts of nursing documents including recording vital sign, recording wound care ,recording medication treatment, and recording intake and output of fluids ,the total mean of score was poor nursing documentation .Further investigation of results of study revealed the most of items that weren’t recorded by nurses in recording wound care dressing ,location of wound(68%), size of wound (82%),wound discharge (96%),all items related to Amount of discharge, colour of discharge, odor of discharge(96%), signs of wound healing(94%) all items that mention up that weren’t recorded by nurses ,the total mean of score related to wound care was poor.

In recording intake and output of fluids most items that weren’t recorded were including, where not recording fluid take through mouth(64%), intravenous fluid(72%), nasogastric tube and gastrostomy route (88%) all items are absent (88%) all items are absent (88%) all items are absent in nursing documentation. Also recording were absent in fluid output including urination,defecaion,vomiting (74%) ,chest tube, drain (88%) and nasogastric tube (92%) of all items related fluid intake and output not recorded by nursing ,the total of mean of score related to fluid intake and output was poor.

In recording vital sign assessment art most items are recorded the mean of score of vital sign was fair. In recording medication treatment most items are recorded by nurses, the total of mean of score related drugs treatment was good.

This finding was in good agreement with that obtained from other researcher reported that the quality of nurses’ documents was moderate. Further investigation showed that most items that weren’t recorded by nurses in recording nursing report part were including “recording the time of reports” (100%), “recording the response of patients to interventions” (97.9%) and “recording the time of nursing cares” (96.5%). In recording medication treatment part most items that weren’t recorded were including “respect suitable method for correct errors” (40.6%) and other items were completely respected by nurses. In recording intake and output of fluids most items that weren’t recorded were including recording accurate time of checking I & O of fluids” (100%) and “recording the differences between the intake and output of fluids” (78.3%). In recording vital sign assessment part most items that weren’t recorded were including “recording the location of controlling vital signs”, “recording the unit of temperature”, “the limb used for controlling the blood pressure” (100%) and “the unit of blood pressure” (97.1%) [8].

Another study agree with the finding of the study who stated the nursing records showed In the vital sign section, data showed that all of them had moderate level and their mean score were 10.69 ± 0.52. In I&O fluid section data showed that 18.6% of flow sheets had moderate quality but most of them 81.4% had suitable quality and their mean score were 13.24 ± 1.07. In chronology sections, all of flow sheets had suitable quality. In drug intervention part, mean score was 11.78 ± 1.42 and most (85.9%) of them had good quality [9].

These findings agreed with study done by other researcher who reported that the quality of nursing care records was poor and inadequate to reflect individualized
nursing care. Their results suggested that more emphasis is needed in nursing practice, and nursing education on the quality of record keeping in order increasing its evidential value [12].

These finding is the same line with study done Rangraz Jedi et al by In one study, assessed the quality of 540 nursing documents and reported that only 11% of these documents didn’t Contain necessary information [13]. Hanifi, (2002) assessed the quality of 30 medical records and reported that only 16.1% of nursing documents had a good quality and 35.8% of them didn’t contain necessary information[14]. Findings of most other studies have also showed that nursing documents have inadequate information about nursing care process and are consistent with the findings of our study [15,16].

In order to respond to second question of the study the association between the nursing documentation for nursing care with some demographic characters of selected nurses. There are no significant relationship between nursing documentation and demographic characteristics of nursing, but significant relationship between nursing documentation and training course.

This finding was in good agreement with that obtained from other study who reported that correlation between age and clinical experience of nurses with quality of their documents chi-square test was used. Results showed that there was no meaningful statistical correlation between qualities of nurses’ documents with their age (χ² = 1.34, df = 2, p = 0.51) [8].

Conclusions

The study concluded that; nurses that working in surgical ward in all selected teaching hospitals had poor documentation in most aspect of nursing daily documentation for nursing care. We recommend conducting teaching programs or sessions must emphasize on all aspects of nursing documentation, for improving quality of nursing documentation and also the study recommends to nursing documentation must be covered widely and in-depth in nursing curriculum of nursing schools.

Abstract

Introduction & Aim: The birth of a premature infant who needs to be admitted to neonatal intensive care unit from birth impedes early communication and participation of mother in her infant’s care. The best way to prevent infant’s harm in hospital is to participate in the care of infant. The purpose of this study was to determine the effect of empowerment program on the participation of mothers with premature infants admitted to neonatal intensive care unit of Sayyed Shirazi hospital in Gorgan, Iran.

Materials and Methods: This study was a randomized clinical trial in 2018, which was conduct on a sample of mothers with premature infant who had randomly been divided into two intervention and control groups. The data collection tools were the Parents’ Participation Inventory designed by Melnick in 1994. Data were analyzed by descriptive statistics (tables, mean and standard deviation) and inferential statistics (independent t-test, paired t-test and covariance) using SPSS-16 software.

Results: There was no significant difference in the level of mothers’ participation in the care of their infants between the two groups before the intervention (p = 0.45). But after the empowerment training program, the results showed that mothers’ participation in the intervention group (19.10 ± 3.09) was higher than the control group (16.8 ± 2.01), (p = 0.01).

Conclusion: The results of this study showed that implementation of empowerment training program increases mothers’ participation in the care of their premature infants. Early intervention and the use of written information along with the booklet will increase the mothers’ participation in the care of their infant.

Key words: Empowerment, Participation, Mothers of premature infants

Introduction

Infants who are born before 37 weeks from the last menstruation day are called premature infants that often weight less than 2500 grams (1). Premature or gestational age of less than 37 weeks is one of the most important health indicators in any society, and infant survival is directly related to gestational age and birth weight (2). Advances in technology and neonatal care have ensured the survival of pre-term infants and reduced their mortality rate (3, 4). Every year 140 million infants are born in the world, of whom around 15 million are premature, accounting for 98% of infant mortality in developing countries (5, 6). Unfortunately, despite all efforts made to prevent preterm births, the prevalence of preterm and low weight infant are still high (1). Various

factors are involved in preterm birth, including maternal and fetal factors, etc. Maternal factors include maternal illness, chorioamnionitis, multiple birth, maternal smoking, placenta abruption and previa, uterine problems, etc (5). It has been recognized that premature infants require sophisticated treatment and care due to their physical, mental and psychological problems (1). Premature infant hospitalization immediately after birth is inevitable (7). Admission of a newborn infant to a neonatal intensive care unit (NICU) is a frightening and stressful experience for parents (8, 9). Number of adverse outcomes including increased risk of mental problems such as anxiety, depression, traumatic stress disorder, poor parent-infant interactions, and emotional, behavioral and cognitive problems are associated with the premature birth. It has been well documented that, the presence of scary medical equipment in the neonatal intensive care unit and other factors such as unfamiliar staff, restrictive patient policies, infant appearance, vague parental role and parent-infant interactions often create a frustrating and stressful condition for the parents of premature infants (10). As a result, mothers of preterm infants have very different experiences than mothers of term infants and will be challenged and faced with a crisis (11). Birth of a premature infant is not only an emotional and stressful experience for parents, but also an evolutionary stage of life for infant. Although experiencing the motherhood is a joyful one, with the birth of a premature infant the process of mental preparedness to become a mother will be stopped and parents often are not mentally, physically and emotionally ready for such event (6). Understanding the process of becoming a parent is difficult due to the fast and unexpected events that unfold, and having a premature infant can be a sad experience and difficult to cope with and sometime, this emotion is so severe that makes it difficult to control the situation (12). Numerous studies have shown that parental roles and responsibilities will change in these situations (13). Mothers of premature infants are less likely to have parental roles and often have doubts about their abilities to identify and meet their infant’s needs (14). Parents need to be able to cope with these conditions and their new role, but this process is not always easy (13). It is known that the sense of tension is associated with the reduced supportive and protective behaviors and maternal anxiety and behavioral disorder (15). Undoubtedly, the parents of premature infants require support and currently, one of the best and most effective ways to prevent injuries and harm to premature infants is to actively involve their parents in their care (16). Parents of premature infants repeatedly suffer a great deal of psychological distress during their infants’ hospitalization due to lack of involvement and participation in the care process (17). Parents are an inevitable element of a hospitalized child’s care (18). Providing a condition for the presence of parents by their infant will have many benefits for the parents and this is while, most parents are eager to attend and participate actively in the care of their infant (7). When a mother cares for her baby, the sense of motherhood and mother-child solidarity is strengthened. The mother-infant relationship in the intensive care unit is not only as important as the mother-infant relationship for a healthy child, but also is even more important (19). Among suggestions to encourage parents in this situation is to empower them in the care of their infant (17). This type of care was designed by Dr. Bernadette Melinck in 2008 in a form of a program called; “creating opportunities for parent empowerment (COPE), (3). In this program in addition to the psychological support of parents, information about appearance and behaviors of premature infant, parental role, and the care environment are given to parents (20) in order to provide comprehensive care for premature infants and facilitate comprehensive participation of parents in the infant care (19). The empowerment program aims to increase self-awareness, knowledge, motivation, self-esteem, control and preventive behaviors in parents in order to promote health and quality of life (21).

Involving the family in the care and decision-making for their infant from birth is beneficial, as parents are considered primary caregivers and can work closely with the staff and implement the care plan. This type of care has been reported to improve respiratory function, nutrition, weight gain, and reduce hospital stay and treatment costs (22). One of the key components of empowerment considered by health educators is the family participation in care to enhance and improve the quality of life (21). Participation in care enhances family relationships, reduces the negative effects of child illness on the family, maintains family integrity, provides unique care and promotes infant and family health (18). This type of care delivery has many positive outcomes for the neonate such as weight gain, start of oral feeding, self-regulation, neurodevelopment, and family satisfaction (23). Family empowerment is needed for a better life (24) and is one of the main stages of knowledge enhancement and practical participation (24, 25). The purpose of this study was to determine the effect
of empowerment program on participation of mothers with premature infants hospitalized in neonatal intensive care unit of Sayyed Shirazi hospital in Gorgan, Iran.

**Materials and Method**

This study is a randomized clinical trial which was conducted on the two groups of mothers with preterm infants. The setting of this study was Sayyad Shirazi Hospital at the city of Gorgan, Iran. The sample size in this study was determined based on the study of Gavami et al (2012) using G*POWER software with the effect size of 0.94, significant level 0.05, confidence interval of 0.95 and test power 0.080. The samples were randomly divided into two groups of intervention (n=20) and control (n=20). Inclusion criteria were: being over 18 years old, having the ability to read and write, having no history of neonatal intensive care unit care, having no physical or mental illness leading to drug use, having a 26 to 37 weeks old infant who weigh less than 2500 grams, and lack of life-threatening condition in the infant. The simple random sampling method was used in this study.

Data collection tools were demographic information questionnaire (maternal age, education, occupation, number of children) and Parents’ Participation Inventory, which was designed by Melnick in 1997 to measure parental involvement in the neonatal intensive care unit. This questionnaire lists 25 activities that a mother can perform for her infant. Also, the mother is asked to tick every activity that she has performed. The questions in this questionnaire have two options, and the higher number of options selected by the mother indicate the greater care provided by the mother and the more involvement she has in the care of her infant. A score of less than 9 indicates low level of participation, 10-18 indicates moderate level of participation, and score of 19 or more indicates the high level of participation.

In Melnick’s (1997) study, the Cronbach’s alpha of this tool was 0.85.

This project was approved by the Faculty’s Research Council, and a code of ethics was obtained from the University’s Deputy for Technology. After explaining the purpose of study, the necessary permission was obtained from the hospital authorities. According to the inclusion criteria, purposeful sampling was done in the first step and then, the study samples were randomly divided into two intervention and control groups. The researcher, after introducing herself, explained the aims of study to the mothers, ensured them about the principles of confidentiality and anonymity, asked them to provide a written informed consent and informed them that they could withdraw from the study at any time with any reason. The first appointments were made with the participating parents and the meeting place was agreed upon. The interval between each intervention step was 4 days. Three phases of the parent empowerment program were implemented for the parents in the intervention group. The control group received no intervention other than routine care and support in the ward. At the beginning and the end of the study, pre-test and post-test questions were completed by the participants. Data were analyzed by SPSS-16 software.

After the study, audio tapes containing written information and booklets used for parents in the intervention group during the study were given to the control group, so that they could also benefit from the program.

</table>
Findings

The results of independent t-test showed no significant difference between the two groups in terms of mothers’ age (p = 0.62) and length of hospital stay (p = 0.27). In the intervention group, 0.09 of the samples (N=18) were housewives and 0.010 (N = 2) were employed. Also in the control group, 0.080 of the samples (N = 41) were housewives and 0.020 (N = 4) were employed. The result of chi-square test showed no significant difference between the two groups in terms of mother’s occupation (p = 0.66), history of childbirth (p = 0.25), delivery method (p=0.35), history of abortion (p = 0.26), and type of pregnancy (p = 0.36). The Fisher test showed no significant difference between the two groups in terms of education (p = 0.69), and the Mann-Whitney test also showed no significant difference between the two groups in terms of number of children (p = 0.31), (Table 1).

Chi-square test did not show a significant difference between the two groups before and after the intervention (p = 0.45). Also the independent t-test showed no significant difference between the two groups in terms of the mean score of level of participation (p=0.21), (Table 2).
Table 2: Level of parents’ participation in the intervention and control groups before the intervention

Chi-square test showed a significant difference between the two groups in terms of the level of participation after the intervention \((p=0.01)\), so that the level of participation increased to 55% \((N=11)\). Paired t-test showed a significant difference between the two groups in terms of the level of participation before and after the intervention \((p=0.008)\), (Table 3).

Conclusion

Findings of the present study showed that mothers with premature infants who had an empowerment training program were more involved in the care of their infants. In a study by Melnick et al., four stages of the “creating opportunities for parent empowerment” (COPE) were implemented in the United States (3). In this program, parents learned about the premature infant, family’s abilities and activities that parents can perform. Also, psychological support was provided for parents and sufficient time was given to them for preparation. Consequently, the confidence of parents in caring for their premature infants increased (5). Jaw Brown conducted a study on parents of premature infants that showed that the knowledge of mothers increased after the training. Providing information on infant behavior and interaction with infant reduce mothers’ stress and have positive effects on the level of parents’ participation in the care of their infants (14). Results of studies by Fatemeh Alaei Karahroudi et al. (2012) showed that COPE program had a positive effect on mothers’ participation in the care of their infant and increased it in the intervention group (5). A study by Marzieh Akbarzadeh et al. (2012) showed that mothers’ education increased their positive attitude and self-confidence (26). Study of Noohi et al (2014) revealed that implementation of participatory care and intervention reduces the anxiety of mother more than conventional care (22). Study of Abdolali Zadeh et al. (2015) showed that a health promotion support program is effective in promoting the quality of life in mothers of premature infants (19). Empowering and involving parents and families in the care and decision-making for their infants promote health and wellbeing. People who are able to control their emotions can make the right decision (27). Family empowerment can be an important mechanism in changing care delivery to a better care (10-21). Therefore, empowerment model can be considered as an appropriate model for promoting health, increasing knowledge and enhancing parents’ participation in the care of their infants (22).

Final Result

Considering the results and the impact of empowerment program on the participation of parents in the care of their premature infants, it can be said that the implementation of empowerment program can facilitate active participation of parents in the care of their premature infants. Thus, we suggest to implement this program from the first day of delivery for mothers of premature infants.

In Vitro Technique for Heavy Metal, Cobalt Tolerance in Aloe Vera Callus

Hashim K. Mohammed Al-Obaidi1, Sundus Hameed Ahmed1, Liqaa Jameel Ibraheem1

1Biology Department/ College of Science/ Mustansiriyah University-Iraq

Abstract

In vitro tissue culture application in plant biotechnology is an efficient plant propagation tool in arising plants resistant to diverse biotic stresses such as drought and salinity. In this investigation, the aim on the in vitro breeding process applied for plants resistant to heavy metal (HM) stress. The experiment included the following two sequent stages: (i) callus cells initiation, some of which are soma clonal variation with new characteristics, (ii) susceptibility of the callus to HMs as selective factor during multiplication to select variants with enhanced HM-resistance. Aloe callus was grown on media complemented with 0.5, 1.0, 1.5 and 2.0 mg/l cobalt (Co) plus the control treatment. Cobalt accumulation level, mineral status, and callus growth were examined. Results indicate that the increase of Co concentration in medium had influenced callus growth giving the best growth 737 and 56.6 mg for fresh and dry weight respectively at 0.5 mg/l Co concentration, and that growth decreased with increase of Co concentration in medium. With concern to mineral status, cobalt had increased dramatically in callus cells with the increase of Co concentration treatment reaching 108.63ppm at 2.0 mg/l Cobalt, Fe ion concentration reached its highest level 1712.0ppm at 2.0mg/l Cobalt, Mn ions give the highest accumulation level 126.07 ppm at 1.0 mg/l cobalt. While potassium (K) and magnesium (Mg) decreased with increase of cobalt in callus medium recording their highest accumulation level 22244.0 and 492.47 respectively at plant control treatment. Na ions reached its highest level of accumulation 104.3 ppm at 0.5 mg/l cobalt concentration and decreased with the increase of cobalt concentration in the medium.

Key words: Cobalt, tolerance, in vitro, Aloe

Introduction

Soils generally include low levels of heavy metals, high levels can be hazardous to man, plants and animals. In attempt to preserve our environment, new techniques of remediation using chemical, physical and biological theories are being examined (1). Phytoremediation is defined according to Cunningham et al. 1995 (2), as the utilization of plants to withdraw, embrace, or provide harmless environmental contaminants.

Phytoremediation offer many benefits compared to other remediation techniques: it is appropriate to a broad variety of contaminants; organic pollutants could be depraved to CO2 and H2O; it is cost-effective for vast areas having low to moderately contaminated soil surface (3).

Tissue culture is an effective mean that gives the solution to grow millions of cells under controlled conditions, moreover to obtain physiological facts about the action of plant cells under stress conditions (4). Investigate and select at plant cell level established clones of plants with increased tolerance or defiance towards many environmental stresses like drought, heat, salt and heavy metals (5). Plants are often sensitive to both high and low availability of some heavy metal ions as important micronutrients. Useful heavy metals at high level could hurt the soil environment that successively negatively influence soil fertility and plant growth (6).

Bakkaus et al. 2005 (7) mentioned the average Co concentration for plants among 0.1 and 10 µg g⁻¹ dry weight and moreover detailed the beneficial part of Cobalt for the normal metabolic activity of plant at low
concentration. Li et al. 2009 (8) studied toxicity of Cobalt on Hordeum, Lycopersicon and Brassica and reported that Cobalt has reduced growth and biomass in these plants shoots.

This study aimed to establish an in vitro procedure to assess the ability of Aloe vera tissue culture to accumulate heavy metals as an important step for biotechnology researches to select tolerant plants for HMs pollution.

**Materials and Method**

**In vitro culture medium**

Sterilized Explants (leaves) of Aloe vera L. were excised and cultured in universal tubes containing MS medium Murashige and Skoog, 1962 (9). Different concentrations of the Auxin 2,4-D were tested (0.5, 1.0, 1.5, and 2.0 mg/l) which incubated in dark at a temperature 25 ± 1 °C for callus initiation (10).

**Cobalt treatment**

In vitro study was conducted using MS medium complemented with Cobalt, four different concentrations were tested: 0.5, 1.0, 1.5, and 2.0mg/l Cobalt, plus the control treatment, ten replicates were tested for each treatment. Cultures were maintained in a growth chamber at 25 ± 1 °C with a three-week subculture interval.

**Callus growth evaluation**

dry and fresh weight of callus were calculated, using three replicates for each treatment in the Auxin 2,4-D experiment, while regarding the heavy metal experiment using cobalt five replicates were used for each treatment.

**Determination of Co essential and other trace elements content**

Callus samples were previously dried in oven in order to determine the content of Fe, Ca, K, Cu, Mn, Na, Mg, and Co using Atomic Absorption Spectrometer (Solar Mb, thermo Fisher, USA).

**Statistical Analysis**

Biometrical data concerning the callus dry and fresh weight, and the content of cobalt and other chemical elements were subjected to Randomized complete design (CRD) analysis. The least significant difference L.S.D. test was used to study differences means between treatments at P<0.05 (11).

**Results and Discussion**

**Callus initiation**

Table 1 data reveals that dry weight of Aloe callus reached the highest weight (0.110 mg) at 1.0mg/l 2,4-D which differ significantly from the other 2,4-D concentrations treatment and from control treatment, while regarding the fresh weight of callus there was no significant difference between all 2,4-D concentrations treatment except from control.

Cobalt and other minerals concentration status in callus

Table 3 displays an increase with cobalt concentration in Aloe callus at 2.0 mg/l cobalt concentration treatment giving 108.63 ppm with a significant difference from the other cobalt concentration treatments and that cobalt accumulation decreased and reached its low level at callus and plant control treatments giving 10.27 and 0.0 ppm respectively. In regards to Fe ions, table 3 also shows that the highest accumulation of Fe ions was recorded at 2.0 mg/l cobalt concentration treatment registering 1712.0 ppm which differed significantly from control and the rest of cobalt concentration treatments. Table 3 also demonstrated that Na and Ca ions give the highest accumulation 104.3 and 40363.0 ppm respectively at 0.5 mg/l cobalt concentration treatment which differed significantly from the other treatments, while K and Mg ions decreased with the increase of cobalt concentration in medium reaching its highest levels at plant control treatment which differed significantly from the other treatments. Table 3 also resulted that Cu ions was at their lowest concentration level 0.363 ppm at 0.5 mg/l cobalt treatment.

Plants capture essential heavy metals like iron, zinc, manganese and copper from the soil due to concentration slope and selective uptakes of these metals (12). The organic and inorganic manures are the agricultural origins of heavy metal contamination, irrigation water; liming, pesticides, and sewage discarding are the major cause of heavy metal release in the soil (13). Chabukdhara et al. (2016) (14) revealed in a case study about heavy
metal in peri-urban and urban-industrial clusters in Ghaziabad, India, that waste water irrigation is behind the heavy load of HMs in agricultural soils. HMs ions strongly affected the activity of many enzymes and cellular metabolism; they also play an important role in protein, photosynthetic pigments, nucleic acids synthesis plus their role in the structural and functional integrity of cell membranes (15).

Cobalt plays an important role in growth and development of plants through regulating plant water utilization and reduce transpiration rate (16). Gad and Hassan (2013) (17) conducted an experiment on tomato with Co application at 7.5 ppm, which improved growth, nutrients level and yield, although Arif et al. (2016) (3) reported that application of cobalt at 5µM on mung beans inhibited seedling growth and caused chlorosis in young leaves.

Hell and Stephan (2003) (18); Thomine and Lanoquar (2011) (19) stated that Fe is easily reduced and oxidized in many biochemical processes and it’s an important cofactor in cytochrome. Cu ions had also an essential role in plant growth by, engaging in many redox-active reactions, while Mn ions act in detoxification of ROS (20). ROS could cause damage of photosynthetic pigments, plants generally response to ROS using antioxidant defense mechanism through synthesis of antioxidant enzymes such as superoxide dismutase, glutathione reductase and catalase that acts as scavengers of ROS (21).

Conclusion

Soil represents the most critical component gathering large amount of dangerous chemical pollutants from different sources per year. And according to Food and Agriculture Organization of UN report (FAO) in 2009, the world population will increase rapidly to reach about 9.6 billion till 2050. Thus, the future world challenge is to obscure the worlds hunger through prolonged agriculture and food production. Plants require some beneficial HMs in a limited quality. While, at high level these metals favor to create distinctive level of toxicity in plant that could inhibit plant growth, damage plant morphology and physiology. This create a need of much expand research on the mechanism of HMs uptake and translocation in relative to their impact on plant growth and development is obligatory to keep step with healthy agronomy production.

Abstract

Air pollution can be caused by the number of dangerous gases that arise due to the process of accumulating decaying waste which has acute and chronic effects for people who are exposed. Judging from the data collection method, this study is observational. The study design used in this study was a cross-sectional study design. Risk agent toxicity is expressed in reference doses. For non-carcinogenic inhalation exposures expressed by the Reference Concentration (RfC). Based on primary data derived from the results of measurements of ambient air quality at the loading terminal IIB TPA Garbage Surabaya, the results showed that H$_2$S gas levels of 0.04 where the levels are still below the ambient air quality standards based on East Java Governor Regulation No. 10 of 2009 concerning Quality Standards Air Ambient. From the calculation above, the researcher took the safe value by choosing the cancer risk safe value from the calculation data most likely to be applied by scavengers in the TPA Sampoerna Benowo Surabaya, namely C safe at 3 mg / m$^3$, safe for 3 hours/day and safe for 2 years. Preventive efforts that can be carried out are by controlling the source such as not doing landfill with the open dumping method using the sanitary system. Routinely monitor and control emissions, so that the air quality around the waste picker environment is maintained. Reducing the number of exposures by using personal protective equipment (PPE) in the form of respirators (masks). Perform administrative control by reducing the time and frequency of exposure to H$_2$S dangerous gases. It is better for the Surabaya government and PT X to socialize the hazards and impacts of H$_2$S exposure to workers.

Keywords: Risk Analys, Gas H2S, Risk Management

Introduction

The Waste Management Site is a place where waste reaches the last stage in its management since it starts to rise at the source, collection, transfer or transportation, processing to disposal. Landfill can have an impact on environmental quality such as air pollution from dust and gas resulting from the anaerobic decomposition process, especially if waste disposal uses an open dumping system$^1$.

Direct exposure to environmental pollution, especially gas to health, is more dangerous than indirect exposure. This can be seen from the health problems that occur in landfill waste such as complaints of respiratory problems that occur more on scavengers in TPA garbage, compared to people who are far from pollutant sources.

Air pollution can be caused by the number of dangerous gases that arise due to the process of accumulating decaying waste which has acute and chronic effects for people who are exposed. According to Soemirat (2005) that the decay of waste will produce Methane gas (CH4), Ammonia gas (N3), and Hydrogen Sulphide (H2S) gas which is toxic to the body. States that the gas formation from TPA consists of several types of gas, the gas found from TPA consists mainly of Ammonia(NH3), Carbon dioxide(CO2), Carbon monoxide (CO), Hydrogen(H2),

Hydrogen sulphide (H2S), Methane (CH4), Nitrogen (N2), and Oxide (O2)2.

H2S gas is included in the type of chemical asphyxiants, namely chemicals that can cause breathing difficulties because the mechanism of toxicity is through chemical reactions or inhibits oxygen transport 3.

**Material and Method**

Judging from the data collection method, this study is observational. The study design used in this study was a cross-sectional study design. Namely, research conducted by collecting exposure and outcome data simultaneously. In a cross-sectional study, researchers only observe phenomena at a certain point 4.

The research design uses a risk analysis paradigm design by taking one of its components, namely risk assessment/risk assessment 5. Risk assessment is used to calculate the estimated level of health risk and determine the control in the form of safe exposure time (Dt). The steps taken in the risk assessment are hazard identification, exposure analysis, dose-response analysis, and risk characteristics.

This research was conducted in 1 (one) work location, precisely at the South IIB waste point in Benowo Surabaya landfill, with the subjects of the study being 37 female respondents aged 15-64 years. The way to determine the sample will be done using Simple Random Sampling. H2S concentration measurements were carried out in the work environment, precisely in the active terminal of the loading and unloading truck using a laboratory test using the Gravimetric method.

The calculation of non-carcinogen intake with sources of exposure through the air can be formulated as follows 6:

\[
I = \text{Intake}, \text{ the amount of risk agent that enters (mg/kg/day)}
\]

\[
C = \text{Concentration risk agent, (mg/m³) for air medium, (mg/L) for drinking water, (mg/kg) for food/food}
\]

\[
R = \text{Rate for air intake (adult: 20 m³/day or 0.83 m³/hour, children: 12 m³/day or 0.5 m³/hour)}
\]

\[
tE = \text{daily exposure time (24 hours/day for residential exposure, 8 hours/day for exposure to the workplace)}
\]

\[
fE = \text{Frequency of annual exposure (Exposure to settlements: 350 days/year) and (Exposure to the work environment: 250 days/year)}
\]

\[
Dt = \text{Duration of exposure, real-time or projections for residential (residential/occupational age), adults: 30 years, children: 6 years}
\]

\[
Wb = \text{Body weight, adult 70 kg / 55 kg (70 kg for Europe from US-EPA 1990, 55 kg for Asia from Nukman, et al. 2005)}
\]

\[
Tavg = \text{Average time period, 30 years x 365 days/year (non carcinogens) or 70 years x 365 days/year (carcinogens)}
\]

The risk characteristics of non-cancer effects can be known by dividing the value of Non-cancerous Intake with the value of RfD or RfC with the following formula 7:

\[
RQ = \frac{Ik}{RFC}
\]

After the RQ value is obtained, then the assumption is used. If the value of \(RQ \leq 1\) indicates no possibility of the risk of noncarcinogenic health effects, it needs to be maintained so that the numerical value of RQ does not exceed 1. While \(RQ > 1\) indicates an indication of the possibility of risk of non-carcinogenic health effects control efforts 8.

After conducting a risk assessment and obtaining results that are beyond the threshold value, the next thing that can be done is risk management. This is done
to minimize and even eliminate the risk of danger arising from the source of danger in the right work. The non-
carcinogenic risk management used is the RQ value. In
reducing the risk agent concentration value, the value of
RQ = 1 so that the intake value = RfC is obtained.

In non-carcinogenic risk management to obtain a
safe value is calculated using the following formula9:

Based on the calculation formula for non-
carcinogenic effects above, it can be derived to find safe
values of C, tE, and Dt as follows:

Findings

a. Risk Analysis and Hazard Identification

H2S is produced due to the process of decomposition
of waste by anaerobic bacteria, in this process, the role of
microbial activity is very important. The microorganisms
that live at this stage are nonmethanogenic types which
consist of facultative anaerobic bacteria. H2S which is
a byproduct of the decomposition of organic matter, the
percentage of H2S gas produced from TPA ranges from
0-0.2%10.

H2S gas is quickly absorbed by the lungs, at low
concentrations, it can cause eye, nose and throat irritation,
at high concentrations it can cause loss of consciousness
and even death 10.

b. Dose Response Analysis

Dose-response analysis is the stage used to
determine the relationship between the size of the dose
or the level of exposure to chemicals with the occurrence
of adverse effects on human health. Where this stage is
a stage to determine the quality of risk agent toxicity has
the potential to have an effect that can be detrimental to
health in at-risk populations.

The risk agent toxicity is expressed in reference
doses. For non-carcinogenic inhalation exposures
expressed by the Reference Concentration (RfC). The
reference dose is used to estimate the amount of exposure
each day in the human population that can be accepted
without causing harmful effects during their lifetime.
The H2S gas RfC value in this study uses the reference
dose value of dust RfC (TSP) in the IRIS list, which is
2.10-3 mg / m3.

c. Exposure Analysis

Based on primary data derived from the results
of measurements of ambient air quality at the loading
terminal IIB At Benowo Landfill Surabaya, the results
showed that H2S gas levels of 0.04 where the levels
are still below the ambient air quality standards based
on East Java Governor Regulation No. 10 of 2009
concerning Quality Standards Air Ambient.

In air pollution, the general impact of continuous
exposure to air pollution can cause lung, heart, and other
diseases which are risk factors for death11.

The calculation of carcinogen intake with sources of
exposure through the air can be formulated as follows:

The results obtained through interviews revealed
that the average respondent had a body weight of 56 kg
(Wb), every day worked 9 hours/day (tie), the number
of workdays for one year was 336 days (Fe), and had
worked on an average for 6 years (Dt). With the rate of
inhalation (R) of 20 m³/HR and tag for non-carcinogenic substances is 30 x 365 days/yr. With the results of air measurements that have H₂S (C) concentrations of 0.01 mg / m³, so the amount of noncarcinogenic intake is 5.9 mg/kg.

d. **Risk Characteristics**

Risk characteristics for non-cancer effects can be known by dividing the value of Non-cancerous Intake with the value of RfD or RfC with the following calculations:

Based on the above calculations, it is known that the Ink is 5.9 and the RFC is 0.002. The results of the RQ calculation are 2.95 where the RQ value >1.

According to experts, around the year 2000 the deaths caused by air pollution reached 57,000 people per year. During the 20 years the death rate caused by air pollution rose to close to 14% or up close to 0.7% per year. In addition, material losses caused by air pollution are very large.

e. **Risk Management**

After conducting a risk assessment and obtaining the results that RQ > 1, the next thing that can be done is risk management by carrying out the following calculations:

From the calculation of the figures above, it can be seen that the concentration of H₂S gas at the garbage loading and unloading location even though it is still below the predetermined NAB standard. However, the concentration must be reduced to a maximum concentration of H₂S gas of 3 mg / m³ for the duration of exposure for the next 30 years, assuming that the frequency of workday exposure is 336 days per year and the exposure time is also 9 hours per day.

From the calculation using an average H₂S concentration of 10 mg / m³, we get 3 hours of results, which means that a 56 kg scavenger who is exposed to H₂S gas will be safe for the next 30 years if the daily exposure time is 3 hours/day or around 16 minutes.

From the above calculations, it can be seen that a person weighing 56 kg has been exposed to H₂S gas every day for 9 hours with a dust concentration of 10 mg / m³ so the duration of safe exposure is 2 years.

From the calculation above, the researcher took the safe value by choosing the cancer risk safe value from the calculation data most likely to be applied by scavengers in the At Benowo Landfill Surabaya, namely C safe at 3 mg / m³, safe for 3 hours/day and safe for 2 years.

**Conflicts Of Interest:** All authors have no conflicts of interest to declare.

**Source of Funding:** The source of this research costs from self.

**Ethical Clearance:** The study was approved by Health Research Ethics Committee Faculty of Public Health Airlangga University No: 154-KEPK

All subjects were fully informed about the procedures and objectives of this study each subject prior to the study signed an informed consent form.

**Conclusion**

According to Minister of Manpower Regulation number 5 of 2018, it is explained that H₂S gas exposure can cause upper and eye respiratory irritation, and Nausea. The intake calculation results are 5.9 mg/kg.hari. The results of the current RQ calculation are 2.95 where the RQ value >1, so we have to Safe C calculation results of 3.37 mg/m³, the calculation results are safe for 3 hours/day and the Dt results are safe for 2 years. Risk management has been carried out, but additional control is needed so that the risk of illness and occupational accidents can be reduced.

**Suggestion:**

Preventive measures that can be taken, namely by controlling sources such as not carrying out landfill with the open dumping method using the sanitary system. Carry out regular monitoring and emission control tools so that the air quality around the waste picker environment is maintained. Reducing the number of exposures by using personal protective equipment (PPE) in the form of respirators (masks).

Perform administrative control by reducing the time and frequency of exposure to H₂S dangerous gases. It is better for the Surabaya government to socialize the hazards and impacts of H₂S exposure to workers.

The Influence of Age, Time off and Pesticides Exposure on Haemoglobin Levels on Vegetable Farmers in Landasan Ulin Utara Subdistrict Banjarbaru City

Herry Cahyadi1, Achmad Rofi’i2, Eko Suhartono3, Husaini 4, Meitria Syahadatina Noor5

1 Banjarbaru Health Office, Kalimantan Selatan, Indonesia, 2Department of Surgery, Faculty of Medicine, Lambung Mangkurat University, 3 Department of Biochemistry, Faculty of Medicine, Lambung Mangkurat University, 4 Master of Public Health Sciences Study Program, Faculty of Medicine, Lambung Mangkurat University, 5 Department of Public Health, Faculty of Medicine, Lambung Mangkurat University

Abstract

Several estimates can occur in the status of blood haemoglobin levels, which can be rated lower or higher than average values. Some previous studies revealed several factors that can affect a person’s Hb levels, such as age and level of exposure. Data from the Banjarbaru City Health Office states that 2017 found farmers in Banjarbaru added to anaemia by 25% for the average age of 47 to 67 years. Meanwhile, the average cholinesterase level was 8.36 U / L. In the data it was also found that polycythemia was 13.33% with an average of 48 to 75 years, whereas the average cholinesterase level was 9.33 U / L. This study aim to analyze age, time off and pesticide exposure to hemoglobin levels in vegetable farmers in the Landasan Ulin Utara Sub-District, Banjarbaru City. This type of research is observational analytic with cross-sectional study design. The population in this study were vegetable farmers who used pesticides in the area of Landasan Ulin Utara Sub-District with a sample of 51 people. Based on the results of research related to age and exposure to pesticides or the levels of Acetyl Cholinesterase (AchE) to Hb levels of vegetable farmers in the Landasan Ulin Utara Sub-District, Banjarbaru City. Cholinesterase levels are the most dominant factor.

Keywords: haemoglobin, age, time off, pesticide, vegetable farmer, acetylcholinesterase

Introduction

Haemoglobin has two essential roles in the human body, namely the transport of oxygen throughout the body’s tissues with red blood cells from respiration organs to peripheral tissues and transport of carbon dioxide from peripheral tissues to respiration organs which are then excreted out.1

Several trends can occur in the status of blood haemoglobin levels whose values can be lower or higher than average values. Some previous studies revealed that age factors also influence a person’s haemoglobin (Hb) levels. Adult farmers have a greater risk of chronic effects for anaemia due to inadequate oxygen supply and decreased physical ability and decreased endurance.2 The older a person, the lower of Hb level. The increasing age accompanied by a decrease in health status. There will also be a decrease in lung function which can make it easier for harmful substances to enter through the respiratory system and will be able to enter the lung tissue which then enters the blood vessels that affect the blood levels haemoglobin.3 The high physical activity but not accompanied sufficient rest can increase a metabolic as well as a decrease in pH, where pH is low will reduce the attractiveness between oxygen and haemoglobin.4

Another factor that influences the haemoglobin level of the vegetable farmer is the level of pesticides exposure. The exposure to pesticides could cause the incidence of anaemia in horticultural farmers in Gombong Village, Belik District, Pemalang District, Central Java.5 The exposure to pesticides in Thailand caused farmers as much as 62% to experience Hb levels.6
Data from the Banjarbaru City Health Office states that in 2017, farmers in Banjarbaru found anaemia as much as 25% for the average age of 47 to 67 years. Meanwhile, the average cholesterol level was 8.36 U/L. The data also found 13.33% polycythemia with an average age of 48 to 75 years, while the average cholinesterase level was 9.33 U/L. The data also found 13.33% polycythemia with an average age of 48 to 75 years, while the average cholinesterase level was 9.33 U/L. In the age group of known disorders due to exposure to pesticides haemoglobin form of anaemia was 43.28% from 25% and 28% polycythemia findings of 13.33%.

The findings of anaemia and polycythemia in vegetable farmers in the Banjarbaru area most (55.6%) belong to the category of old vegetable farmers, namely between 40 to 67 years of work rest without a procedural schedule. Banjarbaru is one of the cities that has the most significant number of vegetable production in South Kalimantan, which, in its management, uses pesticides. Therefore, this study will reveal the extent of the influence of age, time off and exposure to pesticides on haemoglobin level in vegetable farmers in the Landasan Ulin Utara Subdistrict, Banjarbaru City.

Materials and Method

The type of this research is observational analytic with a cross-sectional design. Population in this study were vegetable farmers who use pesticides that are in the region of Landasan Ulin Utara Subdistrict. This village has the most number of farmers from all villages in Liang Anggang District and even from all villages in Banjarbaru City, which is equal to 80 vegetable farmers. The number of samples is calculated using the formula Lameshow (1997), which is 51 people.

Findings and Discussion

The Influence of Age on Haemoglobin

Based on the results that the p-value of 0.034 (p-value <0.05, which means that there is the influence of age on Hb). The value of β = -0.274, which means that the more age, the lower Hb level will be. The strength of the influence of age on haemoglobin levels of haemoglobin. The value of R² = 7.5%, which means that age affects Hb levels of 7.5%, the remaining 92.5% is influenced by other factors.

In general, the older a person is, the lower the Hb level. With increasing age and decreasing health status, there is a decrease in the function of various organs, including lung function. Decreased lung function makes it easy to organophosphate entering through the respiratory system will be able to enter into the lung tissue further into the blood vessels and affects the haemoglobin concentration in the blood.

At old age, there is a change in the blood which is a decrease in the Total Body Water so that the blood volume decreases and the number of red blood cells (Haemoglobin and Haematocrit) decreases. There is a tendency for the older age of vegetable farmers, the lower the cholinesterase activity in their blood. Cholinesterase is a blood enzyme that is needed so that the nerve can function properly. When cholinesterase is bound, enzymes cannot carry out their duties in the body, especially continuing orders to certain muscles in the body, so that the muscles always move without being able to be controlled.

Old-age farmers have cholinesterase activity which is relatively faster than the age of the respondent especially if it is affected by exposure or exposure to pesticides so
that it can aggravate the occurrence of poisoning. A study conducted by Reddy PB and Jagdish Kanojia in 2012 in India where they found changes in haemoglobin levels, especially a decrease in these levels. The level of haemoglobin is because pesticides reduce production or increase the destruction of red blood cells. It makes the formation of methemoglobin in red blood cells, causing haemoglobin to become abnormal and unable to carry out its function in delivering oxygen.

The Influence of Time Off on Haemoglobin

The results show that p-value is 0.571 (p-value > 0.05, there is no influence of time off on Hb levels). B value = 0.075, which means that the longer the rest period, the higher the Hb level of a person. The strength of the influence of time off is very weak against Hb levels. The value of $R^2 = 0.6\%$, which means a break affecting haemoglobin level of 0.6\%, the remaining 99.4\% is influenced by other factors. It means that statistically, there is no significant relationship between work breaks and impaired haemoglobin levels in vegetable farmers.

Break time does not affect the haemoglobin level because the use of pesticides in a short time can cause poisoning to farmers. Symptoms of chronic organophosphate poisoning arise from inhibition of cholinesterase and will persist for 2 - 6 weeks, resembling mild acute poisoning. However, if exposed again in small amounts, severe symptoms can arise. For carbamate groups, cholinesterase bonds will be temporary and will be re-released in a few hours (reversible), so that chronic poisoning will not arise.

Farmers’ time off from spraying using pesticides is a time estimated that the cholinesterase level would return to normal to 7 days after spraying and no later than 14 days later the cholinesterase level is estimated to increase. If farmers stop using pesticides for a long time, then poisoning due to pesticides will disappear by itself, because the pesticide bonds in the blood will be re-released.

The results of this study are that there is no influence on Hb levels because when taking blood, farmers are not in the period of spraying pesticides so that exposure or exposure to pesticides decreases. As is known that vegetable farmers exposed to anticholinesterase pesticides from the organophosphate group can be repaired. Organophosphate group pesticides can reduce cholinesterase levels in blood serum and erythrocytes. Cholinesterase activity can recover in two weeks without working (spraying) in 1-2 weeks.

The symptoms of organophosphate and carbamate pesticide poisoning usually occur after 4 hours of contact but can occur after 12 hours. The result of the farmer in the village Tejosari shows that the average - average respondent spraying for 2 hours and as much as 76 respondents (97.4\%) spraying <4 hours in every practice spraying.

Based on the provisions stipulated in Permenaker No.Per-03/Men/1986 article 2 paragraph 2a states that in order to maintain unwanted effects, it is recommended that it does not exceed four hours per day in a week in a row when using pesticides. Workers who manage pesticides should not experience exposure more than 5 hours a day and 30 hours a week. While WHO (1996) stipulates the length of spraying of pesticide exposure when working for 5-6 hours per day and every week health tests must be carried out, including blood cholinesterase levels. So it can be said that the more often someone works, the more likely it is to be exposed to pesticides and pesticide poisoning.

Work scheduling and work breaks are work patterns that usually exceed conventional working hours, which are 8 hours a day. Jobs that exceed 8 hours are more at risk for health problems than workers with regular rest periods.

The influence of Acetylcholinesterase (AChE) on Haemoglobin

It was found that the p-value was 0.002 (p-value <0.05, there was an influence of AchE level on Hb levels). B value = 0.396, which means that the higher the AchE level, the higher the Hb level of a person. The value of $R^2 = 15.7\%$, which means that the AchE level affects the Hb level by 15.7\% has a weak influence; other factors influence the remaining 84.3\%. It means there is a statistically significant relationship between exposure to pesticides and the incidence of anaemia in vegetable farmers.

Exposure to pesticides can cause a decrease in oxygen in the tissues. It reduced oxygen being inhaled so that the production of haemoglobin will increase. Every situation that causes a decrease in the transport of the amount of oxygen to the tissue will usually increase the speed of production of red blood cells as compensation for the amount of oxygen transported to the tissues is lacking, the production of red blood cells increases.
The farmer that poisoned by pesticide can be seen by reduced levels cholinesterase in the blood. The cholinesterase will bind class of organophosphate pesticides. The reaction between organophosphate and cholinesterase is called phosphorylase. In the condition of AchE, phosphorylase can no longer be hydrolyzed, which results in AchE buried in receptor sites.

The Influence of Age, Time Off, Cholinesterase and Haemoglobin Levels of Vegetable Farmers in the Landasan Ulin Utara Subdistrict, Banjarbaru City

<table>
<thead>

<td>0.222</td>
</tr>
<tr>
<td>AchE</td>
<td>0.385</td>
<td>0.002</td>
<td></td>
</tr>
</tbody>
</table>

The results showed that the three independent variables, namely age, time off and AchE levels had an influence on overall Hb levels but the value was only 22.2% while 77.8% was influenced by other factors. Based on the three variables that measured the value of \( \beta \) greatest is 0.385 which levels of AChE means that pesticide poisoning effect on haemoglobin levels where the higher levels of cholinesterase of a person, the higher the haemoglobin level.

Farmers who are poisoned by pesticides are characterised by decreased levels of cholinesterase in the blood because cholinesterase will bind to organophosphate pesticides. Increasing age and declining health status, then a decline in the function of various organs, including lung function. Decreased lung function makes it easy to organophosphate entering through the respiratory tract system will be able to enter into the lung tissue further into the blood vessels and affects the haemoglobin concentration in the blood.

The older the age of the farmer, the more likely direct contact with pesticides. There is a tendency for the older age of vegetable farmers, the lower the cholinesterase activity in their blood. Older farmers have a relatively faster cholinesterase activity compared to younger age respondents, especially if it is influenced by exposure or exposure to pesticides so that it can aggravate poisoning.

Symptoms of organophosphate and carbamate pesticide poisoning usually occur after 4 hours of contact, but can occur after 12 hours. So that the break does not affect the Hb level. Besides, farmers who stop using pesticides for a long time, then poisoning due to pesticides will disappear by itself, because the pesticide bonds in the blood will be rereleased.

Low levels of poisoning in vegetable farmers can occur because, at the time of blood collection, farmers are not in the period of spraying pesticides so that exposure to pesticides decreases. As is known that vegetable farmers exposed to anticholinesterase pesticides from the organophosphate group can be repaired. Organophosphate group pesticides can reduce cholinesterase levels in blood serum and erythrocytes. Cholinesterase activity can recover in two weeks without working (spraying) in 1-2 weeks.

Therefore, repairs can occur if the sprayer is rested for several weeks so that the body can synthesise the cholinesterase enzyme again so that its activity returns to rise. Cholinesterase in plasma takes weeks to return to normal, while in red blood cells, it takes 2 weeks.

Conclusion

There is an influence of age on the haemoglobin of vegetable farmer in the Landasan Ulin Utara Banjarbaru. There was no effect of time off on Hb levels of vegetable farmers in the Landasan Ulin Utara Banjarbaru City. There is an influence of pesticide exposure or AchE level on Hb levels of vegetable farmers Landasan Ulin Utara Banjarbaru City. Pesticide exposure Levels of cholinesterase were the most dominant factor influencing for Hb levels of vegetable farmers in the Landasan Ulin Utara Banjarbaru City.

Abstract

The study was carried out during a period of March 2018-July 2019 for the detection of Salmonellosis in 106 suspected patients with age group range from 17 - 69 years, who attended to Baghdad teaching hospitals, that had been examined and defined as suspected cases by specialized physician with the recording of clinical manifestation. The diagnosis done by immunochromatography method, a blood sample was taken from each patients as well as other 30 healthy control matching in age and gender. The study included measurement of the level of antineutrophil antibodies, activity of Alkaline phosphatase, and Lactic acid dehydrogenase in sera of patients and healthy control. The result indicated that anti–salmonella IgM positive in 54 cases, anti–salmonella IgG positive in 40 cases and 12 positive cases with both IgM and IgG. The Level of c-ANCA and p-ANCA, Alkaline phosphatase and Lactic acid dehydrogenase increased significantly, with no statistical difference between the gender of patients sera in comparison with healthy control.

Key Words: Salmonellosis, Alkaline phosphatase, Lactic acid dehydrogenase, c-ANCA, p-ANCA

Introduction

Salmonella typhoid and paratyphoid are transmitted mainly by the fecal-oral route. In most cases an asymptomatic carrier of S. typhi, or an individual who has recently recovered from the infection, continues to excrete large numbers of organisms in the stool and contaminates food or water, either through direct food handling, through transfer of bacteria by flies and other insects, or by contamination of potable water and raw frozen chickens meat

Only 10% of patients recovering from typhoid fever excrete S. typhi in the stool for three months, and in the past 2-3% became permanent carriers. These infections have great potential for epidemic spread. Salmonella typhi infections are commonly mild and self limiting. Severe disease represents the “tip of the iceberg”. In temperate countries persistent carriers are a more important reservoir of infection. A number of host factors increase the risk of Salmonella infections. Disease related (achlorhydria) or iatrogenic (antacids, H2 blockers, proton pump inhibitors) reduction in stomach acidity or gut pathology (surgery, inflammatory bowel disease, malignancy) and recent antibiotics increase the susceptibility to infection. Disease related or iatrogenic immuno suppression and several other infections, notably schistosomiasis, malaria.

The clinical features of typhoid and paratyphoid fever are generally similar, although paratyphoid tends to be a more mild infection. Most patients with enteric fever present with a non-specific gradual onset of an influenza-like illness although Salmonella typhi infection can present with fever and a bewildering array of signs and symptoms ranging from non-metastatic central nervous system syndromes including psychosis and cerebellar ataxia, through to focal involvement of bone, liver, spleen, testes, menninges, vascular prostheses, atheromatous plaques.

In general the enteric fevers are sub-acute infections with an incubation period of approximately 7-14 days (range 3-60 days) following exposure. The illness begins insidiously with non-specific signs and symptoms of fever, headache, muscle and joint aches, malaise, lassitude, anorexia, often a dry cough (sometimes associated with a sore throat). The spleen enlarges, but lymphadenopathy is not usually prominent. Relative bradycardia is considered common in typhoid although
in many series this has not been a feature of the disease. Some abdominal complaints are usual although either diarrhea or constipation may occur.

There is usually some abdominal discomfort, and even in the first week of the disease the patient may notice passage per-rectum of a small amount of blood or melena normal bowel habit is unusual in typhoid. diarrhea (3,18) The clinical evolution of untreated typhoid is divided classically into weeks (19). During the first week the fever rises gradually, and in the second week reaches a high plateau. By the second week the patient has become progressively weaker, has lost weigh. By the third week of infection, if untreated, a dangerous stage is entered upon in which either intestinal perforation or hemorrhage become more likely as the necrotic Peyer’s patches either erode through the wall of the terminal ileum (20) or penetrate a large blood vessels .complications in the third and fourth week also include pneumonia, acute psychosis, coma, myocarditis (21), pericarditis, orchitis, meningitis (22), most salmonellae induce an acute inflammatory response, which can cause ulceration. They may elaborate cytotoxin that inhibit protein synthesis, and contribute to the inflammatory response or to ulceration. However, invasion of the mucosa causes the epithelial cells to synthesize and release various proinflammatory cytokines, including: IL-1, IL-6, IL-8, TNF-α, IFN-α, MCP-1, and GM-CSF. These evoke an acute inflammatory response and may also be responsible for damage to the intestine. Initial host responses involve neutrophil infiltration, followed by the arrival of Lymphocytes and macrophages. Occasionally, diffuse colitis occur mimicking inflammatory bowel disease (23).

Material and Method

The study carried out during the period from (March 2018- July 2019), studied group were involved Suspected patients their age range between 17-69 years. Blood samples were obtained from a total of 106 patients clinically suspected with Salmonellosis that had been examined and defined as suspected cases by specialized physician with the recording of clinical manifestation.

Blood samples

Five mL of venous blood was obtained from each patients and collected in sterilized screw cap plastic tube, blood samples were left for 30 min. at room temperature, then centrifuge at 3000 rpm for five minute, then the serum for each sample was collected in eppendorf tubes and then test for Salmonellosis (IgM and IgG) and stored in deep freeze at -20° C until the time for using.

Immunochromatographic assay

About 100 μl of serum from each sample was added to the sample hole of the kit. The colour density is proportional to the antibody titer. The complexes (appears in colour band after 10 minutes) confirm that the test was performed correctly. This CerTest-salmonella kit which determines the salmonella quality in bloods samples. Pre-coating was achieved to the membrane proceeding to test band region to the monoclonal antibodies of the mouse, it was achieved against salmonella antigens. Through test, samples were reacted with conjugated colors’ (anti-salmonella of monoclonal mouse microsphere (red antibodies)), the samples were dried before that, the combination then travelled to reach membranes via the act of capillaries. While samples move via the membranes tests, tinted particle were migrated. In positive results, certain antibodies that have existed on the membranes captured these particles which lead to appearance of red tinted line that can clearly observed while the other result appears in a green tinted line (the negative results that represent the control samples.

Immunological and Clinical biochemical tests

The level of Anti proteinase-3; Cyclic -anti neutrophil cytoplasmic antibodies (c-ANCA) are examined by Enzyme Linked Immunosorbent Assay (ELISA) according to (24). Alkaline phosphatase and Lactic dehydrogenase Concentration determined according to manufactures instructions of Biosystem (Spain).

Statistical Analysis

The results were analyzed using statistical system SPSS version -18 (T-testing).

Result

Serological tests

Serum level anti –salmonella IgM present in 54 cases with a percent of 50.9%, also, the level of anti –salmonella IgG present in 40 cases with a percent of 37%.While the level of both IgG and IgM present in 12 cases with a percent of 11.3% (Table 1).

Discussion

Salmonella can both colonize and cause infections in humans and animals. Of interest, some Salmonella species appear to be better adapted to humans, and vice versa. For example, S.typhi does not have an animal reservoir and is solely transmitted by humans. Most human cases of Salmonella involve ingestion of a contaminated food item, in particular, eggs, poultry, ground beef, or dairy products (25). Salmonella can be acquired by direct personal contact, nosocomial transmission, or contaminated drugs/solutions (26). The result indicated anti-salmonella IgG was 40 (37%) of cases while IgM was 54 (50.9%) cases by immunochromatography method (Table 1).

Generally, the prevalence of infection is related to several factors including nutritional habits (27). The level of anti-PR3, in the serum of patients with Salmonellosis shows a significant increasing (P< 0.05) in comparison to healthy control, while the results shows no significant difference (P> 0.05) between the gender in both groups (Table 2). There are many explanations for the presence of the antibodies in Salmonellosis, one of them is the disruptive effect of salmonella on polymorph nuclear PMN expose, change intracellular proteins and rendering them antigenic city and result in the production of antibodies for epitope of anti -PR3 [28], also the other explanation is the antibody produced as a response to amoebic antigen, this antigen is cross-react with PMNL cytoplasmic components like anti PR3 [29].

The level of anti-MPO shows a significant increasing (P<0.05) in serum of patients with Salmonella in comparison with healthy control, while the results shows no significant differences (P>0.05) between the gender in both groups (Table 3). The results are in line with other studies which proved that PMNL granulocytes have an important role in innate immunity and their programmed cell death & removal are effective for acute inflammation resolution. MPO which is a hem protein generally associated with killing bacteria and tissue injury which oxidative, this property is expressed in
neutrophils, MPO binds to neutrophil (29).

The level of ALP increased significantly (P<0.05) in patients sera with Salmonellosis in comparison with healthy control, while the results showed no-significant difference (P>0.05) between the genders in both groups. The increasing level of alkaline phosphatase in the serum may be as a result to damage of liver cells and other cells infected with bacteria and released of the enzymes to blood stream (28).

The activity of Lactate dehydrogenase increase significantly (P<0.05) in patients sera of Salmonellosis in comparison to healthy control. While the results show no-significant difference (P>0.05) between gender in both groups. (Table-5). The increasing in LDH enzyme level may be due to cellular death and leakage of the enzyme from the infected cells (30).

**Conclusion**

The result indicated that anti –salmonella IgM positive in 54 cases, anti- salmonella IgG positive in 40 cases and 12 positive cases with both IgM and IgG. The Level of c-ANCA and p-ANCA, Alkaline phosphatase and Lactic acid dehydrogenase increased significantly, with no statistical difference between the gender of patients sera in comparison with healthy control.

Preparation and Characterization of Some Complexes with New (Azo-Schiff base) Ligand and Study of Complex as Anticancer

Layla Ali Mohammed¹, Muna Abass Hadi¹, Noor Alhuda Basim²

¹,²Assist. Prof., Dep. of Chemistry; College of Education for Girls, University of Kufa, Iraq, ²Lecturer, Dep. of Medical laboratory Techniques, Collage of Medical Technology, University of Islamic, Iraq

Abstract

A new series of transition metal complexes of Co(II), Ni(II), Cu(II), Zn(II), Cd(II), Hg(II), Au(III) and Pt(II) have been preparation and characterization using anew azo-Schiff base ligand derived from Schiff base (N¹,N²Z)-N¹,N²-bis(4-amino-1,5-dimethyl-2-phenyl-1H-pyrazol-3(2H)-ylidene)benzene-1,2-diamine with 5-methyl-imidazole. The structures of the new ligand azo-schiff base and their transition metal complexes are characterized using several techniques, including analysis (C.H.N), molar conductance, magnetic measurements, electronic spectral, IR spectral studies, ¹³CNMR, ¹HNMR and mass spectra. The data show that these complexes have composition of [MLCl₂] where M=Co(II), Ni(II), Cu(II), Zn(II), Cd(II) and Hg(II), [ML]Cl₃ where M= Au(III) and [ML]Cl₂ where M=Pt(II). The electronic spectral, and magnetic susceptibility data of the complexes suggest octahedral geometry of all complexes, except the Au(III) and Pt(II) complex suggest a square planar geometry. The IR results demonstrate that the co-ordination sites are the azomethine nitrogen and azo nitrogen atoms of the ligand. The ligand behaves natural tetra dentate manner. The biological screening effect of the Pt(II) complex are tested against human breast cancer cell line MCF-7and normal cells (cell line WRL68). The results show the highest inhibitory effect for complex.

Key word: transition metal, schiff base ligand, imidazole

Introduction

Imidazole are heterocyclic have gained great importance as display wide range of pharmacological properties in addition to their excellent donor abilities and chelating agent, Schiff base and azo-Schiff bases important for the preparation because this class of compounds possess active \((\pi–acidic)\) for this reason a number of these compounds were prepared. Imidazole derivatives are of high interest among the researchers and uses in different fields because of their biological applications including antifungal, antioxidant, antiprototzoal, antihypertensive, antibacterial, and anticancer. Azo dyes are highly colored and have been used for dyeing industry, electrochromism, nonlinear optical elements, printing system, and pigments for a long time. On the other hand, azo compounds represent (60-70%) from all azo dyes, while Schiff base have played important role as chelating ligands in the development of coordination chemistry and optical materials, in addition to complexes show biomedical application like antimicrobial, anticancer, and antioxidant activities. Azo-Schiff base ligands and their complexes having multifunctional group play an important role due to their complexing, catalytic properties. Recently, this paper reports the synthesis, characterization and biological activity study of Pt(II) complex as anticancer of the new azo-Schiff base ligand \((3z)-N-(2-(((3z)-1,5-dimethyl-4-((4-methyl-1H-imidazol-2-yl)diazenyl)-2-phenyl-1,2-dihydro-3H-pyrazol-3-ylidene)amino)\) and its metal complexes with selected metal ions.

Measurement: The electrothermal melting point model 9300 was used to measure the melting point of the ligand and its complexes. Elemental analyses were carried out by means of micro analytical unit of 1180 (C.H.N) elemental analyzer. Electronic spectra were recorded on Shimadzu spectrophotometer double beam model 1700 Uv-Vis spectrophotometer–FTIR spectra were recorded in KBr disc on FTIR Shimadzu spectrophotometer model 8400 in wave number(4000-400)cm⁻¹. ¹H-NMR
&$^{13}$C-NMR-spectra in (ppm) unit were operating in DMSO-d$_6$ as solvent using (Bruker-Ultra Shield 3000 MHz Switzerland). And Mass Spectra were recorded on AB Scieix-3200 QTRAP LC/MS/MS. (Mass range-m/z(5-2000)-quad mode and(50-1700)linear ion trap mode). Magnetic susceptibility were carried out on a balance magnetic (MSB-MKI) using faraday method. The diamagnetic corrections were made by Pascal’s constants.

Preparation of ligands:

Preparation of the Schiff base[12]:

(4.06 gm, 0.02 mol) from 4-amino antipyrine dissolved in ethanol (50 ml) and then mixed with (1.08 g, 0.01 mol) (o-phenylene diamine) dissolved in ethanol. Three drops from glacial acetic acid were added and the mixture was refluxed with stirring for 35 hrs. Schiff base ligand was isolated after the volume of the mixture was reduced to half by evaporation and precipitated product was collected by filtered off and dried over anhydrous CaCl$_2$. Yield: 88%; mp: (125-127) C$^\circ$.

Preparation of the new azo-Schiff base ligand:

The new azo-schiff base ligand is prepared by coupling reaction of diazonium salt with appropriate amount of (5-methyl—imidazole) as coupling component in alkaline solution. Adiazonium solution is prepared by dissolving (4.78 g, 0.01 mole) of (N$^1$Z,N$^2$Z)-N$^1$N$^2$-bis(4-amino-1,5-dimethyl-2-phenyl-1H- pyrazol-3(2H)-ylidine)benzene-1,2-diamine in 4 ml of concentrated hydrochloric acid and (25 ml) distilled water. To this mixture a solution of (1.4 g, 0.02 mole) of sodium nitrate in 15 ml of distilled water was added drop wise at (0-5) $^\circ$C, and left to stand (30 min). This diazonium solution was added drop wise to 5-methyl—imidazole (1.64 g, 0.02 mole) dissolved in (30 ml) of ethanol and (50 ml) of (2 N) sodium hydroxide at (0-5) $^\circ$C. The mixture was allowed to stand overnight. The precipitate was filtered off, washed with distilled water, and recrystallized twice from hot ethanol and then dried in oven at 40 $^\circ$C for 10 hours. m.p(224-226) $^\circ$C, yield (60%), scheme 1.

Scheme-1: preparation of Schiff base, (azo-Schiff base) ligands and Complexes.

Preparation of metal complexes:

The metal complexes were prepared by mixing of 30 ml ethanol solution of (CoCl$_2$.6H$_2$O, NiCl$_2$.6H$_2$O, CuCl$_2$.2H$_2$O, ZnCl$_2$, CdCl$_2$.2H$_2$O, HgCl$_2$.2H$_2$O, PtCl$_2$. NaAuCl$_4$.H$_2$O) with 30 ml ethanol solution of (azo-Schiff base) ligand in (1:1) (metal: ligand) ratio. The resulting mixture was refluxed for 2 hrs. The product was isolated after reduced of volume by evaporation. It was filtered off, washed with ethanol and dried under vacuum. The complexes obtained are listed in table 2.

**Method**

Cytotoxicity Assays

To determine the cytotoxic effect, the MTT cell viability assay was conducted on 96-well plates. Cell lines were seeded at (1×10$^3$ cells/well). After (24 hrs). or a confluent monolayer was achieved, cells were treated with tested compound. Cell viability was measured after 72 hrs of treatment by removing the medium, adding 28 µL of 2 mg/mL solution of (3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyl tetrazolium bromide) reagentMTT (and incubating the cells for 1.5 h at (37°C). After removing the MTT solution, the crystals remaining in
the wells were solubilized by the addition of (130µL) of DMSO (Dimethyl Sulphoxide) followed by (37°C) incubation for (15min) with shaking.\(^{(13,14)}\). The inhibition rate of cell growth (the percentage of cytotoxicity) was calculated as the following equation: \[ \text{Percent Inhibition} = \frac{(X - Y)}{X} \times 100 \]

### Results and Discussion

All our complexes are Freely soluble in DMF, DMSO, Methanol and Ethanol. Also, They are stable in air. The metal complexes were characterized by elemental analysis, molar conductivities, magnetic susceptibility, IR, UV-Vis, Mass and \(^{13}\)C, \(^{1}H\), MNR spectra. The analytical data of the complexes are in agreement with the experimental data. The value reveals that the metal to ligand ratio is (1:1) and are presented in Table 2. The magnetic susceptibility of the chelate complexes at room temperature were consistent with octahedral geometry, except the Pt(II) and Au(III) complex suggest a square planar geometry around the central metal ion. Most of chelate complexes prepared in this work showed lower conductivity values of the complexes. This proves that complexes have non-electrolytic nature. Except the Pt(II) and Au(III) complex which showed higher conductivity values support the electrolytic nature of the metal complexes.

### Micro analysis:

The elemental analysis data of 1:1 [M:L] ratio complexes showed that the theoretical values are in a good agreement with the found data, as listed in Table 1. The purity of azo-schiff base ligand was tested by TLC technique and C.H.N analysis.

Infrared Spectra studies of the ligand and complexes:

The important infrared spectral bands for the synthesized ligand and its chelate complexes are given in table.2. The ligand contains four potential donor sites: (1,2) the azometheine nitrogen, and (3,4) the azo group nitrogen. The IR spectrum of the ligand shows characteristic bands at (1639 and 1454) cm⁻¹ due to the (C=N) and (N=N) functional groups respectively. (15) The (C=N) and (N=N) bands in the free ligand shift to (1627-1614) cm⁻¹ and (1436-1409) cm⁻¹, respectively for the complexes. The reduction in bond order, upon complexation, can be attributed to delocalization of metal electron density (t²g) to the -system of the ligand. These shifts confirm the coordination of the ligand via the nitrogen of azo methine and the azo groups to metal ions. (16) The absorption band in free ligand observed at 3423 cm⁻¹ attributed to the (NH) group. (17) This band remains unchanged in the spectra of their complexes. The absorption band in ligand azo-schiff observed at 1666 cm⁻¹ attributed to the (C=N) of the N₃ imidazole nitrogen. This band remains unchanged in the spectra of their complexes. (18) This suggests that the (C=N) group is not taking part in coordination. New bands are attributed to (M-N) vibrations appearance in all complexes at (447-412) cm⁻¹ respectively. (19) The stretching wave number due to (N-N) in the coordinated compound was slightly affected from (1047) cm⁻¹ which indicate the un sharing of this linkage of pyrazolone ring in coordination with metal ions. Representative example for their spectra is given in Fig1.

**Mass spectra:**

The mass spectra of synthesized ligand and its Cu(II) complex are recorded at room temperature. The obtained peaks confirm the proposed formulae for the compounds. The mass spectrum of Ligand show the molecular ion peak at m/z 798.2(0.9%) to the molecular formula (Cu(C₃₆H₅₆N₁₄Cl₂)consistent with the molecular weight of the Cu(II) complex.

**¹HNMR spectra:**

The ¹HNMR spectrum of the ligand shows the following signals: phenyl multiples at (7.3-7.5) ppm, =C-CH₃ at 2.3 ppm, N-CH₃ 3.3 ppm, CH₃ imidazole ring at
There is no appreciable change in all other signals in these complexes.

**13CNMR spectra:**

The spectra of the azo-Schiff base ligand were measured at room temperature in [D$_6$]DMSO. The $^{13}$C NMR spectrum of the ligand displayed characteristic signals at 8, 13.2, 39.3, 154.2 and 136.2 ppm due to (C–CH$_3$ imidazole), (>C–CH$_3$), (>N–CH$_3$), (>C–N=N–) antipyrine ring and (>C=N imidazole ring) of the azo-Schiff base ligand, respectively.\(^{(23,24)}\). The peak at $\delta = 164.9$ ppm was due to azomethine carbon of the ligand.\(^{(23)}\). Moreover, the spectrum of the ligand showed peaks in the region of (120.1, 124.2, 127.6, 128.6, 129.01 and 144.2, 146.0 ppm) due to aromatic carbon atoms.

**Electronic Spectra:**

Electronic spectra provide the most detailed information about the electronic structure. The UV-Vis spectrum of the (azo-schiff base) ligand exhibits two charge transfer (CT) bands at (310 nm) (32285 cm$^{-1}$) and (370 nm) (27027 cm$^{-1}$) attributed to ($\pi \rightarrow \pi^*$) and ($n \rightarrow \pi^*$) transition within the (azo-schiff base) ligand. In the spectrum of the complexes, the CT band at (310 nm) remains as such, in agreement with the $\pi \rightarrow \pi^*$ transition of the (azo-schiff base) ligand. The band observed at (370 nm) in the spectrum of the free ligand is red-shifted to (529–546 nm) in complexes due to ligand to metal charge transfer (LMCT) transition\(^{(25)}\), suggesting an octahedral geometry around metal(II) in the complexes.\(^{(26)}\). The electronic transitions, magnetic properties and conductivity values of the ligand and its complexes are listed in Table 3.

**Magnetic measurements:**

The Co(II) complex has a magnetic moment of 5.01 B.M, which is in agreement with the reported value for octahedral Co(II) complexes.\(^{(27)}\). The Ni(II) complex shows a magnetic moment value of (2.9) within the range of (2.9, 3.3) B.M\(^{(28)}\), suggesting an octahedral environment. The Cu(II) complex shows a magnetic moment value of 1.71 B.M, and consistent with a distorted octahedral geometry.\(^{(29)}\). The Zn(II), Cd(II), Hg(II), Au(III), Pt(II) are diamagnetic and according to the empirical formulae of complexes, an octahedral geometry is proposed\(^{(30)}\) except the Au(III) and Pt(II) complex suggest a square planar geometry.\(^{(31)}\).

Anticancer activity:

Evaluation of newly synthesized complex in cancer therapy are studied. The antitumor activities of the synthesized Pt(II) complex was tested against breast cancer cell line MCF-7 and normal cells (cell line WRL68). The results showed that the highest inhibitory effect was reported for complex give IC50 value (93) and (1193), respectively. The cell cytotoxic effect of tested Pt(II) complex was calculated. The optical density was measured with the micro plate reader to determine the number of viable cells and the Inhibition Rate was calculated as

\[
\text{Percent Inhibition} = \frac{\text{Rate without inhibitor} - \text{rate with inhibitor}}{\text{rate without inhibitor}} \times 100
\]

The (50%) inhibitory concentration (IC50), the concentration required to cause toxic effects in (50%) of intact cells, was estimated from graphic plots of the dose response curve for each concentration. Using Graph pad Prism 6. The anticancer activity of the synthesized Pt(II) complex was determined against an human breast cancer cell line MCF-7 and normal cells (cell line WRL68) using different concentrations was evaluated. The cytotoxicity of Pt(II) complex on normal cells (WRL68) were studied using MTT assay. The results indicate effect of toxicity was very low on normal cells (WRL68). The platinum complex exhibit good results and expressed as IC50 value (μg/ml). The results are shown in fig. (1).

Fig. 1: Curve with plotting of IC50 of: (a) human breast cancer cell line MCF-7 & (b) WRL68
Treating tumors or tumor metastases

Killing cancer cells because of DNA binding cannot account for a selective mechanism of cell recognition and of discriminating toxicity. Provided that tumor cells differ from their healthy counterparts for the activated genes rather than for DNA content (which is almost identical in terms of nucleotide content, e.g. the number of guanines and their sequence, in any cell of the body including the tumor mass), the question remains open why, besides the high sensitivity of testicular tumors that can be cured, other tumors towards which platinum drugs are applied in a number of combination chemotherapeutic regimens show[32].

Conductivity measurement:

Molar conductance (Am) measurements of the metal complexes table (3) carried out using DMSO as solvent at the concentration of 10^-3M in room temperature. All chelate complexes prepared in this work showed conductivity values ranged between (6.14-10.23) s.mol^-1.cm^2 that non-electrolyte and no conductive species[15] While the molar conductance of Au(III) and Pt(II) complex are (75.03-166.17) s.mol^-1.cm^2 indicating the electrolytic nature (1:3) and (1:2) electrolyte of this complexes furthermore the chloride ions are located outside the coordination sphere[16].

Conclusions

In this paper we have explored the synthesis and coordination chemistry of some monomeric complexes obtained from the reaction of the tetra dentate ligand with some metal ions as shown in Figure (2). The mode of bonding and overall structure of the complexes were determined through physico-chemical and spectroscopic methods. Complex formation study via molar ratio has been investigated and results were consistent
to those found in the solid complexes with a ratio of (M:L) as (1:1). The biological screening effect of the Pt(II) complex are tested against human breast cancer cell line MCF-7and WRL68, the results show the highest inhibitory effect for complex.

The Omega-3 Fatty Acids can Significantly Increase the Height of Children Under Five with Stunting

Lewi Jutomo¹, Bambang Wirjatmadi², Rudi Irawan³
¹Doctoral Student, Faculty of Public Health, Universitas Airlangga, ²Professor, Department of Nutrition, Faculty of Public Health, Universitas Airlangga, ³Lecturer, Faculty of Medicine, Universitas Airlangga

Abstract

Children with stunting are a global public health problem that has implications for impaired physical growth, which has an impact on increasing morbidity and mortality. This study aims to study the role of omega-3 fatty acid supplementation on anthropometric measures of toddlers with stunting, especially height. This type of research was an experimental randomized clinical trial design, in the form of pre-post test control group design. Subjects who participated in this study were toddlers aged 12-36 months, consisting of 12 children as a control group who received placebo, and 12 children as a treatment group who received omega-3 fatty acid supplementation for 2 months. The parameters observed was height. The collected data were analyzed using t-test. The results of the study showed that there was a difference in changes in the subject’s height in the treatment group compared to the control group (p-value = 0.009294). It was further concluded that supplementation of omega-3 fatty acids in children under five with stunting could significantly increase height.

Keywords: omega-3 fatty acids, stunting, children under five, height

Introduction

Children with stunting are a global public health problem, which can increase morbidity and mortality. However, the most serious problem that needs important attention is the inhibition of cognitive and motor development due to brain volume that does not reach optimal size. In this regard, Martorell & Zongrone states that failure to promote linear growth has serious consequences, both in the short and long term, both on health and the formation of quality human capital.

Semba et al. through metabolomics studies concluded that there is a relationship between stunting and low serum omega-3 fatty acids. This nutrient is essential for growth and development. The results of his study also explained that interventions to reduce stunting could be done by increasing food intake of omega-3 fatty acid sources.

Koren et al. reported that exposure to omega-3 fatty acids at an early age can accelerate growth and improve bone quality. It was also explained that omega-3 fatty acids can improve bone health through increased absorption of calcium in the intestine, and increase osteoblast activity and differentiation, reduce osteoclast activity and encourage mineral deposits needed for bone development. Since 1929, Burr & Burr asserted that omega-3 fatty acids EPA and DHA are essential for health, and deficiency of these nutrients in the diet can cause illness. Then it was mentioned that omega-3 fatty acids EPA and DHA were concentrated in nerve tissue, including the brain, retina and breast milk. In particular, DHA is very much a phospholipid compound in the brain and is an essential component for brain growth. Based on the explanation above, supplementation of omega-3 fatty acids is expected to increase linear growth or height in children under five with stunting.

Material and Method

This study was an experimental research, a clinical trial using a randomized controlled trial (RCT), with a specific design that was pre-post test control group design. The sample size was 24 children under five, who were recruited from data available at the “Sikumana” Community Health Center, Kupang; with inclusion criteria namely healthy (physical, mental, social and normal activities), age: 12-36 months, nutritional status:
stunting (height / age <2 standard deviations), and their parents agree with their children’s involvement in the study this. The sample was divided into 2 groups namely; 12 children as a control group who received placebo and 12 children as a treatment group who received omega-3 fatty acid supplementation. The allocation of children under five to the group is done by simple random sampling, using a lottery.

The dose of omega-3 fatty acids given to the treatment group was adjusted for the child’s weight ie; body weight >10-20 kg given 500 mg of omega-3 fatty acids and children with a weight of ≤10 kg were given 350 mg of omega-3 fatty acids. This supplementation was given every day, for 60 days by health cadres.

The height of a toddler was measured using microtoise which has been calibrated before. Height measurements were carried out by health cadres and monitored or assisted by researchers. Height of children aged less than 2 years plus 0.7 cm as a correction. Height measurements were carried out in both groups in the phase before giving treatment (pre test) and after giving treatment (post test). The collected data was numerical data so that it was presented in the form of mean ± SD(7), and then analyzed using an independent sample t-test, about the difference in height gain between the treatment and control groups. Prior to the t-test, all data were proven to be normally distributed based on the results of the Saphiro-Wilk test and had a homogeneous variance based on the Levene test results.

Findings

The results of height measurements in the pre-test and post-test phases in the treatment and control groups are presented in Table 1.

Referring to Table 1, it is known that the mean score of height increase in the treatment group (1.12 cm) was higher than the mean score of height increase in the control group (0.63 cm). Based on the results of the t-test, the difference in height gain from the two groups was significant, as evidenced by the p-value of 0.009, so that it could be interpreted that giving omega-3 fatty acid supplementation was effective to increase the height of a toddler with stunting.

Discussion

Based on the results of the study it is clear that the height increase of the group of children under five who received omega-3 fatty acid supplementation was significantly greater than the group of children who did not get the nutrient.

This condition is in line with the results of Koren et al., (2014) research on female mouse model fat-1 mice by administering high concentrations of omega-3 fatty acids to increase bone growth during pregnancy and postnatal periods. It can be concluded that exposure to high concentrations of omega-3 fatty acids at an early age can accelerate bone growth through changes in growth plates, increased proliferation and differentiation of chondrocytes. Lau, et al., (2013) reported that giving sunflower oil or fish oil for 12 weeks to growing mice had an impact on increasing calcium through absorption in the small intestine. In investigating the role of these unsaturated fatty acids in bone development, it is known that EPA and DHA increase mineralization, and then stimulate the differentiation of MSC (mesenchymal stem cells) into osteoblasts. The addition of arachidonic acid derived from omega-6 fatty acids inhibits the differentiation process into osteoblasts compared to cells that are given DHA. Then, the reduced omega-6 / omega-3 ratio indirectly in the bone has an effect on increasing osteoblast activity, which initiates an increase in bone formation early in life. It was also explained that omega-3 fatty acids could improve bone health through increased intestinal calcium absorption, and increased osteoblast activity and differentiation, reduced osteoclast activity and promoted mineral deposits in bone development.

Koren et al. reported that exposure to omega-3 fatty acids at an early age can accelerate bone growth and improve bone quality. In his experiments using genetically modified fat-1 mice whose bodies were able to synthesize omega-6 fatty acids into omega-3s,
it was found that there was accelerated bone growth as evidenced by the increasing length of the tails of both male and female mice. This acceleration rate of growth is the result of increased thickness of the bone growth plate, along with the thickening of the proliferation, prehypertropic and hypertropic zones. Then, the influence of omega-3 fatty acids is explained through two mechanisms, namely: (a) omega-3 fatty acids stimulate osteoblast differentiation through increased expression of parathyroid hormones and insulin-like growth factor 1, thereby increasing bone formation; (b) omega-3 fatty acids inhibit osteoclastogenesis through reduced NF-κB expression and signal modulation from RANKL, thereby reducing bone resorption.\(^{(4)}\)

In addition, Kajarabille et al. explained that omega-3 fatty acids can regulate bone metabolism, including reducing the release of prostaglandin E2 (PGE2) which is an important factor in osteoclast differentiation, nuclear kappa-β ligand (RANKL) receptor activation. Furthermore, these omega-3 fatty acids can modulate a number of proinflammatory cytokines, increase IGF-1 production and improve bone calcium enhancement. Thus, these fatty acids can maintain bone health and reduce bone loss.\(^{(8)}\)

Gyurko & Van Dyke explained that RvE1 is a derivative of omega-3 fatty acids that are effective in preventing and restoring bone loss in inflammatory bone disease periodontitis. This experiment provides evidence of the action of RvE1 on bone. Aside from being an anti-inflammatory, RvE1 also works on bone cells and promotes bone maintenance.\(^{(9)}\) Other evidence is shown by Gao et al that bioactive compounds derived from omega-3 fatty acids EPA and DHA can prevent bone loss and induce bone formation regeneration. It was also explained that RvE1 is a derivative of EPA omega-3 fatty acids which have anti-inflammatory and proresovin action mediated by the ChemR23 receptor which directly also functions to maintain bone through osteoblasts. In transgenic mice with ChemR23 receptors found additional anti-inflammatory action of RvE1 which directly impacts bone remodeling by suppressing bone resorption.\(^{(10)}\) The same thing was reported by Harerra et al. that RvE1 can inhibit osteoclast growth and bone resorption.\(^{(11)}\)

**Conclusion**

Based on the results of the study concluded that omega-3 fatty acids can significantly increase the height of children under five with stunting.

Relations Exposure to Dust Inhalation Against Impaired Lung Function in Worker Unloading at the Port of Manado, North Sulawesi

Lili Sutanti1, Zikri Fathur Rahman1, Nur Iailatul Masruroh2, Abdul Rohim Tualeka3
1Students at the Department of Occupational Health and Safety, Faculty of Public Health, Airlangga University, 60115 Surabaya, East Java, Indonesia; 2Department of Nursing, Faculty of Health, Muhammadiyah University Malang, 65144 Malang, East Java, Indonesia; 3Department of Occupational Health and Safety, Faculty of Public Health, Airlangga University, 60115 Surabaya, East Java, Indonesia

Abstract
Upper respiratory tract infection has been one of the top ten illness the last three years. In 2014 (28,579 cases), in 2015 (39,110 cases) and in August 2016 (27,068 cases). In the community health service of the Manado Port area, the upper respiratory tract infection is on the top list. The problem of loading and unloading is the problem of loading and unloading workers in Manado Port. The problem of loading and unloading workers in Manado Port. The research was observational with analytical approach and cross sectional design, with 60 samples of respondents. It consists of 9 variables and data was collected by interview, observation and measurement. (P = 0.195; PR = 0.648 (95% CI = 0.533 - 0.789). Smoking habit (p = 0.786; PR = 0.788 (95% CI = 0.361 - 1.719) Working period (p = 0.143; PR = 1.959 (95% CI = 0.896 - 4.283). Working duration (p = 0.838; PR = 0.831 (95% CI = 0.390 - 1.771) With potential variables. Affecting lung function impairment of loading and unloading workers is use of mask (p = 0.195) and period of work (p = 0.143). There is no significant correlation between use of mask, smoking habit, period of work, working duration, inhaled dust exposure and lung function disorder.

Keywords: inhaled dust exposure, lung function disorder.

Introduction
Among the environmental pollution, air pollution in Indonesia is a major determinant lingkungan quality, especially in big cities. Transport accounted for 60-80% of the air pollution. Some types of contaminants that are considered harmful to health community for example: PM2.5 and PM10, namely ka rbon monoxide, nitrogen dioxide, sulfur dioxide, particulates, hydrocarbons, CFCs, lead and carbon dioxide. Odorless and poisonous gas. The impact of air pollutants depends on the type of pollutant. PM10 is all particles that have a diameter of 10 microns. Because of its diameter, particles can enter the airway. Larger particles get stuck in the upper respiratory tract. But smaller particles measuring below 2.5 microns can enter the pulmonary alveoli and cause serious problems, from asthma to Chronic Obstructive Pulmonary Disease.

Respirable dust is dust or particles that are small enough that can enter into the nose to the upper respiratory system and into the inner lungs. Particles that enter the inner lung or inner respiratory system in general cannot released by the body’s mechanism system naturally (cilia and mucus) then as a result the particles will stay forever in the lungs.

The broad surface of the lungs, which is only separated from the thin membrane of the circulatory system, theoretically results in a person easily attacked by the entry of foreign matter (dust) and bacteria that
According to the International Labor Organization (ILO), an abnormality that occurs due to accumulation of dust in the lungs that causes a tissue reaction to dust is known as pneumoconiosis. Symptoms of pneumoconiosis include long coughing, long phlegm, fatigue, shortness of breath sometimes accompanied by wheezing.

Based on ILO data in 2013, 30% to 50% of workers in developing countries suffer from pneumoconiosis. Every year there are 2.3 million people in the world dying from work, both due to work-related illnesses and accidents. This figure is dominated by occupational diseases, namely 2.02 million cases of death.

Data on the prevalence of pneumoconiosis vary in each country in the world. SWORD data in the UK in 1980-1988 showed cases of pneumoconiosis of 10%. In Canada, cases of pneumoconiosis in 1992-1993 were 10%. While data in South Africa in 1996-1999 was 61%. In China from 1949-2001 the number of cumulative pneumoconiosis cases reached 569,129 cases.

Manado Harbor North Sulawesi, which is one of the inter-island connecting ports to the Sangihe and Talaud islands also to Ternate, every year has experienced increased activity, both people, goods and commodities between islands. Circulation of materials, commodities and chemicals and other materials always uses the port area as a route of transit before being sent to users/users. In fact, many chemicals are found stored in warehouses/storage located in the port area for days.

Several studies related to the use of Personal Protective Equipment (PPE) were carried out by Herlita, in the furniture industry in Makassar, showing that not using personal protective equipment (masks) had a significant relationship with a decrease in lung capacity. From the results of these studies it is known, strong relationship between respondents who did not use personal protective equipment with lung capacity and contributed 54.6% to the decline in lung function.

In the last three years ARI disease in the city of Manado ranks the top in 10 prominent diseases. In 2014 (28,579 cases), 2015 (39,110 cases) and 2016 in August (27,068 cases).

Based on preliminary studies at the Wonasa City Manado Public Health Center where the Manado port is included in its working area, for Acute Respiratory Infections (ARI) is the top-most prominent disease in ten prominent diseases that exist. Based on identification and interviews with puskesmas officers that some people with ISPA are laborers or members of TKBM in Manado port.

Based on the background of these problems, the authors suspect that the strong relationship between inhaled dust exposure and pulmonary dysfunction in loading and unloading workers at the port of Manado.

Material and Method

This study was an observational analytic study using a cross sectional design. In cross sectional analytic studies studying the relationship between risk factors and disease (effects), measurement of independent variables and dependent variables is done once at the same time.

The population in this study were all laborers transporting goods/materials from warehouses to ships, which are members of the Koperasi Sejahtera TKBM Manado City, which is 151 people. These transport workers are people who work exposed to dust in goods storage warehouses in the form of cement, fertilizers, pesticides, chemicals, bran, rice, and other basic commodities. The sample in this study is a portion of the population that is considered representative taken by using purposive random sampling technique and the determination of the sample size is calculated based on the Lemeshow formula. After calculated based on the formula, the number of samples was 60 respondents (minimum sample). The sample collection technique is purposive sampling.

Data collected directly by researchers against respondents. Data obtained are:

1. Measurement of inhaled dust levels using a PDS (Personal Dust Sampler)
2. Measurement of lung function capacity with a Spirometer tool
3. Measurement of body weight and height of respondents
4. Interview with respondents by filling out the questionnaire directly prepared (working period, length of work, mask use, smoking habits, exercise habits).

The data collected in this study was analyzed by
Chi-Square at a significance level of 5%.

Findings

The average age of respondents was 38.40 years standard deviation of 10.329. The minimum age of the respondent is 19 years and the maximum value is 58 years. The average working period of respondents is 9.10 years with a standard deviation of 7.489. The minimum value of the respondent’s tenure is 2 years and the maximum score is 38 years. The average length of work of the respondent is 8.60 hours with a standard deviation of 827. The respondent’s minimum length of work is 8 hours and the maximum value is 12 hours. Distribution of mask use is 54 (90%) using masks and 6 (10%) respondents who do not use masks. The distribution of smoking habits is 44 (73.3%) respondents who smoke and 16 (26.7%) who do not smoke.

Respondents with pulmonary disease disorders were experiencing 19 disorders (31.7%) and no interference namely 41 (68.3%). The average level of inhaled dust is 0.22 mg/m³ with a standard deviation of 0.322. The minimum value of inhaled dust is 0.28 mg/m³ and the maximum value is 1.028 mg/m³. The average lung capacity of respondents is 91.52% with a standard deviation of 21.214. The minimum value of the respondent’s lung capacity is 40% and the maximum value is 130%.

Risk Factors for Lung Function Disorders

The relationship between the use of masks and pulmonary dysfunction in loading and unloading workers at the Port of Manado.

In the variable use masks are grouped into not using masks and using masks. Data shows that of 54 respondents who did not use masks 19 (35.2%) respondents experienced pulmonary function disorders and 35 (64.8%) respondents did not experience pulmonary function disorders while those without pulmonary function, namely 16 (57.1%) respondents. Respondents who worked <10 years were 32 (100%) respondents, who underwent pulmonary function disorder, namely 7 (21.9%) respondents and 25 who did not experience pulmonary function disorders (78.1%).

The results of the bivariate analysis for the relationship between smoking habits and pulmonary dysfunction in loading and unloading workers at the Port of Manado obtained a significance value of 0.786, thus the probability (significance) was more than 0.05 (0.786 > 0.05), Ha was rejected or there was no significant relationship between smoking habits and pulmonary function disorders.

The results of bivariate analysis for the relationship between smoking habits and pulmonary dysfunction in loading and unloading workers at the Port of Manado obtained a significance value of 0.786, thus the probability (significance) was more than 0.05 (0.786 > 0.05), Ha was rejected or there was no significant relationship between smoking habits and pulmonary function disorders.

The value of $p = 0.195$ is more than the significance of 0.05, so there is no significant relationship between smoking habits and pulmonary function disorders.

Risk Factors for Lung Function Disorders Work

Relationship of Work Period with pulmonary function disorders

tenure variables are grouped into 2 categories, namely work period> 10 years and 10 years totaling 28 (100%) respondents and 12 (42.9%) respondents who experience pulmonary dysfunction while those without pulmonary function, namely 16 (57.1%) respondents. Respondents who worked <10 years were 32 (100%) respondents, who underwent pulmonary function disorder, namely 7 (21.9%) respondents and 25 who did not experience pulmonary function disorders (78.1%).

The value of $p = 0.143$ is more than the significance of 0.05, so there is no significant relationship between years of work with pulmonary function disorders.

The results of the bivariate analysis for the relationship of working period with pulmonary dysfunction in loading and unloading workers at the Port of Manado, obtained a significance value of 0.143 thus the probability (significance) was more than 0.05 (0.143 > 0.05) then Ha was rejected or there was no meaningful relationship between work periods with lung function disorders workers unloading at the port of Manado.
Workers who are in a high dust environment for a long time have a high risk of pulmonary function disorders. According to Suma’mur, one of the potential variables that can cause lung function disorders is the length of time someone is exposed to these pollutants. This means that the longer the working period of a person, the longer the time of exposure to these pollutants.

**Long work relationship with pulmonary function disorders**

Long-term relationship variables are divided into 2 categories, namely working time > 8 hours and ≤ 8 hours. In the total data of respondents working > 8 hours as many as 28 respondents, 8 (28.6%) respondents experienced pulmonary function disorders and 20 (71.4%) respondents did not experience pulmonary function disorders. While respondents who worked ≤ 8 hours were 32 respondents, 11 (34%) had pulmonary function disorders and 21 (65.6%) did not experience pulmonary function disorders. The value of p = 0.838 is more than the significance of 0.05, so there is no significant relationship between the length of work with pulmonary function disorders.

The results of the bivariate analysis for the length of work relationship with lung function disorders of loading and unloading workers in the port of Manado, obtained a significance value of 0.838, thus the probability (significance) was more than 0.05 (0.838 > 0.05) then Ha was rejected or there was no meaningful relationship between the length of work and pulmonary dysfunction workers loading and unloading at the port of Manado.

**Relationship to inhalation of dust exposure with pulmonary function disorders**

Variable relationships inhaled dust exposure are divided into 2 categories, namely not fulfilling the requirements and fulfilling the requirements. In the data shows that 60 respondents or total respondents there were no respondents who experienced exposure to inhaled dust that did not meet the requirements. Respondents with exposure to inhaled dust who fulfilled the requirements were 19 (31.7%) respondents experiencing pulmonary function disorders while 41 (68.3%) respondents did not experience pulmonary function disorders.

The results of data analysis for respondents exposed to inhaled dust below the Threshold Value (NAB) amounted to 60 (100%) respondents. There were no respondents exposed to dust above the NAB. In line with the research conducted by Fordiastiko, there were no significant abnormalities of pulmonary physiology between groups of cement factory workers who worked with dust levels above the NAB with those below the NAB (p = 0.509). The size of dust or particles that enter into the lung will determine the location of attachment or deposition. Human sucked particles less than 1 micron in size will come out when exhaled breath. Particles measuring 1-3 microns will enter the air bag of the lungs, attaching to the alveoli.

**Conclusion**

There was no significant relationship between mask use (p = 0.195), smoking habits (p = 0.766), work period (p = 0.143), length of work (p = 0.838) and exposure to inhaled dust (100% below NAB) with pulmonary dysfunction in loading and unloading workers at Manado Harbor. The most potential variable associated with pulmonary function disorders in loading and unloading workers in the Port of Manado is the use of masks with a value of p = 0.195 and years of service with a p value = 0.143.

Urinary Tumor Markers for Detection and Surveillance in Non-Muscle Invasive Bladder Cancer

Mohamed Jamal Saadh¹, Abeer Mohammad Kharshid¹, Hala Mousa Sbaih¹, Khalil Altaif¹
¹Department of Pharmacy, Faculty of Pharmacy, Middle East University, Amman, Jordan

Abstract

Objectives: Cystoscopy still remains the gold standard for diagnosis and follow-up monitoring of bladder cancer (BC). Unfortunately, it is an invasive, and the urine cytology is a highly specific, sensitivity for detection of low grade tumors is only 4% to 31%. The advent of noninvasive urine-based markers as well as other novel modalities has yielded improved diagnostic accuracy.

Material and method: Pubmed/Medline search was conducted to identify original articles, review articles, and editorials regarding urine-based biomarkers for screening, early detection, and surveillance of urothelial carcinoma of the bladder. Results: urinary marker shave shown higher sensitivity compared with cytology, and most markers suffer from lower specificity than cytology. In this review, we aimed to summarize the current knowledge on commercially available and promising investigational Urinary tumor markers for detection and surveillance in Non-Muscle Invasive BC. Conclusions: biomarkers into clinical decision making will be of value for BC detection and screening in the future.

Keywords: Bladder cancer (BC), Biomarkers, Urinary marker.

Introduction

Bladder cancer (BC), a highly aggressive and heterogeneous disease, is the most common malignancy of the urinary tract. (1). The highest incidence rates of BC are generally found in industrially developed Countries².

Early diagnosis of BC allows for effective local treatment and optimizes the success of surgical therapy.(3). In this review, we use this framework to discuss the urinary biomarkers for early diagnosis of BC.

1. Cytology

Urinary cytology has been established as the standard noninvasive urinary marker for detecting BC. High-grade cancers are more likely than low-grade tumors to shed their cells into the urine due to their weaker intercellular attachments (1). Many studies demonstrated a poor sensitivity for low-grade BC (13% to 75%), with improved sensitivity and specificity for high-grade disease. The sensitivity for high-grade cancers has been over 80%. The overall sensitivity of cytology ranges from 25 to 70% (2).

2. ImmunoCyt

ImmunoCyt combines cytology with an immunofluorescence assay(3). It detects cellular biomarkers for BC in exfoliated urothelial cells using fluorescent monoclonal antibodies for a high molecular weight form of carcinoembryonic antigen and two bladder tumor cell associated mucins. The test requires trained personnel, it is expensive, and a large number of exfoliated cells are necessary to perform an accurate test(4). ImmunoCyt has a reported overall sensitivity of 50–100% (5). Its specificity has been reported as 69–79%, with a higher false positive rate in patients with benign prostatic hyperplasia or cystitis(4, 5).

3. Fluorescence in situ hybridization (FISH)

FISH is a molecular test that utilizes DNA probes to identify the most common urothelial carcinoma related chromosomal changes in exfoliated cells in the
The test was designed to detect aneuploidy of chromosomes 3, 7, 17 and the loss of the 9p21 locus in malignant urothelial cells (6).

The sensitivity of the UroVysion FISH test to be between 69 and 85%, with a specificity of 78 to 92% (7, 8). In a direct comparison of FISH with cytology and NMP-22, FISH was found to have better sensitivity for low grade tumors. The combination of FISH and cytology detected 97.4% of cancers, while the combination of cytology and NMP-22 detected 92.1% (9).

4. Aurora kinase A (AURKA)

The Aurora kinase A (AURKA) gene encodes a serine/threonine kinase associated with aneuploidy and chromosome instability. This gene has been explored in urine sediment by FISH. A training set was used to establish test conditions. A separate testing set of 100 patients with BC, 92 healthy individuals, and 56 patients with benign urologic disease reported a test sensitivity of 87% and a specificity of 97% (10).

5. Cytokeratins

Cytokeratins are intermediate filaments proteins that are part of the framework of eukaryotic cells; their main function is to enable cells to withstand mechanical stress. In humans 20 different cytokeratin isotypes have been identified. Cytokeratins 8, 18, 19 and 20 have been associated with BC (11). The urinary BC test detects cytokeratin 8 and 18 fragments in urine. The sensitivity of the urinary BC test varies from 35% to 79% (12).

6. Bladder tumor antigen (BTA)

BTA stat and BTA-TRAK are designed to detect bladder tumor associated antigen in voided urine. This antigen is a human complement factor H–related protein similar to human complement factor H. BTA interacting with complement factor C3b interrupts the complement cascade, potentially conferring a selective growth advantage to cancer cells. In cell culture, normal cells do not express the H-related protein (13).

The sensitivity and specificity of BTA stat ranged from 67 to 70% and 75 to 78%, respectively. The sensitivity and specificity of BTA-TRAK was noted at 66 and 65%, respectively (14). BTA stat demonstrates improved sensitivity with increasing histological grade; 53, 76, and 90% for grades 1 through 3. It has also been noted to have improved detection and sensitivity for superficial and low-grade tumors compared to urinary cytology; however, at the cost of lower specificity (13). The infection or urinary lithiasis, may lead to a false positive for BTA. In addition, false positives may be seen in patients with a history of Bacillus Calmette-Guerin (BCG) therapy or urinary diversions utilizing the bowel.

7. LEWIS X

Monoclonal antibodies have also been utilized to detect the Lewis X antigen on exfoliated urothelial cells. The Lewis X is a blood group antigen that is normally absent from urothelial cells in the adult, but is expressed in transitional cell tumors regardless of the secretor status, grade, or stage of the tumor (15). Commercially available antibodies, such as the P-12 murine monoclonal antibody, have been utilized to target and detect the Lewis X antigen (8).

8. ACCU-DX

The Accu-Dx test was developed as a qualitative point-of-care immunoassay utilizing murine monoclonal antibodies specific for (fibrin/fibrinogen degradation products) FDP. However, since these antibodies have also been noted to react with intact fibrinogen typically found in human serum, the usefulness of the test in the presence of hematuria may be low (16).

9. Hyaluronic acid (HA)

HA is an extracellular glycosaminoglycan that supports tumor cell adhesion and migration, and offers some protection from immune system surveillance in tumor tissues. Small fragments of HA stimulate angiogenesis and are produced by hyaluronidase (HAase). The small HA fragments have been identified in the urine of patients with BC (16). The importance of HA and HAase in BC pathogenesis has been noted in a study in which staining of BC tissues for HA and HAase correlated with muscle-invasive disease and recurrence (17). Hyaluronoglucosaminidase-1 (HYAL-1) is a specific HAase that has been identified as a marker for cancer detection, and is a molecular predictor for tumor growth, invasion, and angiogenesis. HYAL-1 mRNA levels have been noted to be elevated 10 to 30 fold higher in bladder cells and tissues that express high HAase activity, as well as in the urine of patients with BC (16).

10. Microsatellite Analysis

One of the most common genetic changes in BC is
loss of heterogeneity in chromosome 9. Chromosomes 4p, 8p, 9p, 11p, and 17p also often display loss of heterogeneity in patients with BC(18).

Microsatellite analysis evaluates for tumor specific genomic alterations in a different manner than FISH. Microsatellite analysis targets highly polymorphic, short tandem repeats. This technique evaluates the shift in the normal ratio of two alleles that occurs with genomic alterations from tumor cell transformation. This loss of heterozygosity can be used as a biomarker of a suspected neoplastic process. It had already been established that microsatellite changes in urine samples matched DNA extracts from tumor tissues(19).

11. BLCA-1 and BLCA-4

BLCA-1 and BLCA-4 are nuclear transcription factors present in BC. BLCA-1 is not expressed in nonmalignant urothelium, whereas BLCA-4 is expressed in both the tumor and adjacent benign areas of the bladder but not in nonmalignant bladders(20).

A nuclear matrix protein specific to BC tissues, termed BLCA-4, has been identified. It holds great promise as a potent urine based bladder tumor marker(5).

12. CEACAM1

Bladder tumor growth and progression depend on angiogenesis. Human carcinoembryonic antigen-related cell adhesion molecule (CEACAM)1 is a cell adhesion molecule with proangiogenic activity. It has previously been observed that CEACAM1, which is ubiquitously expressed in the luminal surface of normal bladder urothelium, is down regulated in BC cells while it is concurrently up regulated in endothelial cells of adjacent blood vesse (5). This differential switch in CEACAM1 expression is accompanied by an up regulation of proangiogenic and prolymphangiogenic factors. Based on these findings, it was assessed whether CEACAM1 was detectable in urine and whether its levels could help differentiate BC patients from healthy subjects(5).

13. MicroRNA markers

MicroRNAs (miRNAs) are noncoding RNAs that post transcriptionally regulate gene expression(21). They might serve as an ideal bladder biomarker because they are stable within urine and require little handling care(22), and they are more stable against nuclease degradation due to their small size. Urine contains many nucleases, and assays to examine mRNA expression often fail due
to target degradation or require stringent prelaboratory handling of the urine sample. Recently, urinary miRNA expression was reported and the upregulation of miRs-126/182/199a was found to discriminate BC patients from disease-free controls(23).

14. Survivin

Survivin, a novel member of the inhibitor-of-apoptosis gene family, is prominently reexpressed in many types of cancer. Survivin messenger ribonucleic acid (mRNA) is overexpressed in human cancers and can be detected in urine using a bio-dot immunoassay incorporating a rabbit polyclonal antisurvivin antibody(24). Urinary levels of survivin gene activation, both at the protein and the mRNA level are associated with BC presence, higher grade, and advanced pathologic stage(5).

15. Proteomics and genomics

Advances in the fields of molecular genetics and tissue microarrays have led to the development of many potential novel biomarkers. The chemokine CXCL-1 and the matrix metalloproteinases MMP-2 and 9 have been identified using these immunochemical techniques as potential urine based markers(25).

16. Additional urinary markers

Many other potential biomarkers have been evaluated for their potential usefulness as a urine-based tumor marker. Some of the more promising of these have included cytokeratin CK20, The CK20 assay has 78 to 87% sensitivity and a 56 to 80% specificity for BC detection. A summary of these current and emerging bladder tumor biomarkers are shown in, Table (1)(8).

17. Nuclear matrix proteins (NMP)

NMP-22 is a nuclear mitotic apparatus that is involved in proper distribution of chromatin to daughter cells during cellular replication(25). It is located in the mitotic spindle during mitosis. NMP-52 and NMP-22 is present at a relatively low level in the interphase nuclear matrix. It is probably released from the nuclei of the tumor cells during apoptosis. NMP-52 and NMP-22 concentration is at least 25 fold greater in BC than in mean levels isolated from normal bladder and also five times greater in urine from patients with pyuria, urolithiasis, hematuria, and cystitis comparing with normal bladder(1, 26).
The NMP marker was identified in the urine of patients with BC at 52 kDa. The dot-ELISA detected the urinary NMP-52 marker in 92% of patients with squamous cell carcinoma, 98% with transitional cell carcinoma, and all six of those with adenocarcinoma of the bladder, with a specificity of 94% (27).

Discussion

Urinary cytology is lacking the sensitivity for different grades of BC specifically in low-grade tumors (1, 2). Urine markers have been investigated; however, to date, no marker has reached widespread use. Although urinary markers have shown higher sensitivity compared with cytology, most suffer from low specificity (18). Combination of different markers is promising concept and seems to represent the future. Another limitation is that each setting (screening/early detection and surveillance) suffers from different requirements. Finally,
each marker has also to prove its cost effectiveness and also the advent of noninvasive urine based markers as well as other novel modalities has yielded improved diagnostic accuracy (26).

Conclusions

Future studies are needed to clarify the prospective biological markers in different stage and grade of BC; The combination of urinary markers and urine cytology is a good diagnostic tool for BC in different pathological types of BC.

Abstract

Background: It has been shown that QT dispersion (QTD) increases during episodes. Current study has been done in order to determine QTD in patients with stable angina, assess myocardial ischemia and infarction.

Aims of Study: This study aiming to determine the relationship between severity of coronary artery disease (CAD) and degree of QTD.

Patients and Method: A 214 patients (177 men and 37 women) underwent diagnostic coronary angiography because of suspected CAD. Standard resting 12 lead electrocardiogram (ECG) were recorded within 24hrs before coronary angiography. QT intervals were measured manually by ruler method and QTD were gauged as (QT maximum – QT minimum).

A 184 patients had CAD and control group (30 persons) had a normal coronary angiogram

Interestingly, QTD has increased significantly as there was sever increment of CAD. QTD was in 1 vessel disease, 2 vessel disease, in 3 vessel disease, and in left main stem disease.

Left ventricular dysfunction has raised QTD significantly in patients with 1,2 vessels, as well as left main stem disease.

QTD clearly elevated as Gensini score increased. Involvement of proximal left anterior descending artery did not increase QTD significantly in patients with CAD.

Multiple regression analysis demonstrated that severity of CAD, left ventricular dysfunction and previous myocardial infarction were independently associated with increased QTD.

QTD increased significantly in patients with stable angina compared to the controls. Severity increase of CAD resulted in significant increase in QTD, and presence of LV dysfunction has caused further increase.

Introduction

QT dispersion (QTD) has been defined as difference between maximum and minimum QT intervals in any number of Electrocardiography (ECG) leads [1, 2] and related to electrical instability and risk of ventricular arrhythmogenesis [2].

QTD increased in patients with coronary artery disease (CAD) [3-5] and it especially prolonged during active ischemia [6, 7].

In present study we tried to determine QTD in patients with chronic stable angina as measured by surface ECG at rest. As well as, to assess the relationship between severity of CAD as assessed by coronary angiography and the degree of QTD.

Patients and Method

Between April 2001-2002, 2106 patients underwent cardiac catheterization and coronary angiography for definite or suspected Ischemic Heart Disease (IHD) in Ibn Albitar Hospital for Cardiac Surgery. Of those patients 214 (177 men and 37 women) fulfilled the following criteria.

1. Coronary angiography because of suspected CAD.
2. No valvular disease.
3. No sign of LV hypertrophy on LV angiogram or Echo study.
4. No evidence of unstable angina or acute myocardial infarction (MI).
5. ECG: sinus rhythm, no bundle branch block, with a well-defined T wave in all or most (10 or more of the 12 leads ECG) leads that make accurate measurement of QT interval possible.
6. Normal levels of serum potassium and calcium.
7. No medication, known to induce prolongation or shortening of QT interval or change QTD.

Detailed history and careful physical examination have been applied for all patients.

Standard resting 12-lead ECG with simultaneous lead acquisition were recorded with Mac 500, version 2.2 (Marquette Hellige GmbH, Freiburg, Germany) at speed 25 mm/second.

Diagnostic coronary angiography and left ventriculography were done within 24 hours of the ECG recording.

Coronary Angiography

Left heart catheterization was done using Judkin’s technique (percutaneous transfemoral) [9]. Coronary angiography has been done in multiple views. Coronary artery lesions were considered significant in cases when stenosis was at least 70% (or 50% left main coronary artery) [10].

Furthermore, coronary angiography was evaluated as single, double or triple vessel disease [8, 11] by quantification of the lesions according to Gensiniscore [12].

In addition, left ventricular function was assessed by single plane left ventricular angiogram in the 300 right anterior oblique positions [13], as well as by two D and M modes Echocardiography [14]. Moreover, normal LV function was defined as ejection fraction of 55% or more [15].

Mild LV dysfunction was defined as ejection fraction (EF) between 40-55%. Finally, moderate LV dysfunction 30-40% and severe LV dysfunction < 30% [15].

Analysis of ECG

Einthoven lead II [8] was analyzed in order to measure QT and corrected QT (QTc) intervals.

QT intervals were measured manually (ruler method) [16] in all limb and chest leads by two observers and were measured from the onset of QRS complex (from the first deflection of QRS complex) to the point of return of the T wave to the isoelectric line [3, 8, 17]. More specifically, when a U wave followed the T wave, the end of the T wave was taken as the nadir between the T and U waves [6]. In case that the end of the T wave could not be identified assuredly, that lead was excluded from the analysis.

Notably, the QT interval was measured in three consecutive complexes in each lead and the average value was relied [6].

QTD was calculated as the difference in ms between longest and shortest measured QT intervals [3, 6, 16 & 18].

No attempt was made to correct for missing leads.

For the measurement of QTc interval of lead II modified Bazett’s formula was applied QTc=QT/RR [1, 8].

Patients were considered normal in term of coronary arteries when there was no angiographic stenosis, no clinical, as well as ECG or angiographic evidence of previous myocardial infarction [6].

Statistical Analysis

All data were given as mean ± standard deviation. Analysis of variance (ANOVA) was used for comparison among variances.

P ≤ 0.05 was considered significant.
Results

The study population was composed of 184 patients with CAD with a mean of age (54.75± 9.19 years) and 30 patients with normal coronary angiogram (control group) with a mean of age (Table 1).

No significant difference was found between the two groups in term of age; however hypertension, diabetes mellitus (D.M.) and smoking were more common among those with CAD. Interestingly, male: female ratio was significantly higher in CAD patients.

Among patients with CAD, ECG evidence of Q wave MI was present in 90 patients that represent (48.9%).

Patients with CAD have been classified according to the severity of their disease as single, two, three- vessel or left main stem (LMS) disease (Table 2). Moreover, those with more extensive disease tended to be older with most common hypertension and D.M. In contrast, there was no significant difference in relative to gender or smoking within the different groups of CAD patients.

No significant difference in the incidence of Q wave MI or LV dysfunction in all groups of CAD patients was detected. In addition, our results have illustrated that QTD significantly increased as severity of CAD elevated (Fig. 1). However, no significant difference in QTD was found between those with three vessels disease and LMS disease.

Patients with CAD (one, two, three vessels or LMS disease) are further stratified according to their LV function (Table 3). LV dysfunction induced QTD significantly in patients with one, two vessels and LMS disease.

We noticed that the occurrence of Q wave MI among those with LV dysfunction was significantly higher than those with normal LV function in patients with one, two vessels and LMS disease.

If Gensini score is used to assess the severity of CAD (Fig. 2), so the QTD is clearly raised as the score increased.

We also found that there was no significant difference in QTc interval when compare normal subjects to those with CAD, or among different groups of patients with CAD (Table 3).

In the current study, when patients with CAD are stratified according to LV function and involvement of proximal left anterior descending (LAD) artery (Table 4).

Discussion

Present study has appraised relationship between QTD and severity of CAD in patients with angina pectoris. Observations of our study have showed that hypertension, diabetes mellitus, smoking and male gender were more prevalent among patients with CAD in comparison to control group. This prevalence indicates the impact of these risk factors in increasing coronary atherosclerosis [11, 19].

Among patients with CAD, we found that those with more extensive disease tended to be older, with most common hypertension and diabetes mellitus. Previous study has revealed that prevalence and severity of coronary artery atherosclerosis increase dramatically with age advance [11]. Our interpretation is that may reflect the cumulative nature of atherogenesis [20]. In addition, it has been demonstrated that aging is associated with higher incidence of hypertension, diabetes mellitus, disturbed lipid profile and obesity [11].

We also found that QTD is significantly increased among patients with stable angina than healthy controls. In agreement with our observations, Tikiz et al [21] has showed that patients with single vessel disease had wider baseline QTD.

Numerous studies have evaluated QTD in patients with CAD during active ischemia either induced by atrial pacing [6], exercise test [23], spontaneous anginal episodes [23] or after acute MI [3].

Transient myocardial ischemia followed by reperfusion, or chronically ischemic and hypo perfused myocardium may result in increased production of superoxide and hydroxyl radicals [24], this leads to impaired sarcolemmal Na+, K+-ATPase and calcium-stimulated ATPase with resultant impaired excitation-contraction coupling and calcium overload which can also activate enzymes that causes further damage in the sarcolemma and sarcoplasmic reticulum [24]. Actually, these changes may persist after resolution of active ischemia [24].

In the current study, we evaluated the relationship between severity of CAD and QTD. We classified the patients into those with single, two, three vessels disease or left main stem disease or three vessels disease had QTD higher than those with two vessels disease who in turn have higher QTD than those with one vessel disease.

Notably, the relationship between severity of CAD and QTD has been demonstrated in post MI patients [25].

This study also assessed the effect of LV dysfunction or proximal LAD artery involvement on QTD in patients with CAD.

QTD did not increase significantly as severity of LV dysfunction increased LV dysfunction in patients with CAD may be due to myocardial stunning, hibernation [24] or scar due to previous MI.

In patients with previous MI, infarcted areas are associated with prolonged recovery times that, in the end, may lead to increased dispersion of repolarization compared with the base line state [24].

In TEAM-3 study [27] LV dysfunction was independently associated with increased QTD in patients with acute MI. However, Bodi et al [28] has revealed that QTD was not related to ejection fraction in patients within six months after an acute MI.

In fact, this contradiction mayy resulted from the differences in patients characteristics in diverse studies, as the study by Bodi and his Colleagues [28] has evaluated the effect of LV dysfunction on QTD in patients who have MI only, whereas the present study involves those with previous MI and those without history of MI.

The absence of significant increment of QTD in patients.

LAD artery supplies anterosuperior two thirds and the entire apical one third of ventricular septum, anterior LV free wall and the medial third of the anterior right ventricular free wall [33]. So critical stenosis in the proximal segment of this artery jeopardizes substantial area of myocardium.

Previously, Tikiz et al [21] showed that there is no relation between QTD and the pattern of CAD or the lesion localization in 119 patients with single vessel disease.

In our study, we used multiple regression analysis to identify variables independently affecting QTD. We included six variables: Age, hypertension, D.M., previous MI, severity of CAD and LV dysfunction.
Among these features, severity of CAD, LV dysfunction and previous MI are independently associated with increased QTD.

The impact of MI on QTD has been demonstrated also by Van de Loo et al [3] and Higham et al [29] who have revealed that QTD was higher in patients with acute MI than in those with unstable angina.

**Conclusions**

QTD is a simple ECG parameter, (which could be calculated easily at bed side) is significantly higher in patients with IHD in comparison to the normal persons and it increases with increased severity of CAD.

Measurement of Interleukin 17a and Transforming Growth Factor-B1 and Its Relation to Disease Activity in Systemic Lupus Erythematosus Patients

Mohammed.T. Alaanzy¹, Jinan .MJ.Alsaffar², Ahmed AbdulBari³
¹Researcher, College of science / University of Baghdad, ²Assist Prof, College of Science / University of Baghdad, ³Senior Specialist Doctor, Ibn Seena Hospital

Abstract

The study was done in January – may 2018, For measuring interleukin concentration 17-A and transforming growth factor-β1 in the serum of systemic lupus erythematosus (SLE) female patients(52 female) compared to the control group (36 healthy female).

An Eоzyme- Link ed Immun Osborne Assay (ELISA) was used to diagnose both IL-17A and TGF β1 in SLE patients and control. In case of IL-17A High significant in.crease (P < 0.0001) in SLE patients (38.54 pg / mL) compared with healthy control (20.24 pg / mL) was observed, while in patients with SLE, the transforming growth factor-β was (70.90 pg / mL) compared to healthy control (116.66 pg / mL) (P < 0.0001). To all SLE patients and control, The laboratory features include full blood count ,erythrocyte sedimentation rate ESR , ,an.d immunological tests like C3,C4,ANA and anti ds-DNA were done. ESR , WBC , ANA and Urea were significantly higher in SLE patient than con trol group (p.value 0.0001, 0.0001, 0.024, 0.0001 respectively) whereas Hemoglobin were significantly lower in SLE Patient than control group (p.value 0.0001) .C3&C4 were lower in SLE patients but with no significance value.

Key word s : Systemic Lupus erythematous ,Interleukin -17A, Trans forming growth factor-β1, disease activity.

Introduction

Systemic lupus erythematosus (SLE) is а chroz nic auto immune di sease that effect s many systems, organ s and tissues in the human bo dy such as kidney s, skin, cardiov.ascular system, lung.s, j.oints, muscles, and nervous system¹ . SLE has a broad variety of clinical presentations and various autoantibodies, most of which involve female of reproductive age.², ³. The duration of the disease differs with periods of remission and recurrence. ⁴. Although there has been important progress in understanding its etiopathogenesis over the previous few years, the actual cause of lupus is unknown. ⁴. Lupus pathogenesis includes many factors that are immunological, hormonal, hereditary and environmental. The incidence of disease differs among ethnic groups, among black females 1:250 and among white females 1:4300. ⁵,⁶.

In SLE pathogenesis, several main players such as cytokine over manufacturing ⁷,⁸, oxidative stress ⁹, and apoptosis s play a significant part. ⁴⁰

Cytokines plays a crucial role in the proeduction, maturaetion and diferentiation of immune cells. The effect of cytokine s on autoimmune SLE can not be continuously anticipated. ⁱ¹.

Interleukin 17 A is a multi-functional cyto.kine th.at influences the development of neutrophils and mediates T-helper-1 (Th1) and T-helper-2 (Th2) cytokines. ¹²,¹³,¹⁴.

In humans, IL-17A is mainly expressed through the T-helper-17 (Th17) subgroup of CD4 T-cells¹⁵, but it also produces neutrophils, CD8 + and double adverse (DN) T cells, and natural killer (NK) cells¹².

In vivo and in vitro production of IL-17 is mainly regulated by transform ing growth fact or beta-1(TGF-β) and interleukin-6 (IL-6) by the activ ation of the signal trans.ducer and the activator of transcription-3 (STAT-3) in mous e and hu.man models, respectively. ¹⁶,¹⁷.
Recent studies of IL-17 inhibition in achieve inanky,ising spo.ndylitis clinical advantage will raise concerns about the potential for inhibition of IL-17 in patients with SLE or in certain symptom types. (18,19) .

There are three tightly associated members in the cytokine family of transforming growth factor β (TGF-β): TGF-β1, TGF-β 2, and TGF-β 3. β 1 is of or m generated by lympho.cytes and mono.cytes with a significant immune regulatory function (20). TGF-β 1 is the most powerful naturally occurring immune suppressant, playing a main role in regulating cell proliferation and cell manufacturing through programmed cell death. TGF-β 1 is a important negative B-cell differentiation and proliferation regulator that inhibits the development of most immunoglobulin iso-types (21). It also co-stimulates the development of T-cells with down-regulating activities (22). TGF-β 1 can play a dual role in inflammatory immune-mediated disease development and progression. The production of TGF-β lymphocytes in SLE is decreased, which can predispose autoreactive T-cell activation and autoantibodies production. In autoimmune diseases, infiltration of target bodies such as T-cells or immune-complex autoantibody deposition triggers early inflammatory lesions that activate local production of anti-inflammatory cytokines such as TGF-β 1 by macrophages and kidney mesangial cells to combat inflammatory mesangial cells to prevent inflammation (23). Increased production of TGF-in 1 in tissues leads to local fibro.genesis and ultimately to severe organ damage (24). Any SLE treatment involving manipulation of TGF-β 1 should therefore be approached with caution, considering the effects on the entire cytokine network(25).

Patients and Method

Fifty-two female SLE patients were enrolled with 23-56 years of age (32.5 ± 1.1 years). They were referred during the period January – May 2018 for diagnosis and treatment to the Consultant Clinic at the Department of Rheumatology (Alyarmook Teaching Hospital and Baghdad Teaching Hospital). A control group of thirty six subjects were also included, and they were matched patients for gender and age where the age of patients and healthy individual range between 20 - 60 years.

Clinical Examination

Patients undergoing complete history and clinical examination including activity of disease , general locoumoter system, skin, cardiovgascular, thoracic, neurological and vascular examination.

Investigations

Investigations of each sample were done by full blood count, erythrocyte sedimentation rate, renal function tests, Com plment 3 , Com plment 4 ,AN A, and Anti double strand.ed DNA anti body.

Est Imation of Il-17A and Tgf B1

The patients ans controls serum were tested for IL-17A and TGF β levels. Sera was analyzed according to manufacturer’s protocols by sandwich enzyme-linked immuno.sorbent assay (ELISA). Quantikine® ELISA kit with. © Catalog Number D1700 used to check IL-17A with assay range: 11.373 - 59.326 pg/ml. TGF β assay by cusabio Co., LTD, the Catalogue Number:CSB-E04725h. Assay range: 22.508-151.321 pg/ml.

Statistical Analysis

Analysis of data was carried out using SPSS-25 (Statistical Social Science Packages- version 25). The significance of differing umeans (quantitative data) has been tested using Students-t-test to differentiate between two independent means or Paired-t-test for paired observation differences (or two dependent means), Or ANOVA test for distinction between more than two independent means. Measures the association closeness by correlation coefficient between twoou quantitative continuous variables. Kruskall Wallis one-way variance analysis (KW) test was used to compare the median for > 2 independent non-related samples. The P value was considered statistically significant less than 0.05.

Results

Table 1 shows the clinical features of patients with SLE compared to healthy control, there was no significant difference in (Creatinine ,Anti-dsDNA ,C4 ,and C3) of SLE patients and healthy control. SLE patients show highly result in ESR , WBC , ANA and Urea than control , whereas the test of Hemoglobin was lower in SLE patients than control.

Discussion

Systemic lupus erythematosus is a complex autoimmune disease involving various aspects of the immune system. In addition to antibody production and immune complex deposition, emerging evidence suggests that cytokines can play a major role in the pathogenesis of SLE(26).

In our study, the comparison of TGF-β1 serum levels for both SLE patients and controls shows significant statistical difference whereas the patients with lower values than control p.value 0.001. This was consistent with the Becker-Merok et al'(27) outcomes, which revealed that SLE patients had reduced concentrations of TGF-β 1 (p 0.01) than controls.

Several cytokine abnormalities have been recorded in SLE and latest developments have revealed new understanding of autoimmune inflammatory reactions in cytokine regulation. The production of TGF-β1, the primary regulatory T cytokines that suppress inflammatory reaction, has been discovered to be profoundly deregulated in SLE patients in specific. They were therefore regarded as essential elements in the disease etiology (28). TGF-β 1 is a extremely pleiotropical cytokine that plays a significant role in immune homeostasis maintenance (29). TGF-β 1 includes many critical cellular procedures, including cell development, extracellular matrix formation, cell motility, hematopoiesis, apoptosis and immune function. (30). TGF-β 1 has strong anti-inflammatory and immunosuppressive properties, controlled by all immune cells activation, proliferation, differentiation and survival (31).

Also we found the IL-17A levels were significantly higher than controls. Other researchers showed elevated levels of IL-17A in the serum of SLE patients because these cytokines are generated by the immune-response T-helper lymphocyte, which can be deregulated in the impaired immune response. (32,33).

Increasing concentration of IL-17A in SLE patients will probably lead to the recruitment and activation of immune cells in target organs, thereby improving the immune response. In SLE patients, the immune environment is ideally suited for IL-17 A producing T-cell.

From this research we found that IL-17 A & TGF-β1 can also serve a protective function in SLE patients.

Abstract

Surveillance of device-associated infections (DAIs) in intensive-care units (ICUs) is essential for a suitable healthcare strategy-planning. This study was conducted to determine the DAIs rate, microbial epidemiology, and antimicrobial resistance pattern (AMR) in ICU. Three major DAIs, ventilator associated pneumonia (VAP), catheter-associated urinary tract infection (CAUTI), and central line-associated bloodstream infection (CLABSI) were assessed prospectively during 6 months (2018 March 21 to September 22) in an 18-bed ICU of a tertiary teaching hospital in Tehran according to new CDC/NHSN definitions for surveillance of DAIs. The incidence of VAP, CAUTI, and CLABSI were 38.2, 8.9, and 13.5 per 1000 device-days respectively. The most organisms were Acinetobacter baumannii (34.9%), Klebsiella pneumonia (19%), E.coli (10.7%), Candida (10.7%), Enterococcus spp. (8.7%), Pseudomonas aeruginosa (8.7%), and Staphylococcus aureus (2.9%). Klebsiella pneumoniae carbapenemase (KPC)-producing was 47.4%. Acinetobacter resistance to Ampicillin-sulbactam and carbapenems was 80.6% and more than 90% respectively. Methicillin resistant Staphylococcus aureus (MRSA) was 66.6% and Vancomycin-resistant Enterococcus (VRE) was 88.9%. This study showed high incidence of DAIs and resistant organisms in the ICU. Preventive measures are essential to decrease the rates.

Key words: Device associated infection; antimicrobial resistance; intensive care unit

Introduction

Health care-associated infection (HAI) is an infection occurring in a patient during the process of care in a hospital or other health care facility which was not present or incubating at the time of admission (1,2). About 10% of patients admitted to hospitals are suffered from HAI (3).

In intensive care units (ICUs), the commonly reported infections are ventilator-associated pneumonia (VAP), catheter-associated urinary tract infection (CAUTI), and central line-associated bloodstream infection (CLABSI) resulting in high mortality (4,5). In low and middle income countries, the frequency of hospital infections in ICU is 2-3 times higher than in high-income countries, and use of devices is much higher than in the United States (4,6).

Considering resistant microorganisms, hospital environments are the largest sources of vancomycin resistant enterococci (VRE), Methicillin-resistant Staphylococcus aureus (MRSA), and multidrug resistance (MDR) gram negative bacilli like Klebsiella.
pneumoniae; so the microbial epidemiology should be investigated and monitored (4,7).

In developing countries such as Iran, there are some limitations in accurate detection of infections, causative agents, and antimicrobial resistance (8). For the importance of HAIs and the antibiotic resistance patterns of microorganisms, this study was conducted to determine the DAIs rate, microbial epidemiology, and AMR in a general ICU in a tertiary collegiate hospital in Tehran, Iran.

**Material and Method**

In this study, 629 patients admitted to the general ICU from 21 March 2018 to 22 September 2018 were studied and analyzed for HAIs according to Center for Disease Control and Prevention/National Healthcare Safety Network (CDC/NHSN) case-definitions (2). Information of the patients affected with infections was recorded according to declaration of Helsinki on medical research ethics (9). In a pre-defined form designed to collect data, the patients’ demographic information, infection types, cultures results, and denominators (patient-days, ventilator days, central-line days, and urinary catheter days) were recorded. Finally, the rate of DAIs and microbial epidemiology were assessed based on the data coded on the questionnaire and entered into the SPSS software version 24. To display quantitative information, mean ± SD is used and prevalence is indicated for qualitative variables.

**Results**

The study was conducted in an 18-bed general ICU during a 6-month period in 2018. In this duration 692 patients were admitted which 385 (56%) were male and 307 (44%) were female.

The study showed that 103 patients (14% of all ICU admission) were infected with DAIs. Infection subtypes included VAP (53 cases, 51.5% of DAIs), CAUTI (27 cases, 26.2% of DAIs) and CLABSI (23 cases, 22.3% of DAIs). The patient-days were 3212 for this time period. Device-days were as follows: 1386 ventilator-days, 3018 urine-catheter-days, 1698 central-line-days. Device associated infection (DAI) rate or density was calculated for each subtype. This rate for VAP, CAUTI, and CLABSI per 1000 device-days was 38.7, 8.9, and 13.5 respectively (Table 1).

**Table 1: Device-associated infection (DAI) rate/density, and device utilization ratio (UR).**

VAP: ventilator-associated pneumonia; CAUTI: catheter-associated urinary tract infection; CLABSI: central line-associated bloodstream infection; UR: utilization ratio

The number of crude mortality among infected patients for VAP, CAUTI, and CLABSI was 27, 15 and 12 patients. According to these total 54 deaths (of 103 HAIs) the crude mortality rate was calculated to be 52%. Among causative agents, gram positive cocci in 14 cases (13.6%), gram negative bacilli in 78 cases (75.7%) and 11 candida isolates (10.7%) were reported (Table 2). And the patterns of antimicrobial resistance (AMR) demonstrate in Table 3.

Discussion

In this study, we investigated the device-associated infections and the microbial pattern in a general ICU in a tertiary collegiate hospital in Tehran, Iran. The incidence for VAP, CAUTI, and CLABSI per 1000 device-days was 38.7, 8.9 and 13.5, respectively. According to the World Health Organization (WHO) report, the incidence for VAP, CAUTI, and CLABSI per 1000 device-days in developing countries is 23.9, 8.8, and 12.2(1). Comparing with this report, the rate of VAP is clearly higher in our ICU. The reason might be failure to fully design and implement an appropriate bundle for infection control of VAP in the ICU. In the International Nosocomial Infection Control Consortium (INICC) report for DAIs in ICUs of 50 low- and middle-income countries, the incidence density for VAP, CAUTI and CLABSI per 1000 device-days was 13.1, 5.07 and 4.1 respectively(10). In our study all DAIs rate were higher; might be for weakly implement of infection control components such as low hand hygiene compliance, inappropriate contact isolation, and etc. Afhami et al in a recent multi-center study in Tehran showed the rate of 21, 7.4, and 10.2 for VAP, CAUTI, and CLABSI in 1000 device-days(4). According to that multi-center study, it seems even in compare with similar ICUs in our local region, the rate of VAP in our ICU is higher and we should consider more preventive and control measures.

For causative agents and antimicrobial resistance, this study showed that overall in DAIs gram negative bacilli like Acinetobacter baumannii and Klebsiella pneumoniae were the most common organisms, and they were often multidrug resistance. In European Centers for Disease Control and Prevention (ECDC) report for ICUs, the most frequently isolated microorganism was Pseudomonas aeruginosa in pneumonia, coagulase-negative staphylococci in bloodstream infecions, and Escherichia coli in urinary tract infections(11). There was also in this report that 30% of Staphylococcus aureus isolates were oxacillin-resistant (MRSA). Resistance to third-generation cephalosporins was reported in 18% of E. coli isolates, 38% of Klebsiella spp. isolates and 32% of Enterobacter spp. isolates. Carbapenem resistance was reported in 11% of Klebsiella spp. isolates, 27% of P. aeruginosa isolates and 66% of Acinetobacter baumannii isolates (11). Comparing with ECDC report, in our study drug-resistance was much higher, representing the necessity of paying more attention to AMR and planning to prevent creation of such resistant microorganisms and control the spread of them in our ICU. In INICC report, the same microorganisms reported but the resistance level was lower than in our study (10).

There were some limitations to this study. The ICU was in a tertiary collegiate hospital; therefore, the patients with severe underlying diseases managed and required more intensive care, so the infection rate in our study may have been higher than the overall rate in the region.

Conclusion

This study showed high incidence of DAIs and resistant organisms in the ICU. Preventive measures are essential to decrease the rates.

NOAEL Benzene in White Mice as the Basis for Determining the Safe Limit of Benzene Concentration in the Pulogadung Shoe Industry Home in Jakarta

Muh. Arfandi Setiawan1, Herman Bagus1, Aisy Rahmania1, Cut Suci1, Carmelita Agustin1, Abdul Rohim Tualeka1

1Department of Occupational Health and Safety, Public Health Faculty, Airlangga University, Surabaya

Abstract

The shoe industry in its operational activities is very dependent on the quality of the material, one of which is glue containing benzene, the industrial workers have a risk of exposure to benzene. The purpose of this study was to determine the safe concentration of benzene in the leather shoe industry in the small industrial village of Pulogadung, Jakarta. This research is descriptive research. The population in this study were shoe workers who worked on the installation of sole 1 and sole 2, which amounted to 16 people. The results of the study were quantitatively analyzed to determine the safe concentration of benzene for workers obtained from data on benzene concentrations in the workplace, worker height, worker weight, rats’ weight, worker respiration rate, length of work, worker body surface area, surface area mice body, highest dose of toxin without effect on experimental animals (NOAEL), Km factor in animals (Animal Km), factor Km in workers (Human Km), and safe limit for toxin dose for workers (RfC). The measurement results of the concentration of benzene in the sole 1 section were 0.19 ppm and in the sole 2 part was 0.06 ppm, which means that the concentration of benzene is still below the Threshold Value according to Minister of Manpower Regulation Number 13 of 2011 at 0.5 ppm. Based on the calculations that have been done, the safe limit value is 0.021 ppm. Based on the minimum risk level (MRL), the concentration of benzene every day that can cause acute effects is 0.009 ppm and that can cause chronic effects is 0.003 ppm. From these standards, it can be seen that the concentration of benzene in the leather shoe industry has the potential to have an impact on the health of workers. Control measures are needed to see potential health problems that workers can experience because of the benzene. Recommendations to the leather shoe industry are to periodically monitor benzene levels in the air, conduct health checks on workers, and use personal protective equipment on workers such as masks to reduce levels of inhaled benzene into workers’ bodies.

Keywords: Benzene, NOAEL, shoe industry

Introduction

The informal industry sector is an unorganized, irregular, and some legal but not registered sector1. One type of informal business is the shoe industry. The materials used in making shoes are leather, footwear, and glue to glue. The increasing number of shoe industries, the more glue is used to produce these shoes. Hazardous substances in glues are volatile organic compounds (benzene, toluene, and xylene) which fall into the category of volatile VOC (Volatile Organic Compound)2. Based on the research conducted by the Director General of Indonesian Public Health, stated that the organic solevents in the glue were 70% toluene and more than 1-2% benzene solevents3.

Benzene is a chemical that is dangerous and carcinogenic to humans and is a colorless and volatile liquid. Benzene is widely used in the rubber industry, oil refining, shoe factories, chemical plants and other
The glue used in the shoe industry contains benzene which affects benzene exposure in the shoe industry. The permissible levels of benzene exposure according to several world organizations are 1 ppm determined by the National Institute for Occupational Safety and Health5 and Occupational Health and Safety Assessment Series6 and 0.5 ppm set by the American Conference of Governmental Industrial Hygienists7.

Indonesia itself has set a limit exposure in the benzene work environment that is set in the Threshold Limit Value (NAB) of benzene of 0.5 ppm in accordance with the Minister of Manpower and Transmigration Regulation of the Republic of Indonesia number PER/1/ MEN/ X/2011 concerning Factor Threshold Values Physics and Chemistry at Work8.

Several health cases related to benzene exposure have been found in several countries. Some cases due to the use of benzene in the shoe industry were in 1946-1956 in the United States there were 107 cases due to the concentration of benzene exposure which exceeded 400 ppm. Of these cases, hemopathy and thrombocytopenia were found9. In 1945-1955 there were 125 cases of platelet decline and abnormal liver function due to exposure to benzene which exceeded 400 ppm in the shoe industry. Whereas in 1948, the API (American Petroleum Institute) published that benzene is certain to cause leukemia and there is no small tolerance (zero ppm level) to benzene emissions10.

Determination of safe limits of benzene concentration in the work environment must involve knowledge of worker respiration rate (R), reference concentration (RfC) benzene, duration of work / day (tE), frequency of work each year (fE), duration of work (years) weight (Wb) and the average cancer year (70 years x 365 days) and non-cancer (30 years x 365 days)11.

This study aims to determine the magnitude of the environmental health risks of benzene exposure to workers in the shoe industry in Pulogadung Small Industry Village using an environmental health risk analysis approach. The population in this study were shoe workers who worked on the installation of solee 1 and solee 2, which amounted to 16 people.

The design of the research is to collect initial data related to work processes (chemicals in the area) and the number of workers. Furthermore, collecting primary data is the concentration of benzene in the workplace air, length of work time, and worker weight. In addition, secondary data collection was also carried out on experimental animals, namely the weight of white mice. The type of data in this study is primary data, obtained through questionnaires and observations as well as measurements of benzene in the air of the respondent’s workplace.

The variables in this study were benzene concentration in the workplace, worker height, worker body weight, rats’ weight, worker respiration rate, length of work, body surface area, surface area of the rat body, highest dose of toxin without effect on experimental animals (NOAEL), Km factor in animals (Animal Km), Km factor in workers (Human Km), safe limit of toxin dose for workers (RfC), and benzene concentration in safe air for workers (Safe C).

Data analysis in this study was carried out by using quantitative data analysis manually to determine the safe concentration of benzene for workers in the pulogadung leather shoes factory working environment.

**FINDINGS**

1. Characteristics of Experimental Animals and Surface Area of Animals Experiments (White Mice)

Toxicity can be interpreted as the ability of poisons (molecules) to cause damage if it enters the body and the location of organs susceptible to it. In this study, the implementation of a toxicity test using experimental animals namely white rats. This is done considering the human response to toxicity qualitatively is the same as the response of animals, so this fact is the basis of extrapolation from animal to human data.
Based on these data, it can be calculated the body surface area of white mice with

Animal BSA = 0.09 \cdot W^{0.67}

Description:

BSA : Body Surface Area (m²)
W : Weight (kg)

2. Characteristics of Workers, Worker’s Body Surface Area, and Worker’s Respiratory Rate

In this study, worker characteristics include weight and duration working time. The sample in this study were 16 respondents, namely workers in the pulogadung leather shoe factory.

Based on data on worker weight and height of workers, the body surface area and the rate of respiration of workers can be calculated using the following formula.

\[
\text{BSA}_{\text{human}} = \sqrt{\frac{W \cdot h}{3600}}
\]

Specification:
BSA: Body surface area (m²)
W : Weight (kg)
h : Height (cm)

B. Respiratory rate of worker

\[
\text{BR} = \frac{5.3 \cdot (\ln W) - 6.9}{24}
\]

Description:
BR : Breathing rate (m³/h)
W : Weight (kg)

From the calculation of the body surface area and the respiratory rate of workers, it is known that the average body surface area of workers is 1.53 m² and the average respiration rate of workers is 0.59 m³/hour.

3. Benzene Concentration

The measurement results of benzene concentration at two points in the leather shoes industry showed that the measurement results in the sole 1 section were 0.63 mg / m³ (0.19 ppm) and in the sole 2 section 0.29 mg / m³ (0.06 ppm)
Measurement results done, it is known that the concentration of benzene in the working environment of pulogadung leather shoes in sole 1 part is 0.19 ppm and in sole 2 parts 0.06 ppm. Based on the Minister of Manpower and Transmigration Regulation No. 13 of 2011 concerning the threshold value of physical factors and chemical factors in the workplace for concentrations of Benzene of 0.5 ppm so that the concentration of benzene in the shoe industry, the concentration of Benzene is below the NAB. However, the concentration of benzene is above the Minimum Risk Level (MRL), the level of benzene inhalation exposure set by ATSDR, i.e., for acute exposure (≤14 days) = 0.009 ppm, moderate exposure (15-364 days) = 0.006 ppm, and exposure chronic (≥365 days) = 0.003 ppm.

4. Animal Km and Human Km

A. Animal Km

\[ \text{Animal Km} = \frac{W_{\text{animal}}}{\text{BSA}_{\text{animal}}} \]

Description:
- Animal Km: Km factor in animals
- W: Experimental animal weight (white mouse)
- BSA: Body Surface Area of experimental animals (White mice)

Table 4. Results of Calculation of Animal Km in Experimental Animals (White Mice)

The calculation results of Human Km are shown in table 5. Average Human Km for Leather Shoe Industry workers which is 34.9.

5. NOAEL

NOAEL is the highest dose of a substance in statistical or biological chronic or subchronic toxicity studies that do not show detrimental effects on test animals. Toxicology testing can be used to calculate No Observed Adverse Effect Level (NOAEL) and is
useful for clinical trials. To determine the safe limit of concentration of a chemical begins with the toxicity test No Observed Adverse Effect Level (NOAEL).

Swaen (2010) states that benzene NOAEL is 3.0 mg / m³ or equivalent to 0.022 mg / kg.

\[
NOAEL_{benzene} = \frac{3 \times 0.0013 \times 8}{0.1405} = 0.022 \text{ mg / kg}
\]

6. Safe Human Dose

\[
RF_C = \frac{NOAEL_{Animal \text{ Km}}}{NOAEL_{Human \text{ Km}}}
\]

**Description:**
- **RF_C**: Safe human dose (mg / kg)
- **Animal Km**: Km factor in animals
- **Human Km**: Km factor in humans

Based on these equations, the calculation of RF_C obtained is

\[
RF_C = \frac{5.81}{34.9} = 0.003 \text{ mg / kg}
\]

7. Limit of Safe Level of Benzene Concentration

Determination of safe limits of benzene concentration in the work environment of the leather shoes industry uses the following formula (William, 1985; Soemirat, 2003; Davis, 1991).

\[
C_{safe} = \frac{(SHD)(W)}{(O)(BR)(t)} \text{ mg / m}^3
\]

To convert units of mg / m³ to ppm the following formula is used.

\[
C_{safe} = \frac{11 \text{ mg / m}^3}{(MW)} \times 24.5 \text{ ppm}
\]

**Description:**
- **C_safe**: concentration of toxin in the air is safe for workers (mg / m³)
- **SHD**: Safe Human Dose (mg / kg)
- **W**: Weight (kg)
- **O**: % of substances absorbed by the lung
- **BR**: Human respiratory rate (m³ / hour)
- **t**: Duration of working time (hours)
- **MW**: Molecular Weight / Molecular Weight

Based on the above equation, the calculation results of the concentration of safe concentration of benzene in the Leather Shoes Industry is:

\[
C_{safe} = \frac{(0.003)(53.75)}{(50%)(0.59)(6)} = 0.006 \text{ mg / m}^3
\]

\[
C_{safe} = \frac{0.068 \times 24.45}{75.11} = 0.021 \text{ ppm}
\]

The results of the calculation of the concentration of safe levels of benzene in the air for workers above can be used to predict the concentration of toxins in the air in a safe work environment for workers and to be compared with NAB that has been set by various good institutions by Kemenakertrans, National Standardization Agency, ACGIH, NIOSH, and OSHA.

Benzene in the shoe industry must be identified to determine the level of exposure that can cause effects on shoe workers. What can be done to reduce benzene exposure to workers is to use PPE regularly such as masks, especially during the bonding process. Another approach is taken by eating foods rich in detoxification enzymes, especially GSH which is usually found in most vegetables such as asparagus, spinach, broccoli, garlic, kale, and onions12.

**Conclusion**

The results of the measurement of benzene concentration in the Leather Shoes Industry in Pulogadung Small Industrial Village, Jakarta in the sole 1 section are 0.19 ppm and in the sole 2 part is 0.06 ppm. Based on the Minister of Manpower and Transmigration Regulation Number 13 of 2011, the threshold value of benzene is 0.5 ppm. From the results of measurements in this study when compared with the threshold value then it is still below the set threshold value.

Based on the minimum risk level (MRL) of ATSDR 2007, the concentration of benzene every day that can cause acute effects is 0.009 ppm and that can cause chronic effects is 0.003 ppm. From these standards, it can be seen that the concentration of benzene in the leather shoe industry has the potential to have an impact on the health of workers.

Control measures are needed to see potential health problems that workers can experience because of the benzene. Recommendations to the leather shoe industry are to periodically monitor benzene levels in the air, conduct health checks on workers, and use personal protective equipment on workers such as masks to reduce levels of inhaled benzene into workers’ bodies.

The Relationship between Heat Stress and Dehydration in the Continuous Casting Machine Section of Pt X

Muhammad Cahya Nur Siddiq¹, Mulyono¹

¹Department of Occupational Health and Safety, Faculty of Public Health, Universitas Airlangga, Surabaya, East Java, Indonesia

Abstract

One of the hazards in the CCM (Continuous Casting Machine) section of PT X is the heat stress. The heat stress is predominantly caused by hot metal liquids processed before being compacted into billets. Heat Stress causes workers sweating a lot and leads to dehydration. The purpose of this study is to find the correlation between heat stress and dehydration in CCM (Continuous Casting Machine) section of PT X. It is an observational study and a cross-sectional study due to time examined. The tools to measure heat stress is Heat Stress Apparatus Quest Temp 36 and measurement of work dehydration is by observing the color of the respondent’s urine compared to the urine color table. This study has a sample of 30 workers exposed to the hot work climate in CCM (Continuous Casting Machine) section of PT X. The data analysis techniques used are univariate and bivariate analysis techniques. The results show that the highest working climate in the place is 42.3 °C and of the 30 respondents studied, there are 28 respondents who are dehydrated, ranging from mild to severe. By using the chi-square test statistical calculations to see the correlation, p is 0.045 where p < α means there is correlation between the work climate and work dehydration. Suggestions that can be given to companies to overcome heat stress problems are by adding fan blowers in the workplace and providing electrolyte salts added to the workers’ drinks.

Keywords: Heat Stress, Relationship, Dehydration, Continuous Casting Machine, PT X

Introduction

Every company has hazards in their workplaces. One of the factors of hazard in the workplace of a company is the work climate. If work climate exceeds the allowable Threshold Limit Value (TLV) that can affect workers, workers can experience a work-related illness caused by the work climate. If the worker suffers from a disease due to the work climate, it will have an impact of decreasing productivity in the company.

Heat Stress is a combination and attachment of work temperature, air humidity, wind speed, and radiation temperature in the workplace. Work climate that is uncomfortable and discordance with the standards of workers and provisions will lessen workers’ capacity resulting a decline in efficiency and productivity of work(1). According to the Minister of Manpower and Transmigration Regulation, the work climate is the result of a combination of temperature, humidity, movement speed of air and radiant heat due to the level of heat dissipation from the workforce as a result of work(2).

The temperature in the workplace can be influenced by machinery and work environment factors. As long as the worker’s body is active, the body will naturally adjust the temperature received through the process of heat loss. The comfortable temperature for Indonesians at work is between 24-26 °C. When workers are exposed to hot temperature, it will reduce agility, prolong reaction time and slow down decision-making time, disrupt the accuracy of the brain’s work, interfere motor sensory nerve coordination, and provoke emotion. The high-risk working environment, especially the hot work climate, can endanger the safety and health of the workers, so it is necessary to make work time adjustments and safeguards to overcome the hazards at work that might happen(3). When the heat in the workplace exceeds the limit and disturbs the comfort of workers, it can cause

e-mail: muhammad.cahya.nur-2015@fkm.unair.ac.id

DOI Number: 10.37506/ijfmt.v14i2.3098
Heat stress is a limit of the body’s ability as a result of receiving heat exposure from the combined contributions while doing a job and the factors that exist in the environment (such as air temperature, humidity, air movement, and heat transfer radiation) and clothing used when working. Mild or moderate heat stress conditions can cause uncomfortable condition for workers, and disturb the performance and safety, although this does not cause harm to workers’ health\textsuperscript{(4)}.

Dehydration is a health disorder caused by lack of fluids, especially Na salt. The effect of exposure to hot temperature and accompanied by excessive sweating will result in the loss of sodium salt. If someone loses fluid $<1.5\%$, the symptoms still do not appear, but fatigue will appear earlier with dry mouth. In such condition, workers only need to be given rest time in a cooler place and given sweat relieving powder\textsuperscript{(5)}.

In a study conducted by Nindi Puspita in 2014, the result of the effect calculation of hot work climate on dehydration by SPSS Mann Whitney test showed that the $p$ value was 0.023 or $p \leq 0.05$. This value indicates that there is a significant influence between the work climate and dehydration\textsuperscript{(6)}.

PT. X is a production site whose scope of business is in the field of hot roll steel plate. In the production process, it has exposure to hot temperatures affecting the company’s workers. The example of impacts that can be caused by hot temperature exposure to workers is dehydration. Therefore, researcher will analyze the correlation between heat stress and dehydration.

**Material and Method**

Based on the type of research and the method of data collection, this research is an observational study with cross sectional study. The sample in this study are 30 workers who work in the CCM (Continuous Casting Machine) section of PT X and exposed to hot work climate in their workplace. This research was conducted in one of the Surabaya regional companies, East Java, which is engaged in the production of hot rolled steel, in this case called PT X. Data collection was carried out in February 2019 for one week.

Secondary data is taken from company data that contains a general description of the company and a list of PT X workers. The first primary data collection is through interviews to find out about the identity and characteristics of the respondents (ages, work periods, and nutritional status). The heat stress measurements were carried out in the workplace that has heat exposure at PT X, the tool used is Questemp 36 heatstress monitor by looking at the Wet Bulb Globe Temperature Index (WBGT Index), after the WBGT results are obtained, they are compared to workload and working time to determine whether the results are more or less than the Threshold Value Limit (TLV) determined by law.

Measuring the level of dehydration is done on workers in areas that have heat exposure in PT. X, the measurement done is observing the color of the respondent’s urine after work. The categories of dehydration work are not dehydrated, mild dehydration, moderate dehydration, and severe dehydration. The variables studied are the characteristics of workers consisted of age, years of service, nutritional status and heat stress with work dehydration. Data is processed by using statistical chi-square test for data with nominal data scale and spearman correlation test for ordinal data scale.

**Finding**

**Ages**

The age group of workers working in the CCM (Continuous Casting Machine) section if PT X is divided into 3; $\leq$35 years, 35–50 years, and $>$50 years. The results of the age group $\leq$35 years are 16 workers, groups of working period 11-20 years are 5 workers, working period 21-30 years are 4 workers and groups working period $>$30 years are 5 workers.

**Work Periods**

The working period of the workers in CCM (Continuous Casting Machine) section of PT X is divided into 4; $\leq$10 years, 11-20 years, 21-30 years, and $>$30 years. The results of working period $\leq$10 years are 16 workers, groups of working period 11-20 years are 5 workers, working period 21-30 years are 4 workers and groups working period $>$30 years are 5 workers.

**Nutritional Status**

The nutritional status group of workers in the CCM (Continuous Casting Machine) section of PT X is divided into 5, namely mild lack of weight, severe lack of weight, normal weight, mild overweight, and heavy overweight. The results of the normal nutritional status
group are 15 workers, the mild overweight status group are 11 workers, and the severe overweight group are 4 workers.

Heat Stress

In measuring heat stress, determining the measurement point is based on the work location of the respondent. There are 3 points, namely the point A CCM located in front of the CCM Control room, point B CCM located near CCM Ladle, and point C CCM is near the Horizontal CCM Burner. The lowest Wet Bulb Globe Temperature Index (WBGT) results is 30.1 °C at Point A CCM which located in front of the CCM control room and the highest Wet Bulb Globe Temperature Index (WBGT) is 42.3 °C at point B CCM near the Horizontal CCM Burner. Setting working hours on the CCM section of PT. X is 25-50%, so the TLV for heat stress is 32 °C for light workloads, 30 °C for medium workloads, and 29 °C for heavy workloads.

Work Dehydration

Measurements of work dehydration is achieved by observation of after working color urine. Furthermore, the measurement results are classified into 4, namely not dehydrated, mild dehydration, moderate dehydration and severe dehydration. The results of not dehydrated group is 2 workers, mild dehydration group is 8 workers, moderately dehydration is 16 workers and severe dehydration is 4 workers.

Relationship Between Age Of Workers And Work Dehydration

Table 1. Cross Tabulation of Relationship between Age and Work Dehydration

<table>
<thead>
<tr>

</tbody>
</table>

The table above shows that most workers aged ≤35 years old experience moderate work dehydration as many as 8 workers with a percentage of 26.7%. Most workers 36-50 years old also experience moderate work dehydration by 5 workers with a percentage of 16.7%. Then the most work dehydration status experienced by workers aged >50 years is moderate work and severe dehydration are 3 workers with a percentage of 10%. The results of statistical tests, namely the Spearman correlation test showed that there is a significant connection between ages and work dehydration with a value of p = 0.000 <α = 0.05 and the correlation coefficient value showed a number of 0.619, which means the age of workers has strong level of correlation strength with dehydration.

</tr>
</tbody>
</table>

The table above shows that most work dehydration status experienced by workers with a work period ≤ 10 years are moderate work dehydration with 8 workers by the percentage of 26.7%. The most work status experienced by workers with a working period of 11-20 years experienced moderate work dehydration is 4 workers with the percentage of 13.3%. The most work dehydration status of work experienced by 21-30 years working period is moderate dehydration and heavy with 2 workers by 6.7%. The most work dehydration status experienced by workers with working period >30 years is severe work dehydration by 3 workers with the percentage of 10%.

The results of statistical tests, namely Spearman correlation test shows that there is a significant correlation between work period and work dehydration. with a value of $p = 0.047 < \alpha = 0.05$ and the correlation coefficient showed a number of 0.365 which meanswork period has a low level of correlation strength with dehydration.

Relationship Between Nutritional Status Of Workers And Work Dehydration

Table 3. Cross Tabulation of Relationship between Nutritional Status and Work Dehydration

<table>
<thead>
<tr>

<td>26,7%</td>
<td>14</td>
</tr>
</tbody>
</table>
The table above shows that the most work dehydration status experienced by workers with normal nutritional status was moderate work dehydration status as many as 9 workers with percentage is 30%. The most work dehydration status experienced by workers with mild level overweight nutrition status were moderate work dehydration as many as 5 workers with a percentage of 26.7%. The most work dehydration status experienced by workers with severe level overweight nutritional status were moderate working and severe dehydration as many as 2 workers with a percentage of 6.7%.

The results of statistical tests, namely the Spearman correlation test showed that there is a significant relationship between nutritional status and work dehydration with a value of $p = 0.034 < \alpha = 0.05$ and the correlation coefficient showed a number of 0.388 which means the age of workers has a weak level relationship with dehydration.

Relationship Between Heat Stress And Work Dehydration

Table 4. Cross Tabulation of Relationship between Nutritional Status and Dehydration Work

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
The table above shows that heat stress measurements ≤TLV (Threshold Limit Values), the most workers experience mild and moderate dehydration are 4 workers with the percentage of 13.3%. The heat stress measurement >TLV, the most workers experience moderate work dehydration are 12 workers with a percentage of 40%. By using the chi-square test statistical calculations to see the relationship produced p is 0.045 where p <α, it means that heat stress and work dehydration are correlated. This research is supported by research conducted by Sari (2014) there is a relationship between hot work climate and dehydration in the boiler part of the workforce at PT. Albasia Sejahtera Mandiri Semarang Regency with a p value of 0.023 <0.05(7).

This research is in line with the theory from Suma’mur (2009), the workforce working in a workplace that exceeds the TLV of the work climate can experience the effects of heat stress. The effect of heat stress occurs as a result of the body’s process of maintaining body heat unsuccessfully. The effects of heat stress can be in the form of subjective complaints due to heat stress such as complaining of heat, sweating, always thirsty, feeling bad and loss of appetite caused by loss of fluid from the body by evaporation of sweat(5).

Exposure to a physical work environment such as heat stress can lead to health problems, one of which is dehydration. Consumption of drinking water needs to be considered because lack of fluids can cause dehydration as well. Prolonged dehydration can cause impaired kidney function. In addition, dehydration can also affect one’s weight due to sweat and urine that comes out during activities. Dehydration is excessive loss of body fluids due to insufficient fluid replacement intake that does not meet the body’s needs and an increase in water expenditure(8).

**Conclusion**

The results show that the heat stress measurement in CCM (Continuous Casting Machine) section of PT X already pass the NAB with a moderate workload and 25-50% working hours setting, namely the WBGT (Wet Bulb Globe Temperature Index) exceeding 30°C. The measurement of worker work dehydration in CCM (Continuous Casting Machine) section of PT X has the most moderate dehydration with 16 workers. There is a relationship between heat stress and dehydration work in the CCM (Continuous Casting Machine) section of PT X.

Advice that can be given to the company is that the company provides several places for workers to take their drinks close to their work area, when workers feel thirst or dehydrated, they can easily take the drinking water. Adding electrolyte salt to the workers’ drinks also strongly recommended.

The Effect of CHOP Chemotherapy Implementation Towards Reduced Global Longitudinal Strain in Non-Hodgkin Lymphoma

Muhammad Perdana Airlanga1, Rochmad Romdoni1, Ami Asharianti2
1Department of Cardiology and Vascular Medicine, Faculty of Medicine Universitas Airlangga, Dr. Soetomo Teaching Hospital, Surabaya 60285, Indonesia, 2Department of Internal Medicine, Faculty of Medicine, Universitas Airlangga, Dr. Soetomo Teaching Hospital, Surabaya, 6025, Indonesia

Abstract

Background: Doxorubicin in CHOP regimen is still the golden standard of first-line chemotherapy in patients with NHL (Non-Hodgkin Lymphoma); however, it has enormous cardiotoxicity side-effects.

Objective: This study aims to investigate the effect of CHOP chemotherapy implementation towards the GLS reduction in cumulative dosage of doxorubicin ≥ 100 mg/m.

Method: This study was pre experimental analysis with modified cohort. The subjects were observed for 1 month, since the first chemotherapy until 1 week after the second chemotherapy. The echocardiogram procedure with ejection fraction and global longitudinal strain was conducted twice which was before the first chemotherapy and 1 week after the second chemotherapy.

Results: The implementation of CHOP therapy with the cumulative dosage of ≥100 mg/m² has resulted in reduced GLS from 19.62% to -18.03%. The reduction of GLS>10% was 40% while the LVEF has not been obtained any reduction > 10%. The case of subclinical left ventricular dysfunctions was attained 16%.

Conclusion: The implementation of CHOP chemotherapy with the dosage of ≥100mg/m² has been proved to cause reduced GLS and subclinical left ventricular dysfunctions.

Keywords: Global longitudinal strain, Left ventricular ejection fraction, anthracycline, CHOP chemotherapy

Background

Chemotherapy is described as one of therapies which are very effective in cancer treatment. One of the serious side-effects which have been noticed by Hematology and Cardiology experts is cardiotoxicity. One of the chemotherapy drugs that have cardio-toxic effects is anthracycline. This compound can cause arrhythmia, pericarditis, myocarditis and cardiomyopathy. The cardio-toxic effects of doxorubicin have been studied by various kinds of researches. The case of heart failure because of cardiotoxicity was first found in leukemia child patient in 1967 who underwent doxorubicin therapy1,2.

Non Hodgkin Lymphoma (NHL) is a primer malignancy which attacks lymphoid tissue and its supportive tissues, such as macrophages, histiocytes, and connective tissue. This disease comes from lymphocytes B, lymphocytes T and NK cells3. In 2010, it was presumed that there were 65,540 lymphoma cases that were diagnosed and caused 20,210 deaths4. In Indonesia, NHL was positioned on the sixth rank along with Hodgkin disease and leukemia as malignancy causes5. The number of malignant NHL cases in Indonesia since 1988 until 1991 was approximately 3.40% to 5.62% in males and, 79% to 3.40% in females6.

Doxorubicin in the Cyclophosphamide, Hydroxydoxorubicin, Oncovin, Prednisone (CHOP) regimen is still the golden standard of first-line chemotherapy in patients with NHL. It requires more attention even though the implementation of first-line chemotherapy will cause cardiotoxicity that will affect the prognosis of patients themselves7,8 doxorubicin, vincristin, prednisone. The case of acute cardiotoxicity after the
The cardiotoxicity causes myocardium damage and continues to decreased ventricular function progressively; then, it ends up being decomposition. The cohort research in 830 patients who underwent chemotherapy for 8.5 years was found 2.5% suffered from heart failure 10.

The risk of cardiotoxicity is caused by several factors such as old age, young age, female, drug consumption duration, mediastinal radiotherapy, history of heart disease, hypertension, and specifically cumulative dose of doxorubicin 11. The heart failure risks occur in 35% patients who obtain cumulative dose of 400 mg/m2, 7-26% in dose of 550 mg/m2, and 18-47% in dose of 700 mg/m2. The suggested administration of maximum cumulative dose is 400-500 mg/m2. The previous study reported that 27% patients who received doxorubicin with cumulative dose of ≥200 mg/m2 underwent cardiomyopathy although the contraction abnormality and ventricular relaxation have occurred in doxorubicin dose of ≤200 mg/m2 7,9,12 doxorubicin, vincristin, prednisone.

The early detection in cardiotoxicity and the preventive action of heart failure are considered as a challenge for cardiology and oncology experts. Several ways are conducted to monitor heart condition such as electrocardiography, echocardiography, radionuclide angiocardiography and endomyocardial biopsy as the golden standard 13,14.

Echocardiography is non-invasive examination that is received generally to evaluate the occurrence of cardiotoxicity15. This examination gives important information to recognize systolic heart function, especially left ventricular ejection fraction that is calculated by using teach method and modified simpson biplane 16. The previous study reported that the global longitudinal strain in 2D-STE has occurred in doses of 200 mg/m2 or the forth chemotherapy 17. This study aims to investigate the effect of CHOP chemotherapy implementation towards the GLS reduction in cumulative dosage of doxorubicin ≥ 100 mg/m2.

### Method

The study was a pre experimental study with modified cohort by using one group pretest posttest group design. It was conducted in Hematology-Medical Oncology Unit Dr. Soetomo General Hospital Surabaya.

The research subjects must fulfill the inclusion criteria which were clinical diagnosis of NHL and hispathology, and EF ≥60%. Subjects who have underwent chemotherapy before, had one of the diseases such as CKD, coronary heart disease, cardiomyopathy, and non-sinus EKG rhythm were excluded from study.

Patients was examined by echocardiography and taken the parameter of LVEF and GLS. Then, the NHL patients underwent CHOP chemotherapy until two cycles (doxorubicin cumulative doses of ≥100 mg). Patients who have undergone CHOP chemotherapy twice were examined by using echocardiography and taken the parameter of LVEF and GLS 1 week after. The echocardiography test was conducted with machine, namely Echo GE vivid 7 [GE Healthcare, USA]. The examination of 2D Speckle Tracking Echocardiography [2D-STE] was conducted with 2D and Automated Function Imaging by using imaging analysis software [EchoPac version 11O.x.x, GE Medical Systems, 2010]. The offline analysis was conducted in 2D imaging (apical long axis, apical 2 - and 4 – chamber) which was kept with frame rate approximately 50-70 bps. Each image was measured PSLS per segment and evenly calculated. Afterwards, the average value of the third value was automatically measured which was called Global Longitudinal Strain GLS. The LVEF test applied the Simpson’s biplane method.

The collected data in this study were analyzed descriptively and statistically. The statistical analysis to assess the different longitudinal strain parameter pre and post doxorubicin chemotherapy used paired t-test. The analysis to measure the correlation between decreased GLS and cardiotoxicity risk factors used Pearson correlation. The analysis of the data was conducted by using SPSS 17.0 program (SPSS, Inc., Chicago, IL) and it was significant if \( p \) value < 0.05.

### Results

#### Subject Characteristics

Most patients were males (73.3%). The average age of the subjects was 49±13 years old and the most frequent subjects based on age categorization were 61-70 years old with the total of 9 individuals (30%). The most frequent clinical stage was stage III which were 73.34% while the most frequent risk factor was smoking (50%; table 1).

**The Analysis Result**

The evaluation result of 30 NHL patients showed that there was no reduced EF more than 10%; however, it was obtained that 12 patients (40%) had reduced GLS > 10%, 10-15% in 7 patients (23.3%) and >15% in 5 patients (16.6%). The reduction of GLS >15% signified the occurrence of subclinical left ventricular dysfunctions (table 2).

**Discussion**

In this study, it was found that the administration of CHOP chemotherapy with a cumulative dose of 100 mg / m2 had an effect of decreasing GLS and causing subclinical left ventricular dysfunction. Swain et al. state that
LVEF is not an accurate predictor of heart failure on chemotherapy and prove there is no relationship between the severity of heart failure and the decrease in LVEF\textsuperscript{18}. The reverse results in the study of Nousiainen \textit{et al}. stated a decrease in LVEF 4\% after the cumulative dose of doxorubicin 200 mg / m\textsuperscript{2} has a sensitivity of 90\% and a specificity of 72\% as predictors of cardiotoxicity. In this study, 1 sample was found which experienced a LVEF decrease of 4\%\textsuperscript{19}.

In this study, there was no reduced LVEF >10\% after NHL patients underwent CHOP chemotherapy with the doses of ≥100 mg/m\textsuperscript{2}. On the other hand, the maximum reduced LVEF in this study was 4\%. This result was in accordance with the study of Stoodley \textit{et al}. in which with the doxorubicin doses of ≥ 200 mg/m\textsuperscript{2}, it has not been obtained reduced LVEF >10\%. However, Limat \textit{et al}. showed different result in which after the giving of doxorubicin cumulative doses of ≥ 200 mg/m\textsuperscript{2} or after the fourth chemotherapy in CHOP regimen, the occurrence of cardio-toxic was 27\% \textsuperscript{7,17,20} doxorubicin, vincristin, prednisone.

Chemotherapy Related Cardiac Dysfunction (CRCD) is divided into I and II. Anthracycline is considered as type I in which it can cause permanent and irreversible myocardium damage compared to type II that can cause reversible myocardium damage. Early detection is required to prevent myocardium cell damage widely and more severe. Swain \textit{et al}. stated that LVEF was not accurate predictor of heart failure in chemotherapy and proved that there was no correlation between the severity of heart failure and reduced LVEF. In contrast, Nousiainen \textit{et al}. asserted that reduced LVEF of 4\% after doxorubicin cumulative doses of 200 mg/m\textsuperscript{2} had the sensitivity of 90\% and specificity of 72\% as cardiotoxicity predictor. This study attained 1 sample that encountered reduced LVEF of 4\%\textsuperscript{12,18,19,21}.

Several previous studies have showed the superiority of GLS test compared to LVEF test. Most population that was being analyzed using GLS parameter was breast cancer by employing the combination regimen of anthracycline and trastuzumab. Researches which employed GLS and NHL as their parameter are rarely conducted. Kang \textit{et al}. used GLS parameter and high sensitivity of troponin-T as cardiotoxicity predictor in NHL. GLS monitoring is conducted on baseline, 1 day after the third cycle, and 1 day after completing chemotherapy. The GLS monitoring in this study was conducted on baseline, and 1 week after the second cycle\textsuperscript{22}.

GLS test is considered capable in detecting subclinical cardio-toxic and has good reproducibility. Expert Consensus Statement recommends GLS test to detect subclinical left ventricular dysfunctions rather than Global Radial Strain [GRS] and Global Circumferential Strain [GCS] because there has not been normal value and different variability between vendor and software. The abnormal reduced GLS value is different in several studies. Stoodley \textit{et al}. determined abnormal reduced GLS value of >10\%\textsuperscript{17}, Negishi \textit{et al}. determined reduced GLS of >11\%\textsuperscript{23}. Banchs suggested that reduced GLS of >10\% was considered in giving anti-remodeling therapy\textsuperscript{24} and clinical monitoring strictly together with oncologist whereas Kang \textit{et al}. determined reduced GLS of >15.9\%\textsuperscript{22}. The abnormal GLS value in this study based on Expert Consensus Statement ASE that stated reduced GLS of >15\% from baseline showed that subclinical left ventricular dysfunctions\textsuperscript{17,21–25}. In this study there was no correlation between reduced GLS and hypertension risk factors while there was no correlation between reduced GLS and other factors such as age, diabetes, and smoking. It was in accordance with the study conducted by Hershman \textit{et al}. in which only hypertension risk factor that synergized with cardio-toxic cases\textsuperscript{26} which improves survival for patients with non-Hodgkin’s lymphoma, is often withheld from elderly patients because of its cardiotoxicity. We studied the cardiac effects of doxorubicin in a population-based sample of older patients with diffuse large B-cell lymphoma (DLBCL).

**Conclusion**

There was an effect in the implementation of CHOP chemotherapy towards global longitudinal strain. The giving of doxorubicin cumulative doses of ≥ 100 mg/m\textsuperscript{2} was able to cause subclinical left ventricular dysfunctions.

**Ethical Clearance:** The study protocol was approved by the Ethical Commission to conduct basic science/clinical research in Dr. Soetomo General Hospital Surabaya, Indonesia. The present study was carried out in accordance with the research principles. This study implemented the basic principle ethics of respect, beneficence, non-maleficence, and justice.

Abstract

The data about this combination effect on platelet function and hematological parameters are sparse, but there is only mention in many medical science websites such as Medscape, there are possible interaction between it, in which metronidazole cause inhibition to cytochrome CYP3A4 which responsible on clopidogrel metabolism, this may put the patients that on clopidogrel bisulphate therapy at risk of clot formation and may be progress, this may occur because clopidogrel is at inactive form and need to activation by cytochrome mention above, so this study was performed in order to achieve the following aims: studying the efficacy of clopidogrel bisulphate on coagulation process by measuring bleeding time when giving clopidogrel alone and in combination with metronidazole and studying the possible effect of two drug alone and in combination on hematological parameters in male albino rats.

Keywords: Clopidogrel bisulphate, metronidazole, cytochrome CYP3A4, bleeding time

Introduction

Clopidogrel, a thienopyridine derivative, binds precisely also permanently to the platelet P2RY12 purinergic receptor, constraining ADP-mediated platelet motivation and aggregation (¹). Next oral taking of clopidogrel is promptly absorbed owned to more metabolism, clopidogrel is one of prodrug that is absorbed in the intestine and activated in the liver, then it converted to its active metabolite needs dual sequential oxidative steps, at the first time result in formation of 2-oxo-clopidogrel, followed by the conversion of 2-oxoclopidogrel to the active metabolite. CYP2C9 and CYP3A4/5 are connected to cytochrome P450 enzymes involved in the metabolism of clopidogrel (²). CYP2C9 is most important hepatic enzymes involved in the formation of clopidogrel’s active metabolite. Genetic polymorphisms of CYP2C9 are associated with impaired clopidogrel metabolism in healthy volunteers and also in patients (³). Metronidazole is antibiotic and antiprotozoal medication. it is one type for a first event of mild-to-moderate Clostridium difficile colitis if vancomycin or fidaxomicin is unavailable (⁴). It has been suggested possible inhibition of cytochrome P450 especially CYP2C9 and CY3A4, this enzyme is responsible for several drugs metabolism such as S-warfarin etc.⁵. And this may appear in revers effect when combined with clopidogrel when compared with warfarin because the difference between two drugs chemically (warfarin is active drug and this combination cause abnormal bleeding).

Materials and Method

Experimental animals: A total number of twenty male Albino Wistar rats weighed (200-250 g) were utilized in this research. Their ages ranged between 4-5 months. Rats in all time of the experiment were housed in plastic cages in conditioned room (22-25°C) in the animal house of College of pharmacy – University Of Anbar with manually controlled lightening supplying daily light of 12 hours (7.00 AM to 19.00 PM) and 12 hours night cycle. They were left for 7 days for adaptation with the research conditions. Rats had free access to water and diet along the experimental period.

Experimental Design: Rats were randomly divided into four equal groups (5rat/group) and administered orally for 28 days by using special gavage needle as the following: C group rats that received ordinary distilled water and served as control, T1 group rats were treated...
1.25 mg/kg B.W of clopidogrel bisulphate, T2 group Rats were treated 35 mg/kg B.W of metronidazole and T3 group rats were treated 1.25 mg/kg B.W of clopidogrel bisulphate + 35mg/kg B.W of metronidazole.

**Bleeding time test performance:** Bleeding time was measured via rat tail transection method according to the prescription of The tail of the rat was warmed for 60 seconds in water at 40°C then dried (6). A slight cut was made in the mid of the tail with a blade. Account started when the 1st drop touched the circular filter paper. It was tested at 30 s intervals till bleeding cosseted

*Total number of spot on filter paper/2= BT/minute.

**Hematological Analysis:** All animals in experiment comparing with the normal values of blood parameters as control and zero time. The blood collected from heart puncture after general anesthesia by using (Ketamine and xylazine). By using Uto-analyzer (setting on vet mode) Platelet count, RBC, WBC, and HB level were estimated. The procedure done according to manufactured instruction.

**Statistical Analysis:** The data was accomplished by using SAS (Statistical Analysis System - version 9.1). One-way ANOVA, two-way ANOVA and Least significant differences (LSD) post hoc test were complete to assess significant differences among means. P < 0.05 was considered statistically significant.

**Results**

Before beginning of dosage of experiment (at zero time), Bleeding time and other hematological parameters was determined and there was no significance different (P <0.05) in all groups.

1. **Bleeding time:** A statistical analysis indicated that the mean value of bleeding time was non-significantly (P<0.05) differed in all experimental groups at zero time when compared to each other. The final results showed significant (P>0.05) increased after oral intubation of clopidogrel bisulphate, metronidazole and combination in T1, T2 and T3 groups comparing to the control group and zero time. The T1 group that receive 75 mg/Kg/day of clopidogrel bisulphate was more potent in increasing of bleeding time comparing to 35 mg/kg/day of metronidazole and in combination treated group (T2, T3) respectively.

Discussion

It was reported that clopidogrel bisulphate cause a significant change in bleeding time in 36 human volunteer after giving a 75 mg of Plavix (7). Also another study indicated that clopidogrel bisulphate associated with significantly increased risk for postoperative wound complications especially increasing of bleeding time in tested patient (8). These normally cause increasing of bleeding in T1 group. In T2 group treated with metronidazole alone, it was reported a partial inhibition platelet aggregation with dose and time dependent in guinea pig and human platelet-rich plasma and this may cause a mild increasing in bleeding time according to dose that we give in comparison with previous study (9).

In T3 the combination of clopidogrel bisulphate and metronidazole which sharing same metabolic enzyme or cytochrome that may lead to inhibition or slowing the process of clopidogrel bisulphate converting to its active form (10), this mention why the combination of two drugs causing less bleeding time than clopidogrel bisulphate alone treated group. Many of case report indicates that in addition to the increased risk of bleeding with the use of Clopidogrel, some of its additional serious side effects include agranulocytosis, aplastic anemia/pancytopenia, thrombotic thrombocytopenic purpura, acquired hemophilia A, and neutropenia, neutrophils make up

Figure (1): showed the steps of experiment performance starting from housing of animals (A), dosing of the drugs (B), (C) anesthetizing animals, (D) bleeding time test, and (E&F) blood collection for hematological test parameters.
a significant portion of the WBCs (11). With regard to metronidazole there was reported that metronidazole can cause bone marrow depression (12). And normally this can affect all type of blood cells especially in chronic use

**Conclusion**

The efficacy of clopidogrel bisulphate as blood thinner agent may be reduced when combined with metronidazole despite of the second have characteristic of antiplatelet agent, this were obvious in bleeding time test results and other hematological parameters, may be due to the inhibition of metronidazole to cytochrome that responsible for clopidogrel metabolism, in addition to possibility of compete the two drugs and/or inhibition of each other. This still need to more clearing by check the platelet activity in presence of this combination by more specific tests and apparatus. more attention should be paid when use the metronidazole in patient who take clopidogrel bisulphate especially critical cases by putting the patient under close monitoring or use alternative drugs.

The Influence of Slow Back Stroke Massage, Cold-compress and Warm-compress to the Level of Prostaglandin F2α (PGF2α) in Primary Dysmenorrhea

Mukhoirotin¹, Kurniawati¹, Diah Ayu Fatmawati¹
¹Nursing Science Program, Faculty of Health Science, Unipdu Jombang

Abstract

The cause of primary dysmenorrhea is excessive release of the hormone prostaglandin F2-alpha (PGF2α). The aim of this study was to assess the influence of SBBM, cold-compresses and warm-compresses toward the level of PGF2α in primary dysmenorrhea, using Post Test Only with Control Group Design and Pretest-Postest Control Group Design. The subjects were 76 female-student, selected by purposive sampling. NRS used to measure the pain level and ELISA used to measure PGF2α levels. The data were analyzed by using Paired Sample T-Test, One-Way Anova and Kruskal-Wallis test. SSBM, cold-compresses and warm-compresses are effective to decreasing of pain level and PGF2α levels in primary dysmenorrhea.

Keywords: Slow Stroke Back Massage, Cold-compresses, Warm-compresses, PGF2α, menstrual pain

Introduction

This incidence of dysmenorrhea is 20% to 90% among reproductive women and 15% occurred among young female followed with pain level around 2%-29%. Primary dysmenorrhea commonly occurred among adolescents without any pathological problems at the pelvis. The prevalence of primary dysmenorrhea among adolescent was 55.5-90.1%. In Mexico, dysmenorrhea affects 65% of students’ daily activities.

The cause of primary dysmenorrhea is an increase in prostaglandin F2-alpha (PGF2α) production. The treatment of dysmenorrhea commonly used nonsteroidal anti-inflammatory drugs (NSAIDs). As we know medication consumption for long time will give some impact such as medication addictive, diarrhea, abdominal pain, nausea, kidney-complications, liver-complications, sleep-disorders, digestion-problems. The pharmacological treatment for dysmenorrhea was successful, but about 20-25% of the failure process. The one of the traditional treatment for dysmenorrhea is Slow Stroke Back Massage (SSBM), cold-compresses and warm-compresses. SSBM reduces pain and effectively increases endorphin levels. Cold-compresses reduce prostaglandins, so it will make strengthens the sensitivity of pain and other subcutaneous at the injury site by inhibiting the inflammatory process and giving analgesic. The skin stimulation causes endorphin loose so it will block blocking the transmission of pain stimulus. Skin stimulation activates the transmission of sensory A-Beta nerve fibers and decreases pain transmission C and delta-A fibers so the synaptic gate closes the transmission of pain impulse. Cold-compresses and warm-compresses are stimulates to loosing the endorphin β levels and regulate uterine hypercontractility during menstrual pain.

The results of previous studies indicated that Moxibustion consumption can reduce the levels of PGF2α, OT, vWF and increase the levels of β-EP (β Endorphin). However, the influence of SSBM, Cold-compresses and Warm-compresses toward the intensity of pain and PGF2α levels in Primary Dysmenorrhea have not been clearly known. The aim of this study was to analysis the effect of SSBM, Cold-compresses and Warm-compresses toward Pain Intensity and Prostaglandin F2α levels in Primary Dysmenorrhea.

Method

The design in this study was Post Test Only with Control Group Design and Pretest-Postest Control Group Design. The sample was 76 female students in faculty of health science of Unipdu Jombang who experienced dysmenorrhea, selected by purposive sampling. The samples were divided into six groups: SSBM (n=13), cold-compress (n=12), warm-compress (n=13), SSBM+cold-compresses (n=13), SSBM+warm-compresses (n=13), control (n=12). The data were collected by two istruments: NRS (Numeric Rating Scale) and ELISA (Enzyme-Linked Immunosorbent Assay) to measure PGF2α levels.
Scale) to measured the pain level, ELISA to measured PGF2α. Data were analyzed by Paired Sample T-Test, One-Way Anova and Kruskal-Wallis test.

**Discussion**

The menstrual pain level before give the interventions were moderate to severe and after give treatments the average menstrual pain level in all treatment groups was mild and in control group was moderate level. The intensity of menstrual pain in this study was addressed with some previous studies which showed that the menstrual pain level among he respondents was moderate to severe level(19-20). Some risk factors of dysmenorrhea are include the early of age menarche, the longer of menstrual periods, the higher of menstrual volume, family history of dysmenorrhea, smokers, obesity, alcohol consumption(2,21-22), high caffeine diet(23), and high levels of stress(24).

The results of this study showed that the average of menstrual pain level in all intervention groups are significantly decrease between pre-test and post-test. This showed that SSBM, cold-compresses and warm-compresses, SSBM+cold-compresses, SSBM+warm-compresses are effective to reduce the menstrual pain level. These interventions are cutaneous stimulation techniques, where the mechanism of these interventions in reducing pain level was explained according to the gate control theory. Gate control theory explained that skin stimulation can activate the transmission of the fibers of A-Beta nerve sensory(25). This process can reduce pain transmission through small diameter of C and delta-A fibers so the synaptic gate will closes the transmission of pain impulse. Generally, the cutaneous stimulation on the body is on the back and shoulders. Cutaneous stimulation are influenced peripheral fibers to send the impulses by using dorsal horn in the spinal cord, when the impulses carried by A-Beta fibers are dominate so the gate mechanism will close so the pain...
impulses are not delivered to the brain\(^{(26)}\).

The average decrease of menstrual pain level in SSBM-group. Touch and massage are the technique of sensory integration that affect the activity of nervous system. Individuals who perceived touch as a stimulation to relax, a relaxation response will appear. The use of appropriate cutaneous stimulation can reduce pain perception and muscle tension. Conversely muscle tension can increase pain perception\(^{(16)}\). Massage of connective tissue makes relaxes on body, reduces muscle spasms, connective tissue tenderness, increases the circulation and \(\beta\)-endorphin plasma\(^{(27)}\). This intervention can stimulate the autonomic nervous system to balance the sympathetic and parasympathetic nerves\(^{(28)}\). The SSBM was effective in reducing menstrual pain level\(^{(14)}\). The connective tissue manipulation (CTM) can be used as an intervention to primary dysmenorrhoea and menstrual-related symptoms because this method didn’t give the potential effects such as analgesic, noninvasive and easy to do\(^{(29)}\).

The average of menstrual pain level in cold-compress group was ranged 6.75-2.83. The intervention of cold-compress in the abdomen for 20 minutes by using a bag filled ice. The intervention of cold-compress to respondents was helpful to reduce the pain level, this because of the blood flow was decreased in area which is compressed, and gave analgesic effect by slowing the speed of nerve delivery so the pain impulses will be decrease or less to the brain. Cold-compresses was gave the physiological effects to reduce the inflammatory response, reduce blood flow, reduce edema, and reduce local pain\(^{(20)}\). Cold therapy (ice compresses) intervention will be blocked and the impulses of pain will be reduce or loose for few times\(^{(26)}\). Previous research results showed that cold-compresses was effective reduced menstrual pain\(^{(31)}\).

After given of warm-compresses the average of menstrual pain significantly decreased. Warm-compresses is an intervention that can help to reduce pain by using dilated method of blood vessels so this will increasing the blood supply to the body\(^{(32)}\). Some previous research said that warm-compresses was effected to reduce menstrual pain level\(^{(33-34)}\).

In the control group after given management information about menstrual pain, a small proportion experienced a decreasing of menstrual pain level but was not significant. The information was included pharmacological and non-pharmacological menstrual pain treatment. Non-pharmacological treatment are regular exercise, adequate rest, warm-compresses on abdomen, yoga, warm water shower, massage, deep breath, acupunctur, acupressure, TENS, salt and sugar diet, cold-compresses and deuretics consumption (asparagus and watermelon). Pharmacological treatments are hormonal-drugs and NSAIDs\(^{(35)}\).

The results of this study showed that there were no significant differences in PGF2\(\alpha\) levels in all intervention groups, there were significant differences in PGF2\(\alpha\) levels between intervention and control. Primary dysmenorrhoea caused by the increasing of prostaglandin production and the release of endometrial prostaglandins during menstruation so it will induce uterine hypercontractility, reduce uterine blood flow, and hypersensitive of pain\(^{(36)}\). Menstrual cramps more worse because PGF2\(\alpha\) was increased and PGE2 decreases, so primary dysmenorrhoea increased the ratio of PGF2\(\alpha\) to PGE2\(^{(37-38)}\).

Massage is a therapy to reduce the production of NF-\(\kappa\)B, inflammatory cytokines and TNF-\(\alpha\)\(^{(39)}\). Inflammatory cytokines (ex: IL1-\(\beta\), TNF-\(\alpha\)) is stimulates prostaglandin production in the first day of menstrual phase\(^{(40-41)}\). The results of previous studies indicated that the Swedish Massage Therapy reduced the level of Mitogen-Stimulation of IL-1\(\beta\), IL-2, IL-4, IL-5, IL-6, IL-10, IL-13, and IFN-g\(^{(42)}\). The decreasing of inflammatory cytokines impacted decreasing of prostaglandin stimulation production. Therefore, the SSBM intervention can reduce prostaglandin levels in primary dysmenorrhoea.

Cold-compresses are the intervention which give vasoconstriction effects, prevented the edema, reduce inflammation, local anesthetics effect, reduce cell metabolism and increase blood viscosity. Warm-compresses are the interventions which give a vasodilation effects to blood circulation to becomes smooth and muscles relax\(^{(32)}\). Hot stimulation can increase blood flow in blood vessels at uterus and consequently the prostaglandin vascular will be liquid, bradykinin, and histamine\(^{(25)}\). Heat interventions in local area is as effective as NSAIDs\(^{(43)}\). The NSAIDs mechanism to relieve primary dysmenorrhoea depends on the inhibition of cyclooxygenase (COX), an enzyme which responsible for the prostaglandins production and (other prostanooids). The unbalanced amount of prostaglandins from the endometrium during menstruation are major cause of dysrhythmias.
contraction at the uterus, the reducing of local blood flow and the increasing of peripheral nerve sensitivity during Primary Dysmenorrhea. Therefore, cold-compresses and warm-compresses are same effectively to reducing prostaglandins.

Conclusion

SSBM, cold-compresses and warm-compresses are effectively reduced pain level and PGF2α levels to dysmenorrhea.

Enhanced the Antibacterial and Mechanical properties of UHMWPE by Addition Sort Fibers of Polyacrylonitrile PAN, Graphene Nanoplate (GNP) and Hydroxyapatite (HAp)

Najim A. Saad¹, Massar Najim Obaid¹

¹ College of Materials Engineering – University of Babylon, Iraq

Abstract

The UHMWPE is a gold material in total joint replacement due to excellent properties but with the time was degradation therefor, In present study it was reinforced with 5% short fibers of polyacrylonitrile (PAN) and different weight fraction (0.3, 0.8 and 1.3)% of graphene nanoplate (GNP) and hydroxyapatite (HAp) to increase the mechanical properties (flexural strength, flexural modulus, compression strength and hardness) due to good bonding between fibers and nanoparticles (GNP, HAp) with polymer which improved the load transfer from matrix to reinforcement phases, and also attributed to good mechanical properties of reinforcement fillers. Moreover, these fillers maintained the antibacterial properties to avoid infection which can happened per implantation of knee joint replacement.

Keyword: UHMWPE; PAN; GNP; HAp; Antibacterial Properties and Flexural Strength.

Introduction

Ultra high molecular weight polyethylene, UHMWPE have been used as bearing components in total joint replacements due to their excellent properties. Such as low friction coefficient against metallic components, high impact strength, and good chemical resistance, was widely investigated as a biomaterial especially as a bearing material in the total joint prostheses [1]

The great success of surgically-implanted biomaterials may be compromised in every case by the challenging complication of bacterial per implant infection [2]. Approximately 2.6 million orthopedic biomaterials are implanted annually in the USA, hence the incidence of implant-associated infections is also increasing [3]. Most important in the pathogenesis of infection is the colonization of the device surface and the consecutive formation of a biofilm [4], in which Staphylococcus aureus and koagulase –negative Staphylococci are most frequently implicated as the etiologic agents [5]. Systemic antibiotic prophylaxis and various local antibiotic delivery techniques have been proven to reduce the rate of infection [6]

Polyacrylonitrile PAN hollow fibers are already used as dialyzers that eliminate proteins and low molecular weight compounds. PAN fibers have high surface area, very high mechanical strength, abrasion resistance and had insect resistance. However, PAN has various greater properties, the existence of nitrile groups along with the fiber backbone deals multidirectional methods to alter fibers for definite applications dissimilar artificial films which can be damaged during the alteration [7].

Graphene is a one-atom-thick sheet of carbon atoms arranged in a 2D honeycomb structure. The strong carbon-carbon bonding in the plane, the aromatic structure, the presence of free p electrons, and reactive sites for surface reactions make graphene a unique material with excellent properties [8].

The polymer composites reinforced with graphene had better elastic modulus, toughness, hardness and fatigue strength. The main benefits of graphene as reinforce phase improved load transfer from a matrix to reinforcement due to have excellent in-plane strength and actual high surface area. [9,10]

Nano-hydroxyapatite who the main mineral constituent of bone, is one of the greatest interesting inorganic materials for applications in bone re-forming, thus it has been broadly used in hard tissue engineering to stimulate biological properties of bio-inert polymer by compound process. [11]
Hydroxyapatite-reinforced polymer composites display attractive properties for biomedical uses because of the existence of HA increases the biological properties of the material [12].

In current study, the hybrid nanocomposite of UHMWPE reinforced by 5% PAN with different weight fraction of nanoparticles (GNP, HAp) were prepared and examined mechanical properties (flexural and compression strength) and anti-bacterial properties for prepared hybrid nanocomposites to use in knee joint replacement.

**Experimental Procedure**

Ultra high molecular weight polyethylene (UHMWPE) was gained as a powder from LUOYANG MAX PIPE INDUSTRY with Molecular weight 600-700×10^4 g/mol., density (0.093-0.94) g/cm^3 and Granularity (≥99%) 20-40 Mesh.

Polyacrylonitrile (PAN) is a short fiber was obtained from TENGZHOU TUOLDUO INDUSTRIAL & TRADE CO., LTD, with length 3mm, diameter (15 ± 2) µm and density 1.18±0.01 g/cm^3.

Graphene nanoplate are two dimension Nanoparticles obtained from TIANRUN SUNSHINEGRAPHITE CO., LTD with purity >95wt.% , Thickness (1.0-1.7) nm, diameter (0.5-5) µm, (2-5) layers and SSA (360-450 m^2/g).

Hydroxyapatite (HAp 04) is a nanopowder were used in this research are acquired from N&R INDUSTRIEIES, INC with purity 99% and Average Particle Size (20nm).

The two groups of hybrid composite material were prepared by addition 5% PAN short fibers and addition different weight fraction (0, 0.3, 0.8 and 1.3%) of graphene nanoplate GNP for first group and hydroxyapatite for second group. the nanoparticals are dispersion in ethanol by sonication instrument for 30 min for HAP and 15 min for GNP after that the nanoparticles were mixing by mechanical mixing the PAN fibers are added gradually and also dispersion in the sonication instrument for 15 min, the mixture are mixing by mechanical mixing and the powder of UHMWPE are added gradually. the mixing process were continued for 30 min. After that, the mixture was put in an oven with vacuum for drying at (60°C). After that the mixture was put in mold and press in hydraulic press at temperature 180 °C and pressure 12 MPa for one hour. Then the mold left to cool in air up to room temperature to get the sheet of composite material which was cut by CNC laser machine according to ASTM standard of each test in present study.

The samples of flexural properties test are cut from sheet according to ASTM D790 [13], the sample dimensions (100×10×4) mm. the test (three point - type) is achieved after fixed the ends of sample the loud applied at midpoint at strain rate 5mm/min. also The five sample are tested each time.

The samples of compression strength test are cut from sheet according to ASTM D695-02a. the test is achieved at velocity 1.3mm/min and the loud applied until the sample is failed. The data of stress-strain are obtained. each time The five sample are tested and the mechanical properties are the average of the data of sample [14].

Hardness test is required to measure the resistance of material to indentation, shore D instrument model (TH 210 FJ) made in Germany, the specimen is Cylindrical shape, the test was being done according to ASTM (D2240) [15]. To obtained correct readings the surface of sample must be smooth and clean and the minimum thickness of sample is 4mm, the position at which the test is proceed is far at least from the edge is 12mm. Each specimen was tested five times at different positions and the final hardness is average of them.

By using the Agar Well Diffusion Method was being used to determinate antibacterial activity of the samples. the Muller Hinton agar plates were prepared and were inoculated with Escherichia coli (E. coli), staphylococcus aureus (S. aureus) as test organisms which spreading on the surface of the media with the help of sterile swab.

Neat Polymer and polymer nanocomposites samples have been inserted to the plates at two state (solid after press, liquid state before evaporate the ethanol and also pure ethanol) to determine the inhibition zone. Finally, these plates were incubated at 37°C, and after 24 hours of incubation; zones of inhibition were visualized and measured the diameter of the inhibition zone and recorded in mm.

**Results and Discussion**

Figure (1) described the relationship between the flexural strength with different weight fraction.
of nanoparticles (GNP and HAp) w.t %, the figure illustrated the flexural strength was increased with addition PAN short fibers and increased with increased weight fraction of HAp% and also increased with weight fraction of GNP% up to 0.8% due to good interfacial bonding between matrix and reinforcement phases (PAN fibers and nanoparticles) thus impeded the growth of cracks within polymer, but at 1.3% GNP slightly decreased due to agglomeration of GNP. The flexural strength was increased from (16.2) for neat UHMWPE, (20.4075 MPa) for (UHMWPE + 5% PAN) to (28.317 MPa) for (UHMWPE + 5% PAN + 0.8% GNP) and to (27.228 MPa) for (UHMWPE + 5% PAN + 1.3% HAp). Generally, the increment in flexural strength at addition GNP was higher than at addition of HAp [16-18]

Figure (1) The Flexural Strength of Nanocomposite materials as function of Nanoparticles wt.% content in Nanocomposite

Figure (2) described the relationship of flexural modulus with weight fraction of nanoparticles (GNP + HAp) %. This figure showed the flexural modulus increased with addition of PAN fibers and with increased weight fraction of HAp%, also increased with increased weight fraction of GNP% up to 0.8% due to the properties of nanoparticles which had flexural modulus higher than UHMWPE and also due to good interfacial bonding between matrix and reinforcement phases (PAN fibers and nanoparticles) [16]

Figure (2) The Flexural Modulus of Nanocomposite materials as function of Nanoparticles wt.% content in Nanocomposite

Figure (3) demonstrated the effect of addition different weight fraction of nanoparticles w.t% (GNP and HAp) on compression strength. The compression strength increased with addition PAN fibers and with increased of weight fraction of HAp% also increased with GNP% up to 0.8% and after that the compression strength slightly decreased. Moreover, the increment in compression strength at addition HAp% was higher than at addition of GNP% due to the nature of nanoparticles and the Lubricant properties of GNP which made it more susceptible to compression than HAp nanoparticles
The figure (4) illustrate the hardness increased with addition PAN fibers and increased weight fraction of GNP% and HAp% due to strong interfacial bond between the matrix and the reinforcement allowing efficient load transfer mechanism. Also nanoparticles have good mechanical properties that can influence the properties of the matrix positively thus lead to transfer the load from matrix to nanoparticles. [19,20]

The hardness at addition HAp was higher than at addition GNP due to natural HAP is a ceramic brittle material.
Figure (5) show the bacterial inhabitation area of pure ethanol (a) and neat UHMWPE, composite material (UHMWPE+5%PAN fiber) (b) and nanocomposite material reinforced with different weight fraction wt.% of GNP and HAp (c and d) respectively. which illustrated there was not inhibition of bacterial for all solid compressed samples because the agar needed to media to diffuse within it but the natural of UHMWPE had low absorbedly thus at compress sample the agar cannot diffusion within it. And also there was not inhibition area for ethanol alone. Table 1 exhibited the anti-bacterial activity of neat UHMWPE, composite material (UHMWPE+5%PAN fiber) and nanocomposite material reinforced with different weight fraction wt.% of GNP and HAp. The neat polymer had good antibacterial activity and the composite material (UHMWPE+5%PAN fiber) cause to increase the diameter of inhabitation of E-coli Bacteria due to PAN fiber had antibacterial properties[21]. while, diameter of inhibition decreased at addition 0.3% of nano particles (GNP and HAp) but with increase the weight fraction of Nanoparticles, the diameter of inhibition increased and become more stable especially at 0.8% for GNP% and for HAp% start increased and stable after over 0.3 w.t HAp [22]. Moreover, the antibacterial activity of HAp is more than GNP which attributed to the particles size of HAp is about 20 nm moreover, the HAP nanoparticles activate the bacterial grovel and spores so that the efficiency of bactericidal became higher [22].
Figure (5) illustrated the inhibition area neat polymer and composite material for E. coli and Staphylococcus colony.

**Conclusion**

The hybrid nanocomposite was enhanced the mechanical properties (flexural strength, flexural modulus, compression strength and hardness) to support the weight of patient and improved the performance of knee joint replacement by develop the properties of cartridge and enhance the anti-bacterial properties to avoid the infection after implantation process that cusses the failed joint replacement.

**Ethical Clearance:** I am studied ten case of patient that proceed surgical operation to replace knee joint in (Medical City Hospital) for knowing the important notes, the defects of joint and the service life of synthetic joint before replacement.

**Acknowledgement:** I would like to thank Medical City Hospital and I would like to express my gratitude to Dr. Montadher Najim /Ph.D in Orthopaedic Surgery that help me for obtain information about knee joint replacement

The Relationship of Age, Working Periode, and Work Attitude with Complaints of Carpal Tunnel Syndrome on Workers in the Sumenep Batik Industry Indonesia

Nanik Khomairoh1, Noeroel Widajati2

1 Department of Occupational Health and Safety, Public Health Faculty, Airlangga, University, 60115, Surabaya, East Java, Indonesia; 2 Department of Occupational Health and Safety, Public Health Faculty, Airlangga, University, 60115, Surabaya, East Java, Indonesia

Abstract

Making batik pattern is a job involving hand pinning the canting spout (a small metal cup with a wooden handle) and bending. Unnatural working position for a long time can cause a variety of health problems to workers, one of which is the hands. This can cause Carpal Tunnel Syndrome (CTS) which is closely related to repeated and excessive use of hands. The purpose of this study was to analyze the relationship of age, working period and work attitude with complaints of carpal tunnel syndrome on workers in the Sumenep Batik Industry.

This study is an analytical research using observational methods and through a cross sectional approach. The population in the study were all worker in batik who worked using canting. The sample was 32 workers out of 47 workers in the population. Data was collected using interview, questionnaires, panel tests, and work attitude measurements using the RULA observation sheet.

The results showed that 68.8% of respondents experienced complaints of Carpal Tunnel Syndrome. The majority of CTS complaints were from respondents aged 36-45 years, working for more than 10 years, and having high risk work attitude.

The conclusion is that there is a relationship between age, working period and work attitude with CTS complaints. Industrial owners are expected to prepare the same number of melted-wax pan and the workers, so that the workers will have more ergonomic work attitudes. Workers are suggested to take short breaks, do CTS exercises, to immediately visit to the nearest health center if they experience CTS complaints.

Keywords: carpal tunnel syndrome, working periode, work attitude, worker in batik

Introduction

Carpal Tunnel Syndrome (CTS) is a medical disorder that occurs due to suppression of the median nerve in the carpal tunnel with the main symptoms of tingling and pain in the fingers and hands which are innervated by the median nerve. The other symptoms are numbness, muscle weakness, stiffness and the possibility of muscle atrophy\(^1\). The prevalence rate of CTS is 276 in 100,000 per year. CTS is more common in women than men and often occurs bilaterally with an increased incidence between the ages of 40-60\(^2\).

Based on the American Academy of Orthopedic Surgeons report (2009), the incidence of carpal tunnel syndrome in the United States was estimated to be 1-3 cases per 1,000 subjects per year. However, the prevalence of CTS in Indonesia is still unknown due to very few diagnoses of occupational complaints were reported\(^3\).

Manufacturing industry is a group of types of business that process materials into semi-finished goods or finished goods which have greater added value\(^4\). One of the manufacturing industries in Indonesia is the batik industry. Worker in batik are informal sector workers who traditionally process various types of
cloth into batik. They draw and design the batik, make the batik pattern using the melted wax, color the batik using dyes and dry it using traditional methods\(^5\). One of the batik industries in Indonesia, especially East Java, is the Sumenep Batik Industry. Here, worker in batik work with the position of the hands pinning the canting pen and bending in the process of making batik. This position makes the wrist bear heavy load.

Age is one of the factors that can increase the number of CTS complaints. According to Bridger (2003), the older a person is, the higher the risk of the person experiencing a decrease in bone elasticity, so that it becomes a trigger for symptoms that include MSDs, one of them is CTS\(^6\). In addition, working period and work attitudes are also among the factors that can trigger CTS complaints.

According to Budiono (2003), the working period is divided into 3 categories, namely new (less than 6 years), moderate (6-10 years), and long (more than 10 years)\(^7\). The longer the working period, there will be more continuously repeated movements of the finger for a long time, causing stress on the tissue around the carpal tunnel\(^8\). In addition, worker in batik often make sideways movements to obtain batik candles during the waxing process due to the stove position which is quite far from the workers. If this work attitude is carried out continuously, workers will easily experience the risk of Carpal Tunnel Syndrome (CTS) complaints\(^6\).

The description above shows that worker in batik have the potential danger of complaints of Carpal Tunnel Syndrome (CTS). Thus, this research was aimed to analyze the relationship of age, working period and work attitudes with complaints of Carpal Tunnel Syndrome (CTS) in workers in the Sumenep Batik Industry.

The purpose of this study was to analyze the relationship of age, working period, work attitude and Carpal Tunnel Syndrome (CTS) complaints on workers in the Sumenep Batik Industry.

**Material and Method**

This research is an observational study with a cross sectional approach. The population in this study were 47 worker in batik who worked using canting pen in the Sumenep Batik Industry. The sample in this study were 32 people.

A sample of 32 workers was taken by the Simple Random Sampling technique, which is taking samples from the population randomly drawn without regard to the strata in the population\(^9\). The sample size was determined using the following formula:

\[
\begin{align*}
    n &= \frac{(Z_{1-\alpha})^2 \times p \times q \times N}{d^2(N-1) + (Z_{1-\alpha})^2 \times p \times q} \\
    \text{Statement:} \\
    (Z_{1-\alpha})^2 &= \text{The value of Z on the normal curve to } \alpha = 0.05 \text{ confidence coefficient } 95\% \text{ by } 1.96 \\
    p &= \text{The proportion of the value of 0.5} \\
    q &= 1-p = 1-0.5 = 0.5 \\

    n &= \text{The number of samples} \\
    n &= \frac{(1.96)^2 \times 0.5 \times 0.5 \times 47}{0.1^2(47 - 1) + (1.96)^2 \times 0.5 \times 0.5} \\
    \text{or } n &= 31.77 = 32 \text{ workers}
\end{align*}
\]

The variablers of this research were age, working period, work attitude and Carpal Tunnel Syndrome (CTS) complaints. The instruments used in collecting the data were interview, questionnaires, panel tests, and the RULA observation sheet.

To analyze the data, Kendall’s Tau-b test was employed. A significance value was obtained from the test. Then, the significance value is compared with the \(\alpha\) value, which is equal to 5% or 0.05. If the significance value obtained is less than the value of \(\alpha\), the two tested variables have a correlation. If the significance value is more than the value of \(\alpha\), then the two tested variables have no correlation.

To find out the strong of the relationship between
independent variables and the dependent variable, the contingency coefficient (CC) of the symmetric measure table was used. According to Sugiyono (2010) the category of CC value is divided into:

**Tabel 1. Contingency Coefficient**

| Total          |          | 32| 100% |

Table 2 shows that majority of respondents (43.8%) are 36 – 45 years old and have been working in the industry for more than 10 years. This table also shows that most of the workers (59.4%) have CTS high risk work attitude.

Complaints of Carpal Tunnel Syndrome (CTS) were obtained using questionnaires and panel tests. Table 3 shows that respondents who reported CTS complaints were 22 workers (68.8%), while those who reported no CTS complaints were 10 workers (31.3%).

Complaints of Carpal Tunnel Syndrome (CTS) were obtained using questionnaires and panel tests. Table 3 shows that respondents who reported CTS complaints were 22 workers (68.8%), while those who reported no CTS complaints were 10 workers (31.3%).

Bivariate analysis produces data relating to the relationship between independent variables consisting of age, working period and work attitudes, which are associated with the dependent variable, namely Carpal Tunnel Syndrome complaints. The statistical test used was the Kendall’s Tau-b.

Statistical analysis using the Kendall’s Tau-b test obtained a significance value of 0.005 at the level of error (α) = 5% for the correlation of age variable and CTS complaints. It means that there is a correlation between age and CTS complaints. Level of relationship closeness is shown by the value of the contingency coefficient, which is 0.497. This means that the correlation between age and CTS complaints is a moderate and in a positive direction.

The correlation of working period and CTS complaints has a significance values of 0.00 at the error level (α) = 5% and the contingency coefficient (CC) of 0.614. This means that the correlation between work period and CTS complaint is strong and positive.

The correlation of working attitude and CTS complaints has a significance values of 0.00 at the error level (α) = 5% and the contingency coefficient (CC) of 0.542. This means that the correlation between work attitude and CTS complaint is moderate and positive.
Discussion

Carpal Tunnel Syndrome (CTS) is a disorder caused by excessive use of hands for a long time period\(^{(10)}\). Age factors, working period, and work attitudes are some of the factors that can cause CTS\(^{(6)}\).

According to the Ministry of Health (2009), age categories are divided into five categories, namely\(^{(11)}\):

- **a) Late adolescence**: 17-25 years
- **b) Early adulthood**: 26-35 years
- **c) Late adulthood**: 36-45 years
- **d) The early elderly period**: 46-55 years
- **e) The final elderly period**: 56-65 years

In this study, the majority of respondents who experienced CTS were in the age category of 36-45 years or 34.4%.

Statistical test found that there was a moderate and positive correlation of age and CTS complaints. This means that the more you age, the more you will experience CTS complaints. Making batik requires special creativity and expertise from workers. Therefore, at the end of their late adulthood to elderly age, workers tend to be more skilled and quite skilled in making batik as they have accustomed with the works for years. This means that respondents are at more risk of experiencing CTS complaints at this age.

This findings support Tarwaka (2015) who stated that the first muscle complaints is more likely experienced by someone at the age of 30 years. Starting from this age, the level of complaints will always increase along with the age. This happens because muscle strength and endurance begin to decrease at middle age, so the risk of muscle complaints also increases from this age\(^{(12)}\). This findings also confirm and support the findings of Ibrahim et al (2012) which stated that CTS often occurs between the age of 40-60 years old\(^{(2)}\). In addition, this findings is also in line with what Dhaniswara (2017) found that there is a significant relationship between age and incidence of CTS in worker in batik and those who experience a greater incidence of CTS are aged 41-60 years\(^{(13)}\).

The correlation statistical result between working period and complaints of CTS shows a positive relationship. This means that the longer the working period, the higher the risk of experiencing CTS complaints. According to Budiono (2003), the working period is divided into 3 categories, namely new (<6 years), moderate (6-10 years), and long (> 10 years)\(^{(7)}\).

The correlation between working period and CTS complaints is a positive and strong. The majority of respondents who reported CTS complaints are the workers with more than 10 years period of working (40.6%). This is due to the repeated and excessive hand and fingers movements for a long time period, which then causes the tissue around the carpal tunnel\(^{(8)}\).

This findings is in line with the findings of Dhaniswara (2017), which stated that there is correlation between working period and CTS complaints\(^{(13)}\). This finding is also supported by Angelia (2014) who found that the correlation between working period and CTS complaints is strong. There were 74.4% of his respondents who worked for more than 10 years reported most of complaints of CTS compared to the other workers who had less working period\(^{(14)}\).

Another factor that can also cause CTS is work attitude. Measurements of work attitude can be done by several methods. One of them is using the RULA (Rapid Upper Limb Assessment) method. RULA is a research method for investigating disorders of the upper limb. The method was designed by Lynn Mc Atamney and Nigel Corlett (1993) who provided a calculation of musculoskeletal load levels in a job that can cause CTS complaints, a risk to body parts from the abdomen to the neck or upper limbs including the wrist\(^{(15)}\). This method is very suitable to be applied to a static work such as batik. According to Tarwaka (2015), the results of the RULA assessment are categorized into 4, namely low, moderate, high, and very high\(^{(12)}\).

The statistical test result shows that there is a moderate and positive correlation between work attitudes and CTS complaints. This means that the more high-risk work attitudes, the higher the risk of experiencing CTS. The work attitudes of most of respondents (46.9%) were in the high-risk category and they reported most of CTS complaints.

This findings confirms findings of Agustin (2012) which stated that there was a moderate correlation between work attitude and CTS complaints on the worker in batik\(^{(16)}\).
Conclusion

It can be concluded that of the 32 respondents who work in the Sumenep Batik Industry:

1. The majority of them are aged 36-45 years (14 workers), have been working for more than 10 years (14 workers), and have high risk work attitudes (19 workers)
2. It also can be concluded that there is a positive and moderate correlation between age and CTS complaints
3. Strong correlation between working period and CTS complaints.
4. Moderate correlation between work attitude and CTS complaints on the worker in batik

Recommendation

1. To apply ergonomic work attitude for the workers’ wrist.
2. We suggest the industrial owners to prepare melted-wax pan the same number of workers so that workers do not need to make un-ergonomic (sideways or twisting) movement to take the wax.
3. It is recommended for the workers to take regular break every 15-20 minutes by bending and straightening the wrist. Agustin (2012) suggested batik workers to do exercises by clenching their fists, bending the wrists downward and upward and holding for 30 seconds\(^1\).
4. It is better for workers who experience CTS to immediately report their complaints to the nearest health care or doctor, so that their complaints are immediately followed up with medication and prevention.

Comparative Analysis Study of Different Positions by Hands and Feet on Functional Mobility Assessed by Five Times Sit to Stand Test on Post-Stroke Patients

Nini Natalia Li1, Bayu Santoso2, R. A. Meisy Andriana3

1Department of Physical Medical and Rehabilitation, Faculty of Medicine, Universitas Airlangga, Dr. Soetomo Teaching Hospital, Surabaya 60131, Indonesia, 2Doctor of Physical Medicine, Department of Physical Medical and Rehabilitation, Faculty of Medicine, Universitas Airlangga, Dr. Soetomo Teaching Hospital, Surabaya 60131, Indonesia, 3Doctor of Physical Medicine, Department of Physical Medical and Rehabilitation, Faculty of Medicine, Universitas Airlangga, Dr. Soetomo Teaching Hospital, Surabaya 60131, Indonesia

Abstract

Background: Five times sit to stand test (FTSTS) has been recognized for its validity and reliability in assessing muscle strength of the lower extremities functionally, evaluating functional mobility, balance and risk of falling in post-stroke individuals. However, there is no standard protocol for FTSTS implementation.

Objectives: To analyze the differences in functional mobility assessed with FTSTS results in various post-stroke post-hand posture and posture changes.

Method: There were 11 patients ischemic stroke patients enrolled in the study. The age ranked from 40-60 years old. This study used an observational and cross-sectional study. The characteristic and FTSTS data was recorded in the Five times sit to stand test form that designed for this study. The data will then be analyzed using paired t-test in groups with SSPS 16.0 program.

Results: The paired t-test results show that there are significant differences between the FTSTS results in both hand positions, either on the spontaneous feet position or asymmetric feet position (p = 0.038 and 0.020). There are no significant differences in FTSTS results with changes in spontaneous or asymmetric feet position (p = 0.779 and 0.278).

Conclusion: The augmented hand position gives the best result to shift the center of the body mass on the post-stroke patient with post-hand changes. Then, there was no difference in functional mobility assessed by FTSTS in feet position changes of the post-stroke patient.

Keywords: FTSTS, Stroke, Hand position, Feet position

Introduction

Clinically the most common symptom in stroke patients is the presence of hemiparesis, which results in the loss of normal postural reflex mechanisms for balance and body rotation for functional movement of the extremities 1,2. The previous study in 161 elderly stroke patients, showed 37% fell during a change in position such as getting up from a chair. As a consequence, improving the symmetry of body load distribution and balance becomes the goal of rehabilitation in stroke 3–6. Related to the purpose of stroke rehabilitation, the clinician requires a valid and reliable measurement to know and evaluate the motor status and functional mobility of the patient7. The ability to get up from the chair is a prerequisite for independent ambulation and more functional daily life activities such as meals,
attending an activity and while on public transport. This transition movement becomes more difficult in individuals with post-stroke hemiparesis.

FTSTS has been recognized for its validity and reliability in assessing functional lower extremity muscle strength, evaluating functional mobility, balance and risk of falling in healthy elderly individuals, stroke and Parkinson’s. Although it has been commonly used as an output parameter, there is no standard of FTSTS implementation protocol. The position of the hand when the subject performs the FTSTS is inconsistent. In most studies, subjects were asked to fold or cross their arms in the chest. While, in another study, subjects were asked to place their hands on their laps or simply stand without using hands during FTSTS. In fact, some studies do not mention the position of the hand at all.

In this study, our aim is to compare the results of FTSTS with the various hand and feet position after stroke when performing the FTSTS. We also add a condition where the augmented hand positions with asymmetry feet positions have not been studied together before. It is hoped that this research could provide information to physicians and physiotherapists in improving services in post-stroke patients at Dr. Soetomo General Hospital Surabaya, Indonesia.

Method

This research was an observational analytic with cross-sectional study approach that performed in outpatient unit of Medical Rehabilitation Installation at Dr. Soetomo Teaching Hospital Surabaya, Indonesia. The characteristic and FTSTS data were taken from August to November 2015. The subjects were first chronic ischemic stroke-patients, with hemiparesis aged 40-60 years, understanding the command, able to stand independently from the chair without the help of hands, stable general medical conditions, and willing participant in this research by the signing of informed consent.

The subjects were consecutive sampling and the number of samples obtained by 11 patients. Ethical appeals were submitted to the Ethics Commission for basic science / clinical clearance research at Dr. Soetomo General Hospital Surabaya, Indonesia. The data was recorded in the Five times sit to stand test form that designed for this study. The data will then be analyzed using paired t-test in groups with SSPS 16.0 (SPSS, Inc., Chicago, IL) program.

Results

Functional mobility capability (FTSTS results) of post stroke

All study subjects performed by FTSTS according to the study protocol in the following order: condition 1 was the position of the spontaneous feet and arms across the chest; condition 2 was the position of the spontaneous feet and the position of the hand augmented; condition 3 was the position of the feet of asymmetry and the position of the hand across the chest; and condition 4 was the position of the feet asymmetry and hand positions augmented. The average FTSTS results for 4 conditions ranged from 9.2 ± 2.8 to 10.3 ± 2.9 seconds (4.8 to 16.1 seconds). However, in condition 2 was the spontaneous feet position and the augmented hand gave the FTSTS the shortest result with 9.2 ± 2.8 seconds.

FTSTS Results at Different Hand Positions

Based on paired t-test results, there was a significant difference between FTSTS results in both hand positions, either on the spontaneous feet position or asymmetric feet position (p = 0.038 and 0.020) (Table 3).

FTSTS Results at Different Feet Positions

In this study, there was no significant difference in FTSTS results with changes in spontaneous or asymmetric feet position. The paired t-test of the change of the position of the feet against the FTSTS results is shown in Table 4.

FTSTS: Five times sit to stand test

Discussion

Based on paired t-test results, there were significant differences in FTSTS results with hand position changes in post-stroke patients. Between the two hand positions assessed in this study, the augmented hand positions gave shorter results than the crossed position in the chest (Table 3). This result was in accordance with research by Kwong and his friends that augmented hand positions help shift the centre of the body mass forward more efficiently. Previous research on sitting
to standing movements is often performed by limiting the use of the hands. The centre of the body mass moves forward at the end of the sitting to stand while the subject is pointing with their hands. Hand restrictions cause different patterns of angular changes in ankle joints, a much higher standard deviation than in the free arm that obtained. The position of the augmented arm is the position of both hands interlocked with shoulder flexion 90° and full extension elbow. This augmented hand position is often used in functional mobility exercises with the Bobath method.

The mean of time to complete the FTSTS in this study was ranged from 9.2 ± 2.8 seconds to 10.3 ± 2.9 seconds. These results were shorter than those of Mong study who received mean FTSTS in post-stroke patients was 17.1 ± 7.5 seconds in the mean post-stroke subjects aged 60.0 ± 4.8 years. Similar results were obtained in the previous study that the mean of FTSTS was 15.2 ± 17.1 seconds, with age of study subjects ranging from 60 ± 5.6 years. Similarly, research by Ng in post-stroke patients with mean age between 60.0 ± 5.56 (50-70 years) obtained FTSTS results between 15.81 to 18.20 seconds. FTSTS results in this study could be due to post-stroke patients that included the younger age of 51.9 ± 7.3 years (40 - 58 years).

Previous study did not take into account the height of the chair and using a standard chair by 43 cm. However, in this study using an especially adjustable seat height between 41 - 47 cm with seat height was 100% of the length of the lower limbs of the study subjects. According to Ng, the lower the seat, the longer it takes to complete the FTSTS. The lower seats the lower the centre of body mass and increase the degree of togok flexion and the angle of flexibility movement of togok, hip joints, knee joints and ankles while sitting to standing. As it moves from sitting to standing, it takes a greater increase of greater moments on the hip joint and knee joint.

It is obtained that sitting down to standing was required shorter time. The posterior positioning of the feet also gives the hip joint flexion and flexion speed of the smaller hip joint. Another study examined the effect of early posterior feet placement. The posterior position of the feet causes the maximum mean moment of extension of the lower hip joint. Early feet placement also affects the travel distance of the centre of gravity (CoG). Upon awakening, the movement of the centre of gravity of the body forward during standing was significantly longer on normal feet placement when compared to posterior feet placement, with reference to 10 cm behind the normal position.

In this study, there was no significant differences in FTSTS results with 2-feet positions, spontaneous and asymmetric feet position with parese feet that placed behind. Similar Lecours et al. study, on subjects with hemiparesis that has 2 possibilities when the asymmetry of the feet was positioned on the task of sitting to stand and standing up to sit. First, the subjects do a weight bearing on the position of the feet that was in the posterior as well as healthy people. Second, naturally subjects still place weight bearing on healthy feet, although “forced” weight bearing on parent feets. In this study, the second possibility has occurred.

According to previous study, it suggested the presence of weight-bearing asymmetry in patients with hemiparesis. These results are supported by evidence of togok asymmetry towards the healthy side. In this study, the patient performs a sitting motion to stand by uniforiming the starting position by starting leaning on the back of the chair, but not instructing to return again on leaning back in the seat during sitting motion, during the FTSTS. According to the researchers, there could be asymmetry togok toward the healthy side that helps stability when subjects perform FTSTS and give short results, without affected feet position.

**Conclusion**

There was a difference in functional mobility assessed by FTSTS on the post-stroke patient with post-hand changes where the augmented hand position gives the best result to shift the center of the body mass. Then, there was no difference in functional mobility assessed by FTSTS in feet position changes of the post-stroke patient.

**Ethical Clearance:** This research involves participants in the process using a questionnaire that was accordant with the ethical research principle based on the regulation of research ethic regulation. The present study was carried out in accordance with the research principles. This study implemented the basic principle ethics of respect, beneficence, non-maleficence, and justice.

**Conflict of Interest:** The authors have not found any conflict of interest related to this research so far.

Relationship between Fatigue and Musculoskeletal Complaints on Pedicab drivers in the Pedicab Association Solo Balapan Station

Novvini Miriam Suaebo1, Kinanti Anggraini Dewi2, Abdul Rohim Tualeka1

1Department of Occupational Health and Safety, Faculty of Public Health, Airlangga, University, Indonesia,
2Faculty of Health Science, Muhammadiyah University, Surakarta, Indonesia

Abstract

Musculoskeletal complaints can occur when muscles or skeletons receive a load or work is done repeatedly and the work is done for a long time. Pedaling a pedicab every day for a long time can cause fatigue. The fatigue felt by the pedicab drivers will have an impact on the pain in the muscles both in the legs, back, hands, shoulders, and neck. The aim of the study was to determine the relationship between the level of work fatigue and musculoskeletal complaints on pedicab drivers in the pedicab association Solo Balapan Station. This type of research is quantitative research. The research method used observational research. The study design was cross-sectional. The population in this study were 35 pedicab drivers, a sample of 33 people. Instrument research uses a questionnaire. Data analysis used the test Fisher exact. The results showed that there was a relationship between the level of work fatigue and musculoskeletal complaints (p=0.001). There is no relationship between age of workers and musculoskeletal complaints (p=1). There is no relationship between work periods drivers and musculoskeletal complaints (p=1). There is no relationship between the length of work/day with musculoskeletal complaints (p=0.273). There is no relationship between the average distance traveled with musculoskeletal complaints (p = 0.273)

Keywords: Fatigue, Musculoskeletal, Pedicab drivers

Introduction

The human body is designed to be able to carry out daily work activities. The existence of a muscle mass that weighs more than half the weight of the body makes it possible to move the body and do work. Every job is a burden for the person concerned. The burden is in the form of physical workload and mental workload. In practice the workload encountered is a combination of physical burden and mental burden1.

Fatigue is a condition characterized by feeling tired and decreasing alertness and influencing work productivity. According to Grandjean (1993) work fatigue is a symptom characterized by feelings of fatigue and decreased alertness2.

Exhaustion of work can have an impact on decreased attention, slowing and barriers to perception, slow and difficult thinking, decreased motivation to work, decreased alertness, decreased concentration and accuracy, low work performance, low work quality, and decreased reaction speed. These things will cause a lot of mistakes so that workers experience musculoskeletal complaints, work stress, work-related diseases, workplace accidents, and ultimately productivity decreases3.

According to Setyawati (2010), work fatigue occurs due to the accumulation of lactic acid. At work the body needs energy. The energy is obtained from the results of glycogen breakdown. In addition to energy, lactic acid is one result of the breakdown of glycogen. When the muscles contract, the lactic acid buildup will occur. This lactic acid inhibits muscle action and causes fatigue4.

Work exhaustion is a condition of weakening activities, motivate, and physical fatigue to do work. According to Cameron (1973) in Setyawati (2010), work fatigue involves a decrease in physical performance, a feeling of fatigue, a decrease in motivation, and a decrease in work productivity4. Work exhaustion cannot be defined but can be felt so that the determination of
work fatigue can be known subjectively based on the feelings experienced by the workforce. According to Suma’mur (2009), that work fatigue does not only occur at the end of work time but can also occur before work.

Complaints of the musculoskeletal system are complaints to parts of the skeletal muscles that are felt by someone starting from very mild complaints to very sick. If the muscle receives a static load repeatedly over a long period of time it will cause complaints in the form of damage to joints, ligaments, and tendons.

Work activities carried out by pedicab drivers include pedaling and lifting weights. During pedaling activities, the posture is sitting upright or bent, right and left foot pedaling alternately, with a pattern of movement of both feet pedaling, and intense limbs moving the hips, thighs, calves, soles of the feet. When the pedicab lifts the weight, the posture is in the position of the back straight or bent, hands raised, feet become the foundation of the body with a pattern of movement of the hand holding the load and lifting it, and intense limbs move the hands, back, and legs. As a result of the activity of pedaling a pedicab, pedicab drivers can be at risk of developing musculoskeletal complaints. Based on the background, the researchers wanted to examine further the relationship between the level of work fatigue and musculoskeletal complaints on pedicab drivers in the pedicab association Solo Balapan Station. The purpose of this study was to determine the relationship between the level of work fatigue with musculoskeletal complaints on pedicab drivers in the pedicab association Solo Balapan Station.

Material and Method

This study is an observational study. The design in this study uses cross-sectional. The population in this study are all 33 pedicab drivers who are members of the association of Solo Balapan Station rickshaw. The sampling technique used in this study was using total bivariate analysis using the Fisher exact test.

Based on Table 1 unknown 32 respondents (97%) > 35 years old, while 1 respondent (3%) does not include the age at musculoskeletal risk. It is known that 19 respondents (57.6%) experienced mild fatigue. A total of 14 respondents did not experience fatigue (14%). Many respondents complained of musculoskeletal pain as many as 21 people (63.6%), 12 respondents did not complain musculoskeletal (36.4%). The length of work known to 30 respondents (90.9%) have long been pedicab drivers. 3 respondents worked <7 years (9.1%). Many respondents worked 8 hours per day as many as 19 people (57.6%) while 14 people worked <8 hours per day (42.4%). A total of 22 respondents (66.7%) pedaled pedicabs in long distances, while 11 respondents (33.3%) pedaled pedicabs in short distances.

The results of testing the statistics are Fisher Exact known to be $p = 0.001$ ($p < 0.05$) with 95% CI = 3.280-137,667. These results indicate fatigue associated with musculoskeletal complaints in pedicab drivers at Balapan Station.

Based on the results of the study it was found that there was a relationship between fatigue and musculoskeletal complaints on pedicab drivers at Balapan Station. The results of this study explain fatigue as one of the factors causing musculoskeletal disorders. Fatigue is a condition where the body feels tired and not energized at any given time. This condition is actually a warning or sign from the body so that the body can be rested for a moment. Important rest is done as an effort so that the body can avoid more serious damage due to fatigue\(^6\). Musculoskeletal disorders can develop into disability and loss of ability and working time\(^7\).

Symptoms Muscle fatigue can be seen in symptoms that appear from the outside. There is a general theory of chemistry explaining that fatigue is a result of reduced energy reserves and increased metabolic waste as a cause of loss of muscle efficiency. While changes in electric current in the muscles and nerves are secondary causes. Whereas the central nervous theory explains that chemical changes are only supporting processes. Chemical changes that occur result in the delivery of nerve stimulation through sensory nerves to the brain that is recognized as muscle fatigue. This afferent stimulation inhibits the brain centers in controlling movement so that the potential frequency of activity in nerve cells is reduced. The reduced frequency will reduce the strength and speed of muscle contraction and movement on the orders of will to be slow. This the slower the movement of a person will show the more tired the condition of one’s muscles. With conditions that are tired of the respondent, the greater the experience of musculoskeletal complaints.

The results of this study indicate that failure is associated with musculoskeletal complaints. The fatigue of these respondents can also be caused by the existence of a long working period of more than 8 hours a day. This condition is very possible for workers to experience musculoskeletal complaints because a long time a person works well no more than 8 hours a day. The longer the work time spent, the greater the likelihood of things that are not desirable, even though the results of the analysis of statistical tests that the length of work per day does not show a relationship to musculoskeletal complaints, thus that duration of work is not directly related to musculoskeletal output, but the long work process in the respondent will result in fatigue, resulting in musculoskeletal complaints.

Based on the results of the study it is known that the respondent’s working hours are erratic so that if the respondent feels tired or sick, the respondent will reduce working hours or even not work. But on the other hand, if the respondent gets a lot of passengers when working, then the respondents tend to be less rested, even though the respondents already feel tired. Based on interviews with respondents, that the income factor of passengers is a factor that can influence respondents to reduce rest, especially when competition in the Railway Station is increasingly tight, such as conventional taxis and taxis online, while the presence of online motorcycle taxi or base rent does not become competition because motorcycle taxis online only carry passengers without large capacity goods. With a lack of attention to the wife, the respondents who experienced fatigue resulted in musculoskeletal complaints. The aim is to deliver the feeder from the train station at most with the aim of the Tirtonadi bus terminal with a distance of around 700 m. Other objectives that were also frequently sent by respondents were Klewer market, Beteng market, Solo Wholesale Center (PGS) or arrived at the Surakarta Palace. Usually, after arriving at the destination, the respondent also gets a new passenger before returning to the train station. With a large number of passengers, the wife’s time is reduced and results in complaints of pain such as hand injury.
Injuries that most respondents feel the body like the wrist. A wrist injury can occur due to work such as bending the body and lifting the rear wheel of the rickshaw and holding it when the passenger rides a rickshaw and sits down. The weight of the pressure resulting from holding the load by hand results in the respondent experiencing complaints to the wrist. According to Tarwaka (2010), there are several types of musculoskeletal disorders that occur in the hands, including tendinitis, inflammation (swelling) or irritation of the tendons. It usually occurs at the point where the muscles attach to the bone. This situation will continue to develop if the continuous tendon is used to do unusual things such as strong pressure on the hand, bending the wrist while working or moving the wrist repeatedly.

Another complaint felt by respondents was a pain in the shoulder and neck. This shoulder and neck pain occur because of the position of the body when pedaling so that the rickshaw starts to run after the respondent pushes the rickshaw. Shoulder and neck pain will be increasingly felt when the respondent carries passengers or heavy items so that when the foot pedal the pedicab firmly, then the neck will feel tense due to the energy released so that the pedicab continues. The pedicab design used causes the position of the body to move away from its natural position, so pedicab drivers generally complain of upper neck, lower neck, back, right upper arm, waist, buttocks, buttocks, left forearm, right forearm, left hand, right hand, left thigh, right thigh, right knee, left calf, right calf, left foot and right foot.

Respondents’ complaints on the part of the foot most felt at the knee. This working condition occurs when pedaling a good rickshaw when pushing on a ramp, thinking of the rear wheel of a rickshaw when raising and lowering passengers, pedaling with heavy loads and carried out at a considerable distance. NIOSH (2007) states injuries to the back and knees such as - Low Back Pain due to bent back posture. If this bending posture continues it will weaken the disc and can cause disc discontinuation or herniation. At the knee is very much related to the pressure on the fluid between the bones and tendons. The pressure that occurs on the knee for a long time can cause inflammation or bursitis.

Based on the results of the study that respondents who experience pain complaints, the way to reduce pain is to rest, especially during lunch hours. Respondents sometimes sleep in passenger rickshaw seats. Fatigue can be reduced in various ways, namely by providing enough calories as input for the body, working by using good working methods, for example by working with the economic principles of movement, paying attention to the body’s ability, meaning that the expenditure of energy does not exceed income by paying attention to its limits, paying attention to regular work time by making arrangements for working hours, rest periods and facilities, during holidays and recreation and others, and trying to reduce monotony and work-related tension. The incidence of shirt injury is caused by exposure with awkward postures and the burden raised exceeds the capacity of the worker itself.

**Conclusion**

a. A large number of respondents are > 35 years old, over 7 years of working time, length of work above 8 hours per day and the average distance above 5 km.

b. Most respondents had fatigue.

c. Most respondents had complaints of the musculoskeletal system.

d. There was a correlation between the level of fatigue and complaints of the musculoskeletal system in pedicab drivers in the pedicab community, Solo Balapan Station.

Abstract

Background and Objectives: On the basis of newly synthesized i.e. imidazolidine-2tion (IMT), highly selective poly vinyl chloride (PVC) membrane electrode was utilized as a carrier for iodide selective electrode via the incorporation of membrane ingredients within the graphite electrode surface.

Method: The impact of different factors consisting of the pH, membrane arrangement and likely intervening anions were examined on the electrode’s response characteristics. The created sensor displayed Nernstian responses to iodide across a concentration of 1× 10⁻⁶ to 0.1 M with slopes of 57.8± 0.7 mV per iodide concentration decade and 7 × 10⁻⁷M detection limit, across a pH range of 3.0-10.5.

Results: The sensor response time was 6 seconds and may be used for a minimum of 2 months with no significant divergence at potential responses.

Conclusion: The electrode was implemented with success to determine iodide within synthetic pharmaceutical samples as well as using as an indicator electrode for precipitation titration.

Keywords: Iodide-selective electrode, potentiometric sensor, imidazolidine-2tion, coated-graphite electrode.

Introduction

Iodide is a fundamental component of thyroid hormones which has a significant role in developing cell growth and brain function and its absence entails considerable delays in neurological development¹. Iodine is vital to determine iodide in natural waters and biological samples in regard to environmental and biological terms². Several analytical approaches have been conducted to determine iodide at low concentration levels since this bio-essential lement typically takes place at extremely low concentrations. The majority of these approaches need costly instruments, complex techniques, inadequate sensitivity and are time consuming e.g. classical spectrophotometry or titrimetry, and/or sample pretreatments namely in a complex matrix such as wastewater. A simple approach i.e. potentiometric detection on the basis of an ion-selective electrode has numerous advantages such as a speedy process, straightforward preparation, simple instrumentation, expeditious response, extensive dynamic range, appropriate selectivity and is cost-effective. Such properties have unavoidably produced sensors for numerous species with the available electrodes list expanding significantly over the past few years. Different types of electrodes have been recommended to determine the analyst ion. In addition to traditionally produced electrodes, the coated wire electrode has gained attention due to its simple manipulation and fabrication, great dynamic range, low detection limit and improved miniaturization potential. Thus, there has been growing interest in developing and applying potentiometric sensors. The majority of lately reported potentiometric sensors are carrier based ion-selective electrodes (ISEs) that likely act on chemical recognition principles. Numerous recognition elements types have been used in selecting or synthesizing appropriate carriers to construct ISE’s such as the utilization of adequate sized...
A selective interaction among the ionophores and anions is needed in ion selective electrodes for the purpose of successfully complex anions within a selective manner. The attraction between active sites used in anions and membranes may be separated into two categories; a quaternary ammonium and phosphonium salts by the ion exchange procedure and generates a selectivity pattern named the Hofmeister pattern. In this study, the selectivity for various ions and the impact of the membrane matrix, ionophore concentration, additives and the pH on potentiometric response characteristics regarding the suggested electrodes is examined.

**Experimental**

Coated-graphite electrodes were prepared based on a prior method. The spectroscopic grade graphite was used to prepare the graphite rods of 3mm diameter and 10 mm length. A silver loaded epoxy resin was used to glue a shielded copper wire to one of the ends of the graphite rod. The rod was then placed into the end of the PVC tube. A polishing cloth was used to polish the electrode. Water and methanol were used to rinse the electrode before being left to dry. A concoction of the membrane additive, MTOAC, PVC, plasticizer with an overall mass of 100mg was disintegrated in approximately 3 ml of THF. The electro active material imidazolidine-2tion was added to the mixture prior to being mixed. By repeatedly dipping the polished graphite electrodes into the membrane solution, the electrodes were coated. On the graphite surface, a membrane was created which was left to set overnight. Water was used to rinse the electrodes prior to being conditioned for 14 hour and 18 hour time periods in a 0.05 M potassium iodide solution for the imidazolidine-2tion. If the coating solutions are preserved in a refrigerator, they can remain stable and may be used to construct new membranes.

**Findings**

**Membrane composition effect**

As with prior reports, a plasticizer: PVC ratio, 2:1 was maintained as constant in the optimization of the suggested iodide ion-selective electrode ingredients. Because of the plasticizer effect and its quantity on the dielectric constant regarding the ligands mobility and membrane phase, it is assumed to have a significant role in detection limit control and sensitivity/selectivity of the electrode. Since membranes possess 60–70 wt.% of a plasticizer, it is predicted that the dielectric constant values of the liquid membranes are identical to the values resulting from the pure liquid plasticizer. The binding of synchronizing anions namely the thiocyanate and iodide with the complexes’ metal centers is predicted to be strengthened while the polarity of the solvents is decreased. The membrane solvent that is less polar is more appropriate for the anti-Hofmeister actions of a provided anion ionophore. Hence, at plasticizer: PVC ratio of ≈ 2 the impact of the plasticizer type concerning the response properties of the iodide ion-selective electrode was examined using 6 plasticizers with various polarities that included BA, NPOE, DMS, DOP and DBP. From 5 various implemented plasticizers, the membrane was prepared using DOP (ε=5.1) had the most favorable characteristic response. When DOP (ε= 5.1) was replaced with DBP (ε= 6.4), BA (ε= 5.0), or DBS (ε= 5.4), the electrode’s slope was reduced. For the polar membranes based on o-NPOE (ε= 23.9), the detection limit was higher. The o-NPOE polarity is higher than the polarity of DOP but they are of similar lipophilicity. This may be because of the synergism among the polarity and lipophilicity where the most beneficial results were acquired when these properties achieved an intermediate value. The electrode with DBP and DOP with low polarity compounds between the plasticizers were examined and presented useful circumstances to incorporate highly lipophile iodide ion within the membrane before coordinating it with soft mercury ion within the complex. This is in accordance with the literature that proves sensors for iodide ion-selective electrodes with comparatively non-polar membrane material may enhance iodide responses. The responses of the electrode prepared using various IMT amounts were increased when IMT concentrations were increased to 9.7. Adding more ionophores concentrations deteriorated the electrode response which was likely because of membrane saturation or membrane non-uniformity. It is established that lipophilic salts improve the response behavior and selectivity whilst reducing sample anion interference in addition to reducing membrane resistance. Neutral carrier based anion selective electrodes need lipophilic cathionic sites. However, concerning charged carrier-based ISEs, the ionic sites should hold the same charge as analyte ion. The effect of the membrane additives concentration and type were examined by integrating NaTPB or MTOAC into the membranes. The carrier-based membranes potentiometric response significantly enhanced the existence of lipophilic cationic additive,
MTOAC in comparison to the membranes with no additive. However, no responses were seen when NaTPB was integrated into the membranes. The MTOAC concentration influence on the membranes was examined at numerous additive/carrier mole ratios. The electrode with MTOAC/carrier mole with 0.42 ratio exhibited close-Nernstian response within an extensive iodide concentration range.

Response Characteristics and Selectivity of the Electrode

The results shown in Fig. 1, the potential response of the electrode based on carrier is independent of pH over the range 3.0–10.5. Dynamic response time is an important factor for an iodide sensitive electrode. In this study, the practical response time was recorded by changing solution with different low-to-high I⁻ concentrations. The actual potential versus time traces is shown in Fig. 2. As can be seen, in whole the concentration range, the electrode reaches the equilibrium response in a very short time (approx. 6 s). To evaluate the reversibility of the electrode, a similar procedure at the opposite direction was adopted. This time, measurements were performed in the sequence of high-to-low sample concentrations and the results are shown in Fig. 2, which shows that the potentiometric response of the sensor was reversible, although the time needed to reach equilibrium values were somewhat longer than that of the low-to-high order of sample concentration. Optimum conditioning time for the membrane sensor in a 5.0 × 10⁻² M potassium iodide solution is 14 h in 0.05 M potassium iodide. It then generates stable potentials when placed in contact with I⁻ solutions. The long-term stability of the electrode were studied by direct periodically recalibrating in standard solutions (KI and air and distilled water) and calculating the response slope over the range of 1.0 × 10⁻⁵ to 1.0 × 10⁻¹ iodide ion. The slopes of the electrode responses were reproducible to within 1.0 mV/decade over a period of 2 months, but life time studies for more than this period have not been done. Therefore, the membrane electrode can be used for at least 2 months, without a considerable change in the response characteristics towards iodide ion. The electrode was stored in solution when not in use. The potentiometric response of the electrode was examined in the concentration range 1.0 × 10⁻⁷–1.0 × 10⁻¹ M. The calibration plots for iodide selective electrode are shown in Fig. 3, which show linearity over the concentration range of 1.0 × 10⁻⁶–1.0 × 10⁻¹ M and with a detection limit of ≈7.0×10⁻⁷ M and sensitivity of 55.2 ±0.9 mV/decade of iodide concentration (n=6).
Figure 3. Application of the electrode based on IMT for potentiometric titration of (A) 100 ml $1 \times 10^{-3}$ M Ag$^+$ with 0.1 M I$^-$ and (B) 100 ml $1 \times 10^{-3}$ M I$^-$ with 0.1 M Ag$^+$.

**Selectivity of the Electrode**

The selectivity behavior is obviously one of the most important characteristics of an ion-selective electrode, determining whether a reliable measurement in the target sample is possible. In order to assess the selectivity of the proposed iodide ion selective electrode over other anions the method of fix interference method [FIM] and separate solution method [SSM] was employed.$^{14,15}$ According to this method, the potentiometric selectivity coefficients, $K_{pot}$ I, can be evaluated from the potential measurements on solutions containing a fixed concentration (0.01 M or 0.001 M) of interfering ion (respective potassium or sodium salts) and varying concentration of iodide ion in FIM and in SSM potential of different solution containing same amount of iodide or interfering ion (0.01 M). As can be seen, the electrode based on carrier has not shown the tendency toward the highly lipophilic anions such as ClO$_4^-$, N$_3^-$, Br$^-$, NO$_3^-$, and NO$_2^-$.

**Indirect Determination of Iodine-containing Drug**

The proposed electrode was applied for the indirect determination of iodine containing drugs including iodiquinol (Jalinous Pharmaceutical Co, Tehran, Iran) and Levothyroxin (Iran Hormon Co, Tehran, Iran) as follow: 2 g of sodium were placed into an alkaline fusion tube and heated until all of the sodium was fused. Then an appropriate and accurately weighed amount of finely powder tablet (i.e., 0.1 g of 4 mixture tablet) was added to hot tube, and the resulting mixture was completely burned. The hot tube was immediately transferred into a beaker containing 25 ml distilled water. After cooling the reaction mixture was filtered and washed with water and diluted to mark in a 50 ml calibrated volumetric flask. The iodide released from the decomposition of drug was determined by potentiometric titration method using standardized silver nitrate, the proposed electrode as indicator electrode.

**Direct Determination of Iodide-containing Drug**

The resulting electrodes were applied to determine iodide in a drug preparation (Meglumine Compound Injection, from Darou Pakhsh Pharmaceutical Co., Iran; is an iodide containing drug used for protection from light and secondary X-rays). The sample was prepared by refluxing 1.0 ml of the drug preparation in concentrated sodium hydroxide solution in the presence of zinc powder for 30 min.$^{16}$ After cooling, the reaction
mixture was filtered and washed with water three times. The filtrate was acidified with H$_2$SO$_4$ and diluted to 1 with water. The iodide content of the resulting solution was determined potentiometrically by the standard addition method.

**Conclusions**

This iodide selective electrode based on IMT as new carrier can be used for determination of iodide in polluted and industrial samples. Due to the high mechanical resistance and durability of the coated-wire electrode, and low solubility of the carrier used, the proposed electrode can be used in flowing streams. The characteristics and the typical applications presented in this paper, make the electrode suitable for measuring the iodide content in a wide variety of samples, without a significant interaction from concomitant anionic species. The results show that there was a coordination interaction between iodide and the proposed carrier, which played an important role in the response characteristics and selectivity of the electrode.

Rituximab in the Treatment of Refractory Myasthenia Gravis: Studying the Outcomes using MMT Score and Need for Plasmapheresis in Baghdad Teaching Hospital

Abeer Abdulhadi Rashid¹, Sarmad Abdulrasool Almashta², Rana Ali Hussein³, Ahmed Khaleel Mashaallah⁴

¹Lecturer, department of Clinical Pharmacy, College of Pharmacy, Mustansiriyah University, Iraq

⁴Bactriologist, Baghdad Health Directorate - Al-Karkh, Iraq.

Abstract

Introduction: Myasthenia gravis (MG) is an uncommon autoimmune disease that is caused by acetylcholine receptor antibodies (AChRA) at the neuromuscular junction. Its pathogenesis involves complement fixing antibodies directed against acetylcholine receptors, muscle-specific tyrosine kinase or low density lipoprotein receptor–related protein.

Method: A descriptive case series study investigating rituximab in refractory MG was conducted in Baghdad teaching hospital. Patients who were included in the study had received a regimen of rituximab that was deemed appropriate by their treating physician.

Results: A total of 24 patients with mean disease duration of 6.3 years ±3.6 standard deviation were included in this study. The results showed that the average age of patients was 33.3 years ±10.1 SD and 62.5% was females. All twenty four patients showed an obvious improvement in clinical status after finishing the follow-up period. The results demonstrated from all patients that enrolled in our study, only one patient that who was on 14 sessions of plasmapheresis was in need for plasmapheresis after induction of rituximab and this difference was statistically significant.

Conclusion: There were a great clinical improvement as shown with MMT score in addition to discontinuation of plasma exchange treatments following treatment with rituximab.

Keywords: Rituximab, Myasthenia gravis, Refractory, plasmapheresis
review of population-based studies, and showed a higher incidence rate of MG in young women and older men\textsuperscript{[9]}. The neuromuscular abnormalities in MG are thought to be an autoimmune response related to specific anti-AChR antibodies, but how the autoimmune response is started and preserved in MG is not fully understood\textsuperscript{[10]}. AChR antibodies mostly belong to the IgG1 and IgG3 subclasses, which stimulate the complement cascade to destruct the postsynaptic membrane, which may lead to up regulation of inflammatory cytokines\textsuperscript{[11]}. The ultimate goal of treatment is to achieve complete stable remission, defined as no myasthenic symptoms or signs without any ongoing treatment for at least 1 year\textsuperscript{[12]}. Therapies in MG should therefore eliminate patients’ symptoms within the boundaries of adverse events associated with treatment itself\textsuperscript{[13]}.

**Patients and Method**

A descriptive case series study examining rituximab in refractory MG was performed in Baghdad teaching hospital. Patients who were included in the study had received a regimen of rituximab that was deemed appropriate by their treating physician. Total of twenty four patients identified with refractory generalized MG were enrolled in the study. Physical tests were estimated before and after treatment with rituximab. MMT score is used to show clinical improvement. MMT is a procedure for the evaluation of strength of individual muscle or muscles group based upon the effective performance of movement relation to the forces of gravity or manual resistance.

There were no specific criteria used to stage clinical response against no clinical response. The main outcome of the study was the improvement in MMT score and symptoms of patients, with the other outcomes being the change in the frequency of plasma exchange which were done at the estimation of the clinician. Patients that are included in the study are 13 to 90 years old that must have refractory MG, that not respond to glucorticoid and other immunosuppressive therapy. Subjects must be on a stable standard immunosuppressive regimen with no history of thymoma, tumor, infection, or interstitial lung disease on chest CT, MRI, or chest x-ray. Patients that are excluded from the study are patients with history of chronic degenerative, psychiatric, or neurologic disorder other than MG that can produce weakness or fatigue. Female subjects who are premenopausal who are pregnant, breast feeding or not use effective method for contraception. Protocol for Rituximab was administered in a standard dose of 1g. Every cycle is estimated as one infusion for two weeks. The space between cycles was adjusted as 6 months.

To see the safety and adverse events, we collected notes from the infusion center and also, a complete blood count and, liver function test profiles present in patient’s medical records. SPSS version 22 was used for data entry and analysis. Mean and standard deviation was used to represent the numerical data while the frequency and percentage for categorical data. Independent student T test and the test chi-square (Fischer exact test if not applicable), were used to confirm significance \( p < 0.05 \) was considered significant.

**Results**

A total of 24 patients with mean disease duration of 6.3 years ±3.6 SD were included in this study. The results showed that the mean age of patients was 33.3 years ±10.1 SD and 62.5% was females. All twenty four patients showed a marked improvement in clinical status by the end of the follow-up period. Five of the patients underwent a single cycle of rituximab, two received two cycles of rituximab while the remaining received either three or more cycles of rituximab. The results indicated there was no significant difference (\( p = 0.5 \)) in plasmapheresis session that as needed after induction of rituximab when compared according to number of cycle of rituximab in term of < 4 or \( \geq 4 \) cycles, where the results showed that only one patient was in need for plasmapheresis session of those who received less than 4 cycles of rituximab while no one in need for plasmapheresis session of those who received more than 4 cycles of rituximab as seen in table 1.
The results demonstrated from all patients that enrolled in our study, only one patient that who was on 14 sessions of plasmapheresis was in need for plasmapheresis after induction of rituximab and this difference was statistically significant (p=0.03) as seen in table 2.

Regarding MMT score the results indicated that the highest frequency (50%) of patients was in score 2 of MMT score before using the rituximab followed by score 3(33.3%) and lastly the score 1(16.7%) as seen in table 3.

The finding revealed that from 4 patients who was with score one before treatment with rituximab; 3 patients were improved to score 4 and 1 to score 5. From 12 patients who were in score 2 before using of rituximab; 4 patients were improved to score 3, 3 patients improved to score 4 and 5 patients to score 5. From 8 patients who were in score 3 before treatment with rituximab; 2 patients were improved to score 4 and 6 patients to score 5. So the results revealed that the frequency of patient who had pretreatment high score of MMT, who were reach the highest score after treatment with rituximab was higher than those who were already had low score before using the rituximab but this difference was non-significant as seen in table 5.

Discussion

In this study of 24 patients that present with refractory generalized myasthenia gravis, we see that rituximab result in a sustained clinical improvement as demonstrated by improved MMT score in addition to reduce frequency or lack of need for plasma exchange treatments as shown with Anderson et al study[14]. At time of this study, all patients were followed for 1 year following infusion with rituximab. The results of this analysis favor the theory that rituximab can be effective for treatment of refractory MG which is compatible with small reports that were done previously as in Zebardast et al and other studies[15,16]. Most patients may need two or more cycles of rituximab for obvious decrease and discontinuation of other immunosuppressant, in addition to the attainment of disease remission. As there is no fixed protocol for rituximab use in myasthenia gravis, retreatment is decided based on disease activity and clinical improvement, with a minimum interval between infusions of 6 months which is similar to Peres et al[17]. A perfect protocol has not yet been confirmed, however, some studies used peripheral B-cell count as a guide for retreatment with rituximab and to decrease toxicity and side effects [18,19]. An additional studies are required to recognize the best objective clinical indicators and to fix pharmacokinetics in this kind of patients. Immunoglobulin levels, B-cell counts, titers for antibody would seem the most helpful objectives at this time but in our study we depend on symptoms improvement and MMT score. All patients in this study can tolerate rituximab with no severe hematologic derangements[20,21]. The patients in this study were monitored clinically for rituximab adverse effects while in the infusion center as well as with CBC and LFT at baseline and after each infusion. All patients in this study can tolerate rituximab with no severe hematologic derangements. Infusion reaction is the most common side effect reported in general[22]. There is a need for a larger prospective controlled trial to gain more definitive conclusions about the efficacy of rituximab in the treatment of refractory MG. The strong effect of rituximab in patients with refractory MG in our center as well as in similar studies is promising and suggests that further investigation of this agent in MG is warranted[23,24].

Conclusion

There were a great clinical improvement based on MMT score, in addition to decrease or cutting the use of plasma exchange following treatment with rituximab. Rituximab is an attractive treatment because of its mechanism of action that result in targeting CD20-positive B cells which are engaged in the production of antibodies. Most patients in this study can tolerate rituximab with no severe hematologic derangements and mild infusion reactions were the most common side effects associated with our study.

Assessment of Nurses’ Knowledge toward Nursing Intervention for Eye Trauma at Baghdad Teaching Hospitals

Ahmed F. Hassan1, Tahseen R. Mohamed2, Aqeel H. Jassim2

1Assistant Instructor; 2Teacher, Fundamentals of Nursing Department, College of Nursing-University of Baghdad

Abstract: Nurses in emergency care for eye trauma usually concentrate on life threatening issues which are emergency in most situations that lead to little concern of the less emergency issues like eye problems even it is serious problem. Objectives: Assessment of Nurses’ Knowledge toward Nursing Intervention for Eye Trauma and to find out a relationship between nurses knowledge with some variables such as (educational level, year of experience in hospital, training course). Methodology: A descriptive study was conducted in the period of December 10th 2017 up to the end of 5th May 2018. The sample consisted of (100) nurses who were systematically selected one by one. The data collected was analyzed using SPSS version 17.0. Results: The majority of the study were female who accounted for (59%) of the total participants while male constituted (41%). Most of the study participants (32%) were ages over 41 years old. (43%) of the nurses were Nursing high school graduate. Seventy eight percent of the nurses were married and fourth eight percent were barely sufficient. Majority (83%) of nurses had training course. Conclusions: Findings of study demonstrate that, nurses have good knowledge about eyes Trauma.

Keywords: Knowledge, intervention, nurses, Eye Injuries

Introduction

Eye injuries come at a high cost to society and can be avoided. Primary explosion injuries can be initial, from the same explosion wave secondary from the wind-blown fragments. Post-secondary; due to structural collapse or thrown against a fixed body; or the quartet, burns and injuries of indirect[1]. Chemical eye injuries are common and represent one of the “true” eye emergencies. Virtually any chemical can cause ocular irritation. Most of these injuries are unpredictable and do not cause permanent lesions (e.g., shampoos, defense sprays, home cleaning solutions, etc.) while others may result in permanent decay [2]. Eye trauma is the main cause of impaired vision and affects the individual by influencing their quality of life and society by causing loss of ability to work [3]. Penetrating orbital injuries pose a serious threat to vision, eye movement, and life in some cases. Previous studies have shown that risk and type of infection are often associated with age, sex and race [4]. Management of an injured eye requires taking accurate history, evaluation of vision that measures the acuity and if there is a relative glaucoma defect as well as careful examination of the eyes, under an aesthetic if necessary. A lateral canthotomy with cantholysis should be performed immediately if there is a sight-threatening retro bulbar haemorrhage. Systemic antibiotics should be prescribed if there is suspected penetration or perforation of injury. The world should be protected by ruptured eye shield [5].

Materials and Method

A descriptive study: Assessment of Nurses’ Knowledge toward Nursing Intervention for Eye Trauma at Baghdad Teaching Hospitals. This study was conducted at Baghdad Teaching Hospitals between December 10th 2017 up to the end of 5th May 2018. A tool of knowledge questionnaire was developed and distributed to the participants in this study. The sample consisted of (100) nurses at Baghdad Teaching Hospital, Ibn-AL-Hathaim Teaching Hospital, AL.Yarmouk Teaching Hospital, Imamiein Kadhimein Medical City. A questionnaire- interview format was designed and developed by the researcher for the purpose of the study; such development was employed through the available literature, clinical background and interview with nurses. All the items were measured on scale of (2) indicates that the know 1; don’t know 0.The questionnaire consisted of (2) parts. Part I: Demographic Information Sheet. Part II: Assessment of Nurses knowledge toward Nursing Intervention for Eye Trauma which Includes:
foreign body, chemical substance and embedded object. Rating scale was used to rate the frequency and extension of the problems. The content validity of the instrument was established through a panel of (10) experts. Test- retest reliability was determined through a computation of person correlations for the scales. The data were collected by using the questionnaire structured format through interview and inspection technique. The determination was conducted during the period from 1st January 2018 to 30th February 2018. The data were analyzed through descriptive data analysis and inferential data analysis the data were analyzed through the use of Statistical Package of Social Sciences (SPSS) version (17).

This table indicates that there is no significant association between levels of education, experience of nursing in hospitals with nurse’s knowledge and there is significant association between training courses with nurse’s knowledge.
Discussion

Through the course of the data analysis of the present study the finding showed that the majority (59%) of the study were female while the remaining were male. The highest percentage of age group in present study (43%) were over 41 years old and lowest percentage(8%) were (21- 25) years old. Concerning marital status and level of education, (78%) of the sample were married, most of them are (43%) nursing had high school graduate. monthly income for study sample were (48%) o barely sufficient income.

These results are agreement with the findings obtained from other study, who shows that nurses in age group of 41–60 had good knowledge (11.1%) compared to age group of 20–30 (1.1%), also this study disagree with level of education, who shows nurses with certificates have good knowledge (25%) compared to post basic nursing (0%) [6].

Regarding experience years, majority (28%) of the study was experience years in nursing and (37%) of nurses had Experience years in eyes hospitals, (83%) have training and (55%) had number of courses in nursing.

These results are accordance with findings obtained from other study, shows that after the training course, 47.5% of the respondents were somehow familiar with high reliability organizations model (HROs), and 52.5% admitted that they were completely familiar with this model, although, only 18.8% proved completely familiar with HROs model before the training course [7].

The result of accurate study that show foreign body domain in table (2) for nurses knowledge is high good knowledge in item (keep the person still and comfortable) and poor knowledge in item (To Attempt to flush and foreign objects from the eye whilst keeping the injured eye down). The mean of score is good at all Foreign body domains. A finding suggest the large injured of patients to enter foreign body to the eye hospital in the eyes that leads to frequent nurses cope with these injuries and to increase knowledge about these trauma.

This finding was similar to a study conducted by other researcher who stated that study which reported that the chemical injuries were accidental in 73.9% of the cases and of these 76.5% were work related. The remaining 26.1% resulting from assault were bilateral and led to blindness in all the patients. Main injurious agents were acid and alkali [9].

The finding demonstrated the mean of score of embedded object in table (2) for nurses knowledge are high good knowledge in item (Do not try to remove the object from the eye) and (Refer immediately to ophthalmologist) and poor in item (Place a pad over the uninjured eye to minimize the movement in both eyes). The mean of score is good at all embedded object domains. This finding indicted nurses have good knowledge to deal with the Embedded object of eyes in hospitals.

This finding are good agreement done which other researchers who reported that successful removal of penetrating oculo-cranial foreign body by non-operative methods can be done in the emergency department in carefully selected patients [10].

Level of education, experience of nursing in hospitals in comparison of the respondent’s total Nurses knowledge domain in table (4), there is non-significant association between level of education (χ² obs=3.550)a and poor knowledge in item (To Attempt to flush and foreign objects from the eye whilst keeping the injured eye down). The mean of score is good at all Foreign body domains. A finding suggest the large injured of patients to enter foreign body to the eye hospital in the eyes that leads to frequent nurses cope with these injuries and to increase knowledge about these trauma.

The result of accurate study that show foreign body domain in table (2) for nurses knowledge are high good knowledge in item (Going to ophthalmologist) and poor in items (Pressure patch or bandage on the contact lens) and (Use the Anatiglaucoma). The mean of score is good at all Foreign body domains. A result that refers to frequent patients enter the chemical injury to the eye hospital in the eyes of leads to frequent nurses to deal with chemical injuries and to increase knowledge and skills about these trauma.

Training course in comparison of the respondent’s total nurses knowledge domains with training course in

This result of study are disagreements with other studies done by other researchers whose reported that the association between knowledge and education level there was statistically significant (significant level is value less than 0.05) association between the two variables(χ² obs== 8.003 a, df=1 , p ≤ 0.05) [11].

Training course in comparison of the respondent’s total nurses knowledge domains with training course in
table (4), there is significant between training course ($\chi^2_{\text{obs}}=14.560a$, df=2, $p \leq 0.05$) with nurses knowledge domains.

These result were similar to those result obtained from other researcher who reported that total knowledge of staff about high reliability organizations model increased after training course ($P<0.0001$) [7].

**Conclusions**

This study demonstrate that, despite good nurses knowledge regarding eyes trauma, as well as study indicated overall nurses have positive correlation eyes trauma and training course.

**Recommendations**

1. Health education programs for nurses about eyes trauma.

2. Increases training course for nurses inside and outside in Iraq that contributed to improve nurses knowledge and practice about eyes trauma.

This research was funded by Author. Moreover, we would like to thank the study participants and data collectors for their fully participation and responsible data collection.

Anti malignant (HepG2, MOLT-3) Activity of One, Two, Three- Triazoles New Prepared Bearing Hetero Compounds in Baghdad

Ahmed Sa’adi Hassan

1Medical Lab Technique, College of Health and Medical Technical, Middle Technical University, Baghdad, Iraq

Abstract

In the current work, chemistry a group of related chemicals that are similar in structure or properties of new heterocyclic compounds were prepared from para nitrobenzoic acid. This work includes four parts: the first part Preparation of 5-(4-nitro phenyl)-1,3,4-thiadiazol-2-amine by the reaction of p-nitrobenzoic acid with thiosemicarbazide, the second part prepared 2-chloro-N-(5-(4-Nitrophenyl)-1,3,4-thiadiazol-2-yl) Acetamide by reaction Chloroacetyl chloride with compound and part three contain reaction compound(2) with urea/thiourea to get compounds cyclization by using urea (thiourea) finally step reaction these compounds with different aldehydes and ketones in glacial acetic acid \(^{(6-10)}\), as shown in Scheme 1

The aim of present work is synthesis new derivatives of 1,2,3-Triazole having heterocyclic compounds on ring from the reaction of azine with a different reagent to give (1,2,3- Triazole) rings. The 1,2,3-Triazoles It has been derivatives A long time ago and has been Scout mainly for their potential in anti-tumor chemotherapy the prepared of 11,2,3-Triazole financial products have good Anti malignant (HepG2, MOLT-3) Activity. Many groups have carried out focused research in this particular

Keywords: 1,2,3-Triazoles • Heterocyclic • Anti malignant• (HepG2, MOLT-3)

Introduction

Heterocyclic compounds are considered an important branch of Bioorganic compounds due to their implication in drugs and industrial studies. They are cyclic compounds in which one or more of the atoms of the ring are hetero atoms. Nitrogen, oxygen and sulfur are considered the most hetero atoms known \(^{(1, 2)}\).

Heterocyclic compounds are found as construction units through several biological molecules \(^{(3)}\), and mostly are molecules which contain five, six and seven-membered rings \(^{(4)}\).

Triazoles comprising of nitrogen containing heterocycles, fused thiazoles, benzimidazoles, lindoles, etc.

Constitute an important base in biological science and medicinal chemistry. Triazine:

The 1,2,3-Triazine, is an Aaza analogue of pyridine, and its derivatives form an important class of heteroaromatic compounds with various interesting biochemical properties.

Triazines are six-membered aromatic rings containing three nitrogen atoms; there are three possible arrangements of the nitrogen atoms in the ring:

1,2,3-Triazines are sometimes referred to as the symmetrical isomer and 1,2,4-triazines as the asymmetrical form; 1,2,3-triazines are often referred to as vic(vicinal) isomers \(^{(4-6)}\).
synthesized 3-Ssubstituted-pyrido[1,2-aa][11,3,5]triazin-2,4-dione [6] by Ccycloaddition betweenndiphenyl methylisocyanate and 2-pyridyl isocyanate according to the following reaction steps:

\[
\begin{align*}
\text{N} & \quad \text{NaNO}_2/HCl \\
\text{N} & \quad \text{NaN}_3 \\
\text{CO} & \quad \text{NHNH}_2 \\
\text{N} & \quad \text{CO} \\
\text{N} & \quad \text{NCO} \\
\text{Curtius rearrangement} & \quad \text{heat, } -\text{N}_2
\end{align*}
\]

2-pyridyl isocyanate

The expansion of new anticancer curative agents is one of the fundamental targets in medicinal chemistry.

Cytotoxicity and genotoxicity of anticancer treatment to the normal cells are major troubles in cancer therapy and engender the risk of inducing secondary malignancy.

A dose of an anticancer drug adequate to kill Tumor cells.

In contemporary years, there has been a mindful search for the invention and development of novel selective anti-cancer agents, devoid of many of the unpleasant side effects of conventional anticancer agents.

The synthesis of a newer class of anticancer agents is in need of time.

In this work prepared the anticancer compounds 1, 2, 3, triazole by linked with another active site moiety by used different delineation [10].
2. Synthetic delineation

A large number of biologically active molecules containing a motif of 1, 2, 3 triazole were well synthesized before the “clickon chemistry” approach became common. A one, two, three-Triazole ring system has been a subject of intense research\(^{(1,2,8)}\) due to its versatile potential to interact with diverse biological systems.

In recent years, many synthetic methodologies have been developed for the synthesis of this ring system. The most common reaction for the production of cracks 1,2,3 triazole is the three-dimensional load 1,3 dipolar cycloaddition also known as Huisgen cycloaddition, between an azide and a terminal alkyne, under conditions thermal but was not initially applied much in drugs synthesis owing to the poor regioselectivity.
Results & Discussion

Chemistry

The synthetic preliminary draft of a treaty or other agreement used for the process of combining different ideas, influences of the desired compounds bioactive property have been depicted in Schemes.

The structure of the newly synthesized compound [1] is in agreement with IR and ^1^H-NMR. Its IR spectrum showed clearly.

The FTIR spectrum of compound [1] revealed a medium stretching vibration band at (1660 cm^-1) that corresponds to (C=C) amide band (see Figure 1, and Table 2). In this spectrum, there are four other characteristic bands at (2952 and 3091 cm^-1), (3249, 1670 and 752 cm^-1) due to (C-H aliph., NH, C=N and C-S cm^-1) group stretching vibrations, respectively. That mean compound (1), ^1^H NMR spectra of prepared compound.

multiplet -H of aromatic rings (6.24- 8.06); Singlet 1H of –NH2 group (8.30); Singlet 1H

The FTIR spectrum of compounds [2] have important characteristic stretching vibration bands that correspond to (N-N=N) Azid band which are appeared, also stretching vibration bands that coincide to (NH) and (NH2) primary amine band which are disappeared. Figure. The FTIR spectra of compounds (6-10) have important characteristic stretching vibration bands that coincide to (C=O or C=S) cyclic amide band which are appeared ^1^H NMR spectra of prepared compound [6]

Singlet 1H of -NH (triazole ring) (8.33); multiplet 6H of aromatic rings (7.36- 7.75); Singlet 1H of –NH group (4.64); Singlet 1H of –CO-CH group (3.55); Singlet 1H of –CH-N group (3.30); Singlet 3H of -N-CH3 group (3.12); Singlet 2H of -CH2 group (3.07); Singlet 3H of –CH3 group (1.84).

Anti-cancer activity\(^{10-15}\)

One, two, three Triazoles have long been derived and have been mainly in a place in order to discover for their likelihood of occurring in Anti malignant (HepG2, MOLT-3)chemotherapy. Many groups have conducted focused research in this particular area, Odlo et al. Researcher discovered a new genetic link to the causes of the disease. A series of cis-restricted 1,5-disubstituted 1,2,3-triazole analogs of combretastatin.

A primary Anti malignant (HepG2, MOLT-3) Activity assay was accomplish a task on a panel of approximately 30 hamantum tumor cell lines derived from two neoplastic diseases (HepG2, MOLT-3) in accordance with the protocol of the Drug Evaluation Branch, National Cancer Institute (NCI). The tested compounds were supplementary to the culture at a single concentricity (10–5 M) and the cultures were incubated for 48 h. Endpoint determinations were made with a protein binding dDye.
Experimental:

Instrument sand apparatuses:

1- The infra-red spectra of the synthesized compoundsswere recorded using FTIR 8400 Fourier transform infrared spectrophotometer of SHIMA-DZU Company as a potassium bromide disc in the wavenumber wavenumber range of (4000-4000) cm⁻¹, University of Baghdad, College of Science, Department of Chemistry.

2- ¹H NMR and ¹³C NMR spectra were recorded on nuclear magnetic resonance Bruker spectrophotometer model Ultrasheild- 400- MHz using Tetramethylsilane internal standard and D₂O as solvent (Isfahan- University of Technology (IUT), Iran).

3- The Melting point was determined by the open capillary method using the hot stage- Gallenkamp-melting point

Ethical Clearance: A local Ethical Committee reviewed and approved the study.

Chemicals: -

The entire chemicals used in this work were of the highest purity available (98-99%) and they were used without further purification.

- Preparation of new ammine 5-(4-nitrophenyl)-1, 3, 4-thiadiazol-2-amine compound by Bharadwaj et al (2010) performed the condensation of (4-nitrophenyl)-1, 3, 4-thiadiazol-2-amine [1] under microwave oven. The structures of the synthesized compound were confirmed on the basis of spectral and elemental analysis. The synthesized compounds were found in better yield than in conventional methods and also screened for in vitro anticancer study.

- Preparation of 2-chloro-N-(5-(4-nitrophenyl)-1,3,4-thiadiazol-2-yl)-acetamide. The literature procedure was used with some modifications. The 4-nitrophenyl)-1, 3, 4-thiadiazol-2-amine (0.02 Mole) was dissolved in DMF (20mL) and then cooled at (0-5°C) and 2-3 drops of TEA were added. Chloroacetyl chloride (0.02 Mole) in DMF (20 mL) was slowly added to R.B.F (Round bottom flask) with vigorous stirring for 3 hours at room temperature. The obtained product was filtered and washed with ether, recrystallized from suitable solvent.

- Preparation of N-5-(5-(4-nitrophenyl)-1,3,4-thiadiazol-2-yl)thiazole-2,5-diamine or N-5-(5-(4-nitrophenyl)-1,3,4-thiadiazol-2-yl)oxazole-2,5-diamine. The literature procedure was used with some modifications. In 100 mL R.B.F (0.02 Mole) of compound (1) and (0.02 Mole) of thiourea / urea was dissolved in 1,4-dioxane (20mL) and the mixture was refluxed for 18 hours. The obtained product was filtered and recrystallized from suitable solvent.

- Preparation of Azide by primary amine. The literature procedure was used with some modifications. In 100 mL R.B.F (0.02 Mole) of hetero primary amine compound and (0.02 Mole) of triethyl amine/CH₂Cl₂ was dissolved in methanol (20mL) and the mixture was refluxed for 18 hours. The obtained product was filtered and recrystallized from suitable solvent.

-- Preparation of 1,3,4-thiadiazol-2-yl-oxazol-5-aminedervative. To 20 mL of hot ethanol, (0.005 mol) of benzaldehyde and (0.0025 Mole) of compounds (16-21) were dissolved. To this mixture, 1.0 mL of glacial acetic acid was added. The reaction mixture was then refluxed in the water bath for 12 hours. Completion of the reaction was monitored by TLC (benzene with ethylacetate). The mixture was allowed to stand for 24 hours at room temperature. The product was collected and recrystallized with a suitable solvent.

Conclusion

The present study gives rise to the following conclusion, This work includes four parts: the first part Preparation of 5-(4-nitro phenyl)-1,3,4-thiadiazol-2-amine by the reaction of p-nitrobenzoic acid with thiosemicarbazide, the second part prepared 2-chloro-N-(5-(4-Nitrophenyl)-1,3,4-thiadiazol-2-yl) Acetamide by reaction Chloroacetyl chloride with compound and part three contain reaction compound(2) with urea/thiourea to get compounds cyclization by using urea (thiourea) finally step reaction these compounds with different aldehydes and ketones in glacial acetic acid present work is synthesis new derivatives of 1,2,3-Triazole having heterocyclic compounds on ring from the reaction of azine with a different reagent to give (1,2,3- Triazole) rings. The 1,2,3-Triazoles It has been derivatives A long time ago and has been Scout mainly for their potential in anti-Tumor chemotherapy the prepared of 1,2,3-Triazole financial products have good AAnti malignant (HepG2, MOLT-3) Activity.
Many groups have carried out focused research in this particular. The tested compounds were supplementary to the culture at a single concentricity (10−5 M) and the cultures were incubated for 48 h. Endpoint determinations were made with a protein binding dye.

Forensic Human and Non-human Blood Discrimination using Mitochondrial 12S rRNA gene

Ameer K. Idan¹, Hussein O.M. Al-Dahmoshi²
¹Biologist at Al-Diwaniyah Central lab, Al-Diwaniyah Health Directorate, Ministry of Health,
²Assistant Professor at Biology Department, College science-University of Babylon, Iraq

Abstract

Background: The blood samples of spots typing regards most important step in forensic analysis. Determining the blood affiliation as human on non-human is not enough as a forensic tool leading to the truth. The mitochondrial 12S rRNA gene are suitable for taxonomy and species identification, especially for the discrimination of even closely related species. The current study aimed to showed the validity of designed 12S rRNA species specific primer pairs for human and nonhuman animal blood typing as a forensic tool.

Methodology: Seventy two blood samples were collected from Homo sapiens, Ovis aries, Capra hircus and Bos taurus (18 blood samples from each). Five milliliter were withdrawn and placed in EDTA-tube and stored in refrigerator for further processing. Four sets of species specific primer pairs targeting mitochondrial 12S rRNA were designed and checked. PCR and sequencing were performed and sequences were analyzed and register in GenBank.

Results: the results revealed that, the amplicon of 12S rRNA gene of Homo sapiens were 800bp, Ovis aries were 560bp, Capra hircus were 460bp, and Bos taurus were 600bp. The first confirmatory test for validity and specificity of designed primer pairs is no amplification for intraspecies primer pairs (i.e. using homo12S rRNA primer pairs to amplify Ovis aries, Capra hircus, and Bos taurus 12S rRNA will not give product and vice versa). The second confirmatory test is the results of sequencing. The identity percentage and alignment of sequences results of amplified 12S rRNA gene of homo sapiens, Ovis aries, Capra hircus and Bos taurus revealed that, the similarity percentage ranged from 98.03% to 100%.

Conclusion: The current study conclude that, validity and accuracy of designed 12S rRNA species specific primer pairs for human and nonhuman animal blood typing as a forensic tool and there is no intraspecies cross amplification.

Keywords: Homo sapiens, Ovis aries, Capra hircus and Bos taurus, 12S rRNA, Sequencing

Introduction

The assignment of blood samples is a fundamental aspect of forensic investigations, mainly for vehement crimes. The important step in forensic that is often skipped or unnoticed is the determination that a bloodstain is of human or nonhuman origin at level of species[1]. The mitochondrial genome consists of multiple copies of 116,569 bp, double stranded mitochondrial DNA (mtDNA) molecules and located adjacent to the OXPHOS system in the matrix. It is haploid in countryside, and thus should evolve four times faster than the average nuclear gene. Hence, mtDNA can be used to track divergence in very closely related taxa and even within species[2-4]. Mitochondrial 12SrrRNA has proven to be a useful molecular marker for better conservation and management of the endangered species. Mitochondrial DNA present in high copy numbers, survive for prolonged periods and absence of recombination when compared with nuclear DNA making it suitable for forensic investigations [5,6]. The mitochondrial 12S rRNA gene are suitable for taxonomy and species identification, especially for the discrimination of even closely related species. It is widely used to differentiate between human from non-human species. Genotyping using 12S rRNA gene
provide cost and time effective results, and yielded information not only for species identification but also for individualization[7,8]. The current study aimed to showed the validity of designed 12S rRNA species specific primer pairs for human and nonhuman animal blood typing as a forensic tool.

Methodology

Sampling:

Seventy two blood samples were collected from Homo sapiens, Ovis aries, Capra hircus and Bos taurus (18 blood samples from each). Five milliliter were withdrawn and placed in EDTA-tube and stored in refrigerator for further processing.

Polymerase Chain Reaction:

G-spinTM Total DNA Extraction Kit (was used to extract mitochondrial DNA from blood of different species according to the manufacture’s protocol instructions (Intronbio/Korea). All extracted DNA samples were submitted for Nanodrop to ensure adequate purity and concentration required for PCR. Setting done by selection dsDNA measuring mode for 2 μl of sample. Blanking were performed using 2 μl microliter of elution buffer and then measuring the DNA samples concentration and purity[9].

The primer pairs were designed using the following reference sequences: Homo sapiens (NC_012920.1, ), Ovis aries: (NC_001941.1), Capra hircus (NC_005044.2) and Bos taurus (NC_006853.1). Primer 3 software was used to design the specific primer pairs: Homo12S-F: CATCCCGTTCCAGTGAGTT, Homo12SR: TACTTGAGGAGGGTGACGGG (800bp); Ovis 12S-F: GCCTGTGATAGCTGGTTGT, Ovis 12S-R: ACGTTTAGTCACTGGGACGG (560bp); Capra 12S-F: GGTGAGTAAACGCCCTCCAA, Capra 12S-R: ATAAAGCACCAGCAGCACCT (460bp); Bos 12S-F: TAAATCTCGTCCAGCCACCC, Bos 12S-R: TGGGCTGCTCAGCCCTAAAT (600bp). The specificity of designed primer pairs were checked using online NCBI/primer blast[10,11]. The PCR conditions were calculated using online Protocol Optimize writer software. The conditions were illustrated in table (1).

Sequence Analysis and Submission

Trimming of sequences were perform by FinchTV and then submitted to NCBI-BLASTN to see the identity of sequences with reference sequences within NCBI data base. All trimmed and confirmed sequences then submitted for GenBank to register all sequences within the database. The gathered accession no. after submission verified the assignment of the sequences samples to the intended species.

Results and Discussion

The results of PCR reveal that, the amplicon of 12S rRNA gene of Homo sapiens were 800bp, *Ovis aries* were 560bp, *Capra hircus* were 460bp, and *Bos taurus* were 600bp (Figure 1: A,B,C,D respectively). The mitochondrial genes have been used as molecular markers to identify mammals, birds, shrimp, and other
species using species-specific primers that amplify the 12S rRNA or 16S rRNA gene regions from mtDNA\cite{12,13}. Gene loci on the mitochondrial genome have been used in species identification due to the greater sequence variation at this non-coding locus, it is now being used as a tool for identifying the presence of particular species within mixture of many species\cite{14,15}.

**Figure (1):** 1.5% Agarose gel electrophoresis for: A: (800bp) amplicon of Homo sapiens 12S rRNA gene. lane H1-H18 represent samples. B: (560bp) amplicon of Ovis aries 12S rRNA gene. lane O1-O18 represent samples. C: (460bp) amplicon of Capra hircus 12S rRNA gene. lane C1-C18 represent samples. D: (600bp) amplicon of Bos taurus 12S rRNA gene. lane B1-B18 represent samples. M represent 100bp DNA ladder.

The first confirmatory test for validity and specificity of designed primer pairs is no amplification for intraspecies primer pairs (i.e. using homo12S rRNA primer pairs to amplify *Ovis aries*, *Capra hircus*, and *Bos taurus* 12S rRNA will not give product and vice versa). The second confirmatory test is the results of sequencing. The identity percentage and alignment of sequences results of amplified 12S rRNA gene of *homo sapiens*, *Ovis aries*, *Capra hircus* and *Bos taurus* with database were illustrated in tables (2,3,4,5) respectively. The PCR amplification and sequencing of mitochondrial DNA 12S rRNA gene could be used for unambiguous species identification of mammalian. The technique has the advantage that only a small amount of material is required. The method could be used even for biological material stored at ambient temperature for prolonged periods of time\cite{16}. Mitochondrial gene12S rRNA the specificity of the primers was tested against 29 animal species including mammals, birds, and fish, as well as 8 plant species. Analysis of experimental feedstuffs demonstrated the detection of each target species in the range of 0.1 to 100\%\cite{17}. Frezza et al., (2003)\cite{18} Polymerase chain reaction allows direct species identification, but high temperatures involved in rendering animal products (133°C for 20 min) cause fragmentation of DNA. Amplifying and sequencing a fragment of mitochondrial DNA that codes for 12S ribosomal RNA, to identify the species origin of non-human casework samples thus mtDNA results are obtained and is especially useful degraded samples\cite{19}.

The results showed no cross-reactivity of designed primer pairs and the PCR assay based on the designed primer pairs will be simple, fast, sensitive, specific, and cost-effective.

Registration of Sequences in GenBank:

All the 32 sequence of 12S rRNA gene were submitted to GenBank for registration. After checking and revision the following accession numbers were donated:

**12S rRNA Homo sapiens (Human):** MN203699, MN203700, MN203701, MN203702, MN203703, MN203704, MN203705, MN203706.

**12S rRNA Ovis aries (Sheep):** MN202782, MN202783, MN202784, MN202785, MN202786, MN202787, MN202788, MN202789.

**12S rRNA Capra hircus (Goat):** MN197657, MN197658, MN197659, MN197660, MN197661, MN197662, MN197663, MN197664.
12S rRNA *Bos taurus* (Cow): MN197785, MN197786, MN197787, MN197788, MN197789, MN197790, MN197791, MN197792.

**Conclusion**

The current study conclude that, validity and accuracy of designed 12S rRNA species specific primer pairs for human and nonhuman animal blood typing as a forensic tool and there is no intraspecies cross amplification.

Antifungal Activity of Crude and Phenolic Extract to Rice Crusts and Chemical Pesticide (Blitinute) in Inhibition of Fungi Isolate from Rice Seeds

Angham Najah Al-khafaji1 Athraa Harjan Muhsin2, Mays Talip Abdallah3

1Al-Furat Al-Awsat Technical University, Kufa Technical Institute, 2 University of Kufa, Faculty of Agriculture, 3University of Al-Naharin, Faculty of Biotechnology

Abstract

Objective: The major goal regarding the presented study is to evaluate the impact of the Rice extract from Rice Crusts and chemical pesticide (Blitinute) on the growth of pathogenic fungi.

Method: Rice seed samples were collected directly from farmers field for isolating significant pathogenic fungi related to the seeds. Anti-fungal activity assay of the crude, Phenolic extract and chemical pesticide were determined by agar plating-method against some pathogenic fungi.

Result: obtained results showed the effect concentration of rice seed extract on growth of fungi especially phenolic extract had wide spectrum antifungal activity than crude extract. when the use of chemical pesticide (Blitinute) at a concentration of 0.3% with reaching rate of inhibition to 100% to Fusarium graminerum , Penicillium viridicatum, while (88.8) the same concentration for the Aspergillus fumigates. In another than the use Integrations between two extract and chemical pesticide (Blitinute) to high effect against test fungi than one extract and chemical pesticide.

Conclusion: This study demonstrates that the presence of three pathogenic fungi (Aspergillus fumigatus , Fusarium graminerium, Penicillium viridicatum) related to the rice grains have been controlled at various concentrations of two extract (crude & phenolic) and chemical pesticide totally inhibited radial growth regarding all test fungi.

Key Words: Rice Crust, Crude & phenolic extract, Chemical pesticide, pathogenic fungi.

Introduction

Continuously plants have been endangered through various pathogenic micro-organisms existing in their environments. Globally, phytopathogenic fungi is specified the major beneficent pest with regard to the farming harvests 1. A Considerable amount of the agricultural products globally and in the country are not suitable for human’s consumption, also they are not healthy because grains are polluted with mycotoxins, created via Penicillium, Fusarium, and Aspergillus. The reports have indicated that over three-hundred 300 fungal metabolites have high toxicity towards humans as well as animals, and 25% of the cereals in the world have been contaminated with certain mycotoxins 2. The diseases produced from fungi form cause a significant loss of many economic crops in the world. The largest effect of fungi with regard to the decrease in efficiency of crops or post-harvest losses and leads to a huge loss to mankind 3.

Rice can be specified as a food of high significance that result in approximately 35% of the industrial costs, approximately 70% of the average calorie consumptions in addition to 93% of total produced food 4. Worldwide, Rice (Oryza sativa) is a major cereal harvest. With regard to India, rice occupy the first in area of approximately 42. 24 million hectares and produce approximately 82 million tons 5. Many studies on rice grain spotting as well as on its control were achieved home and abroad, yet the statistics regarding storages rice grain contain mycoflora as well as its control are not enough 6.
Plants are producing many types secondary metabolites regarding the low-molecular-mass which are typically isn’t needed for basic metabolic procedures related to plants. A lot of secondary metabolites regarding these plants are recognized as allelochemicals which enhanced the protection against other plant competitions, insect/animal predation or microbial adhesion. Allelochemicals might be of high importance in the biological control regarding phytopathogens and weeds. A lot of plant products and plants have antimicrobials against plant pathogenic fungi. Control seed-borne fungal diseases and inhibiting the biodeterioration related to the grains with using use seed treatment is cost-effective and harmless approach. Reports indicates that extracts of many plants were showing antibacterial, anti-fungal as well as insecticidal properties under laboratory trails. Appear plant metabolites in addition to the plant-based pesticides are considered as more effective alternatives since they have minimum environmental impact and dangers to the humans in a way similar to the synthetic pesticides. Earlier, a lot of plant extracts which have source of bio-pesticide because contain substances inhibit the growth of plant pathogens and reduced the risk to environment and health of human. The presence of antifungal compounds in higher plants has long been recognized as important agents for the control of certain plant diseases. Recently, many researchers in the world show interest in the application of plant product as bio-pesticide.

**Aim of Objective:-**

The present work aim was to evaluate the effect of Rice extract from Rice Crusts and chemical pesticide (Blitinute) on the growth of pathogenic fungi.

**Methodology**

**Isolation of fungi from rice seeds:**

Isolate the main pathogenic fungi from seed was collected rice seed samples directly from farmer’s field. During the seventh day of incubation, examine the mycoflora seed samples with use microscopes. Identification 6 fungi based on growth characteristics, spore mycelial morphology, in addition to other features with applying standard guides.

The three species of *Aspergillus* and one species of each *Fusarium graminum*, *Penicillium viridicatum*, *Cladosporium* spp were subculture using Potato Dextrose Agar (PDA) medium.

**Preparation of Rice Seed Extracts:**

- **Crude Extract**

  Weight 100g of Crusts rice powder and put in a 1000 ml glass flask and add 200 ml of ethyl alcohol and leave for 48 hours, taking into reflection the shaker. Periodically from time to time, the filter was filtered using filter paper (Whatman No.4) and by vacuum. The extract was concentrated using (Rotary vacuum Evaporator) at a temperature of 45ºC, then the weight of the concentrated extract, the purpose of the biological activity testing to the raw extract in the test fungi, take 0.3g of dry extract and dissolve in 1ml of ethyl alcohol 99% and then complete the volume to 10ml by distilled water. Concentration is 3%. For control, it is 1ml of ethyl alcohol and full size with distilled water to 10 ml.

- **Phenolic Extract**

  The method was followed by to extract the phenolic compounds from the Crusts rice, take 20g dry weight of the crusted crust and put in a 500ml glass flask, and add 400 ml of 2% HCl. The phenolic compounds were extracted using a water bath at 100 °C for one hour. After the end extraction process, the solution was cooled and filtered with the filter paper type Whattman No.1 and put filter in the separating funnel and added an equal volume of n-propanol, and then added to the amount from NaCl to reach the state of saturation, then formed two layers, isolated the upper layer containing phenolic compounds, and focused on rotary evaporator, then placed in the oven at 40°C to dry, and reduced in a refrigerator for use, For the purpose of testing the biological activity of the phenolic extract in the test fungi, take 6g of phenolic extract and dissolve in 8ml of ethyl alcohol 90% and then complete the volume to 25ml by distilled water. Concentration is 24%. For control, it is 8ml of ethyl alcohol and full size with distilled water to 25 ml.

**Anti-fungal activity assay:**

The preparation of media PDA in two flask the volume each flask about 500ml with the 400 media/flask, then sterilization with autoclave, after sterilization leave to cool, before solidification of the medium to content pour 18 plate, in average 20ml/media, 9 plate content extract to 1ml each plate, while another 9 plate content solution ethyl alcohol and distilled water (control treatment) at 1ml/plate, after solidification of the medium to culture 5mm disc of 7-day-old culture of
test fungi have been inoculated, there are 3 replicates have been maintained for all extracts. Plates have been incubated at a temperature of 22±1 Celsius for 7 days. after the percentage inhibition regarding mycelia growth has been estimated with the use of formula based on 14.

\[
\% \text{ inhibition} = \frac{dc - dt}{dc} \times 100
\]

where:

dc = average increase in mycelia growth in control.
dt = average increase in mycelia growth in plate content extraction.

Result

Isolation and Identification:

Show fungi on seed borne the percent incidence associated with rice seed, the data revealed that the *Aspergillus fumigates*, *Fusarium graminerum*, *Penicillium viridicatum* with the high frequencies, the percent of frequencies include (93,90,89)% respectively. While other include *Aspergillus terrens*, *Aspergillus niger*, *Cladosporium* spp the percent (77, 63, 58)% respectively .

The results of Reagent use to detect crude extract of rice crust, showed that the alkaloids reagent includes (Drakandroff) negative, while positive of (Mayer, Tannic). Phenolic Reagent include (Lead acetate) positive, while negative of Potassium hydroxide. Turpinnes Reagent include (Foam & Mercury chloride) negative.

Effect concentration of rice seed extract and chemical pesticide (Blitinate) in growth inhibition test fungi:

Figure (1) indicates that decrease colony diameters by gradient concentration, with a 5% concentration being the most effective among concentrations (46.55, 52.22, 51.33) for fungi *Aspergillus fumigates*, *Fusarium graminerum*, *Penicillium viridicatum* respectively, compared to control treatments.

![Figure (1): Effect crude extract of Rice Seed to different concentrations (0,1,3,5)% on growth inhibition of test fungi](image1)

![Figure (2): Effect phenolic extract of Rice Seed to different concentrations (0,1,3)% on growth inhibition of test fungi](image2)
Figure (2) show that the phenolic extract of rice seed give high efficiency at 3% concentration as decrease the growth rates of the studied fungi to (45.55, 51.11, 41.11) for fungi Aspergillus fumigates, Fusarium gramineum, Penicillium viridicatum respectively.

The results are shown in figure (3) to decrease the growth rates of fungi and especially Fusarium gramineum, Penicillium viridicatum when the use of chemical pesticide (Blitinute) at a concentration of 0.3% with reaching rate of inhibition to 100% while (88.8) the same concentration for the Aspergillus fumigates.

![Graph showing inhibition zones for different concentrations and fungi](image)

Figure (3): Effect chemical pesticide (Blitinute) to different concentrations (0,0.1,0.3)% on growth inhibition of test fungi

Integration activity between Rice crusts extract and chemical pesticide (Blitinute) in inhibition of test fungi

The result in table (1) shown that the use integrations between crude extract at concentration 5% and chemical pesticide at concentration 0.3 to reduce contamination of seed by fungi Aspergillus fumigatus, Fusarium gramineum, Penicillium viridicatum to (89, 94, 80) respectively.

**Discussion**

Botanist can be specified as rich storehouse related to the natural chemicals which might be exploited to be used as pesticides. Reports indicates the overall quantity regarding plant chemicals might be over 4,000,000 and of these 10,000 are to be create secondary metabolites which are of high importance in the plant’s protective them. Previous researches indicate that anti-microbial activity includes anti-fungal properties with the use of diverse classes regarding the extracts. The reports indicated creating considerable decrease in nutritious quality and seed quality because of the association to fungi ranges. Other studies have proven the effective role of medicinal plants in eliminating various pathogen. Not been described a lot of species regarding advanced plants have extremely less studied for chemical or biologically active components and novel sources of commercially valuable pesticides. Various studies indicate a major alternative for better alternatives plant metabolites and plant based pesticides as recognized to have reduced environmental impact and hazard to the consumers when compared to the synthetic pesticides. This study is consistent with other studies in the inhibition of pathogen using probiotics in the treatment of multiple microorganism resistant to antibiotics.

The attributed to destruction regarding the occurrence of seed borne fungi which might have killed embryo of seeds because of the ability of extracts for increasing seed germination as well as seedling development. Such results are in accordance with the results of who indicated that leaf extracts of *C. viscosum* have increased the growth of seeds as well as improving the development regarding rice seeds. Plant extracts are considered to be bio-pesticide control agent which are of high importance due to 2 certain reasons. The first on is it can be safely used for individuals as well as environmental accumulation. The second reason is its capability for controlling pathogens as well as inhibiting pathogens from the emerging resistance to fungicide. The main step is application of the bio-pesticides for using natural products from the plants as measure for controlling and inhibiting plant diseases. This result consistent with another studies. Such results are in accordance with for showing the impacts of 2 biocides (“Bacillin and Floramyle”) on inhibition the fungus growth (*Aspergillus flavus* and *Aspergillus niger*) for rice seed contamination.

**Conclusion**

The main step of this study demonstrates in the
development of pesticides based on plant that are environmentally approachable for the controlling fungi on seed-borne and the improvement of commercial preparations of plants, and revealed the presence of three pathogenic fungi (*Aspergillus fumigatus*, *Fusarium graminerium*, *Penicillium viridicatum*) on rice grains were controlled in different concentrations, the two extracts (crude and phenolic) and chemical pesticides completely inhibit the radial growth of all test fungi.

Identification of Farnesoid X Receptor as a Novel Nuclear Receptor Sensing for Gallstone Diseases

Antesar Rheem Obead1, Maha Fahdil Mohammed2, Mohend AL. Shalah3

Babylon University, College Of Medicine, Biochemistry Dept., Hilla, Iraq

Abstract

Objective:- The bile acid-make active nuclear receptor farnesoid X receptor (FXR) acting an significant part in lipid then glucose metabolism, besides furthermore, it controls numerous lipid carriers complicated in stone disposition. We observed whether a useful single nucleotide polymorphism (SNP) in FXR (82 G>T) predisposed the gallstone development.

Material and Method: - The polymorphism were confirmed by polymerase chain reaction monitored by PCR amplicons were commercially sequenced from both (forward and reverse) termini according to education manuals of the sequencing company (Macrogen Inc. Geumchen, Seoul, South Korea), in two group match by age ≥20 : patient with gallstone (n=140) and stone-free control (n=140).

Result: - For Sequencing of the 195 bp region within the NR1H4 (FXR) gene Within this locus, twenty samples were included in the present study that had shown to amplify the NR1H4 (or FXR) genetic sequences in the chromosome number 12. The latter gene is responsible for encoding on nuclear receptor subfamily 1 group H member 4 (NR1H4). The alignment results of the 195 bp samples revealed the presence of one SNP occurred in this position in sample no. 10 within the analyzed twenty samples in comparison with the referring reference DNA sequences. The sequencing chromatogram of the observed substitution SNP, as well as its detailed annotations, were documented, and the chromatogram details of the observed SNP were shown according to their positions in the PCR amplicon, in which samples no. 10-20 had shown this (T82G) variation.

Conclusion: - the education presented that the variation allele of the communal FXR 82G>T polymorphism was significantly associated with stone formation in Iraq patients. The association is possibly concluded the effect of the FXR 82G>T polymorphism on the expression of the efflux carriers for lipid trails in hepatic.

Key word: - FXR, PCR, Gallstone, polymorphism, sequencing analyzing.

Introduction

Gallstones are aggregation of hard substance that forms inside gallbladder1, when there is disequilibrium in the constitution of bile such as more cholesterol, accumulated amount of pigment material and/or decreased amount of bile acid2. Gallstones may also result from dysfunction of gallbladder contraction3. Nuclear receptors (NRs) are ligand-activated transcription factors with important roles in different aspects of human physiology and development of gallstone4. FXR regulates the expression of various genes involved in bile acid, lipid and glucose metabolism, by binding to DNA either as a monomer or an heterodimer with a common partner for NRs, Retinoid X Receptor (RXR). FXR is highly expressed in the liver, intestine, kidney and adrenals5. Two known FXR genes exist, the Fxrα and Fxrβ. Fxrα gene in humans encodes four FXRα isoforms (FXRα1, FXRα2, FXRα3 and FXRα4) as a result of the use of different promoters and alternative RNA splicing. Given the importance of the FXR in bile acid and in regulating the expression of the gene that are involved in gallstone formation, we examined the association between the functional SNP FXR 82G>T and gallstone disorder.

Material and Method

Object in this analysis include two groups matched by age ≥20 years, consecutive symptomatic patients (n...
with gallstone disease (GD), and healthy stone-free control subjects \( n = 140 \) confirmed by abdominal ultrasonography.

**DNA extraction and genotyping**

DNA was isolated from whole blood by Wizard® Genomic DNA Purification Kit Staining. FXR genotyping was performed as previously described \(^8\). Briefly, PCR was carried out in a reaction mixture of 25 μL containing 0.5 units of Taq DNA polymerase and 5 μL of template DNA with a concentration of 50 to 150 ng/μL, using primers 5’-GAGCCAGTGAACAGAAACCC-3’ (sense) and 5’GTGAGAGAGGACAGAGGTTG-3’ (antisense) \(^7\). Amplification reaction consisted of 30 cycles, with Initial Denaturation 95°C for 3 minute , annealing 61°C for 30 second, Extension 72°C for 1 minute , to yield 194bp of product FXR.

**Detection of farsenoid X Receptor (FXR) gene polymorphism (82 T>G)**

**PCR Product using Promega Master Mix**

PCR Product using Promega master mix was given sharp and apparent 195 bp band as figure (1) shown , therefore the study choose it in the rest of the work because of its high reliability

**Sequncing Method**

**DNA Sequencing of PCR amplicons**

The resolved PCR amplicons were commercially sequenced from both (forward and reverse) termini according to instruction manuals of the sequencing company (Macrogen Inc. Geumchen, Seoul, South Korea). Only clear chromatographs obtained from ABI sequence files were further analyzed, ensuring that the annotation and variations are not because of PC or sequencing artifacts. By comparing the observed DNA sequences of local bacterial samples with the retrieved neighboring DNA sequences of the NCBI Blastn engine, the virtual positions and other details of the retrieved PCR fragments were identified.

**Checking the novelty of SNPs**

The observed SNP was submitted to the dbSNP database to check their originality. Each particular SNP was re-positioned according to its place in the reference genome Subsequently, the determination of the presence of previous SNP was performed by viewing its corresponding dbSNP position. Then, the dbSNPs position for the detected SNP was documented.
Sequencing Result

1. Sequencing of the 195 bp region within the NR1H4 (FXR) gene

Within this locus, twenty samples were included in the present study that had shown to amplify the NR1H4 (or FXR) genetic sequences in the chromosome number 12. The latter gene is responsible for encoding on nuclear receptor subfamily 1 group H member 4 (NR1H4). This protein functions as a receptor for bile acids, and when bound to bile acids, binds to DNA and regulates the expression of genes involved in bile acid synthesis and transport (https://www.ncbi.nlm.nih.gov/gene/9971). The sequencing reactions indicated that the exact identity after performing NCBI blastn for these PCR amplicons (https://blast.ncbi.nlm.nih.gov/Blast.cgi?PAGE_TYPE=BlastSearch). Concerning the supposed 195 bp amplicons, NCBI BLASTn engine shown about 99% sequences similarity between the sequenced samples and the intended reference target sequences. By comparing the observed DNA sequences of these local samples with the retrieved DNA sequences (GenBank acc. NG_029843.1), the approximate positions and other details of the retrieved PCR fragments were identified (Fig. 2).

![Image of chromosome 12](https://www.ncbi.nlm.nih.gov/gene/9971)

Fig. 2. The exact position of the retrieved 195 bp amplicon that partially covered a portion of the FXR gene within chromosome 12 (GenBank acc no. NG_029843.1). The green arrow refers to the starting point of this amplicon while the blue arrow refers to its end point.

After positioning the 195 bp amplicons’ sequences within the FXR gene, the details of its sequences were highlighted, in terms of the positioning of both forward and reverse primers of the 195 bp amplified amplicon (Table 1).

* refers to the forward primer sequences

** refers to the reverse primer sequences

The alignment results of the 195 bp samples revealed the presence of one SNP occurred in this position in sample no. 10-20 within the analyzed twenty samples in comparison with the referring reference DNA sequences (Fig. 3).
Fig. 3. DNA sequences alignment of twenty local samples with their corresponding reference sequences of the 195 bp amplicons of the \textit{FXR} genetic DNA sequences. Each substitution mutation was highlighted according to its position in the PCR products. The symbol “ref” refers to the NCBI referring sequence, “S1-S20” refer to the samples 1 to 20, respectively.

The sequencing chromatogram of the observed substitution SNP, as well as its detailed annotations, were documented, and the chromatogram details of the observed SNP were shown according to their positions in the PCR amplicon, in which only sample no. 10 - 20 (S10-S20) had shown this T82G variation (Fig. 4).

Fig. 4. The pattern of the observed substitution mutation within the DNA chromatogram of the targeted 195 bp amplicons within the \textit{FXR} gene. The observed substitution mutations are highlighted according to their positions in the PCR products. The symbol “\textgreater{}\textless{}” refers to substitution mutation.
SNPs characteristics check

To elucidate the positions of the observed SNP with regard to their deposited SNP database of the sequenced 195 bp fragment, the corresponding position of the FXR gene was retrieved from the dbSNP server (https://www.ncbi.nlm.nih.gov/projects/SNP/). To find out the nature of the observed SNP, a graphical representation was performed concerning the FXR dbSNP database within chromosome 12 (GenBank Acc. No. NG_029843.1). By reviewing the dbSNP engine, it was found that this SNP was novel (Fig.5). However, this SNP was found to be located in an intronic position.

![Fig.5. The SNP’s novelty checking of FXR genetic single nucleotides polymorphism using dbSNP server. The identified SNP is marked with a green color.](image_url)

Therefore, it was found that this observed variant was not previously known and positioned in the intronic region within the FXR gene. To summarize all the results obtained from the sequenced 195 bp fragments, the exact position of the observed variation was described in the NCBI reference sequences. The pattern of the observed SNP in the 195 bp amplicons in comparison with the NCBI referring sequences of the FXR gene within the chromosome 12 (GenBank acc. no. NG_029843.1).

Discussion

It has been recommended that variations in monitoring protein coding genes, such as FXR, may possibly donate to the general dissimilarity for gene expression in tissues then thus effect stone nature then replies 8,9. This education is the first to report that the communal polymorphism (82 G>T) in FXR resulting in significantly condensed role of the gene was related with development of stone in Iraq patients through gallstone syndrome then that this suggestion remained important after regulating for the potential features.

To our information, there is no education reporting whether the gene for ABCG2, the main efflux carrier of , is a board of FXR, but then again unintended indication proposes that hepatic ABCG2 expression is controlled by some nuclear receptors, such as constitutive androstane receptor (CAR) then pregnane X receptor (PXR) 10, and the last is a board of FXR11. Consequently, it is likely that the condensed FXR action because of the 82G>T mutation may possibly decrease the ABCG2 expression by sound effects on PXR. It seems that the relationship between the FXR 82G>T polymorphism and stone development is additional apparent in issues homozygous for the wild-type alleles than in those with one or two duplicates of the variation allele of the FXR82G>T polymorphism. This consequence may possibly propose that the outcome of the FXR polymorphism on the gallstone is facilitated concluded a monitoring outcome on gene expression.

Comparision between Nonvisualized Finding of 3D-Tof Mrv Cerebral and Cerebral Angiography Result

Arif Shidiq1, Anggraini Dwi Sensusiai1
1Department of Radiology, Faculty of Medicine, Universitas Airlangga, Surabaya (60131), Indonesia

Abstract

Background: Magnetic Resonance Venography (MRV) is a non-invasive method that evaluates the venous system without exposure to the radiation in the procedure compared to cerebral angiography and CT Venography. Nowadays, the use of MRV cerebral started to increase even though there are still many non-visualized (not visualized vein image) on MRV led to divergent interpretations or noncompliance to the findings of cerebral angiography, which is the gold standard to evaluate venous system. There has been few research comparing MRV findings with cerebral angiography so far.

Objective: The aim of this study is to evaluate the findings of non-visualized on MRV compare to cerebral angiography as the gold standard in helping the interpretation of examinations to avoid misdiagnosis.

Methods: Observational retrospective analytic study was used in this study that conducted at Husada Utama Surabaya Hospital from October 2013 to February 2014. 39 out of 49 patients selected as samples for fulfilling the inclusion criteria. The observation on the results of MRV and cerebral angiography procedures performed by two specialists of radiology, then the data were analyzed using SPSS.

Results: Based on the findings of abnormalities location from 39 samples, we found 35.45% abnormalities in the transverse sinus, 32.91% in the sigmoid sinus, 27.84% in the jugular vein, 2.53% in the straight sinus, and 1.27% in the superior sagittal sinus. The results of comparison between MRV test and cerebral angiography showed compliance at 21% hypoplasia with 88.9% of thrombus. MRV test results with the cause of hypoplasia have 100% sensitivity, 67.4% specificity, and 70% accuracy. Meanwhile, we found that 41% sensitivity, 82% specificity, and 50% accuracy because of thrombus.

Conclusion: There was significant compliance between 3D-TOF MRV cerebral findings along with cerebral angiography, especially at thrombus.

Keywords: Magnetic Resonance Venography, Cerebral Angiography, Thrombus, Nonvisualized

Introduction

The use of Magnetic Resonance Venography (MRV) cerebral as a non-invasive method in the diagnosis of intracranial venous system abnormalities start to increase. MRI combined with MR Venography (MRV) has largely replaced the conventional invasive modalities such as angiography and CT. MRV could be done without the use of contrast agents but by using of Time-of-Flight (TOF) technique. However, based on the previous studies, flow and artifacts could interfere in the evaluation of venous structures.

MRV has been widely used because not only it is non-invasive but also it does not give radiation exposure like cerebral angiography and CT Venography procedure. Therefore, the non-visualized (vein image not visualized) findings on MRV often led to diverse interpretations. Some previous studies also found many images that show MRV pitfall or inconsistency in findings compared with cerebral angiography as the
gold standard: R.H. Ayanzen et al. (31%), Sharma UK (47%), E. Widjaja (51%) 4.

There has been few research findings comparing MRV with cerebral angiography so far. The aim of this study is to evaluate the findings of non-visualized on MRV compared to cerebral angiography as the gold standard to help the interpretation of the examinations to avoid misdiagnosis.

Method

Observational retrospective analytic study was used in this study that conducted at Husada Utama Surabaya Hospital from October 2013 to February 2014. The data obtained from observing the medical records of patients that examined with MRV cerebral and angiography cerebral 5. There were 49 patients that examined with MRV cerebral and angiography cerebral. However, we only used 39 samples which their medical records were completed and accessible. Interpretation of the results of MRV and cerebral angiography performed by two specialists in radiology meanwhile, the data were analyzed using SPSS 6.

Results

Most of the research samples were chronic CVA patients (35.89%) while, patients with a ruptured aneurysm (2.56%) were the fewest sample. The data distribution of patients based on clinical diagnosis could be seen in Table 1. Meanwhile, table 2 shows the location of abnormalities with the highest percentage was in the transverse sinus (35.45%), and the lowest percentage was in the superior sagittal sinus (1.27%).

The examination of 39 samples using MRV found 50 findings. Detailed MRV examination results could be seen in Table 3. MRV examination results show the highest readings was hypoplasia in 19 people (38%), while the thrombus and non-visualized respectively were 18 people (36%) and 13 patients (26%).

We found 50 findings in 39 patients using angiography. The results of angiography could be seen in Table 4 that was showed the highest result in the examination is thrombus in 39 samples (78%). Table 5 shows the results of cross tabulation between MRV examination results with the results of angiography examination. 20 samples (40%) from the results of MRV examination are found match with the results of angiography. MRV examination results with hypoplasia were 19 samples, while the results of angiography were only 4 samples (21%). The remaining 11 samples were thrombus and four other samples were normal. MRV examination results showed 18 samples of thrombus while, 16 samples (88.9%) of thrombus were found in the results of angiography. Then, the remaining two samples were normal. MRV examination results showed 13 samples of non-visualized which examined with angiography showed 12 samples (92.3%) of thrombus and the other one sample was normal.

Table 5 shows the results of MRV sensitivity of hypoplasia were 100% with a specificity of 67.4% and accuracy of 70%, whereas the results of MRV sensitivity of the thrombus were 41% with a specificity of 82% and accuracy of 50%. Both MRV and cerebral angiography readings in this study were observed by the two senior radiology specialists (dr. ADS experts of neuroradiology and dr. LM who works in interventional radiology section). If there is a difference in the interpretation of MRV and cerebral angiography, then decisions are taken by consensus (agreement). However, before consensus, each observer of MRV and cerebral angiography were tested their interpretation reliability by calculating the interobserver variation for each parameter characteristic image of MRV and cerebral angiography that were observed. The interobserver reliability showed good results, with a kappa coefficient (k) above 0.9 with p <0.05 for all parameters examined in the interpretation on the readings of MRV and cerebral angiography. It could be said that the examiners have good reliability interobserver.

Discussion

Based on the data, the distribution pattern of sample by the highest amount of clinical diagnosis are chronic CVA 14 people (35.89%), vertigo 7 people (17.95%), cephalgia 2 people (5.13%), acute CVA 10 people (25.64%), sub-acute CVA 3 people (7.69%), TIA 2 (5.13%). The findings are consistent with the previous studies that have reported CVT could be found in about 10-20% of stroke patients. The distribution based on the
highest percentage abnormality located on the first place were; transverse sinus abnormalities 35.45%, sigmoid sinus 32.91%, jugular venous 27.84%, straight sinus 2.53%, and superior sagittal sinus 1.27%.

Location prediction is matching with previous research that showed 31% of abnormalities found in sinus transversus and 90% of thrombus have been reported in transverse sinus and sigmoid sinus, while 15% to 30% of non-visualized patients have partial or complete absence on one of the transverse sinus. Images related the loss signal of blood vessels mostly appeared at the use of 3D-TOF MRV that occurs in sinus transverse non-dominant. If it appeared on the sinus transverse dominant, it could be estimated that there are venous obstruction which resulting in the appearance of venous hypertension intracranial. Variant of normal venous anatomy may resemble sinus thrombosis 7. MRV artifacts could resemble cerebral venous thrombosis in the absence of normal signal flow in venous or sinus 8.

Test results of MRV with hypoplasia were 19 samples, but the results of angiography with hypoplastic were only 4 samples (21%), while the remaining 11 samples thrombus and four other samples were normal. That happened may be due to changes in the dynamics of blood flow in hypoplasia or aplasia venous sinus resulting in loss of flow marks on 3D-TOF MR Venography which able to resemble thrombosis. MRV pitfall in the diagnosis is related to flow and refocusing of the slow flow 9, that could resemble intraluminal thrombus or blood products paramagnetic (intracellular deoxyhemoglobin or methemoglobin) as a normal signal 10. Low T2 signal intensity in the early stages could be interpreted as a flow-void 10. This variant could be further divided into veins anatomical variants that resemble occlusion (sinus atresia or hypoplasia), asymmetric or sinus drainage variant (occipital sinus, sinus duplication), and normal sinus filling defects (arachnoid granulation, intrasinus septa). Usually, when there is a low signal into a vein, it is associated with flow void and signs of venous patency 11. However, there are intracellular deoxyhemoglobin, which is dark on T2 and resembles a flow void at some stages of thrombus. Hypoplasia and aplasia transverse sinus on the right or left side is a common finding that could be considered as sinus thrombosis because on the MRA showed one of the transverse sinuses was not visible. If hypoplasia still suspected on the transverse sinus, the size of the jugular foramen must be observed 12.

MRV test results showed 18 samples of thrombus, from 18 samples to 16 samples (88.9%) of thrombus and the other two samples were normal on cerebral angiography examination. Results of previous studies showed that MRV has sensitivity of 100% and a specificity of 78.6% for detecting the presence of thrombus. High sensitivity of MRV to see a thrombus in the thrombus images is due to dural sinus or vein is pathognomonic. Signals of thrombus within the dural sinus or cortical veins vary. However, most patient’s thrombus image showing of hyper-intense signal in both the T1 and T2 images. Abnormal T2 signal replaces the normal signal of sinus thrombosis as a definite sign of the existence of a very slow blood flow that could sometimes create a high signal on spin echo T1WI. Findings on the examination of two samples using MRV were read as thrombus but in cerebral angiography read as normal, this may occurs because MRV artifacts may resemble cerebral venous thrombosis in the absence of signals in normal flow or venous sinuses. Most of the loss of artifactual on vascular signal could be seen with the use of 3D-TOF MRV 13.

MRV test results showed 13 samples of non-visualized, from those 13 samples the angiography obtained 12 samples (92.3%) of thrombus, while the remaining sample was normal. Findings nonvisualized on MRV showed 92.3% of thrombus on its angiography cerebral could be due to the 3D-TOF flow gap occurs as a result of intravascular slow blood flow as blood flow patterns are complex and varied features 14. This diversity illustrates the pathophysiological changes seen after venous occlusion. There are two main processes; the first process is the presence of local edema and venous infarction that usually seen after a cortical vein occlusion, while the second process is the presence of intracranial hypertension, both processes often occur together 15. These results indicate that the sensitivity of hypoplasia using MRV of 100% with a specificity of 67.4% and accuracy of 70%, whereas the sensitivity of the thrombus using MRV is 41% with a specificity of 82% and accuracy of 50%.

Conclusions

MRV test’s results have compatibility with cerebral angiography examination’s results by 40%. The examination results MRV suitability with the results of angiography showed 21% hypoplasia, 88.9% thrombus. Meanwhile, MRV test results that showed nonvisualized obtained 92.3% of thrombus while the remaining 7.7%
were normal in the results of angiography.

MRV test results with the cause of hypoplasia have a sensitivity of 100% and a specificity of 67.4% and an accuracy of 70%. The examination results of MRV with the cause of thrombus have a sensitivity of 41% with a specificity of 82% and an accuracy of 50%. MRV examination without contrast has a diagnostic value that could be considered as non-invasive imaging methods that are useful in cerebral venous disorders.

**Ethical Clearance:** This research involves participants in the survey using sampling method that was accordant with the ethical research principle based on the regulation of research ethic committee. The present study was carried out in accordance with the research principles. This study implemented the basic principle ethics of respect, beneficence, nonmaleficence, and justice.

**Conflict of Interest:** The authors report that there is no conflict of interest related with this paper.

**Source of Funding:** This study is done with authors’ funding only.

**Authors’ Contribution:** Arif Shidiq do the laboratory research while Anggraini Dwi Sensusiti writes the laboratory result into this paper.

Abstract

Background: Gastrointestinal endoscopy is one of the main diagnostic tools for gastrointestinal examination. In this study, we measured the effect pre-procedure education on the readiness of patients for the endoscopy.

Method: This quasi-experimental study was performed on 70 patients aged 35-60 years who were candidates for endoscopy from SEP 2018 to MAY 2019. Data were collected by a valid and reliable, 22 items’ questionnaire that developed by the researcher. Data were analyzed by SPSS, version 16.

Results: mean score of readiness for endoscopy in the intervention group 105.8 (5.3) was significantly higher than control group 62.6 (7.8), (p<0.001). Also, the level of readiness of the intervention group was 11.4% good and 88.6% very good. The level of readiness of the control group was 91.4% moderate and 8.6% good.

Conclusions: Considering the effect of pre-procedure education on the readiness of patients for the endoscopy, it can be inferred that providing educational programs before endoscopy can be helpful.

Keywords: readiness, endoscopy, anxiety

Introduction

Gastrointestinal endoscopy is one of the main diagnostic tools for gastrointestinal examination. This diagnostic method, which is frequently used in clinical settings, has obvious diagnostic benefits and therapeutic applications(1). Patients who are candidates for endoscopy should receive the necessary information about readiness for endoscopy accurately and simply because of the need for complete gastrointestinal clearance for proper physician visibility and non-repetition of endoscopy. On the other hand, the findings of a study examining pre-procedure anxiety showed that the level of anxiety was severe in 14% of patients and moderate in 74% (2).

Asymmetry reduces patients’ health(3). Anxiety is especially important in gastrointestinal patients(4). Therefore, the role of patients’ physical and mental readiness is crucial to achieve the expected outcome of endoscopy in terms of correct and timely diagnosis and treatment, with minimal damage to and side effects on the patient (5, 6). Readiness is the quality or status of preparation for the procedure (7).

Readiness for endoscopy increases the likelihood of successful endoscopy and prevention of repeating endoscopy as well as early diagnosis of the disease (8). Research on medical complaints has shown that the most common form of neglect has been reported due to the patient’s lack of readiness for interventions (9). It can be expected that if patients candidate for endoscopy receive empathetic information, they will cooperate better, accept the process consciously, and endure the pain and possible side effects more easily (6, 10, 11). In this study, we measured the effect pre-procedure education on the...
Material and Method

The sample was randomly selected from the population of endoscopy candidates who admitted in Sheikh Mostafa hospital, and assigned to control and intervention group. Each group consist 35 volunteer patients. Inclusion criteria were age between 35-60 years, full consent to participate in research, having acceptable literacy to write and read, no previous history of endoscopy, no known mental illness and anxiety disorders, no emergency conditions for endoscopy, no history of drug and alcohol use, lack of effective visual and hearing impairment, and exclusion criteria were emergency conditions such as hemorrhage and rupture during endoscopy, as well as patients’ unwillingness to participate in the study.

The instrument used in this study was the endoscopy readiness questionnaire. The first part of the questionnaire included demographic information including age, gender, job, education, income, marital status, and the second part was the endoscopy readiness questionnaire was developed that assesses patients’ readiness in the areas of information provision, mastery of endoscopy team, anxiolysis (de-stressing), up close experience, and training during endoscopy. To assess content validity of instrument using the Waltz & Bausell method (12), the primary 27 items questionnaire were evaluated by 10 experts including internist and experienced nurses in terms of relevance, clarity, and simplicity. According to experts’ comments, the three lowest-scored items were deleted, and several of them were combined and modified and finally a 22-items questionnaire was prepared (table 1). Last item of the questionnaire did the open-ended question that asked the patient viewpoint for likelihood of re-select the center for doing later endoscopies. Based on a Likert scale, each item scored in a range from 1 (Strongly disagree) to 5 (Strongly agree) total score ranged from 21 as lowest to 105 as highest readiness.

To determine the reliability of the questionnaire, a test- retest method was used. The questionnaire was administered to 10 candidate patients for endoscopy who were not included in the intervention or control group, and two weeks later the same subjects completed the questionnaire again. The test-retest correlation coefficient ($r = 0.97, 0.001$) indicated the reliability of the instrument. Indeed, a value of 0.949 was obtained for Cronbach’s alpha which was an acceptable score to confirm the internal consistency of the questionnaire.

Data were analyzed using SPSS, version 16. Mean and standard deviation were used for descriptive statistics, and chi-square and t-test were used for inferential statistics.

Findings

Kolmogorov-Smirnov test and showed that the two groups were homogeneous in terms of demographic characteristics and there were not significant differences. The frequency of respondents to each item of the questionnaire is listed in Table 2. the mean scores of endoscopy readiness after for intervention group (90.8±5.3) was more than control group (50.6±7.8) significantly ($p <0.001$) (Table 3). In terms of comparing the levels of readiness, there was a statistically significant difference between the two groups (Table 3). Regression analysis showed that in the intervention group, 11.4% of participants had high level of readiness and 88.6% had very high level of readiness. In the control group, 91.4% of participants had moderate level of readiness and 8.6% had high level of readiness. Also, in response to the open-ended question, 81% of the patients in the
intervention group stated that they would choose the same center for future referral, compared to 38% in the control group.

Discussion

According to the results of the study, the post intervention mean score of readiness of the patients in the intervention group was significantly higher than the control group, which indicates the effectiveness of education. Findings of Beitzer study (10), which aimed to investigate the effect of film education on the level of satisfaction and anxiety of patients undergoing colonoscopy, showed that education leads to more tolerance and patient satisfaction, which is in line with the results of the current study. Patients who are candidates for endoscopy should receive the necessary information about readiness for endoscopy accurately and simply because of the need for complete gastrointestinal clearance for proper physician visibility and non-repetition of endoscopy. Failure to receive this information increases patients’ anxiety (13). In a study by Onal et al. in Turkey, it was confirmed that a lack of awareness of the treatment process was a source of increased anxiety among patients and subsequently an increase in the need for sedative medications (14). In this vein, the results of a qualitative study conducted by Azami et al. (2016) to examine the expectations and experiences of patients with angioplasty suggest that lack of knowledge about the procedure and its side effects has been one of the main themes, and this defect in patient education was caused mainly by the care team (13). Pehlivian et al. (6), reported that the benefits of providing information to candidate for anxious therapies such as endoscopy are increasing patients understanding and facilitating patients’ coping with endoscopy which have been shown to achieve more successful outcomes.

Moyo et al. stated that the main causes of dissatisfaction and failure to reach therapeutic goals are lack of information about the disease process and interventions performed by the care team, lack of attention to the patient’s and family’s ambiguities, and failure to provide meaningful explanations to the patient (15). Pre-endoscopic education can cause success in therapeutic interventions, increase satisfaction, reduce nurses’ workload as well as reduce the cost for patients because of the prevention of endoscopy repetition due to the failure of the physician to obtain proper vision, and accelerate patients’ recovery. The results of some studies confirming this finding indicated the effects of different methods such as patient preparation (11), providing clear information and social support (16), providing cognitive and behavioral information (17), nursing counseling (18), using Quran phonics (19) and informing patients before endoscopy (9) on the success of therapeutic procedures such as endoscopy.

Abstract

Type I interferons (IFNs), are considered as a main host immune system cytokines effector against infectious virus. In addition to innate immune receptor bacterial ligands and/or bacterial infections. Furthermore, the development of kinds IIIFNs are also triggered, suggesting a wider physiological function for those cytokines in homeostasis and host protection than initially expected. Results: To recognize both structural divergence and sequence various bioinformatics methods were used. Initial sequence analysis of IFNß1 showed that they shared with human over 70% similarity and some identity like Rhesus monkey, pig, domestic cat, for dog. With few exceptions, sequences showed a high degree of sequence preservation. The physico-chemical analysis indicated a large developmental difference between humans and others and an estimate of 39% to 42% of hydrophobic residues. Four human mammals house mouse pig Norway rat have various Pfam types. The secondary structure of IFNß1 composed of random coil, extended strand and alpha helix. Conclusions: Depending on the results collected, which maybe assumed that in these mammalian species IFNß1 has the same counterpart, highly retained and functional similarities.

Keywords: Interferons, host protection, cytokines, divergence, counterpart.

Introduction

Type I interferons (IFN) play an essential role in the defense of antivirals and are formed in a variety of cells following viral infection. It is understood that IFN-a/b therapy of immature dendritic cells (DC) causes their phenotypic and functional maturation. Interferons (IFNs) are a group of cell-produced pleiotropic cytokines in reaction to viral infections [1]. Such cytokines have antiviral, immunomodulatory, and antitumor properties by regulating the expression of hundreds of genes involved in critical biological processes such as progression of the cell cycle, cell proliferation, and apoptosis [2]. Some cells, such as endothelial cells, osteoblasts, action, lymphocytes, fibroblasts and macrophages (NK cells, T-cells and B-cells) topathogens, are secreting IFNßs. Through expression of several genes, they enable NK cells and MFs to elicit immunomodulatory, antiviral, antitumor, and anti-inflammatory responses [3] including response to therapy. A number of disease modifying drugs, including traditional first line agents such as, interferon-beta (IFN-ß).
Materials and Method

2.1 Recovery or analysis of sequences

Nucleotides and amino acid sequences of Mus musculus (house mouse), Homo sapiens (human), Rattus norvegicus (Norway rat), Sus scrofa (pig), Macaca mulatta (Rhesus monkey), Felis catus (home cat) and Canis lupus familiaris (dog) have been extracted from NCBI. For obtain related sequences in other species, the Basic Local Alignment Selection Tool (BLAST) was used. Seven IFNB1 protein mammalian species were considered for study. NCBI (nlm.nih.gov/bank) obtained three classifications in fastfor mal.

2.2 Determination of personality and similarity percentage

The percentage of identity and similarity in domestic cat, human, dog, house mouse, Norway rat, pig and Rhesus monkey among the amino acid series of the IFNB1 genes were identified by showing a pair sequence comparison using BLAST.

2.3 IFNB1 Protein Physicochemical Properties Determination

“The proteomic database of the (SII/B) (wlb. exlpasy. orl), to use the (ExPASy), physicochemical properties of the seven mammalian species IFNB1 protein was defined. Protein analysis was performed on the web server PepTide 21.10 (http://peptide2.com/lnp eptidehydrophobicityhydrophilicity.phlp), whereas humans were usledals references points.”

Results

IFNB1 gene sequences of nucleotides and amino acids recovered:

Variations were shown in the distances of the amino acid sequences and retrieved nucleotide. The length of the IFNB1 gene nucleotide sequences ranged from 555-839 bps while the amino acid sequence length differed from residues of 182-187 amino acids. Among the seven selected mammals, thllegenlhovfthle human IFNB1 nucleotide sequences were the longest (839bps), followed by the house mouse (750bps) and the shortest (555bps) of the Norway rat. The residues of amino acids were the same for Rhesus monkey and human (187). 186amino acid residues respectively, in pig, dog and domestic cat. Residue of shorter amino acids for house mouse (Table 1).

Physicochemical properties of IFNB1 protein:

The IFNB1 protein analysis of selected mammals showed, when compared, changing physicochemical things. The result exposed that pig IFNB1 protein (4.93) was the least theoretical pl, while house mouse IFNB1 protein (9.69) was the highest. The molecular weight of IFNB1 proteins from the seven mammalian species showed that the weight of human IFNB1 protein was 22293.88 kDa, while the weight of dog IFNB1 protein was 22387.92 kDa. The weight of the pig protein was 21950.46 kDa, the least. The percentages hydrophobic residues in IFNB1 protein of the species showed the following: human (39.57%), house mouse (42.31%), domestic cat (40.32%). The Norway rat (40.76%), Rhesus monkey (40.64%) and pig (42.47%) higher percentage (Table 2).

IFNB1 gene secondary protein structures:

For the seven chosen mammalian species, GORIV software was used to predict the secondary structures of IFNB1 protein. Their IFNB1 protein is shown to contain mainly random coil, extended strand and alpha helix. Though, the human IFNB1 protein alpha helix was 43.85 percent, while mammals were 69.78 percent higher for house mouse. The least was in the pig with 41.94% of the design in alpha helix. In addition, the IFNB1 protein expanded strand for humans was the longest (23.53%) with the dog being the shortest (10.22%). Variations have been found on the unexpected coils of the seven species additional structures of IFNB1 protein with the random coil of pig IFNB1 protein occupying 41.94% of the structure relative to other mammals (Table 3).
Discussion

Type I interferons (IFN) are a group of cytokines expressed under physiological conditions at low levels or induced by stimuli such as viral infection to high levels[7]. Form I IFN includes a number of evolutionary proteins produced by closely related and connected genes, the major species being several IFN-a subtypes and a single IFN-b [8]. Here we note that sequence lengths of nucleotide amino acids varying from the human, house mouse, pig Norway rat, Rhesus monkey, domestic cat, and dog gene IFNB1. It is also claimed that variations in the sequence length are induced by mutations in the indels, which may have collected through evolution.

As a results, the percentage of human, house mouse, pig, Norway rat, Rhesus monkey, domestic cat and dog identity ranged from 48.7-95.2 percent compared to that of human IFNB1 amino acids, viewing that they might have related evolutionary strategies. This is also the situation with percentage similarity (62-97.9 %). Importantly, sequences of approximately 70 percent percent similarity indicate the IFNB1 gene has the same homology, similarities of function And the preservation is very high. In addition, Xu and Joshi [9] reported that if two samples have a sequencing similarity higher than 70%, it is proposed that they have been inclined to share approximately 90% or more of the same functions and biological processes. Proteins in the samlegroluphalve a sequencessimilarity of at lastmolorethahn 30 % of alminoacilds. “In clinicians with relapsing multiple sclerosis[10][11] and in patients with chronic hepatitis C infection virus [12][13]. IFNβ treatment significantly improved the rate and suppressive activity of TReg cells, and also decreased expression of Foxp3 mRNA in PBMCs in patients with recurrence-remitting multiple sclerosis[14][15].

“NLRP1 and NLRP3 inflamasomes are directly inhibited by IFNβ signaling) in an STAT1-dependent manner. Second, IFNs of type I induced IL-10 production which infrared effect actuated the STAT3 transcription factors in n an autocrinemanner[16]. Type I IFNs was tested as IBD therapy. Although some medical therapy studies initially showed promising results in patients with ulcerative colitise[17][18].”

It may depend on the conduct’ motives. Thus stressing the adequacy of the phylogenetic tree, the mammalian species separation period represents Stone et al previous reports. 28.

“GRAVY value greater than zero, according to Kyte and Doolittle[19] indicated a enzyme very hydrophobic. Though, for seven mammals IFNB1 proteinThe values of GRAVY gained in the present study are less than zero, implying that they are in nature rather hydrophilic.”

In all the seven mammalian species mentioned in this study, the fact that IFNB1 protein has lower damagingly exciting remains than positive exciting remains renders IFNB1 proteins intracellular in these animals[20]
According to Guruprasad et al, the coefficient of validity, that is the measurement of a protein stability in vitro when it reaches NMT sequences and 3D structures has revealed motif properties in addition to the known PROSITE motif that are utilized in a new predictor described here. The composite prediction function (with separate ad hoc parameterization) indicates that the protein may be safe. This is attributed, as stated by Devi et al., to the surplus tyrosine that results in the structure of the disulfide bonds relationship in the protein molecule. Regrettably, we show a measurement of validity greater than 50, suggesting that this protein is likely to be in vitro defective. Our finding revealed that secondary elements on the mammalian species subordinate structures of the seven IFNB1 protein were alpha-helix, expanded strand and the spontaneous coils. These are the three mechanisms were involved in the protein folding stability and function.

Conclusion

Structural analysis and sequence of seven mammals indicated regions correlated with evolution and structure. In addition to the variation of retained amino acid sequences from the physico-chemical properties in the active site, preservation may lead to the functional heterogeneity in a few amino acid substitutions at the respective site. Because IFNB1 has a role in immunomodulatory, antiviral, anti-tumor effects are very significant inflammatory protein conditions, the studies on it will lead to further research into proteomics.

Rapid Qualitative Test for Drunkenness Detection and the Presence of Alcohol in Beverages

Ausama Abbas Faisal¹, Maher Ahmed Abed², Khalid Jamal Abdulwahab³

¹Lecturer, University of Anbar, college of medicine, Department of Biochemistry, Iraq, ²Lecturer, University of Anbar, college of Agriculture, Department of Food science, Iraq, ³Assistant, University of Anbar, college of medicine, Department of Biochemistry, Iraq

Abstract

In many situations like car accidents, troubles and crime scenes we need to know if someone is drunk. This research includes rapid test to detect the alcohol drinking for those that not exhibit any signs of drunk like ataxia and vomiting, and to detect the beverage containing alcohols. The study included 30 volunteers of alcoholics and five types of beverages (Whisky, vodka, beer, wine and barbican). The sampling includes random quantity of sputum and 2 ml of blood from the volunteers. The sputum and beverages are examined by qualitative method depending on the change of dichromate solution color which is saturated and dried up on a filter paper piece in polyethylene container ready for use. If the color changes from yellow to blue-green this means that the sample contains alcohol and the result is positive, and if the color of dichromate dose not changed the result is negative and the sample dose not contains alcohol. The blood samples were examined by the measuring of GGT enzyme to confirm alcohol drinking. All of the sputum samples showed positive results by changing the color of dichromate. All of the beverages except barbican showed positive results this means that these beverages contain alcohol while barbican not. The values of GGT for volunteers were higher than the normal values which confirm the test of sputum.

Key words: Alcoholics, beverages, sputum and potassium dichromate.

Introduction

Alcohols are organic compounds which contain hydroxyl functional group (OH) connected to carbon atom.¹ The term alcohol belongs to primary alcohol ethanol which is the predominant type of alcohol in beverages produced by fermentation of sugars via yeasts². Alcohols are neurotoxic and psychoactive drugs.³ Alcohols can cause alcohol intoxication when consumed in large amounts. Ethanol is colorless, flammable, liquid, light chemical odor with chemical formula CH₃CH₂OH which is abbreviated to C₂H₅OH⁴. Ethanol has many uses like antiseptic⁵, antitussive⁶, antidotes⁷, chemical solvent⁸ and recreational⁹. Although alcohol has many benefits, its drinking causes adverse effects like ataxia (10), gastrointestinal diseases (11), cancer¹² and dependence¹³. In human body ethanol is metabolized to acetaldehyde by alcohol dehydrogenase enzyme in liver and then oxidized by acetaldehyde dehydrogenase enzyme to acetyl Co-A which is the final product of fat and carbohydrate metabolism and can be used to produce energy. Ethanol is a macronutrient energetic molecule yields about 7 kcal.per gram¹⁴. The first product of ethanol metabolism acetaldehyde is more toxic than ethanol¹⁵. Acetaldehyde showed to increase the risk of developing cirrhosis and multiple forms of cancers¹⁶. When ethanol is metabolized by dehydrogenase liver enzymes NAD will be converted to reduced NAD, normally, NAD participates in the fat metabolism in the liver; therefore, alcohol competes with fat for NAD. Long term alcohol drinking leads to fat accumulation in the liver causing fatty liver. Alcoholism leads to cell death in the hepatocytes because the stored fat reduces the function of the cell. These cells are then converted to scar tissue leading to cirrhosis, Sherwood et al¹⁷. Liver can metabolize certain amounts of alcohol, when the consumed alcohol exceeds the ability of liver to metabolize, alcohol reaches the heart and reduces the force of heart contraction. Consequently, the heart will pump less blood, lowering the total body blood pressure. When alcohol reaches the heart it also reaches the lungs, in this stage the person can breathe out trace of alcohol, this is the major principle of alcohol breath testing to determine if a driver has been drinking and drive¹⁸.
Materials and Methods

Principle

Alcohol reacts with yellow potassium dichromate (K₂Cr₂O₇) to produce blue-green Chromium (III) sulfate. Therefore the appearance of blue-green color means the presence of alcohol when a solution is added to potassium dichromate as shown below:\(^1\)

\[
2\text{K}_2\text{Cr}_2\text{O}_7 + 8\text{H}_2\text{SO}_4 + 3\text{CH}_3\text{CH}_2\text{OH} \rightarrow 2\text{Cr}_2(\text{SO}_4)_3 + 2\text{K}_2\text{SO}_4 + 3\text{CH}_3\text{COOH} + 11 \text{H}_2\text{O}
\]

Orange-yellow alcohol blue-green

Preparation of test solution

In a clean dry 250 ml beaker add 5.0 ml of 0.25 M potassium dichromate (K₂Cr₂O₇) solution, add 1 drop of 0.1 M silver nitrate (AgNO₃) and swirl the beaker immediately after addition, add 5.0mL of 6 M sulfuric acid (H₂SO₄) and swirl the beaker immediately after addition. The color of this test solution is orange – yellow which is converted to blue – green after the addition to alcohol or the addition of any solution containing alcohol.

Technique:

Saturate a filter paper with test solution prepared above for about 3 hours then dry this filter paper by using drying oven on 30°C until it be dry. The filter paper now is dry orange color containing the test solution; the filter paper is only holder for test solution. Cut the filter paper in a circle shape in a diameter of 3 cm and put it in plastic translucent cylindrical container with a volume of 10 ml and cap the container. The plastic container now is ready for use.

Sampling:

The samples that are examined are sputum, blood, and beverages. The sputum and blood were collected from 30 volunteers, while the beverages (Whisky, vodka, beer, wine and barbican) were purchased from markets. The sputum samples and beverages have been examined by potassium dichromate test, while the blood samples are used to determine the concentration of GGT enzyme as confirmatory test of alcohol drinking. Sputum of non alcoholics and water were used as a control to be compared with alcoholics and beverages respectively.

Test procedure

1. Open the cap of the plastic container that contains the test solution filter paper.
2. Add the sample under test in a quantity of 1 – 3 ml.
3. Recap the plastic container and shake it gently for 5 minutes.
4. Notice the color change and record the result.
5. You can add ethanol instead of sample to checkup the validity of test.

GGT determination

The GGT level was determined by colorimetric method using assay kit from Linear Company.

Results and Discussion

The results showed a positive test for all beverages except barbican meaning that all the beverages contain alcohol, while barbican does not contain. The positive results means that the color of filter paper test solution is converted to blue color, the density of color is directly proportional to the concentration of alcohol present, so dark blue color means the presence of large percentage of ethanol. The samples of sputum gave a positive result for drunks and negative results for non alcoholics (control). In the sample of low ethanol concentration the color of dichromate disappeared only, this means a positive result. The results are depicted in Table 1 and 2.

The results of GGT determination showed an increase in the level of GGT for drunks in comparison with non alcoholics (control). The results of GGT determination showed an increase in the level of GGT for drunks in comparison with non alcoholics (control) and with normal values of W.H.O. This increase confirm the dichromate test because GGT level is an indicator for alcoholics and its level increases directly with the amount of alcohol consumption.

</tr>
<tr>
<td>barbican</td>
<td>Negative</td>
<td>No change in color</td>
</tr>
<tr>
<td>Water</td>
<td>Negative</td>
<td>No change in color</td>
</tr>
</tbody>
</table>

The results depend on the presence of ethanol in the sample; if the sample contains ethanol positive result will appear and negative result appears if the sample does not contain alcohol. The density of appeared color depends up on the concentration of ethanol, dark blue-green color appears in high ethanol concentration and light blue in low concentration and the color of dichromate may disappear only in very small amounts of ethanol. The results are depicted in figure 1. The mechanism of this experiment depends on the presence of alcohol which reacts with an orange-yellow chemical compound called potassium dichromate (K$_2$Cr$_2$O$_7$). When the alcohol reacts with the potassium dichromate, a blue-green compound called Chromium (III) sulfate is produced. The reaction is as follows:

$$2\text{K}_2\text{Cr}_2\text{O}_7 + 8\text{H}_2\text{SO}_4 + 3\text{CH}_3\text{CH}_2\text{OH} \rightarrow 2\text{Cr}_2(\text{SO}_4)_3 + 2\text{K}_2\text{SO}_4 + 3\text{CH}_3\text{COOH} + 11\text{H}_2\text{O}$$

**Conclusion**

The results obtained showed a good method can be used to detect the drunkenness and presence of ethanol in various beverages; this is benefit for the investigation in crime scenes and for qualitative control and measuring. The method is rapid needs for five minutes only.

Nurses’ Knowledge Regarding Prevention of Surgical Site Infections at Baghdad Cardiac Centers and Hospitals.

Bassima A. Naji Msc1, Aqeel H. jasim2, Ayad M. Moussa3
1Assistant instructor, 2Instructor, 3Instructor, Fundamentals of Nursing Department, College of Nursing-University of Baghdad

Abstract

Background: Surgical site infections (SSIs), are defined as infections that occur within 30 days of the operation. Nosocomial infection, also called hospital acquired infection occur in patient who are admitted in Hospital for a long or short period of time which leading to cause of morbidity and death, therefore, we decided to establish the extent of knowledge of Surgical site infections Prevention among nurses at Baghdad Cardiac Centers and Hospitals. Objectives: the study aimed to assess the nurse’s knowledge regarding prevention of surgical site infections and to find out the relationship between Nurses’ Knowledge and some of demographic data (age, gender, level of education, years of experiences, and training session).

Methods: Across- sectional study was conducted in the period of December 16th, 2018 up to the end of 18th June, 2019. A purposive sample consisted of (50) nurses were selected out of two cardiac centers and one cardiac hospital in Baghdad city. The data collected was analyzed by using SPSS version 20.0 the study instrument consist of two major sections were constructed it is based on the review of literatures. First one is concerned with demographic data for sample, and the second section is knowledge, The extent of knowledge concerning SSI was determined using multiple-choice questionnaires covering the nurse’s knowledge, Question tools is composed of (23) items, reliability and validity of the questionnaire was determined through the analysis of pilot study. Data were collected through the use of self-report method, which analyzed through two statistical approaches. They are descriptive statistical analysis (frequencies, percentage) and inferential statistical analysis (Chi-Square).

Results: the findings of study reveals the study sample reveals that most of the sample (78%) were in age group (25-35) years and most them (52%) were female, the majority of the sample (68%) were married and most of them (42%) were nursing college graduate, the high percent (90%) of them having participation in training session, the majority of their nursing experience in general were (42%) from (1-5) years and most of them (66%) have experience in cardiac care unit from (1-5) years. Conclusions: most of the study sample has moderate knowledge regarding prevention of surgical site infection in Baghdad cardiac centers and hospitals. Recommendation: on the basis of the results of the study the researcher recommends that further research needed with large sample, to find out more result relationships and in different area. And special training programs should be designed and constructed for nurses in these areas to increase their skills.

Keywords: Nursing knowledge, Surgical Site Infections.

Introduction

Surgical site infections are defined as infections that occur within 30 days of the operation (1). One of the most common types of Healthcare-Associated infection is Surgical Site Infection (SSI) which is considered 20% to 25% of all Healthcare-Associated infections (2). (SSI) is an infection that happens among thirty days when an operation causes redness, fever, pain and swelling. It’s additionally one among the foremost imperative complications of a surgical intervention (3) Nosocomial infection have a great impact on the health of hundreds of millions people and it is considered a major global issue today by all the stakeholders (4). Throughout the literature, SSIs were associated with factors including advanced age, malnutrition, metabolic diseases, smoking, obesity, hypoxia, and immune-suppression (5). Nurse’s
pre and post-operative care play a significant influence in infection management responsibilities. Nurses have the distinctive opportunity to reduce the potential for hospital-acquired infections. By utilizing the skills and knowledge of nursing practice, they can facilitate patient recovery while minimizing complications related to infections. Nurses require being knowledgeable regarding the cause, effect and management of SSI to ensure optimum patient’s outcomes following surgery.

Materials and Method

Across-sectional study in which approach is applied in order to achieve the earlier stated objective. The study was initiated from December 16th, 2018 to 18th June, 2019.

A purposive (non-probability) sample of 50 nurses works in cardiac units. The study has been conducted on the Iraqi Center of Heart Disease, Ibn al-Nafees Hospital and Ibn-Albettar Center. Self-administrative questionnaire was modified by investigators for the present study depending on: Review of available literature, the related previous studies scales. The modified questionnaire consist of two parts: the first contained the demographic Characteristics of nursing student consist of (7) items; the second part include nurses’ knowledge Regarding Prevention of Cardiac Surgical Site Infections at Baghdad Cardiac Centers and Hospitals which consist of (23) items rated to tow levels of likers scale and scored the follows: (1) for right answer (0) for wrong answer. Validity for the instrument was determined through the use of panel experts to investigate the clarity, relevancy, and adequacy of the questionnaire in order to achieve the present studies objectives. A pilot study was carried out for period from January 28th, 2019 to February 10th, 2019 and conducted on 10 nurses. Statistical analysis were conducted by using statistical package for social science (SPSS) version 20.0 data analysis was employed through the application of descriptive and inferential statistical approaches.

**Discussion of the Nurse’s Demographic Characteristics**

Through the data Analysis of the present study the findings shows that most of the study samples (78%) were in age group (25-35) years and most them (52%) were female.
This result agree with the findings obtained from other study, which shows that the majority (73%) of the studied nurses had 21 years and less than 30 years and most of them (52%) were female(9).

Regarding the marital status of our study the results shows that the majority of the samples (68%) were married and most of them (42%) were nursing college graduate.

This result is agree with findings obtained from others study which found B.S (89% ) are more likely to have better knowledge than diploma holders(10).

This agrees with result obtained from other study which found that the highest percentages (40.0%) of the sample were academic nurses who graduated from Colleges of Nursing(11).

According to training session the results shows that Most of our study sample (90%) having participation in training session, this study disagree with another study which found that More than half of studied nurses said that they; did not have any previous training course(12).

The results of our study shows that the majority of nursing experience in general were (42%) from (1-5) years and most of them (66%) have experience in cardiac care unit from (1-5) years.

This result agree with another study which found that Most of the study have work experience (52%) of sample from (1-5) years(13).

Discussion of Nurses Knowledge Regarding Prevention of Surgical Site Infections in Cardiac Centers and Hospitals.

In this study the results reveal that the nurses have a good knowledge about (sign and symptom of SSI?), (intraoperative prevention of SSI), (prophylactic prevention of SSI?), (postoperative prevention of SSI), (form discharge instruction?), (what is the purpose for pre-operative skin preparation), (which one is the correct answer for the benefit of wound dressing?). While about (treatment of SSI?), (when is the best time for pre-operative hair remove?), (which one is best agent for preoperative skin preparation?), (when should you administer prophylaxis antibiotic surgical patient), the nurses have deficit knowledge, related prevention of Surgical Site Infections in Cardiac Centers and hospitals.

The results disagree with findings of another study which found that the majority of the samples (32%) have good knowledge regarding infection control(14).

Discussion of the Nurse’s Knowledge of the Study Sample.

The Results of this study Shows that the majority of the sample (50%) were rated as moderate knowledge while (6%) of them have poor knowledge.

These results agree with the previous study that found the proportion of nurses who were knowledgeable about prevention of surgical site infection was found to be 40.7% with a mean score of 56.3%. This finding indicated that more than half of the nurses demonstrated inadequate knowledge on prevention of surgical site infections(15).

Discussion of Relationship between Nurse’s Knowledge and Hospitals which working there.

The result of our study shows that there are no significant association between nurse’s knowledge and hospitals which working there. Hospital No. (2) Ibn Al-Nafees Hospital is the high percentage (36 %) of good knowledge for their staff in cardiac units.

Discussion of the Nurse’s Knowledge and Years of Experience in Nursing in General.

The result of the present study report that there are significant differences between nurse’s knowledge and Years of Experience in nursing in General.

This finding is in line with findings from European and African studies in which found that the years of experience was positively associated with knowledge regarding infection prevention(16).

Conclusion

Most of the study samples have moderate knowledge regarding prevention of surgical site infection in Baghdad cardiac centers and hospitals.

Recommendation: on the basis of the results of the study the researcher recommends that further research needed with large sample, to find out more result relationships and in different area. And special training programs should be designed and constructed for nurses in these areas to increase their skills.

Abstract

Photoaging is skin aging, caused by chronic exposure of ultraviolet radiation. Photoaging decreases patients’ quality of life because the skin was the outer organ seen by others. Ultraviolet radiation causes oxidative stress, that activated inhibitory kappa B kinase (IKK), increased nuclear factor kappa B (NF-kB), matrix metalloproteinase (MMP), and degradation of collagen. Epigallocatechin-3-gallate (EGCG) was the main green tea polyphenol and the main source of biologic activity of green tea. This study was an in silico study, aimed to obtain the effectiveness of EGCG component through molecular docking on IKK receptor (PDB ID: 5EBZ). The bioinformatics tools based on reverse docking used in this study, were Protein Data Bank, ChemDraw, Chem3D, and Molegro Virtual Docker software. Docking and binding site analysis showed, that EGCG was able to interact with IKK receptor. Rerank score of interaction between EGCG and IKK receptor was higher than that of arbutin and 5TL_701[A]. It showed that EGCG has higher potential in photoaging prevention than arbutin, as one of the agents in photoaging prevention. Pharmacokinetics and toxicity (ADMET) prediction in this in silico study were conducted using pkCSM On Line tool. The pkCSM results showed EGCG was predicted having good pharmacokinetics profile without toxicity effect.

Keywords: photoaging, EGCG, IKK, docking, pharmacokinetics, toxicity, ADMET.

Introduction

Photoaging is extrinsic skin aging, caused by ultraviolet radiation. Photoaging plays role in 80-90% of skin aging procession. Geriatric population in developed and developing countries were increased. Geriatric population in the United States in 2000 was 13% (35 million people), and predicted it would be 30% in 2030. Increasing life expectancy will increase the aging problems, especially skin aging because the skin is the outer layer of human organ seen by others. Photoaging decreases patients’ self-esteem and quality of life.1,5

Inhibitory kappa B kinase (IKK) plays an important role in photoaging pathogenesis, and are an attractive target for photoaging prevention. The IKK receptor can be used as a target in photoaging prevention and can be applied in molecular modeling and structure-activity relationship based drug design.6,7,8,9 The biggest problems in photoaging prevention are drug effectivity and drug efficiency. The discovery of new drugs with the effective target, that was started with research on drug design, is needed in photoaging prevention.10

The drug discovery and development are complicated processions. These processions need a long duration of time and expensive cost. The methods of drug discovery and development are divided into 2 methods, high throughput screening (HTS) dan virtual
screening. High throughput screening (HTS) consist of chemical compound synthesis and screening based on the protein. Synthesis of a chemical compound, in vitro study, and low hit rate were performed in all pharmacy company, but the high cost in these processions are always the biggest problem.\textsuperscript{(11,12)}

Drug discovery and development term become drug design, so the knowledge about biochemical procession and protein that play role in the pathogenesis of diseases, and drug design in modulating this protein are needed. In silico study, in vitro study, and in vivo study are completing each other in drug design procession.\textsuperscript{(11,13)}

In vitro study of EGCG for photoaging prevention has already done. It can prevent photoaging by inhibiting cJun terminal kinase (JNK) and p38-mitogen-activated protein kinase (p38 MAPK) pathway.\textsuperscript{(14)} This study was an in silico study, aimed to obtain the effectiveness of EGCG component through molecular docking on IKK receptor (PDB ID: 5EBZ).

In silico study in drug development is based on protein-drug interaction, by docking procession. The reactivity of protein is based on protein structure and chemical bond (hydrogen bond, van der Waals bond, covalent bond, and ionic bond). Computer-aided drug delivery (CADD) is able to show computational analysis of protein reactivity, by evaluating protein structure, chemical bond, and protein-drug interaction.\textsuperscript{(15)}

\textbf{Material and Method}

The molecular structure of IKK receptor was downloaded from protein data bank (PDB), and PDB ID: 5EBZ was selected. The structure of ligands was drawn using ChemDraw software application, version 11 and copied into Chem 3D software application, version 11 to create the 3D structure and measure its minimum energy using Molegro Virtual Docker, version 5.5. The validation of the docking study was performed by re-docking the ligand reference into an appropriate protein cavity. Re-docking is accepted if the root mean square value (RMSD) $< 2.0 \text{ Å}$.\textsuperscript{(16)}

The docking study of EGCG on the IKK receptor (PDB ID: 5EBZ) was conducted using Molegro Virtual Docker, version 5.0 (processor: Intel (R) Pentium (R) CPU N4200 @1.10GHz; installed RAM: 4.00 GB; system type: 64-bit operating system). The best docking results were detected visually by comparing the structure of the docked molecules with the structure of reference ligand (STL\_701[A] or 6'-amino-5'-(amino(hydroxy)methyl)-1,2,3,6'-tetrahydro-[1,1':3',1''-terpenyl]-4-sulfonamide) in the binding site. The MolDock and ReRank scores have presented the energy needed in receptor-ligand bond (Table 1). The lowest energy visualized the best binding pose between the ligand and amino acid residue of the protein.\textsuperscript{(16)}

\end{table}

Pharmacokinetics prediction (absorption, distribution, metabolism, excretion) and toxicity prediction of EGCG, arbutin, and reference ligand were performed using pkCSM On-Line Tool. The molecular structure of EGCG, arbutin, and reference ligand were drawn as 2D molecular structures with ChemDraw software, copied into Chem3D software to create 3D structure, and stored as a .sdf file. The .sdf format of EGCG, arbutin, and reference ligand were translated into SMILE format using SMILE Translator Online Help. The SMILE format was processed using the pkCSM Online Tool to predict the pharmacokinetics and toxicity of compounds.\textsuperscript{(16,17,18,19)}

\section*{Findings}

Molecular docking was performed to evaluate the mode of binding between the compound and IKK receptor (PDB ID: 5EBZ). The result of molecular docking 3D structure between candidate ligand (EGCG), control ligand (arbutin), and reference ligand (STL\_701[A]) in IKK cavity showed, that the ligands were able to interact with IKK receptor as the target protein (PDB ID: 5EBZ) on the same binding site (Figure 1).

\begin{figure}[h]
\centering
\includegraphics[width=\textwidth]{Figure1.png}
\caption{The result of molecular docking 3D structure between candidate ligand (EGCG), control ligand (arbutin), and reference ligand (STL\_701[A]) in IKK cavity. Description: green (IKK cavity), red (EGCG), yellow (arbutin), white (STL\_701[A]).}
\end{figure}
The best docking position in the 3D structure molecules of EGCG to IKK receptor (PDB ID: 5EBZ) can be seen in Figure 2A. The docking was carried out at cavity 5, vol. 86.016; surface: 296.96. The bond location of the ligand binding site and target protein showed, that EGCG interacted with IKK receptor through 54 number of bonds. Hydrogen and steric bond from 10 amino acids (Asp 165, Asn 149, Ile 150, Val 74, Leu 166, Met 65, Ile 164, Met 95, Val 29, and Cys 98) were showed at Figure 2B. The Mol Dock score and Rerank score of interaction between EGCG and 5EBZ in IKK cavity were shown in Table 1.

The best docking position in the 3D structure molecules of EGCG in IKK cavity using Molegro Virtual Docker software. EGCG (red) was bound to target protein (5EBZ). (B) Hydrogen and steric bound between EGCG and target protein (5EBZ).

Figure 3 (A) Hydrophobicity view of the interaction between arbutin in IKK cavity using Molegro Virtual Docker software.
Arbutin (yellow) was bound to target protein (5EBZ). (B) Hydrogen and steric bound between arbutin and target protein (5EBZ).

Arbutin is a topical agent that is used in photoaging prevention. The best docking position in the 3D structure molecules of arbutin to IKK receptor (PDB ID: 5EBZ) can be seen in Figure 3A. The docking was carried out at 5, vol. 86.016; surface: 296.96. The bond location of the ligand binding site and target protein showed, that control ligand (arbutin) interacted with IKK receptor through 36 number of bonds. Hydrogen and steric bonds from 7 amino acids (Cys 98, Gly 22, Gly 24, Thr 23, Val 29, Asp 165, and Leu 21) were showed in Figure 3B. The Mol Dock score and Rerank score of interaction between arbutin and 5EBZ in IKK cavity were shown in Table 1.

The result of molecular docking between IKK receptor (PDB ID: 5EBZ) with a candidate ligand (EGCG), a control ligand (arbutin, as one of topical agent in photoaging prevention), and a reference ligand (5TL_701[A]) using Molegro Virtual Docker software, showed that the binding affinity of IKK receptor with EGCG to be higher than that of arbutin. Based on Table 1, the average Mol Dock and Rerank score of interaction between IKK receptor and EGCG were -154.7±7.80 kcal/mol and -115.8±2.96 kcal/mol; between IKK receptor and arbutin were -84.52±0.03 kcal/mol and -79.05±0.85 kcal/mol; and between IKK receptor and 5TL_701[A] were -128.31±2.24 kcal/mol and -84.46±0.75 kcal/mol.

Based on the in silico study of the physicochemical properties of EGCG, the molecular weight value was 458.375 (<500), and the value of the log of octanol/water partition coefficient (log P) was 2.2332. The result of pharmacokinetic prediction of EGCG can be seen in Table 2.

The absorption of a compound is very important because it determines the action of the compound. The pkCSM intestinal absorption prediction is based on the proportion of compounds that were absorbed via the human small intestine. If the pkCSM intestinal absorption prediction value is less than 30%, it is considered to be poorly absorbed. The absorption of EGCG was 48%, higher than arbutin. Therefore, it can be predicted that EGCG has moderate intestinal absorption.

**Discussion**

The potentially interactive target protein with EGCG was IKK receptor. The IKK receptor plays role in inhibition of kappa B kinase, which activated NFkB. Nuclear factor kappa B (NFkB) plays role in photoaging pathogenesis, by activating matrix metalloproteinase (MMP) and increasing collagen degradation.\(^{5,19,20}\) It was predicted, that inhibition of IKK receptor by EGCG would be able to prevent photoaging.

The binding affinity of EGCG to IKK receptor was higher than that of arbutin and reference ligand (5TL_701[A]), and it showed that EGCG has higher potential than arbutin and reference ligand (5TL_701[A]) to be an alternative agent in photoaging prevention.

The blood-brain barrier (BBB) protects the brain from the exogenous compound. If the logBB is more than 0.3, it is considered that the compound is able to across blood-brain barrier and enter to the brain, while the logBB less than -1 showed that the compound is poorly across blood-brain barrier and enter to the brain.\(^{17,18}\) The BBB permeability of EGCG was -2.091 (Table 2), lower than arbutin and reference ligand. Therefore, it can be predicted that EGCG is poorly distributed to the brain. It can also be predicted EGCG gives minimal side effect and toxicity into the brain.

The most important detoxification enzyme in the body in liver is cytochrome P450. Cytochrome P450 deactivated some drugs, and it can also activated several drugs. The drug metabolism are mainly regulated by two isoforms (CYP2D6 and CYP3A4 substrates). These two main isoforms will predict whether a molecule can be metabolized by cytochrome P450. Inhibition of cytochrome P450 may disturb the drug metabolism. The different isoforms of cytochrome P450 (CYP1A2/ CYP2C19/ CYP2C9/ CYP2D6/ CYP3A4) were built.
These different isoforms were able to inhibit cytochrome P450. The predictors in pkCSM can predict whether a molecule was an inhibitor of cytochrome P450 or whether a molecule metabolised by cytochrome P450. Table 2 showed that EGCG is not likely to be metabolized by cytochrome P450 and does not inhibit CYP1A2, CYP2C19, CYP2C9, CYP2D6, but inhibits CYP3A4. Therefore, it can be predicted that EGCG is unable to metabolize by cytochrome P450 and EGCG is not likely going to be a cytochrome P450 inhibitor.

Total clearance of the drug is measured by proportionally constant CL tot, and it is a combination of hepatic and kidney clearance. Total clearance is related to the bioavailability of a molecule. The total clearance predictors is given in log(ml/min/kg). Table 2 showed that the prediction of total clearance of EGCG was 0.406 log ml/min/kg.

Toxicity of compound can be predicted from AMES toxicity, hepatotoxicity, and skin sensitization. The mutagenic potential of the compounds can be predicted from the AMES test. A positive AMES toxicity test indicates that a compound is mutagenic and may become a carcinogen agent. The important safety consideration for new drug development is drug-induced liver injury. The drug-induced liver injury may also cause drug attrition. The hepatotoxicity predictors in pkCSM may predict whether a molecule may disturb the function of the liver. The most potential adverse effect from topical drug application is skin sensitization. The most important safety consideration of topical drug is the evaluation of whether a compound can induce allergic contact dermatitis. It was predicted from pkCSM that EGCG does not induce mutagenic effect, hepatotoxicity, and skin sensitization.

Conclusion

This in silico study showed, that EGCG has potential in photoaging prevention, by interacting with IKK receptor (PDB ID: 5EBZ). EGCG was predicted having good pharmacokinetics profile and no toxicity effect to be an alternative agent in photoaging prevention.

Correlation between High Serum Uric Acid Levels with Occurrence of Diabetic Peripheral Neuropathy in Patients with Type 2 Diabetes

Mudjiani Basuki, Muhammad Hamdan, Fidiana, Fadil, Deasy Putri Sukarno

1Department of Neurology, Faculty of Medicine, Universitas Airlangga, Surabaya (60131), Indonesia

Abstract

Background: Diabetic Peripheral Neuropathy is a chronic microvascular complication of type 2 diabetes mellitus (T2DM) leads to increased risk of foot ulceration and morbidity. The increased serum uric acid (SUA) levels have been linked to macro vascular disease in T2DM. We found that the correlation between SUA levels and diabetic peripheral neuropathy has not been investigated.

Objective: To determine the correlation between high serum uric acid levels and diabetic peripheral neuropathy.

Method: The case-control design was used in this study and the sampling was done consecutively by following the inclusion and the exclusion criteria. The diabetic peripheral neuropathy was evaluated using EMNG and the serum were taken for uric acid levels examination. Chi square test was used for data analysis.

Results: Thirty subjects were enrolled and divided into an experimental group of 15 subjects and a control group of 15 subjects as well. We found that the diabetic peripheral neuropathy did not show a significant correlation with high serum uric acid levels, p=0.136 and OR 3.143 (CI 95% 0.681-14.503).

Conclusion: High serum uric acid levels did not have correlation with diabetic peripheral neuropathy.

Keywords: High Serum, Neuropathy, Diabetes Mellitus

Introduction

Diabetes mellitus (DM) is a clinical syndrome characterized by hyperglycemia that occurs due to insulin secretion abnormalities, insulin performance, or both. Type 2 Diabetes Mellitus (T2DM) is an increasing health problem of incidence and prevalence so it becomes a worldwide concern. Diabetic Peripheral Neuropathy (DPN) is one of the most frequent chronic microvascular complications in T2DM. Finger or foot infections and amputations are common risks faced by DPN. This causes an increase in morbidity and mortality resulting in increased medical costs of patients with DPN. Prevalence of neuropathy in DM patients over 50% for 25 years. The overall prevalence of neuropathy was estimated at 30%. In the EURODIAB IDDM Complication Study, DPN is associated with blood glucose control and DM duration. Microvascular complications still occur, despite controlling of blood glucose levels was performed well (HbA1c 5.4% to 7%), so it is suspected other factors involved besides blood glucose control and duration of DM.

High serum uric acid (SUA) levels were associated with the incidence of macrovascular and microvascular complications in patients with DM. Increased levels of SUA have been associated with endothelial dysfunction, ischemic heart disease, stroke, peripheral artery disease and death from cardiovascular disease. In T2DM, the increased levels of SUA were associated with metabolic syndrome and insulin resistance. The association of high SUA levels with DM was reported in several studies. The association of hyperuricemia with DPN is still controversial. The study by Ito et al (2011)
shows that DPN had a moderate significance (p < 0.001) with a positive correlation (r=0.509) towards high SUA levels. Therefore, the purpose of this study was to determine the correlation between high serum uric acid levels and diabetic peripheral neuropathy.

**Method**

This study used a case control design with the population of all T2DM patients who visited to the endocrinology outpatient unit of Soetomo General Hospital and fulfilled the inclusion and the exclusion criteria during the period of August to December 2016. The inclusion criteria were 40-60 years old, EMNG results did not support the DPN and agreed to follow the research. While the exclusion criteria were chronic renal impairment, chronic liver disorder, history of malignancy, history of drug use and radiotherapy, history of alcohol consumption.

We used consecutive sampling as the sampling technique because it was the best non-probability sampling and easy to do. The sample size was determined using the formula of unpaired categorical analytic research. The value of the effect proportion on the control (P2) was determined based on the preliminary study and the calculation of the required minimum sample size was 15 people for each group.

The samples were divided into two groups; 15 subjects with EMNG results that did not support the diabetic neuropathy referred to as control group and 15 subjects with EMNG results that supported the diabetic neuropathy, hereinafter referred to as case/experimental group. The sampling conducted for 5 (five) months.

Additionally, the T2DM patients who fulfilled the inclusion and the exclusion criteria will be performed anamnesis, physical examination and then performed the blood tests for serum uric acid levels and other confounding factors. Statistical analysis was performed using SPSS 20.0 program. Collected categorical data were analyzed using Chi-Square test while numerical data were analyzed by T-test.

**Result**

The total subjects were 30 patients consisting of 15 subjects with EMNG results that did not support the DPN that referred to as control group and 15 subjects with EMNG results that supported the DPN, hereinafter referred to as case/experimental group. The basic characteristics of research subjects consisting of demographic and clinical data were showed in table 1. While the correlation between high serum uric acid levels and the incidence of diabetic peripheral neuropathy was shown in table 2.

**Discussion**

This study shows that there were no significant differences in basic variables consisting of demographic data. In addition we obtained that there were no significant differences in clinical data except the T2DM duration. Demographic data included age and sex while clinical data included BMI, dyslipidemia, hypertension, smoking, serum HbA1c levels and T2DM duration.
The mean age of the experimental group (51.60±6.52 years) was slightly younger than the control group (53.53±4.72 years), but this difference was not statistically significant with \( p=0.360 \). This result was in accordance with a study by Volmer et al that the mean age of samples that has suffering from DPN was 56.9±9.6 years \(^9\). But the mean age in this study was relatively young compared to the research that conducted by Wallace et al that the mean age of samples suffering DPN was 68.27±10.66 and the mean age that did not suffer DPN was 62.26±10.05 \(^10\). Multicenter studies conducted in the United Kingdom reported that the prevalence of diabetic peripheral neuropathy increases with age, from 5% (3.1-6.9%) in the 20-29 years age group to 44.2% (41.1-47.3%) in the 70-79 years age group. However, the samples over the age of 60 were not included in this study, because the age affects other types of neuropathy such as neuropathy due to vitamin deficiency, malnutrition, and others \(^11\).

Characteristics of the subjects based on body mass index (BMI) in the experimental group were the subjects with normal BMI that was 9 patients (60.0%) meanwhile the subject of obesity in 6 patients (40.0%). However, this difference was not statistically significant with \( p=1.000 \). This was in accordance with a study that conducted by Koe et al., reported that there was also no significant difference between BMI and diabetic neuropathy \( p=0.056 \) in 84 subjects. Obesity or combination with metabolic syndrome was a risk factor for neuropathy complications \(^12\). Obesity and triglycerides were associated with the loss of small axon nerves that were unveiled myelin.

Obesity was associated with edema that precedes the occurrence of clamp phenomena that disrupt the barrier so that nutritional deficiencies in susceptible nerve tissue. Obesity along with other metabolic syndromes leads to an increase in insulin resistance. T2DM and obesity have a complex relationship. Obesity was a precursor of T2DM via insulin resistance mechanism \(^13\). Characteristics of the subjects based on the risk factor of dyslipidemia in the experimental group were found in 10 patients (66.7%) that less than the control group as many as 13 patients (86.7%).

Study conducted by Putri et al who found that dyslipidemia in the diabetic neuropathy group was 8% while in the diabetic neuropathy group was 44% with \( p=0.075 \) \( p <0.001 \).\(^24\) The study of dyslipidemia as a risk factor for neuropathy was still controversial. There was no significant difference between total cholesterol, HDL, LDL and triglyceride levels in people with type 2 DM who had somatic neuropathy with or without neuropathy. Patients with type 2 DM who were treated intensively with statins reduce the risk of autonomic neuropathy, but not DPN \(^14\).

The different studies found that dyslipidemia was an independent risk factor for macro vascular disease in type 2 diabetes mellitus patients. In the preliminary study, decreased lipid levels with both fibrates and statins within 5 years prevented the incidence of new sensory neuropathy \(^3\). The decrease in lipid levels was performed using fibrate therapy \( HR = 0.52; 95\% CI 0.27-0.98 \) and the use of statins therapy \( HR = 0.65; 95\% CI 0.46-0.93; \ p<0.042 \).\(^32\) The results was consistent with the in vitro studies and animal studies that showed the levels of lipid-lowering therapy had the neuroprotective effects by improving the Schwann cells, polyol pathway, and the repair of nerve blood flow \(^2\).

The characteristics of subjects based on hypertension in the experimental group found 4 patients (26.7%) with hypertension, then fewer than the control group that was 10 patients (40.0%). But in this study there was no statistically significant difference between the experimental and control group \( p=0.439 \). West et al.’s study also found that there was no significant difference between the history of hypertension \( p=0.124 \), systolic blood pressure \( p=0.373 \), and diastolic blood pressure \( p=0.640 \) with diabetic neuropathy. Hypertension was an independent factor in macro vascular disease, retinopathy, and nephropathy. Hypertension was a complication of blood vessels due to hyperinsulinemia. Insulin resistance increases sodium reabsorption in the proximal tubules of the kidney \(^15\).

The characteristics of subjects based on smoking were 1 person (6.7%) who smoked in the experiment group while in the control group there were 14 people who did not (93.3%). But in this study there was no statistically significant difference between the experiment and control group \( p=1.000 \). Additionally, the characteristics of subjects based on long-term T2DM ≥5 years in the case group was 12 people (80.0%) it was more than the control group that only 2 people (13.3%). While the subjects who suffer from DM <5 years in the case group was 5 people (20.0%), less than the control group that was 13 people (86.7%). The correlation test results showed that there was a correlation between the duration of DMT2 and the incidence of diabetic
peripheral neuropathy (p=0.000; odds ratio 0.038; 95% CI 0.005-0.271). This was consistent with some studies obtained a correlation between the duration of DM and diabetic neuropathy 16. Research conducted by Fatkhur et al stated that the longer the patient suffering from DM, the risk of diabetic neuropathy was 16.7787 times greater in DM ≥5 years (p = 0.000). In addition to hyperglycemia, the duration of DM was a risk factor for DPN in Diabetes Control and Complications Trial.

Moreover, characteristics of the subjects by high serum levels of HbA1c as many as 12 people in the experimental group (80.0%) was more than the control group as many as 10 people (66.7%). Based on the risk factor of serum uric acid level in the group of the incidence of peripheral diabetic neuropathy was obtained 8 people (53.3%) with high serum uric acid level, it was more than in the group without peripheral paralytic neuropathy that found 4 people with high serum uric acid level (26.7%).

However, there was no statistically significant difference with p=0.136 and odds ratio by 3.143 (95% CI 0.681-14.503) in this study. The result of odds ratio (OR) was more than 1, so then it was concluded that high serum uric acid levels had no correlation with the incidence of diabetic peripheral neuropathy in type 2 diabetes mellitus. It was not in accordance with this research that conducted by Rafie et al against 132 patients with T2DM aged 45-80 years who suggested there was a correlation between high serum uric acid and diabetic peripheral neuropathy in DM patients (p <0.0001).

Next, the difference could be caused by the age of research. The subjects in this study was 40-60 years while the subjects by Rafie et al up to 80 years. In general, the older age also affects the incidence of peripheral diabetic neuropathy. The multicenter study conducted in the UK, the prevalence of diabetic peripheral neuropathy increased with age, from 5% (3.1- 6.9%) in the 20-29 year age group to 44.2% (41.1-47.3%) In the 70-79 age group 17. The risk factor that affected the DPN was the duration of T2DM. In the experimental group with T2DM duration ≥5 years more than the control group and statistically significant with p=0.000.

**Conclusion**

There was no correlation between the high serum uric acid levels and the incidence of diabetic peripheral neuropathy in patients with T2DM in Soetomo General Hospital Surabaya in August until December 2016.

Nephrotoxicity Effects of Post-Cisplatin Paclitaxel Chemotherapy in Severe Head and Neck Tumor

Des Dwiputra Effendy¹, Soeprijadi¹

¹Departement of Otolaryngology, Faculty of Medicine, Universitas Airlangga (60131), Indonesia

Abstract

Background: Cisplatin-paclitaxel is a combination of chemotherapy drugs used in the treatment of head and neck malignancy. The main side effect of cisplatin is nephrotoxicity. Nephrotoxicity manifests in decreased glomerular filtration rate (GFR), increased blood urea nitrogen (BUN) and creatinine serum, and decreased magnesium and potassium serum. Objective: this study aimed to determine the nephrotoxicity effects of post cisplatin-paclitaxel chemotherapy in patients with malignant head and neck tumors.

Method: Patients with malignant head and neck tumor who received cisplatin-paclitaxel chemotherapy were taken consecutively and examined their GFR, BUN, creatinine, magnesium and potassium pre- and post-chemotherapy. The data were statistically analyzed whether nephrotoxicity happened post cisplatin-paclitaxel chemotherapy.

Result: Thirty five samples consisted of 24 men and 11 women. The diagnose were 25 nasopharyngeal carcinoma (71.42%), 3 of each sinonasal carcinoma and laryngeal carcinoma (8.57%), and 1 of each tongue carcinoma, parotid carcinoma, tonsillar carcinoma and MAE carcinoma (2.86%). The average of pre-chemotherapy GFR was 94.43±17.44 ml/min, average of post-chemotherapy GFR was 68.17±17.96. Mostly found decreased mild kidney function in 24 (68.57%) post chemotherapy patients.

Conclusion: There was a nephrotoxicity effects after cisplatin-paclitaxel chemotherapy treatment in patients with head and neck malignant tumors treated

Keywords: Nephrotoxicity, Chemotherapy, Cisplatin-paclitaxel, Malignant head and neck tumor.

Introduction

Malignant head and neck tumors are a major problem in ENT unit. Research in Dr. Soetomo General Hospital 1996 - 2000 by got 2119 patients with malignant head and neck tumors. New patients in 2009 - 2012 that underwent treatment in ENT outpatient unit Dr. Soetomo General Hospital were 1479 patients of 15867 total visits ¹. In the United States, 5% of all malignancies in 2006, was found 500,000 new cases. The majority of malignancies in head and neck (>75%) are squamous cell carcinomas, which are relatively radiosensitive. Approximately one-third still has an early stage and two-thirds are in locally advanced stage at the time of treatment ².

Chemotherapy is one of the alternative options in malignant head and neck tumors advanced. The most commonly chemotherapy used in Lotus inpatient unit Dr. Soetomo General Hospital Surabaya is a combination of cisplatin - paclitaxel (cisplatin based), 31% of 2013 patients who received chemotherapy in 2009-2012. The use of cisplatin alone reached 55% in combination with other regimens in chemotherapy of head and neck malignancy ³.

The nephrotoxicity of cisplatin had been recognized since 25 years ago, but since no other drug had been found to be as effective and less toxic, cisplatin continues to be used. Cisplatin nephrotoxicity in experimental animals...
was first discovered in 1971 showing a histopathologic change in the form of acute tubular necrosis accompanied by azotemia. Acute kidney failure due to cisplatin occurs 14-100% of patients, with varied incidents according to dose. Renal insufficiency was found in 20-30% of patients. Onset of renal insufficiency usually occurred on day 3 to 5 after cisplatin consumption, which was indicated by an increase of creatinine serum and BUN levels. Hypomagnesemia, hypocalcemia, hypophosphatemia and hypokalemia commonly happened, especially after repeated doses of cisplatin characterized by decreased GFR 4.

Cisplatin chemotherapy led to a significant increase of creatinine (44.87%), and an insignificant increase of BUN (8.71%) compared to before treatment. At electrolyte serum examination there was a significant decrease of magnesium (7.18%), potassium (6.44%), phosphate (16.44%) and calcium (5.94%), significant increase of sodium (1.35%) and chloride (3.85%) compared to before treatment 5. Another study in India reported 15 patients (20.5%) with acute renal injury characterized by a significant increase in creatinine serum levels within the first 48 hours after cisplatin chemotherapy 6. A study in the United States comparing nephrotoxicity increased in 11 patients receiving cisplatin-paclitaxel combination chemotherapy with 14 cisplatin-treated patients alone had decreased creatinine clearance in 9 patients (81%) who received cisplatin-paclitaxel combination and only 4 (29%) of 14 patients treated with cisplatin alone 7.

**Method**

The samples were taken by consecutive sampling. The independent variable in this study was cisplatin-paclitaxel and dependent variables were nephrotoxicity effects assessed by GFR, BUN, serum creatinine, magnesium (Mg++), potassium (K+) blood plasma 8.

Administration of cisplatin-paclitaxel is the process of incorporating chemotherapy drugs consisting of cisplatin and paclitaxel into the body. The dose of cisplatin in this study was 100 mg/m² of body surface and paclitaxel dose in this study was 200 mg/m² of body surface. The effect of nephrotoxicity is a condition that indicates renal impairment due to chemicals characterized by decreased GFR, increased BUN and creatinin, and decreased Mg++ and K+ in 10 days' post-cisplatin-paclitaxel chemotherapy 9. The data collected in sheet was arranged in table then analyzed descriptively and analytically. Normal distribution test on the data used Shapiro-Wilk, while the analytical test used t 2 paired samples if the data were ratio scale and normal distribution, if the requirement was not met, it would use Wilcoxon test 10.

**Results**

It was obtained 35 samples with age distribution of 17-25 years (8.57%), 26-35 years (17.14%), 36-45 years (25.71%), 46-55 years (42.86%), 56-65 years (5.72%). Sex distribution obtained 24 males (68.57%) and 11 females (31.43%). Ethnicity distribution obtained Java was 28 (80%), Madura was 5 (14.28%), Batak and Dayak was 1 each (2.86%). The diagnosis obtained were 25 nasopharyngeal carcinoma (71.42%), 3 of each sinonasal carcinoma and laryngeal carcinoma (8.57%), and 1 of each tongue carcinoma, parotid carcinoma, tonsillar carcinoma and MAE carcinoma (2.86%).

GFR examination was done pre-chemotherapy and post-chemotherapy of cisplatin-paclitaxel. The average of pre-chemotherapy GFR was 94.43±17.44 ml/min, average of post-chemotherapy GFR was 68.17±17.96 ml/min (Table 1). Decreased mild kidney function with GFR values range of 56-90 ml/min was 24 (68.57%) patients. Decreased moderate kidney function with GFR value range of 35-55 ml/min was 6 (17.14%) patients. Severe kidney dysfunction patients with GFR <35 ml/min was 2 (5.72%) (Table 2).

The average of pre-chemotherapy BUN level was 9.11±3.27 mg/dl and post-chemotherapy BUN level was 14.94±13.88 mg/dl (Table 3). The average of pre-chemotherapy creatinin serum levels was 0.84±0.15 mg/dl and post-chemotherapy creatinin serum level was 1.20±0.54 mg/dl (Table 3). The average of pre-chemotherapy Mg++ levels was 2.20±0.31 mg/dl, while post chemotherapy was 1.93±0.35 mg/dl (Table 3). Patients with hypomagnesium in post cisplatin-paclitaxel chemotherapy were 8 (22.86%), 26 (74.28%) patients had normal Mg++ levels, and 1 (2.86%) patient had hypermagnesium (Table 4). The average of pre-chemotherapy K+ level was 4.08±0.42 mmol/l, while post chemotherapy was 3.55±0.52 mmol/l (Table 5).

Discussion

Cisplatin is a strong cellular toxin especially in the low chloride state. In the cell, the chloride atoms in cisplatin will be replaced by water molecules. This hydrolysis product is believed to be an active species that reacts with glutathione in cytoplasm and the DNA nucleus of renal tubular cell. More than 50% of these drugs are excreted in the urine within the first 24 hours after administration, platinum concentrations reach the renal cortex faster than plasma or other organs. Cisplatin primarily damages S3 segment of the proximal tubules causing a decrease in GFR 11.

Factors that increase the risk of nephrotoxicity include female, old age, smoking, hypoalbuminemia, and renal insufficiency. Age affects renal function because along with age it will also be followed by decreased renal function 12. Patients (>40 years) have a greater risk of decreased renal function. This is caused by nephron loss at that age. Decreased renal function estimation on the basis of each decade increase is about 10 ml/min/1.73 m². At the age of the fourth decade or 40 years there has been a decline in renal function about 10% of renal ability. Patients in advanced age are more susceptible to get drug side effects due to their physiological condition that has decreased 13.

Cisplatin nephrotoxicity can occur in a variety of signs and symptoms, one of the most commonly found is acute renal injury with the most common incidence of renal insufficiency. The onset of renal insufficiency occurs a few days after cisplatin consumption, which is indicated by increased creatinine serum and BUN levels. Cisplatin can cause damage to the renal blood vessels resulting in ischemia that may interfere with renal blood perfusion and consequently an increase in creatinine serum 14. Creatinine serum will increase significantly after 5 days of cisplatin administration. There will be a change in the partial glomerular atrophy of some tubular cells. The distal and proximal tubules exhibit partial degeneration and destruction of epithelial cells. Increased creatinine serum may be the final indicator of renal injury due to cisplatin chemotherapy because renal failure can occur without increase creatinine serum 15.

Hypomagnesemia is one of clinical manifestations that occur in patients who received cisplatin chemotherapy. Persistent exhalation of magnesium as a result of decreased magnesium levels indicates that hypomagnesemia occurs due to renal impairment in reabsorbing magnesium 4. Cisplatin causes magnesium receptors damage in the ascending branch of Henle curve and distal tubules, causing tubular cell necrosis resulting in disruption of magnesium reabsorption mechanism. It was found 1 (2.86%) patient who experienced post-chemotherapy hypermagnesemia. Hypermagnesemia is a rare condition except in renal failure or after parenteral Mg++ administration. This condition can cause central nervous system depression as well as heart function and sometimes hypermagnesemia itself may be an indication for dialysis 16.

Hypokalemia is a common electrolyte disorder occurring during cisplatin treatment, causing by increased renal reabsorption ability in response to reduced potassium absorption. Hypomagnesemia can also cause damage of Mg++ dependent Na, K-ATPase due to high loss of sodium in cells, if it was combined with a decrease in renal potassium causing hypokalemia 17. The results showed a significant decrease in glomerular filtration rate (GFR), significant increase in blood urea nitrogen (BUN) levels, significant increases in creatinine serum levels, significant decreases in magnesium (Mg++), and significant decrease in potassium (K+) levels. Thus the hypothesis of this study was proven 7.

Conclusion

There was a nephrotoxicity effect of 27.80% glomerulus filtration rate (GFR), increased blood urea nitrogen (BUN) level of 63.94%, increased serum creatinine of 41.80%, decrease magnesium (Mg++) level of 12.30%, decreased potassium (K+) level of 13% after cisplatin-paclitaxel chemotherapy treatment in patients with malignant head and neck tumors.

Correlation of CD4 and Distal Sensory Polyneuropathy in HIV-Aids Patients

Desti Ariani Kistanti1, Paulus Sugianto1, Erwin Astha Triyono2
1Department of Neurology, 2Department of Internal Medicine, Faculty of Medicine, Universitas Airlangga, Dr.Soetomo Teaching Hospital, Surabaya 60286, Indonesia

Abstract

Infection of human immunodeficiency virus (HIV) and acquired immunodeficiency syndrome (AIDS) has developed into one of the most important health problems in the world. Distal sensory polyneuropathy (DSP) is the most common complication of peripheral neuropathy in HIV-AIDS. Risk factors associated with DSP are elderly, stage of HIV disease, (cluster differential-4) CD4 count, and high plasma viral load in plasma. To analyze the relationship between CD4 and distal sensory polyneuropathy in HIV-AIDS patients. Subjects of the study examined the degree of severity of distal sensory polyneuropathy by examination of the Surface Nerve Surgical Nerve Speed, then divided into case group and control group. After that, the subjects performed a CD4 count examination. Data analysis using chi-square test. Most body mass index (BMI) subjects did not experience malnutrition by 35% of case group and 35% control group (p = 1.000). Most subjects aged ≥40 years were 37.5% of case group and 25% control group (p = 0.102). Analysis of CD4 relation with Speed of Nerve Surgical Nerve Survival was obtained p = 0.038. There was a significant relationship between CD4 and Distal Sensory Polyneuropathy in HIV-AIDS patients. While age and malnutrition were not found a significant relationship with distal sensory polyneuropathy.

Keywords: CD4, distal sensory polyneuropathy, HIV-AIDS

Introduction

Currently, infection human immunodeficiency virus (HIV) and acquired immunodeficiency syndrome (AIDS) has developed into one of the most important health problems in the world. In 2002, the number of new cases of HIV infection worldwide was reported at nearly 3.5 million and among 2.4 million cases of which died from AIDS 1. In 2003, 4.8 million newly infected individuals were infected with HIV. Centers for disease control and prevention (CDC) estimates that 40.000 individuals are infected with HIV each year. World Health Organization (WHO) estimates that the total number of people living with HIV/AIDS worldwide is 42 million 2. Data from the Ministry of Health of the Republic of Indonesia in the second quarter of 2010 increased by 1.206 cases of AIDS, thus as of June 2010 cumulative cases of AIDS reported since 1978 amounted to 21.770 from 32 provinces and 300 districts/cities. East Java was ranked second in HIV positive cases was 5.973 cases 3.

Along with the development of science and the existence of the drug is much active antiretroviral therapy better, then the life expectancy of patients is increasing, resulting in abnormalities in the peripheral nervous system that appears will increase. Peripheral neuropathy generally occurs early in HIV disease, but it can also occur in all stages of the disease with varying and complex clinical features 4.

Peripheral neuropathy (DSP), toxic neuropathies (TN), mononeuropathy multiplex (MM, including brachial and lumbar plexus), inflammatory demyelinating polyneuropathy (IDP, acute or chronic type), and progressive polyradiculopathy (PP). DSP is the most common complication and ranges one-third (about 35%) of all HIV patients 5.
DSP usually appears in later stages and is estimated to be 30% of patients with CD4 counts less than 200/μl. DSP is characterized by the degeneration of axons from sensory fibers with little regeneration of nerve fibers. Risk factors that correlate with DSP include elderly, HIV disease stage, CD4 lymphocyte cell count, and high plasma viral load in plasma, genetic factors may also play a role.6,7

Several factors are suspected to be associate with DSP in HIV patients. These factors include patient age, CD4 cell count, plasma HIV viral load, antiretroviral drugs, and the presence of diabetes mellitus. DSP in the study was upheld from clinical symptoms of the patient i.e sensory complaints in the distal. Neural conduction examination (NCS) with the electromyography device (EMG) was not performed in both studies although the sensitivity was 94% and the specificity was 62.1% for the case of polyneuropathy. Diagnosis of DSP is more objective and more precisely enforced through nerve conduction examination. However, there are some obstacles encountered: EMG checks are quite expensive, need trained operators, limited tools especially in peripheral areas, and possible risk of HIV transmission to other patients through micro lesions of EMG tools.8 Therefore, we aimed to analyze the relationship of CD4 with DSP in HIV/AIDS patients.

Method

The subjects of this study were HIV-AIDS patients who were treated at Dr. Soetomo Teaching Hospital Surabaya, Indonesia that fulfill the criteria of inclusion and exclusion. The subjects consisted of two groups: case and control group. Inclusion criteria are: patients diagnosed with HIV/AIDS, aged 17-60 years, had symptoms or asymptomatic Distal Sensory Polyneuropathy, and nerve survival rate (NSR) Survival (≤40 m/s in case group and ≥40 m/s in the control group)9,10. Exclusion criteria are: taking antiretroviral drugs (ARVs), HIV-AIDS patients using neurotoxic drugs such as Isoniazid, Metronidazol and chemotherapy drugs, and the subject had a history of Diabetes Mellitus. Subjects who were willing to participate in the research first fill out the informed consent sheet.

The procedure of determining the number of subjects includes the identification of HIV-AIDS positive patients using 3 methods of antigen examination for the HIV virus.9 HIV-AIDS patients performed NSR assessment using Electromyography or EMG (Cadwell Laboratories Inc., Kennewick, USA). The patients were then identified and divided into two groups: case and control group. The results of the process were obtained by 20 case group subjects and 20 control group subjects.

The design of this study using the method of case-control was performed by observational. This research procedure consists of several subject data retrieval including demographic and clinical data. Demographic data include sex, education, and age obtained by means of assessment on the subject. Clinical data include malnutrition and CD4 levels. Malnutrition was known by measuring BMI.11 Examination of CD lymphocyte T lymphocyte was performed by taking 2 ml of venous blood stored in EDTA vials. Further examined by flow cytometry method with BD FACS CaliburTM System and with BT Triset CD3 FITC/CD4 PE/CD45 PerCP reagent.

Before the identification of the subject, the researcher conducted a test of ethics at Dr. Soetomo Teaching Hospital Surabaya Indonesia. Data analysis in this research use frequency analysis which is categorized into 2 categories for each variable. Statistical data aliases using SPSS version 23.0 (SPSS, Inc., Chicago, IL). The statistical test used in this research was the chi-square test (p <0.05). If statistical test requirements are not met then the chi-square test is replaced by a Fisher test.

Results

The results of the assessment indicated that most of the subjects were male (52.5%) of which 32.5% of case group and 20% control group (p = 0.113). Most subjects aged ≥40 years (62.5%) were 37.5% of case group and 25% control group (p = 0.102). The majority of subjects had high school or college education (85%) of 42.5% case groups and 42.5% control group (p = 1.000; Table 1).
BMI results in subjects were found to be largely malnourished (70%) by 35% of cases and 35% of controls (OR = 1.000; CI 95%, p = 1.000). In this study, there was a statistically significant relationship between CD4 and surgeon nerve neural velocity with p = 0.038 and Odd’s Ratio of 4.636 (CI 95%, 1.023 - 21.004), meaning that subjects with low CD4 cell counts were <185 cells/mm³ has a risk of decreasing the Surface Nerve Surge Nerve Speed by 4.6 times compared to subjects with CD4 ≥185 cells/mm³. This indicates that the results of this study were clinically and statistically significant (Table 1).

**Discussion**

The prevalence of distal sensory polyneuropathy (DSP) is more prevalent in male patients than in female. The factor that causes the prevalence of DSP in the male is higher than for female was the prevalence of male HIV-AIDS patients in Indonesia was almost twice by female patients. In addition, higher male postures lead to more susceptible to length-dependent neuropathy such as DSP.

Older people have a higher risk of developing DSP than younger age. Study in the United States gained an average age of DSP over 45 years, whereas study in Kenya the median age of patients with DSP was 42 years. Moreover, the level of education is not related to NSR Nervus Suralis.

The condition of malnutrition may aggravate the condition of neuropathy in HIV/AIDS patients. In this study, malnutrition status was not related to DSP because malnutrition status is only assessed from Body Mass Index (BMI) ≤18.5. There was no significant association of DSP incidence with weight, height, and BMI. Malnutrition parameter not only obtained from body mass index but also assessed albumin level, hemoglobin level, and level of vitamin B12 in blood.

The CD4 cell count range in this study was 3 to 509 after a statistical analysis found a CD4 border that had a significant association with NSR Sural Nerve was 185. The CD4 count range for the occurrence of Distal Sensory Polyneuropathy between 50-199 cells/mm³. CD4 cell count <170 cells/mm³ had a significant association with the incidence of peripheral neuropathy.
in HIV/AIDS patients. HIV patients with a CD4 cell count <200 cells/mm³ had a risk of HIV neuropathy and HIV dementia was 3.5 times higher than patients with CD4 count >500 cells/mm³. Low CD4 cell counts indicate low immune system HIV/AIDS patients so that macrophage activation is increasing. High macrophage activation leads to the release of proinflammatory cytokines (TNF α, IL1, IL6). Excessive inflammatory cytokines accelerate the apoptotic process of neurons, especially sensory nerve fibers and cause DSP.

**Conclusion**

The most subjects were male, aged ≥40 years and the majority of subjects have a high school or Bachelor’s degree. The most subject was not malnourished and patients had CD4 <185 cells/mm³. There was a significant relationship between CD4 and Distal Sensory Polyneuropathy in HIV-AIDS patients. While age and malnutrition were not found a significant relationship with Distal Sensory Polyneuropathy.

Legal Efforts on Forensic Examination of the Death of Polling Station Working Committees (KPPS) Members

Dewi Iriani1, Abdul Kadir1, Agus I Supriyanto1, Ahmad Arifin1, Made Wira Suhendra1
1Doctoral Student, Universitas Islam Indonesia

Abstract

Indonesia has held its general election on April 17th, 2019. During the 2019 general election, there were 11,239 members of polling station KPPS members passing out and 527 people passing away. Due to this circumstance, forensic examination is required to examine the reason behind the cases of the dead and the sick members. Therefore, this present article analyzes two issues: 1) how legal effort is conducted regarding health services provided for polling station KPPS members; and 2) what action the government do to take the responsibility on the death of the members.

This research is categorized as legal research that employs four approaches. The first approach is statuary approach by using ordinatie ssth No. 350 of 1957 Visum Et Repertum, preamble of 1945 State Constitution of Republic Indonesia article 179 of Criminal Code, Law of Health No. 36 of 2009 and Election Law No. 7 of 2017. The second one is case approach. The next is conceptual approach for both death and ill health cases. The last one is using comparative approach.

The result showed that the members of polling station committee died due to some illness suffered by the members such as cardiovascular, heart attack, stroke, or even all of them. However, for members who do not suffer from hereditary disease, the cause the death is due to the heavy workload they had that surpasses 20 until 22 hours a day. Besides, lack of sleep is also considered contribute to the members’ death and sickness.

Keywords: Forensic medicine, Polling Station Working Committee, 2019 General Election

Introduction

General election or Pemilu had been conducted in Indonesia on April 17th, 2019. It was one of the biggest democracy parties yet ever as this election includes presidential election and Indonesian legislative elections. Therefore, General Election Commission (KPU) and Regional Election Commission (KPUD) have plenty of things to prepare. Ballot papers, ballot boxes and polling booths are some election supports should be prepared. Besides, the commission also recruit many people to be appointed as polling station KPPS members (KPPS hereafter).

Due to the hectic 24-hour nonstop work and the heavy workload the KPPS members had prior to and after the election cause some people passing out, even many of them are confirmed pass away. According to research conducted by Sidiq Budi Sejati and Dewi Sendhikasari, there is a list of data issued by the KPU that showing the numbers of sick members and dead members. The data is listed as follow: (1)

Besides, Ministry of Health through regional public health offices records that KPPS members who got sick surpass 11,239 people and the dead members surpass 527 people. According to press release held by Ministry of Health in Jakarta on Wednesday (May 16th, 2019), as cited by Antara, those total numbers are generated from the investigation of Ministry of Health in 28 provinces per May 15th, 2019. Compared to this data, the dead members of polling station KPPS are increase, particularly in following four provinces: nine people in North Sumatera, four people in South Sulawesi, one person in Bangka Belitung, and one person in West Sulawesi.
Referring to the report made by Public Health Offices in each province, the highest number of dead KPPS members is in West Java province. For more complete data is provided b: 177 people in West Java(2). On the other hand, Ombudsman also released data of election related officers passing away during election period. However, the data is quite different. Ombudsman stated that there are 608 people including 486 KPPS members, 97 members of Election supervisory agency and 25 police officers who died. That is why Ombudsman conducts an assessment on the case by interviewing some officers of KPU, Regional KPU, Election Supervisory Agency, Ministry of Health, Indonesian Medical Association, and also the family members of the dead polling station working committee(3).

Concerning the aforementioned case, authors are interested to deeply analyze about Forensic Legal Efforts in health services towards the death case of polling station KPPS members during 2019 General Election. Specifically, there are two main issues that will be elaborated. The first is regarding the legal efforts in health services provided for KPPS members and the second one is related to governments’ responsibility in handling the death case of KPPS members.

Research Methodology

This study is a legal research in which four approaches are used, namely statutory approach (4), comparative approach, case approach and conceptual approach. Particularly, ordinantie sth No. 350 of 1957 Visum Et Repertum (report of an autopsy) is employed for the statutory approach. Meanwhile, comparing forensic medical theories with the death case of KPPS members during 2019 general election is employed as comparative approach to analyze the phenomenon.

Finding and Discussions

The field of medical forensic basically covers many components, namely forensic law, dentistry law, nursing law, clinical pharmacy law, hospital law, community health law, and environmental health law(5). Particularly for medical forensic, it defines some terms including post-mortem, mortem, ante mortem, and visum et repertum(6).

Prof. H.J.J. Leene defined medical forensic as medical science that provide direct health services. It relates to criminal laws and it uses sciences and literature as its legal sources. On the other hands, Prof. Van Derminjn stated that medical forensic is closely related to the management and the application of health in criminal law and administration law(7). Speculation sparks within society is that the polling station committee members are die unnaturally as they are poisoned by the political factions. Further discussion regarding the cause of the death of KPPS members will be elaborated in another article.

Forensic law is utilized when something unusual occurs regarding one’s condition that causes severe injury or death(8). In this case, forensic is required in order to know the cause of the death of polling station working members. Therefore, the authors are interested in analyzing deeply the concern regarding forensic employment.

In medical field, there are doctors who not only check the patients’ condition, but also assist police officers in examining one’s cause of death, particularly the unusual one(6). Such doctors who have to contend with dead patients are called as forensics doctors. Specific skills and competencies in uncovering patient’s cause of death is definitely required(9). It is regulated in Article 179 of Indonesian Criminal Code as stated as follows: “(1) everyone who is asked for his/her opinion as medical/ juridical expert or as doctor or other expert is obliged to provide expert information for the sake of justice”. Therefore, doctors’ obligations are categorized into several classifications.

1. Based on the object of examination: live people, corpse, organ or parts of body.
2. Based on the service: conduct examination and provide opinion on the result of examination, only provide opinion without conducting examination.
3. Based on the working place: in hospital/laboratory, in the crime scene, and in the court.

Examination concerning cause of death is necessary in order to prove whether someone is suicide, homicide/murdered, poisoned or etc. In this case, Visum Et Repertum shall be taken place. Basically, there are two types of Visum Et Repertum. They are:

a. Visum Et Repertum on body or corpse: it is conducted to know an odd cause of death due to criminal issue through autopsy
b. Visum Et Repertum on injured patients:
1) Patients who do not need particular treatment after examination: outpatients, autopsy on types of wound, trauma, and injury classification.

2) Patients who decline medical treatments after examination: types of trauma, description on treatment decline even though need some.

Autopsy report can be utilized as a proof in police investigation report to prove the criminal occurrences. It not only covers the examination result of the victims, but it also should be reported in written form. Following is how to write Visum Et Repertum:

a. Write it on the stamped paper with word “Pro Justitia” written in left corner and use general and logical language.

b. Do not use abbreviation on any sentences, numbers or symbols.

c. Any incorrect parts should be signed by the authorities’ officers by providing correction statement.

d. Type the result of Visum Et Repertum neatly and it should be sealed(10).

Pro Justitia

Visum Et Repertum

1. Introduction: it states the identity of all involved parties; people who are being examined; officers who examine the case; time and place where the examination takes place; and modus operandi.

2. Examination part: it states whether the object being examined is dead or alive and provides statement that can be seen or perceived as the expert information that is used as a real proof.

3. Conclusion part: it states the opinion of the examining doctor; causes of death, damage, or negligence. In this part, a judge is allowed not to take side with the suggested opinion.

4. Closing part: According to ordiantie sth No. 350 of 1957, Visum Et Repertum is closed or finalized by such oath or promise when accepting the position”.

The result of Visum Et Repertum is submitted to the authorities. However, according to the applicable law, it does not state the exact time of the submission. Visum Et Repertum is usually required during investigation in which police officers need the post mortem result as one of undeniable proof(11).

In the case of the polling station KPPS members, the autopsy result is used by the family or police to find out whether or not intentional acts that lead to criminal acts are involved. Autopsy examination is expected to provide brief result regarding the cause of the death. It may also give a clue for the investigator teams to examine the case. If the result of Visum Et Repertum indicates any crime issues, the death case can be proceeded to the court (12).

Even though there are hundreds of victims, none of the family members give permission for the authorities to conduct Visum Et Repertum. They said that it possibly has been their destiny. The same thing goes to the family members of the injured committee. They refuse to conduct the autopsy and only give oral statement regarding the case. Conducting general election requires the involvement of polling station KPPS members (KPPS). Unless the committee involvement, the election will not run as expected. However, not everyone could easily appointed as polling station working committee. The requirements are strictly regulated on Law No. 7 of 2017 on General Elections. To form polling station working committee, seven adults living near the polling station. The selection of committee members is conducted fairly by considering their competencies, capacities, and integrity(13).

Researchers from Universitas Gajah Mada investigated the cause of death of polling station KPPS member during 2019 general election. The researchers observed 400 polling stations out of 11,781 available polling stations throughout the Special Region of Yogyakarta. The result showed that from 400 dead members of polling station KPPS member, 12 of them are coming from Special Region of Yogyakarta. This result is reported in a press release in KPUs, Jakarta on June 25th, 2019. The more detail results obtained by the researchers are elaborated as follows:

1. The primary cause of the death of polling station KPPS members is not due to poisoning, but due to some illnesses formerly suffered by the committee members. The illnesses include cardiovascular disease such as heart attack, stroke, or both of them. Other illnesses is excessive fatigue (20%), severe dizziness (12%), low back pain (10%), shortness of breath (5%), etc. As for the sick members, 29 percent of the available members suffered from 1 up to 3 of deadly diseases.
2. Technical problems, logistics, and members’ health problems formerly suffered trigger the members’ illness and the death case. Moreover, lack of sleep leads to excessive fatigue. Prior to the election period, the workload is four times higher (80%) than the break time (20%). This percentage actually decreases as the Election Day approaching. One day prior to the Election Day, the workload is more than twice higher (70%) than the break time (30%) while one day after the election, the workload is little bit higher (60%) than the break time (40%).

3. The researchers found that the polling station KPPS members had experienced multiple morbidities or repeatedly suffering from the same disease. Heavy workloads around 20 until 22 hours a day also worsen the situation. Besides, 80% of the dead members formerly suffered from cardiovascular disease that relates to heart and blood vessels’ condition. Further investigation also revealed there are some other factors that also contribute to the members’ death. They are psychological factor and tiredness (70%), anxiety (30%) and physical condition (40%).

4. The researchers suggest KPPUs to invite students taking community service program to be recruited as polling station KPPS members to lift the heavy workload of the KPPS member. However, certain mechanism to be considered in order to control the quality of the work[14].

Government’s responsibility on constitutional law is included in the principle of good governance. Regarding this issue, government should take responsibility on the case by covering all medical expenses for the ill committee members and giving death benefit for the family of dead members.

Moreover, government is required to investigate the case thoroughly. Considering the high number of dead members of polling station working committee, further solution for the next election should be reckoned by providing comprehensive health services and workers for the KPPS. Furthermore, government through Ministry of Health could perform thorough examination to investigate the cause of the death. Following that, the result may be announced to the public through mass media. Besides, further information regarding death benefit and medical expenses coverage should be clearly stated[15].

Conclusion

Legal efforts through forensics examination on polling station KPPS member had been attempted by conducting visum et repertum. However, such attempt is declined by the KPPS family. The examination result is only deduced from family’s verbal testimony. The researchers from Universitas Gajah Mada revealed that the cause of the death of polling station KPPS is due to cardiovascular disease such as heart attack, stroke, or both of them that formerly suffered by the KPPS members. According to verbal autopsy result, committee members with no hereditary diseases get sick or die due to excessive fatigue and heavy workload that surpasses 20 until 22 hours a day on several day.

The Burden of Toxoplasma Gondii In Spontaneous Miscarriage and its Association with Rhopty Protein 5 Gene and Toxoplasma gondii specific primers GRA 6 Gene Expression in Iraq Women

Dhamyaa Kareem Kadhim¹, Abdulsada Abdulabbas Rahi¹
¹Wasit University/College of Medicine/ Iraq

Abstract

Background: One of the major infectious micro-organism that is associated with spontaneous abortion is toxoplasmosis. Under diagnosis of toxoplasmosis and lack of understanding the exact mechanism and pathogenesis of spontaneous abortion associating toxoplasmosis are in our opinion the main problem facing clinicians who are concerned with categorization and management of spontaneous abortion in our pregnant ladies.

Aim of the current study: to diagnose placental tissues parasitic infections using sophisticated nested PCR method in addition to evaluating gene expression of two pathogenetically Toxoplasma genes, namely ROP-5 and GRA-6, as a step toward estimating the exact prevalence of Toxoplasma associated spontaneous abortion in Iraqi community

Patients and methods: The case control study was based on the inclusion of 101 women with spontaneous abortion and 20 pregnant ladies who succeeded to get pregnant serving as control group. The placental tissues were obtained from the pool of women visiting Al-Kut maternity teaching hospital for purpose of delivery or because of abortion. Those tissues were then processed in central laboratory using conventional PCR technique searching for evidence of toxoplasma gondii DNA. Obtained tissues were also subjected to real time PCR for detection of Rhopty protein 5 gene expression and Toxoplasma gondii specific primers GRA 6. The lab work was done according to instruction of providing company.

Results: Positive results were limited to women with spontaneous abortion, that is, none of control women had PCR evidence of toxoplasma DNA in their placental tissues, 72 (71.3 %) versus 0 (0.0 %); the difference was highly significant (P < 0.001). An estimation of the risk of abortion accompanying toxoplasmosis has been carried out in terms of approximate Odds ratio and the results has been strikingly high (100.8). Both Rhopty protein 5 and Toxoplasma gondii specific primers GRA 6 gene expressions have been significantly correlated to serum IgG and IgM positive tests in a negative way.

Conclusion: PCR carried out on placental tissue is significantly higher sensitive in detecting toxoplasma gondii than serology and Both Rhopty protein 5 and Toxoplasma gondii specific primers GRA 6 gene expressions play significant role in spontaneous abortion.

Key words: spontaneous abortion, Rhopty protein 5, Toxoplasma gondii specific primers GRA 6 gene expressions

Introduction

The problem of spontaneous abortion is relatively common in our community as well as in several regions around the world (¹). The problem of spontaneous abortion...
abortion in addition to infertility account for the major obstacles that every newly married couple may face during their planning to build up their families (2). In addition, spontaneous abortion is associated with a number of obstetric complications that may increase the incidence rate of morbidity and mortality accompanying natural pregnancy (3). Examples of these complications are retained placental and or fetal parts with risk of bleeding and infection. Indeed, hemorrhage and sepsis are among common associated complications that may threaten the life of every pregnant lady experiencing spontaneous abortion (3). Therefore, identifying causes and risk factors that may precipitate spontaneous abortion is a crucial step in the prevention and treatment of spontaneous abortion and its associated complications (4).

Infection of the product of abortion is by far one of the principal etiological factors that predispose pregnant ladies to spontaneous abortion. One of the major infectious micro-organism that is associated with spontaneous abortion is toxoplasmosis (5). Indeed, toxoplasmosis is both common worldwide and in our community (5). This parasite is responsible for a number of morbidities and mortalities as it can infect a number of human systems and tissue such as nervous system and pregnancy products (6).

Serological investigations are the routine investigations that are carried out in daily obstetric practice in order to diagnose toxoplasmosis in women with recurrent spontaneous abortions (7). However, the sensitivity and specificity of these serological methods are variable and are far less than that offered by sophisticated molecular investigations (8).

Under diagnosis of toxoplasmosis and lack of understanding the exact mechanism and pathogenesis of spontaneous abortion associating toxoplasmosis are in our opinion the main problem facing clinicians who are concerned with categorization and management of spontaneous abortion in our pregnant ladies (9). For that reasons, the following study was designed, planned and carried out in order to diagnose placental tissues parasitic infections using sophisticated nested PCR method in addition to evaluating gene expression of two pathogenetically Toxoplasma genes, namely ROP-5 and GRA-6, as a step toward estimating the exact prevalence of Toxoplasma associated spontaneous abortion in Iraqi community and to clarify the role of these two genes in the pathogenesis of spontaneous abortion accompanying toxoplasmosis.

**Patients and Method**

The case control study was based on the inclusion of 101 women with spontaneous abortion, mostly in the first trimester and some in the second trimester, and 20 pregnant ladies who succeeded to get pregnant serving as control group. The placental tissues were obtained from the pool of women visiting Al-Kut maternity teaching hospital for purpose of delivery or because of abortion. Those tissues were then processed in central laboratory using conventional PCR technique searching for evidence of *toxoplasma gondii* DNA. Obtained tissues were also subjected to real time PCR for detection of Rhopty protein 5 gene expression and *Toxoplasma gondii* specific primers GRA 6. The lab work was done according to instruction of providing company.

The statistical work was carried out using SPSS version 23 and Microsoft Office Excel 2010. Categorical variables were expressed as number and percentage whereas quantitative variables were expressed as mean and standard deviation. Independent sample t-test was used to compare mean age between study and control groups and chi-square was used to study association between categorical variables. Risk was estimated according to odds ratio and 95 % confidence interval. The level of significance was considered at *P* ≤ 0.05.

**Results**

The statistical analysis in the current study was based on the inclusion of 101 women with spontaneous abortion, mostly in the first trimester and some in the second trimester, and 20 pregnant ladies who succeeded to get pregnant serving as control group. The mean age of women with spontaneous abortion was 29.10 ±7.35 years and that of control group was 25.70 ±5.75 years; despite some difference in mean age, there was no statistical significance (*P* = 0.053). The results of nested PCR results, that have been performed on women retrieved placental tissues, are shown in table 1. Positive results were limited to women with spontaneous abortion, that is, none of control women had PCR evidence of *Toxoplasma* DNA in their placental tissues, 72 (71.3 %) versus 0 (0.0 %); the difference was highly significant (*P* < 0.001), as shown in table 1. The lab work was done according to instruction of providing company.

The statistical work was carried out using SPSS version 23 and Microsoft Office Excel 2010. Categorical variables were expressed as number and percentage whereas quantitative variables were expressed as mean and standard deviation. Independent sample t-test was used to compare mean age between study and control groups and chi-square was used to study association between categorical variables. Risk was estimated according to odds ratio and 95 % confidence interval. The level of significance was considered at *P* ≤ 0.05.

**Results**

The statistical analysis in the current study was based on the inclusion of 101 women with spontaneous abortion, mostly in the first trimester and some in the second trimester, and 20 pregnant ladies who succeeded to get pregnant serving as control group. The mean age of women with spontaneous abortion was 29.10 ±7.35 years and that of control group was 25.70 ±5.75 years; despite some difference in mean age, there was no statistical significance (*P* = 0.053). The results of nested PCR results, that have been performed on women retrieved placental tissues, are shown in table 1. Positive results were limited to women with spontaneous abortion, that is, none of control women had PCR evidence of *Toxoplasma* DNA in their placental tissues, 72 (71.3 %) versus 0 (0.0 %); the difference was highly significant (*P* < 0.001), as shown in table 1. The lab work was done according to instruction of providing company.

Risk was estimated according to odds ratio and 95 % confidence interval. The level of significance was considered at *P* ≤ 0.05.
strikingly high (100.8). This implies that any women with placental tissue, toxoplasma invasion is 100 times more liable to develop abortion than women whom placental tissue is free of toxoplasmosis, table 1.

Rhoptry protein 5 gene expression in placental tissues obtained from study group is demonstrated in 1. Gene expression up regulation has been observed in 66 (91.5 %) of cases. Gene expression of *Toxoplasma gondii* specific primers GRA 6 in placental tissue of study group has been shown in table 3.13 and figure 3.4. Gene expression down regulation has been observed in 25 (34.7 %); whereas, gene expression up regulation has been recorded in 24 (33.3 %) of cases, as shown in table 3.13. Significant negative association has been observed between the expression of ROP5 and GRA6 as shown in figure 3.4.

**Figure 1**: Rhoptry protein 5 gene expression and *Toxoplasma gondii* specific primers GRA 6 in placental tissues obtained from study group

Both Rhoptry protein 5 and *Toxoplasma gondii* specific primers GRA 6 gene expressions have been significantly correlated to serum IgG and IgM positive tests in a negative way (negative correlation coefficients, -0.347 and -0.374, respectively and a $P$ value of $< 0.01$), as shown in table 2, implying that the higher the level of serum IgM and IgG, the lower the opportunity for *Toxoplasma gondii* to proliferate and invade placental tissue.

**Table 2: Correlations of Rhoptry protein 5 gene expression and *Toxoplasma gondii* specific primers GRA 6 to clinical parameters**

Discussion

Although, PCR can be performed on blood as well as serum samples, positive results are usually low, moreover, the presence of positive PCR results using blood or serum is an indirect evidence for a causal relationship between toxoplasmosis and spontaneous abortion (10); whereas, positive nested PCR results from placental tissues of aborted mothers will be a direct evidence for such causal relationship. For these reasons, the authors of the current study preferred to perform nested PCR on placental tissues over PCR on blood and serum samples.

In the current study, the use of nested PCR significantly increased the detection rate of Toxoplasma parasite in women with spontaneous abortion from 41.6 % to 71.3 % in comparison with serological investigation. In addition, the sensitivity and specificity of both IgG and IgM were low in comparison with nested PCR method. In one study, carried out in Iran on 200 women with spontaneous abortion, the sensitivity of serological test was 53.5 % while that of nested PCR using placental tissue was 10.5 % (8), in disagreement with finding of the current study. Indeed, the low sensitivity and specificity of serologic technique using anti-toxoplasma IgG and IgG in comparison with nested PCR using placental tissue has been proved by several other authors (11), (12) and (13) in clear agreement with our findings.

Toxoplasma gondii is an obligate intracellular single-celled parasite that can invade all warm-blooded animals worldwide. During invasion, proteins from parasite organelles such as rhoptry proteins (ROPs) and dense granule proteins (GRAs) are released into host cells and are able to cause significant host damage (14) and (15). Importantly, maternal Toxoplasma infection may give rise to congenital transmission of the parasite to the fetus through the placenta and/or via interfering with the immune tolerance on maternal-fetal interface (16), (17), (18) and (19).

Toxoplasma gondii, as many intracellular parasites, is separated from the cytosol of its host cell by a parasitophorous vacuole membrane (PVM). This vacuole forms during host cell invasion and parasite apical organelles named rhoptries discharge proteins that associate with its membrane during this process. ROP5 is not processed during trafficking to rhoptries. We show here that ROP5 protein with vacuole membrane can be indirectly assessed by studying ROP5 gene expression in placental tissues of women with spontaneous abortion. Molecular investigation in the current study showed upregulation of ROP5 gene expression up regulation has (91.5 %) of cases.

Both Rhopty protein 5 and Toxoplasma gondii specific primers GRA 6 gene expressions have been significantly correlated to serum IgG and IgM positive tests in a negative way (negative correlation coefficients, -0.347 and -0.374, respectively and a P value of < 0.01), implying that the higher the level of serum IgM and IgG, the lower the opportunity for Toxoplasma gondii to proliferate and invade placental tissue.

Ethical approve: Our study was approved by institutional ethical approval company. Following task facilitating request from my organization (College of Medicine, Wasit University) verbal consent was officially obtained from Wasit Health institution all participating women.

Source of Funding: Self-funded

Conflict of Interest: Nil.

Changes of Interleukin-6 (IL-6) and Immunoglobulin G (IgG) in Respiratory Exercise

Didik Agus Santoso1, FM. Judajana1, Elyana Asnar2

1Department of Clinical Pathology, Faculty of Medicine, Universitas Airlangga, Dr. Soetomo Teaching Hospital, Surabaya-60131, Indonesia, 2Department of Physiology, Faculty of Medicine, Universitas Airlangga, Dr. Soetomo Teaching Hospital, Surabaya-60131, Indonesia

Abstract

Background: Skeletal muscle contraction in exercise will synthesize and release Interleukin-6 (IL-6) into the systemic circulation. IL-6 is a pleiotropic, proinflammatory and anti-inflammatory cytokine. IL-6 in exercise can modulate the immune response and metabolism in the liver, adipose tissue, hypothalamus-hypophyse-adrenal (HPA). Objectives: To analyze and prove changes in levels of Interleukin-6 (IL-6) and Immunoglobulin G (IgG) in respiratory art sports of a exercise club. Methods: Thirty-four members of the breathing arts sport who met the inclusion criteria, male sex, adult age (≥21 years), willing to participate were enrolled in this study. Examination of IL-6 and IgG levels were performed by using Elisa method. The kit for IL-6 used Human IL-6 Immunoassay and IgG level used Total Human IgG Assay. Results: The t-test results obtained p = 0.027 (p <0.05), there was a change between IL-6 pre-test and IL-6 post-test of breathing exercise for three weeks. The t-test results obtained p = 0.000 (p <0.05) there was a change between IgG level of pre-test and IgG post-test of breathing arts sports treatment, this change increased significantly. Conclusion: There was a change in levels of IL-6 and IgG in the breathing exercise.

Keywords: Adipose tissue, breathing exercise, IgG, IL-6

Introduction

Physical, emotional, and environmental challenges are some of the stressors of human life and this results in a physical response of mild to severe illness. The influence of globalization and the current economic pressures has changed the lifestyle and socio-economic community. This change makes people become stressed and lack of movement and lack of exercise. This leads to an increased risk of metabolic and degenerative diseases such as heart disease, kidney, lung, hypertension, diabetes, obesity, and immune disorders.

The impact of stress on physical health can be reduced by exercising regularly. Sports health is a physical activity to maintain health and improve body condition. Respiratory exercise in mild hypoxia conditions can stimulate the increase of various cytokines and stimulate more strongly as stress immunologic response compared to other sports. Breathing exercises of Satria Nusantara with special methods are: the breath, movement, and concentration (pray, spiritual, meditation) which is a physical exercise, mental and social exercise. Satria Nusantara breathing exercise can improve physical fitness and improve body immunity.

Skeletal muscle is the largest organ in the human body. Skeletal muscle contractions in exercise will synthesize and release myokines or cytokines called Interleukin-6 (IL-6) to the interstitial and systemic circulation. This myocyte or cytokine affects the metabolism, the nervous system, the endocrine system, and the immune system that plays a role in the maintenance of homeostasis. Contraction of skeletal muscles when a person is exercising can contribute greatly to the levels of the IL-6 present in the circulation.

Increased levels of IL-6 during exercise include levels of other cytokines, such as IL-1 receptor antagonists (IL-1ra), Tumor necrosis factor receptor (TNF-R), and IL-10. The magnitude of elevated levels of IL-6 induced by exercise response depends on the intensity, duration and model of exercise.
synthesis of IL-6 in muscle contraction occurs through mechanisms: increased calcium influx, hepatic glucose availability, and increased formation of Reactive oxygen species (ROS), this will activate transcription factors governing IL-6 synthesis.

Interleukin-6 (IL-6) is a pleiotropic, proinflammatory and anti-inflammatory cytokine. IL-6 during exercise can modulate immune and metabolic responses in the liver, adipose tissue, Hypothalamus-pituitary-adrenal (HPA) and leukocytes. IL-6 plays a role in the differentiation of B lymphocytes into plasma cells that produce immunoglobulins.

Immunoglobulins are glycoproteins that obtained in blood and other body fluids, which contain antibodies and are produced to protect the body against pathogens. Antibodies formed in the primary immune response are generally Immunoglobulin M (IgM), whereas in the secondary immune response is Immunoglobulin G (IgG). IgG is the highest level of immunoglobulin, which is up to 50-80% of all immunoglobulins in the body. Immunoglobulin levels in serum are used to assess the integrity of immune system function.

Satria Nusantara’s Respiratory Breathing exercise mechanism to increase body immunity until now has not been thoroughly studied, especially the change of IL-6 and IgG levels in Satria Nusantara’s breathing arts sport is still unclear and require further study. The study aimed to determine the changes levels of IL-6 and IgG in Respiratory Exercise.

**Method**

This study was a laboratory study of quasi-experimental analysis and type with one group pretest-post-test design without the control group (comparison) by measuring levels of Interleukin-6 (IL-6) and Immunoglobulin G (IgG) between before and after treatment breathing sport Satria Nusantara.

The study was conducted in the sports arts community of Satria Nusantara Surabaya. Laboratory examination of IL-6 and IgG levels were performed by Elisa method in Department of Clinical Pathology, Faculty of Medicine, Dr. Soetomo Teaching Hospital Surabaya. The study was conducted for 5 months, beginning with library search until presentation of research report. Treatment is conducted in August to September 2013.

The sample used was the member of the sport by 34 members of the sport of breathing art, the basic level of hard control, previously had regular practice 2x/week regularly, with the intention did not require the stage of introduction of motion stance first because it was accustomed and have mastered the breath, stance, concentration correctly, and meet the criteria of the sample.

Inclusion criteria are respiratory sports artist Satria Nusantara Surabaya branch, adult age (≥21 years), male gender, regular practice 2x/week regularly, and willing to participate in the research. While for the exclusion criteria are members who have coronary heart disease, unregulated diabetes mellitus, suffering from systemic infectious diseases, suffering from immunodeficiency, suffering from malignancy, receiving immunosuppressive and antioxidant therapy. The subjects declared drop-out if not exercising more than 1 time out of 9 exercises during the treatment program to be followed or if the absence of more than 12%.

Working procedure begins with members who have met the inclusion criteria carried out the recording of basic data in the form of the name, age, gender, address. Members who are willing to be subjects of research then sign a consent letter following research and medical action as well as medical action information. Prior to the treatment of Satria Nusantara’s breathing art program, blood sampling was performed through the vein mediana kubiti. Blood sampling prior to treatment to obtain baseline values of IL-6 and IgG levels. After that, the research subjects follow the treatment of sports art program Satria Nusantara breathing, for 3 weeks, optimal frequency 3 times a week with duration 90 minutes once the practice. If the last exercise was completed, immediate blood retrieval was performed no more than 1.5 hours after treatment, this is because the half-lives of IL-6±1.5 hours.

Examination of IL-6 levels was performed using Elisa method. The kit used is Human IL-6 Immunoassay, Quanticine Elisa from R & D Systems. The examination of IgG level was performed by using Elisa method. The kit used is Total Human IgG Assay, Elisa kit from Diagnostic Automation, Inc. USA.

All the collected data was arranged in the data collection sheet in tabular form and processed statistically using SPSS 22.0 (SPSS. Inc. Chicago IL). Univariate
data analysis was used to describe each variable, either independent or dependent variable from case group and control group with frequency distribution table. Furthermore, two-tailed paired t-test two paired t-test.

**Results**

Characteristics of the sample consist of age, weight, height and body mass index (BMI). The number of samples obtained in this study were 34 samples, with a sample characteristic of 34 men (100%). The mean age 50.680 years with SD (±10.2590) and age range between 37-73 years old. Weight has a mean of 66.353 kilograms with standard deviation (SD) (±11.0189) and the weight range between 43.0-93.0 kilogram. The mean height (mean) in this study was 164.574 centimeters with SD = (±7.5218) and a height range between 147.5-176.0 centimeters. Body mass index (BMI) has mean of 24.3874 kg/m² with SD = (±2.8568) and BMI range between 19.53-30.37 kg/m² (Table 1).

Note: IL-6: Interleukin-6, IgG: Immunoglobulin G
Physical examination is performed before the subjects follow the training program. This physical examination was performed by measuring blood pressure, breath frequency, temperature, and pulse frequency. The results obtained as follows mean systole blood pressure 117.94 mmHg with SD (± 6.2910) and systole blood pressure range between 110-130 mmHg. While diastole blood pressure 76.47 mmHg with SD (±4.8510) and diastole blood pressure range between 70-80 mmHg. The mean pulse rate was 78.59 x/min with SD (±1.6720) and a pulse frequency range between 76-80 x/min. The mean breath frequency (sample) in this study was 19.06 x/min with SD = (±1.7220) and breath frequency range between 76-80 x/min. The mean body temperature of the sample in this study was 36.868 °C with SD (±0.2239) and the temperature range was between 36.5-37.0 °C (Table 1).

The intensity of the specified workload load is submaximal, determined by the Target heart rate (THR), in a manner calculated with 70% max HR. While maximal HR was calculated with the maximal HR formula = (220-age). The maximum mean frequency of samples was 169.32 x/min with SD (±10.2590) and maximum HR range between 147-183 x/min. The average frequency of THR or 75% HR was 127.15 x/min with SD (±7.692) and maximal 75% HR range between 110-137 x/min (Table 1).

The mean IL-6 pre-test level was 5.0918 pg/mL with SD (±1.95284) and the mean IL-6 level was 6.0444 pg/mL with SD (±2.0311) (Table 1). The mean rate of pre-test IgG 447.3509 mg/dL with SD (±228.5582) and mean post-test IgG was 821.5597 mg/dL with SD (±177.7086) (Table 1).

Note: p<0.05

Levels of IL-6 have a difference of pre-test and post-test mean is (0.95265). The t-test H0: μ pre-test = μ post-test, gives the value t = (-2.309) with degrees of freedom = (n-1) = (34-1) = 33. The SPSS output gives the p-value for two-tailed test = (0.027) (Table 2). Two-tailed t-test results proved that there was a change between IL-6 pre- and IL-6 post-test of breathing exercises of Satria Nusantara art for 3 weeks, the change was significantly increased (p <0.05).

While the mean difference of IgG level of pre-test and post-test was (374.2089). From the table Paired sample test also obtained d = (- 374.2089) and Sd = (252.4772) (Table 2). Two-tailed t-test results proved that there was a change between pre-test IgG and post-test IgG post-breathing exercises of Satria Nusantara respiratory art for 3 weeks, this change was significantly increased (p <0.05).

**Discussion**

Based on two-tailed paired t-test analysis of parameters of IL-6 and IgG parameters between pre- and post- there is a change so that this result is in accordance with some previous research which states if respiratory sports satria nusantara can increase physical fitness and body immunity 5,9. However, other studies suggest that the study was conducted on male students of the 2nd grade Madrasah Aliyah Mu’alimin Yogyakarta who met the inclusion criteria, the result that respiratory exercise of Satria Nusantara can increase beta-endorphin, IgG and IL-6 levels, while IL-2 and IL-4 did not increase, and cortisol levels decreased 9.

Increased levels of IL-6 pre-test and IL-6 post-test treatment of breathing art Satria Nusantara. The resulting increase in IL-6 levels is due to increased IL-6 secretion during exercise physical exercise. IL-6 can increase to 100-fold in physical exercise 7. The IL-6 response was sensitive to exercise intensity, indirectly representing the large muscle mass involved in contraction. Exercise that only involves limited muscle mass, was not sufficient for improving IL-6. Exercise involving large muscles resulted in significant increased IL-6. Increased IL-6 during exercise can be inhibited by antioxidant vitamins C and E as well as drugs Indomethacin (class of NSAIDs). This regimen will inhibit NF-kB activity and inhibit elevated levels of IL-6 in response to exercise 10.

IL-6 might cause some effects in some tissues. IL-6 has catabolic properties, shown by the ability to increase energy expenditure, increase lipolysis, increase fat oxidation, increase endogenous glucose output (by reducing insulin signals in fat and liver), and increase cortisol. The apparent difference between tissues regarding the response to IL-6 may be due to IL-6 signals in different tissues. IL-6 which was released from muscle contraction can stimulate an anti-inflammatory response.
reflected increased IL-1ra, IL-10, CRP, and cortisol without elevated pro-inflammatory mediators 7,11.

Serum IgG levels in individuals who were given physical exercise for 45 minutes (acute moderate exercise) increased levels of IgG and IgM. This increase was due to extravasation blood proteins, increased lymph flow, noradrenergic sympathetic neural influences on immune responses, or many immunogens inhaled along with respiratory air, whose flow increases during exercise, and the destruction of the mucosal immune response that dries up during exercise. This level decreases after 1.5 hours of exercise and when the exercise is increased with a marathon or run of 45-75 km (ultramarathon) then the second level of the immunoglobulin decreases 12.

Other studies have suggested that runners athletes will decrease cadres of IgM, IgG and IgA after undergoing heavy exercise 13. However, it was different from other studies suggesting that short rest periods during exercise will not suppress IgA secretion, but increase cortisol levels. Exercise with moderate and regular intensity will provide a good effect for the immune system with the occurrence of increased immunoglobulin. It was because exercise with a heavy intensity will suppress some parameters of the immune system, among others: Ig A, IgG, and IgM 14. Several other studies have also suggested that weight training until exhausted in the morning and evening has a significant effect on the humoral immune system (IgG, IgA, and IgM) and serum cortisol 15.

Exercise sports a pleasant breathing art will nourish the body and also improve body immunity. The existence of abdominal pressing and abdominal pressing during the motion exercise motion of Satria Nusantara, as an effort to guarantee the implementation of breath arrest during the movement. Abdominal pressing does not cause a disturbance of physiology, and in contrast to thoraco-abdominal pressing (manoeuvre valsava) which can cause physiological disturbance and harm because it will raise blood pressure at the beginning of pressing, followed by decreased blood pressure due to retardation of reverse blood flow and venous pressure will increase. In preliminary exercises need to be explained and emphasized the difference between respiratory chest with abdominal breathing in exercise Satria Nusantara 16,17.

Abdominal breathing will smooth the blood flow back from the vein in the abdominal area to the heart, inspiration time (sucking breath) pressure in the abdomen increased and the pressure in the chest cavity decreased. Increased pressure inside the abdominal cavity causes a sort of massage to the organ in the abdominal cavity, a mechanical stimulation of the digestive tract of food, and will improve peristaltic movement. Abdominal breathing also trains the respiratory muscles and abdominal wall muscles 16,17.

**Conclusion**

There were changes in levels of Interleukin-6 (IL-6) and Immunoglobulin G (IgG) in the breathing art of Satria Nusantara. Increased levels are still within the normal range and good in improving body immunity.

Association between Stretching Exercise with Virtual Reality Game and Over Head Pulley of Frozen Shoulder Patients

Donny Gunawan¹, Reni Hendrarati Kusharyaningsih¹, Noor Idha Handajani¹

¹Departement of Physical Medicine and Rehabilitation, Faculty of Medicine, Universitas Airlangga, Surabaya (60131), Indonesia

Abstract

Background and Objective: Frozen Shoulder (FS) or adhesive capsulitis is the most common musculoskeletal condition that causes pain and extensive restriction of joint motion. Virtual Reality (VR) provides a new option that is expected to help the rehabilitation program. The objective of the study was to compare the effect of stretching exercises with virtual reality games (VGR) and Over Head Pulley (OHP) through shoulder joint motion range (JMR) improvement and functional ability of FS.

Method: This research was conducted on July to September 2012, in Medical Rehabilitation Outpatient Unit of Dr. Soetomo General Hospital Surabaya. The samples were frozen shoulder patients. These inclusion criteria were new or old unilateral FS patients, the limitations of shoulder JMR both passive and active, with a minimum limit of 30 ° compared to normal shoulder JMR at least 2 shoulder movements, flexion and abduction between 6 weeks to 6 months, aged 35-65 years.

Result: The One-Sample Kolmogorov-Smirnov Test on the age range obtained no significant differences (p = 0.418), the chi-square test on the sexes showed no significant differences (p = 1.000). The median of pleasure after treatment with the Mann-Whitney Test showed a non-significant difference (p = 0.317).

Conclusion: Stretching exercises compared with VGR exercises in FS patients provided the same benefits of stretching with the OHP on improvement.

Keywords: Frozen Shoulder, Overhead pulley, Virtual Reality, shoulder wheels

Background

Frozen Shoulder (FS) or adhesive capsulitis is the most common musculoskeletal condition that causes pain and extensive restriction of joint motion range (JMR) which interferes ¹. The exact pathophysiology of FS remains unknown and FS occurs mostly when the disuse factor occurs in people with stress, anxiety, and apathy accompanied by low pain thresholds. Effective standard therapy to restore JMR and eliminate the pain of FS has not been found yet. Previous studies have demonstrated 90% successful of conservative therapy with oral NSAID and rehabilitation therapy. Generally, FS therapeutic principles are medicaments (Non Steroid Anti Inflammatory Drug/NSAID, muscle relaxants, and steroid injections), modalities therapy (cold, heating, transcutaneous electrical nerve stimulation), exercise therapy (JMR exercises such as overhead pulley (OHP), shoulder wheel, finger ladder, Codman Pendular exercise), shoulder manipulation, and surgery ².

A variety of new methods and techniques in the rehabilitation of FS have been developed such as dynamic splinting rigid or Kinesio taping. Exercises with shoulder wheels, OHP, and sticks are standard exercises for FS. Other studies have shown significant improvements in the use of pulleys with transcutaneous
electrical nerve stimulation compared to thermal therapy modalities with therapeutic exercise and manipulation. The OHP is used as one of the standard rehabilitation therapy for stretching exercises in dealing with FS patients in sub-acute or chronic phase.

Virtual Reality (VR) is an interactive environment produced by computer simulations with the real world. This technology is run through an interface that has been adapted to human senses, thus making the user into the virtual world. Users can react with the virtual world through every action detected from position and movement, therefore the hardware processes changes that occur in the virtual world according to the rules created by its creators and provide feedback to its users. Initially, VR was used in students with physical disorder who were often excluded from research because of their lack ability resulting the difficulty to control themselves when in dangerous situations.

Thus, this new technology could provide an attitude-enhancing experience and reduce anxiety. In its development, VR was applied to various rehabilitation programs such as stroke, head trauma, autism, cerebral palsy, and rehabilitation of cognition. The VR has potential to achieve compliance required for effective rehabilitation. Side effects of VR were nausea and visual impairment, but this effect on many studies was minimum or nonexistent. The VR provides a new option to help the rehabilitation program, although it still requires further research and evaluation.

This study was a preliminary study to determine the effect of stretching exercises with virtual reality games (VRG) on the improvement of shoulder JMR and functional ability in FS patients, compared to stretching exercise with OHP which became standard therapy in Medical Rehabilitation, with attention to patient’s pleasure. Therefore, stretching exercises with VRG can be used as a new choice therapy in the treatment of FS patients in the future.

**Method**

This research was an experimental research, randomized pre-post test control group design done on FS patients. This research was conducted on July to September 2012, in Outpatient Unit of Medical Rehabilitation Installation of Dr. Soetomo General Hospital Surabaya. The samples were FS patients who met the inclusion criteria and did not meet exclusion criteria. Ethical appeals were submitted to the Ethics Commission for basic science/clinical research at Dr. Soetomo Surabaya.

The inclusion criteria were new or old unilateral FS patients, with JMR limitation both passive and active, having minimum limit of 30° compared to normal shoulder JMR at least 2 shoulder movement such as flexion and abduction between 6 weeks to 6 months, aged 35-65 years, able to read the clock, could understand and follow simple verbal instructions, willing to fill out shoulder self-report form in the instrument of DASH, mild shoulder pain with VAS score 1-3, the strength of the affected side shoulder muscles: MMT ≥4, willing to stop therapy under treatment with replaced therapy available in the study, willing to participate in this study by signing an informed consent after getting an explanation.

The samples were randomized into 2 groups, group 1 (control) received ultrasound diathermy modal therapy on painful shoulder for 10 minutes and shoulder stretching exercise using OHP, with frequency 3-9 times a week. Group 2 (treatment) received ultrasound diathermy at shoulder pain area for 10 minutes and shoulder stretching exercises using VRG, with frequency 3-9 times a week.

The data were tabulated and analysed statistically using SPSS (SPSS. Inc. Chicago IL). The hypothesis test for increased shoulder JMR obtained ratio data thus independent t-test, delta, paired t-test were performed for the groups. Hypothesis test of functional ability improvement (DASH) pre and post test obtained ordinal data thus it was done Wilcoxon signed rank test. The functional abilities between the treatment and control groups were performed by Wilcoxon-Mann Whitney test and the delta pre and post treatment. The pleasure level obtained ordinal data thus it was done Wilcoxon signed rank test.

**Result**

The average of shoulders JMR of flexion, extension, abduction, adduction, external rotation and internal rotation after treatment between control and treatment groups showed no significant difference (p >0.05). The result of abnormal JMR delta on abduction in control group between before and after treatment was 27.5° ± 33.5° (p = 0.053). While in treatment group was 15.0° ± 12.2° (p = 0.010) (Table 1).
The result of average JMR delta on abduction between the control group and the treatment group showed a non-significant difference ($p = 0.338$, Table 3). While on flexion in the control group was $11.3 \pm 13.6^\circ$ ($p = 0.051$). The average delta on flexion in the treatment group was $10.0^\circ \pm 11.0^\circ$ ($p = 0.037$). The average delta on flexion between control group and treatment group showed significant difference ($p = 0.843$, Table 1).

Median pain scores before and after treatment between the control group and the treatment group showed no significant differences ($p > 0.05$). Median pain scores before and after treatment in the control group showed no significant differences ($p = 0.066$). Median pain scores before and after treatment in the treatment group showed a significant difference ($p = 0.034$) (Table 2).

The median delta pain score in the control group was 0.5 and in the treatment group was 1.0 with $p = 0.955$ (Table 4). Median score of shoulder functional ability, both before and after treatment between control group and treatment group was $p > 0.05$ (Table 2). The median delta score of functional ability in the control group was 9.05 and in the treatment group was 12.50; with the Mann-Whitney Test showed no significant difference ($p = 0.792$) (Table 4). The median pleasure level after treatment between control group and the treatment showed a non-significant difference ($p = 0.317$, Table 3).

Discussion

Frozen shoulder often occurs on non-dominant shoulder because when the shoulder hurts, the body trying to protect by bringing the shoulder to the body and tends not to use the sick shoulder. Other studies have shown that humans who stand upright in their daily activities use supraspinatus muscles, thus gravity causes stress in capsules and tendons that retain hanging arms, and forward and sideways movements cause friction and compression resulting in rotators cuff muscle ischemia between tuberosity major and acromion. OHP has an assistive active stretching effect, indicated in FS sufferers who have subtle signs, where active practice without help is ineffective. Patients with FS who have subtle signs are patients who can not reach the ears or even the back of the head by using a sore shoulder.

Almost all subjects in this study were included in the subtle sign. In control group, when subjects moved the healthy shoulder and the sick shoulder was indirectly pulled by the pulley, thus he sick shoulder muscles did not work fully and there was a maximum pull. In accordance with the theory that the pain is the biggest inhibitor for a muscle movement. This should be avoided, especially in the shoulder area, because its muscle activity required coordinated, stable and functional joint movement. It was proven in previous studies that there was a delay in muscle latency in the impingement subjects versus the healthy group. this was similar to a study on knee that reported an onset of vatus laterals happened before vastus medialis indicating the presence of different motor control.

In addition, because the strain treatment group had to respond to the order of the VRG first, thus the stretching
time was less. Reduced time of this strain would affect the effect. Based on guidance from the American College of Sports Medicine (ACSM), stretching prescribing prescriptions had to adhere to the following guidelines, those were 3 times a week, the intensity at mild discomfort, 10-30 seconds for each stretch, and 3 to 5 repetitions for each stretch

The improvement of JMR in the treatment group due to active stretching exercises was consistent with a study that reported the success of rigid shoulder therapy with active JMR practice. Other studies have shown that active JMR pendulum and exercise were better than passive stretches and manipulations that exceed the pain threshold.

Increased shoulder JMR and functional abilities in this study, proving that physical therapy (modalities and stretching exercises) significantly reduced pain and increased shoulder JMR in patients with FS. Thermal modality therapy as one of FS procedures before exercise was more effective to regain JMR and restore function, but stretching exercise was a major component of therapy in musculoskeletal disorders. A prospective study on the effect of shoulder stretching programs of 75 patients with stage 2 FS showed that 90% subjects had satisfactory results and only 7% required further therapy.

Previous research on healthy subjects was given a pain stimulus while playing VRG which was evaluated directly by functional Magnetic Resonance Imaging reported that there was a significant decrease in pain rate and an increase in brain oxygen activity. Possible mechanism of analgesics was through the attention diversion from pain stimuli and an increase in the pleasure level.

This pleasure would produce endorphins through limbic system activity. Endorphins played a role as excitation-conducting agents that activated brain analgesia system. Pain in treatment group obtained a significant decrease after treatment. Other studies found that adherence to rehabilitation therapy was associated with improved therapeutic outcomes. The VR had the potential to help achieve the adherence required to undergo an effective rehabilitation program. Given the increased motivation through the enjoyment and enthusiasm of the patient’s compliance with physical rehabilitation therapy, VR provided additional useful physical therapy for patient in rehabilitation program.

Both groups did not get any side effects either due to modalities or stretching exercises. Exercise should be done gently and with concentration. The subjects had to understand the purpose of the exercise, thus the effort was more focused and avoided the substitution movement. Uncomfortable sensations might occur, but not to interfere, or to cause persistent pain and aggravation. Stretching exercises were performed with a ‘stretched’ sensation, not a pain.

**Conclusion**

It could be concluded if the stretching exercise compared to JMR exercise in FS patients, VRG provided the same benefits of stretching with the OHP on improvement. Stretching exercises with VRG provided similar benefits compared to stretching exercises with OHP on shoulder functional abilities in FS patients. Stretching exercise therapy with VRG and OHP gave the same pleasure value in FS patients. Stretching exercise therapy with VRG could reduce pain.

Correlation of Serum Alkaline Phosphatase, Lactate Dehydrogenase, C-Reactive Protein, Blood Deposition Rate, B-Hcg Expression and Tumor Volume to Lung Metastasis Risk in Osteosarcoma Patients

Achmad Fachrizal¹, Dwikora Novembri Utomo¹

¹Department of Orthopedics and Traumatology, Faculty of Medicine, Universitas Airlangga, Dr. Soetomo Teaching Hospital, Surabaya 60285, Indonesia

Abstract

Osteosarcoma is the most common type of sarcoma found in bone. The survival rate in osteosarcoma patients was less than 20.00% at the end of 1980 but is currently increasing to over 70.00% for nonmetastatic patients. The objective to analyze the correlation between Lactate Dehydrogenase (LDH), Alkaline Phosphatase (ALP), C-Reactive Protein (CRP), Blood Deposition Rate (LED), hCG expression and tumor volume with pulmonary metastases in osteosarcoma patients. The subjects were osteosarcoma patients that the data taken from January 2015 to December 2016. The subjects will be clinical, radiological (plain, CT scan thorax, MRI) examinations, serum marker tests consisting of ALP, LDH, CRP and LED and histopathologic staining IHC β-hCG. The study design was cross-sectional, while the statistical analysis used was normality test, Spearman correlation, chi-square test and logistic regression. The results majority of subjects were male (52.00%) and aged 11-20 years (85.00%). The tumor volume (p = 0.07), LDH levels (p = 0.07), and ALP levels (p = 0.016) were statistically significant for pulmonary metastases with moderate correlation (r = 0.587; 0.587; 0.53). The tumor volume was the most sensitive biomarker to diagnose lung metastasis in osteosarcoma patients (p = 0.171). Conclusion among other protein biomarkers, tumor volume was most sensitive in diagnosing pulmonary metastases. The volume of the tumor will increase the risk of pulmonary metastases in osteosarcoma patients.

Keywords: Serum Alkaline Phosphatase, Lactate Dehydrogenase, C-Reactive Protein, Blood Deposition Rate, B-Hcg Expression And, Tumor Volume To Lung Metastasis.

Introduction

Osteosarcoma is a malignant neoplasm and is the most common type of sarcoma found in bone ¹. Before the discovery of chemotherapy regimens in the late 1980s, survival rates in patients were less than 20.00%, and up to now have increased to over 70.00% for nonmetastatic patients. Currently, osteosarcoma diagnostics have been developed using biomarkers such as Alkaline phosphatase (ALP), Lactate dehydrogenase (LDH), C-reactive protein (CRP), Erythrocyte sedimentation rate (ESR), Beta human chorionic gonadotropin (β-hCG), and tumor volume².

ALP is a member of zinc metalloproteinase that is produced and located in the membrane cell of osteoblasts. Osteoblast cell transformation in osteosarcoma impairs strict control of proliferation and progressively causes constant increases in ALP levels ³. The association between total ALP activity and the clinical condition of osteosarcoma patients has been known for more than 50 years. However, studies related to the role of ALP levels against prognostic osteosarcoma are still inconsistent⁴.

DOI Number: 10.37506/ijfmt.v14i2.3139
LDH is an enzyme involved in anaerobic metabolism of neoplasms. Many retrospective studies of serum LDH as prognostic factor survival rates in patients with osteosarcoma. However, the results are not convincing. Some studies show poorer results in patients with high LDH levels, while others are not.

CRP is a systemic biomarker widely used to diagnose acute and chronic inflammation. The measurement of serum CRP is a simple, inexpensive, and available method in day-to-day practice. It can serve as an additional prognostic predictor for survival and post-care monitoring in cancer patients.

Erythrocyte sedimentation rate (ESR) is one of the most common laboratory tests used in determining a progression in malignancy. Earlier research mentioned that in the case of patients with ESR increases by 25.00% suffered malignancy, but did not have significant statistics with the incidence of malignancy.

Human chorionic gonadotropin (hCG), a heterodimer protein comprising non-covalent bonds between the α and β subunits, usually secreted by the placenta. Several reports indicate that serum β-hCG and tissue levels are independent prognostic factors for adverse outcomes in some types of tumors. However, negative correlations were also found, with no association between β-hCG levels and survival of patients. Therefore researchers were interested in analyzing serum levels of LDH, ALP, CRP, LED and β-hCG as biomarkers to pulmonary metastases in osteosarcoma patients.

Method

The subjects were osteosarcoma patients that data was taken from January 2015 to December 2016. The inclusion criteria were patients with a clinical and radiological diagnosis of an osteosarcoma and an age less than 25 years. Exclusion criteria were patients who refuse care and research. The study design was cross-sectional. Subjects will be taken history data (age and sex) and physical examination. Subjects also performed laboratory tests in the form of LED, CRP, ALP, LDH. The LED was measured using the Westergren method with a normal value of 15-20 mm. Normal ALP values for males were 45-115 U/l and females 37-98 U/l. The normal standard CRP was ≤10 mg/l with the Immunoturbidimetric Assay method. The normal value of LDH was 100-190 units/l using the Beckman Unicel® DxC 800 Synchron method. The subjects also performed the radiological examination with MSCT thorax (metastatic thorax) and MRI (Volumetric tumor).

The subjects will also be examined histopathologically starting with immuno histochemical imaging on the biopsy specimen. The tissue block was cut with a thickness of 6 micrometers and placed on glass slides, followed by depolarization with xylene and rehydration gradually using an alcohol solution and washed in Tris-buffered saline solution with Tween 20. The specimen block was then immersed in the target retrieve solution, and placed in the hot water bath for 20 minutes and cooled for 20 minutes. Then incubated with β-hCG antibody for 30 min at room temperature on moisture chamber.

Data analysis using test of normality test then continued with correlation test with spearman. Statistical analysis of β-hCG using chi-square test. The quantitative data groups include tumor volume, ALP, LDH, CRP and LED correlated with data groups with nominal data scale, i.e., pulmonary metastases using logistic regression and followed by multivariate analysis to determine which variables are most sensitive as lung metastasis biomarkers. Statistical analysis program using SPSS (SPSS, Inc., Chicago, IL).

Results

Characteristics of subjects

The majority of subjects were male (52.00%) and aged over 11-20 years (85.00%). In the histopathology sample, 17 patients were obtained from open biopsy preparation and post-amputation tissue. 1 patient died before the procedure was performed and 2 patients lost to follow-up and decided not to continue treatment. Out of the 17 specimens obtained, 2 preparations were excluded because the lysis cells were painted (Table 1).

Additionally, 73.00% subjects showed positive results of expression of β-hCG with the majority of subjects of 64.00% with osteosarcoma chondroblasts type. The majority of subjects who expressed negative β-hCG of 50.00% with chondroblastist osteosarcoma type. Out of the 11 positive subjects expressing β-hCG, there were 64.00% of subjects who did not have metastasis to the lungs otherwise negative subjects β-hCG, 50.00% of subjects each metastasized to the...
lungs and did not have metastases to the lungs (Table 1).

**Bivariate Research Analysis**

The tumor volume (p = 0.07), LDH level (p = 0.07), ALP level (p = 0.016) was statistically significant for pulmonary metastases with moderate correlation (r = 0.587; 0.587; 0.53). While CRP levels, plasma levels, and β-hCG expression did not have significant statistics with pulmonary metastases (p = 0.471; 0.447; 1.000) (Table 2).

**Independent Logistic Regression Analysis of Independent Variables Research**

The result of the analysis showed that p-value sub-variable of tumor volume (0.055), LDH (0.17) and ALP (0.136) had the p-value <0.25, so it entered the multivariate test. The smallest value of significance was obtained in tumor volume (p = 0.171). So the tumor volume was a predictor of the sensitivity factor to determine the presence of pulmonary metastasis (Table 2).

**Discussion**

Assessment of tumor malignancy degree based on ALP gives a moderate correlation. The meta-analysis study showed that patients with high ALP values were significantly correlated with a high risk of having osteosarcoma metastasis at the time of diagnosis (Ren, Sun et al. 2015). Serum ALP in patients showed a higher value of metastatic events in patients with higher ALP levels in diagnosis initials than patients with low ALP levels.

Assessment of malignancy degree based on LDH examination in this study showed statistically significant with moderate correlation. This was consistent with a study showing that the percentage of patients with metastases, having twice the LDH (36.60%) higher than non-metastable (18.80%) patients 9.

Assessment of malignancy degree based on LED rate gives negative correlation value. In this study of 20 patients only obtained a significant increase in LEDs in 1 patient (with >4x normal values). In a previous study, the value of an increase in LEDs was only 25.00% of all patients with malignancy 6. In general, the 2 main factors that play a role in increasing the LED was the aggregation of erythrocytes and hematocrit. Aggregation of erythrocytes was influenced by plasma protein levels resulting in decreased negative electrostatic pressure among red blood cells that causing aggregation and increased sedimentation. If variability was found in the composition and interaction of plasma proteins then different values will be obtained.

Assessment of malignancy degree based on CRP examination gives negative correlation. Inflammation was the first sign of initiation and progression of cancer, where there was a linkage between intrinsic factors (oncogenes, genome instability) and extrinsic factors (immune factors and tissue around the tumor) 10. CRP was one single molecule to monitor acute phase reactions. CRP was a sensitive marker but not specific to inflammation. CRP was an independent prognostic factor for survival in high-grade osteosarcoma. The role of CRP as an acute phase protein and the prolonged time span between symptom emergence and diagnosis can be a factor in the absence of a positive correlation between CRP levels and the incidence of pulmonary metastases.

The significance of β-hCG IHC staining in tumor cells was unclear. In this study obtained a positive result 55.00% of the total samples performed β-hCG painting. A recent study showing 57.00% of a total of 49 patients had positive expression and no correlation between β-hCG expression and clinical outcome in patients 11. The results obtained can also be attributed to the limited
time span of the study, and the samples obtained within the timeframe are few. Further research was needed to find out the correlation of β-hCG expression with the outcome and pulmonary metastases with longer periods of time and a large number of samples.

The tumor volume was the best predictor of pulmonary metastases. If after being given tumor chemotherapy increased or fixed, it can be said to have a therapeutic response is still bad. The tumor volume had a sensitivity value of 68.6% and an 80.2% specificity for detecting pulmonary metastases. Patients with a >15 cm diameter tumor had a 3.4 times higher risk of death, whereas in patients with tumor diameter <15 cm the survival rate was better. In patients with small tumor, volumes showed a better response to therapy, with a positive predictive value of 88.00%.

**Conclusion**

However, serum CRP, LED, β-hCG expression did not have a statistically significant relationship with pulmonary metastases. What affects these three biomarkers did not correlate that can limited time span of research, samples, and plasma protein levels. The tumor volume was the best predictor factor against the risk of pulmonary metastasis in osteosarcoma patients. Further studies include larger and longer-term samples so that β-hCG expression may affect pulmonary metastases in osteosarcoma patients.

Effect of Amniotic Membrane-Derived Mesenchymal Stem Cells on TNF-α Expression and Inflammatory Cells Infiltration during Vesicovaginal Fistule Repair Healing Process

Eighty Mardiyan Kurniawati1, Agung Nur Rachman W1, Budi Santoso1, Harry Parathon1, Widjati2, Fedik A. Rantam2, Tri Hastomo1

1Department of Obstetrics and Gynaecology, Faculty of Medicine Universitas Airlangga - Dr. Soetomo General Hospital, Surabaya, Indonesia, 2Department of Veterinary Anatomy, Faculty of Medicine Universitas Airlangga, Surabaya, Indonesia

Abstract

Background: Vesicovaginal fistula (VVF) causes high morbidity in women, affecting both physical and psychological condition. Until now, surgery is the mainstay treatment for this condition. However, prolonged exposure during inflammatory phase after surgery is still a problem in the healing process. TNF-α as potent pro-inflammatory cytokine plays an important role by attracting inflammatory cells to wound tissue. Amniotic membrane is the source for mesenchymal stem cells that had anti-inflammatory and immunomodulatory effect. This study aims to evaluate the effect of Amniotic Membrane-Derived Mesenchymal Stem Cells (AMMSC) on TNF-α expression and inflammatory cell infiltration during VVF repair healing process in New Zealand White (NZW) rabbit model.

Method: This study was an experimental study with randomized posttest only control group design. Twenty-seven NZW rabbit as VVF model was used in this study, randomly divided into 3 different treatment groups after underwent surgical treatment (no treatment <C group>, treated with freeze-dried amniotic membrane <T1 group>, and treated with freeze-dried amniotic membrane that seeded with AMMSC <T2 group>). Evaluation was done 7 days after treatment. TNF-α expression was evaluated semiquantitatively using modified Remmele-Stegner scale. Inflammatory cell infiltration was evaluated using modified Klopfleisch method.

Results: Mean TNF-α expression between C, T1, and T2 group were significantly different (8.5 ± 1.6; 7.1 ± 1.2; 1.6 ± 1.2 respectively, p < 0.001). Median inflammatory cell infiltration between C, T1, and T2 group were significantly different (3.0; 2.0; 1.0 respectively, p < 0.001).

Conclusion: AMMSC significantly reduced TNF-α expression and inflammatory cells infiltration during VVF repair healing process.

Keywords: vesicovaginal fistule, amniotic membrane mesenchymal stem cells, TNF-α, macrophage, neutrophil

Introduction

Vesicovaginal fistula (VVF) causes high morbidity in women, affecting both physical and psychological condition. Quick and accurate diagnosis followed by timely repair is essential to the successful management of these cases. Surgery with primary sutting are still the treatment of choice despite the challenge in healing process and to reduce the recurrence rate. The key to achieve satisfactory surgical outcome for VVF is by
having a good visualization of the surgical field, adequate necrotic tissue dissection, tissue approximation, and the drainage of urine. Surgical access could be transvaginal or transabdominal, depending on the location, size, and profile of the area around the fistula. Another important factor that affect the success of the surgery is the surgeon’s experience.

Failure in VFF healing after fistula surgery is complex and influenced by the severity of the surrounding tissue. Recent systematic review found that the success rate in VFF healing after surgery in developed countries are 94.6%, and 80.4% in patients with cervical malignancy after radiation. Recurrence was reported three months after the surgery with an average failure on day 25. In developing countries, VFF recurrence occurred around 41%. Healing wounds in urogynaecology system require a longer process than in skin because of the influence of spongiosum tissue around the wound and pro-inflammatory cytokine that alter the cell migration. The potent pro-inflammatory cytokine which plays a major role is tumor necrosis factor alpha (TNF-α). TNF-α will stimulate the inflammatory process, attract neutrophils and macrophages to clean up debris around the wound. Once this phase is passed for 4 days, then progressed to proliferative phase. When the inflammatory phase occurs for longer period, it will disrupt and impede the wound healing process.

Urogynaecology tissue engineering had promising result as a potential therapy by reconstructing tissue engineering and tissue regeneration using a combination of biomaterials, stem cells and other biomolecules. Stem cells have the property of self-renewal, differentiation and immunomodulation. It can be given as monotherapy or combined with tissue framework (scaffold) serves to support the cell to attach and differentiate. Local injection of stem cella in experimental animals showed good results. This gives hope to the future in the management of urogynaecology cases.

Human amnion is one source of biomaterials and stem cells. As a biomaterial, amnion can be used directly to close the defect wounds or as scaffold. The one used is dried amnion as a source of stem cells and resemble mesenchymal stem cell (MSCs). The amnion has low immunogenicity properties, antimicrobial and anti-inflammatory effect. It is able to express growth factor as well as proteins such as collagen, glycoproteins, integrins, and lamellar body that helps cells to grow and proliferate. The additional effect is immunomodulation of amniotic stem cells and anti-inflammatory. This study aims to evaluate the effect of dry amniotic and seeding amniotic membrane mesenchymal stem cell (AMMSc) on the expression of TNF-α and inflammatory cell infiltration in VVF using animal model.

**Method**

This study was an experimental analytic study with randomized posttest only control group design. This study was conducted at the Tropical Disease Center Airlangga, Surabaya on March-May 2017. Samples in this study was female New Zealand White (NZW) rabbits with inclusion criteria as follows: weigh 3-4.5 kg, aged 3-5 months, and without birth defect or scar. Dropout criteria for this study were rabbits whose died during the study period.

There were 27 rabbits used in this study. All rabbits were designed to had VVF by making a 5 mm defect on the walls of the vagina and the urinary bladder via laparotomy. Vaginal and urinary bladder wall was then sewn with thread SAFIL 4-0 HR 22 (BI Braun, Tutlingen, Germany), then the defect is maintained by Naso Gastric Tube (NGT) 16F for 3 weeks. Prior to surgical procedure, subjects were under anesthesia using ketamine 25-40 mg/kg and azepromazine 0.25-1 mg / kg intramuscular. After the procedure, tolfenamic acid 10 mg / kg / day were given for post-surgical pain reliever.

After 3 weeks, subjects were divided into 3 groups using simple random sampling, namely control (C) group, treatment 1 (T1) group, and treatment 2 (T2) group. C group underwent laparotomy and the VVF was treated with simple interrupted suture at the vaginal wall and bladder wall using a thread SAFIL 4-0. T1 group underwent the same procedure as C group and receive additional treatment of dry amniotic 1x1 cm placed between the vagina and bladder walls that was sewn at each corner using a thread SAFIL 4-0. T2 group underwent the same procedure as C group and receive...
additional treatment of dry amniotic size 1x1cm seeding with AMMSC placed between the vagina and bladder walls that was sewn at each corner using a thread SAFIL 4-0.

Seven days after the treatment, all subjects underwent another laparotomy procedure to collect sample from the VVF with the size of 1x1 cm for inflammatory cell infiltration and TNF-α evaluation using histological examination. The sample was then washed with 0.9% NaCl fluid twice before stored in the container with 10% buffer formalin for 48 hours. Hematoxilin-eosin staining was done to evaluate the inflammatory cell infiltration (neutrophil and macrophage), while immunohistochemistry staining was done to evaluate the expression of TNF-α. The number of neutrophil and macrophage cells was evaluated under the microscope and were scored using modified Klopfleisch method. Expression of TNF-α were evaluated semiquantitatively using modified Remmele-Stegner Scale based on the intensity of expression and the number of cells/tissue area positively stained.

Acquired data was analyzed using SPSS version 17.0 (SPSS, Inc., Chicago IL). Shappiro-Wilk test was used to analyze the normality of the data. Kruskall Wallis test was used to compare the bodyweight and inflammatory cell infiltration between 3 groups. Mann-whitney test was used to compare the inflammatory infiltration between 2 group. ANOVA test was used to compare the TNF-α expression between 3 groups. Post hoc LSD test was used to compare the TNF-α expression between 2 group. A p < 0.05 was considered statistically significant.

**Result**

There were 27 NZW rabbits with no dropout included in this study. Bodyweight of the rabbits used in this study ranged from 3200 to 3700 grams. After the rabbits had been randomly grouped into 3 groups, normality test showed that the bodyweight in C group, T1 group, and T2 group was normally distributed (p = 0.172; 0.296; and 0.072, respectively). There was no significant difference between bodyweight of C group, T1 group, and T2 group (3366.67 ± 173.2 gram, 3388.89 ± 145.3 gram, and 3455.56 ± 159 respectively; p = 0.461).

TNF-α expression was evaluated semiquantitatively using modified Remmele-Steiger Scale based on the intensity of expression and the number of cells/tissue area positively stained.

Acquired data was analyzed using SPSS version 17.0 (SPSS, Inc., Chicago IL). Shappiro-Wilk test was used to analyze the normality of the data. Kruskall Wallis test was used to compare the bodyweight and inflammatory cell infiltration between 3 groups. Mann-whitney test was used to compare the inflammatory infiltration between 2 group. ANOVA test was used to compare the TNF-α expression between 3 groups. Post hoc LSD test was used to compare the TNF-α expression between 2 group. A p < 0.05 was considered statistically significant.

Discussion

There are significant differences between C group, T1 group, and T2 group in this study. TNF-α expression is highest in C group, and the expression is lower in T1 group where the subjects received an additional treatment of dry amniotic. In T2 group where the subjects received an additional treatment of dry amniotic seeding with AMMSCs, the expression of TNF-α was the lowest compared to C group or T1 group. This finding showed that seeding amniotic stem cells can significantly decrease TNF-α as pro-inflammatory cytokines. Previous study that compared between the amnion and amniotic administration with seeding adipose stem cells on healing of rat skin found that in group received stem cells treatment had accelerated wound healing with minimal inflammation.

Amniotic membrane has anti-inflammatory effects and helps the wound healing process. Previous study proved its effectiveness in the cornea reconstruction and skin wound healing. Other study which compared the use of dry amniotic scaffold hyaluronic acid based on case repair tendon found a significant reduction in TNF-α expression on the seventh day. Another study found that in rabbits given mesh made from propylene compared with added amnion, the level of inflammation is significantly decreased when receive the amniotic treatment.

Amnion is part of the fetus during pregnancy which express nonclassic Human Leukocyte Antigen G (HLA-G) (class Ib antigen). HLA-G polymorphism of this type is lower than the mother’s antigen class. Because of the low immunogenicity, maternal immune system does not attack the fetus. There are two proposed mechanisms of how the amniotic membrane has a low immunogenicity. The first one is that the HLA-G plays a role in reducing the activity of lymphocytes and dendritic cell when it binds to receptors inhibitor. The second mechanism is when HLA-G recognized by CD8 T cells and activated, CD8 would bind to HLA-G and will have the immunosuppression function. This mechanism might explain why there has been no rejection to the seeding amniotic stem cell.

In our finding, there are significant differences in inflammatory cell infiltration between groups. In C group where the subjects did not receive additional treatment other than surgical treatment, the inflammatory cell infiltration was significantly higher compared to the other groups. In T1 group where the subjects receive additional treatment of dry amniotic compared to T2 group where the subject receive additional treatment of dry amniotic seeding with AMMSCs. Previous study in the case of duodenum repair showed that suture plus amnion patch compared to primary suture alone had a lower inflammatory infiltration of histopathologic score. Anti-inflammatory mechanism of amniotic believed to be a factor in reducing the response of inflammatory cells in the tissue. In addition, amnion contain growth factors and multipotent cells that help the process of angiogenesis and fibroplasia.

Mesenchymal stem cells can regulate the proliferation, activation, and as an effector for T cells, dendritic cells, macrophages, NK cells, and neutrophils. Stem cells that are affected will polarize the inflammatory environment and convert M1 into M2 macrophages that have anti-inflammatory properties. M2 macrophage phagocytic activity and the secretion of proinflammatory cytokines such as IL-12 and TNF-α is low. Factors affecting the intermediary of M2 is PGE2, TNF-α stimulated gene 6 (TSG-6), and IDO. In the acute inflammatory phase, mesenchymal stem cells protect neutrophils from apoptosis through activation of TLR3. In chronic inflammatory phase, the effect of IFN-γ reduction will reduce the migration of neutrophils to the network to prevent further damage.

Macrophages control lifespan of neutrophils to secrete receptor death ligands as Fas ligand (FasL), TNF-α and TRAIL. When FasL is secreted at low concentration, it will extend the lifespan of neutrophils and increase infiltration into the wound tissue. TNF-α delay the apoptosis of neutrophil through transcription factor NF-κβ in order to improve the tissue survival. TGF-β thought to regulate the activity and function of neutrophils. TGF-β inhibition will increase the infiltration of neutrophils in tissues. Analogous to the M1 and M2 macrophage polarization, polarize TGF-β phenotype of neutrophils. Provision of amniotic stem cells will decrease the expression of TNF-α in wound tissue, where low TNF-α will not suppress the expression of TGF-β. This is in accordance with the histopathologic evaluation of T2 groups in our study where there are decreased neutrophil infiltration compared to T1 and control.
Conlussion

Amniotic membrane could reduce TNF-α expression and inflammatory cell infiltration during the VVF repair healing process in NZW rabbit model. Seeding the membrane with AMMSC enhance the reduction effect more significantly.

Conflict of Interest: There is no conflict of interest

suPAR is a Bad Omen for Chronic Kidney Disease Progression

Ekhlas Abdallah Hassan¹, Fayhaa M. Khaleel²

¹ Lecturer, ²Assistant Professor, Chemistry Dept. College of Science for Women, Baghdad University, Baghdad, Iraq

Abstract

The rationale for considering serum soluble-urokinase plasminogen activator receptor (s-uPAR) concentration as a potential biomarker for incipient CKD was primarily based on reports that increased levels of this receptor will serve as a circulating permeability variable that may be impaired at the start of FSGS and DN, a crucial explanation for CKD. So in early stages(1-3) of CKD, suPAR was evaluated. The aims of present paper are to investigate whether patients with CKD have distinct circulating suPAR, that could lead to a potential development of noninvasive diagnostic biomarkers of the disease. And finally using healthy subjects as a control group to determine specificity and sensitivity. 135 subjects were incorporated in this study, 30 were healthy control, with mean age 48.7±9.7years, and they were 14 males and 16 females. 105CKD patient, with mean age 50.1±10.0years, they were 54 males and 51 females. Blood samples were collected. Serum after centrifugation was isolated for estimation of suPAR by Enzyme linked immune sorbent assay, creatinine, and urea by enzymatic method. Early morning urine sample was collected to be used for determination albumin creatinine ratio in patient. suPAR level was higher in CKD patients than in healthy control, 6.179±2.221 versus 2.303±0.475, respectively; the difference was highly significant (P < 0.001). To study the potential role of suPAR in diagnosis of patients with CKD, ROC showed that the cutoff value of suPAR was > 3.5 ng / ml fold shift with sensitivity and specificity; the AUC was 0.826 (95% confidence interval: 0.690-0.920) and therefore 82.6 % precision and significance level of (P < 0.001). In conclusion, The suPAR is significantly more effective and also more comprehensive to CKD clinical assessment and can be supported with creatinine blood analysis.

Key words: CKD, soluble- urokinase plasminogen activator receptor, creatinine, albumin creatinine ratio

Introduction

Chronic kidney disease (CKD) is increasingly recognized worldwide as a major concern for public health. It is a leading cause of mortality and morbidity and a major economic burden on health care systems. It is difficult to recognize the early stages of CKD since people affected are typically asymptomatic. It often stays undiagnosed until kidney function failure is serious. CKD is distinguished by a progressive deterioration of kidney function. The most common risk factors of CKD are hypertension, diabetes, and conditions that less commonly induce CKD include glomerulonephritis. In medical practice, a strategy of checking kidney disorder is restricted to measure urinary protein secretion and estimate the glomerular filtration rate (eGFR). Proteinuria and reduction in eGFR is enormously insensitive to early infection and has restrained advantage in screening for CKD. Therefore, more sensitive biomarkers are wanted to discover at-threat sufferers in advance in the disorder process. So in early stages of CKD, suPAR novel maker was evaluated. suPAR is the uPAR receptor’s soluble form and can be determined in serum/ plasma. SuPAR is considered a biomarker of inflammation and is high in both acute and chronic diseases. Increased levels of suPAR were related to poor effects in numerous patient populations. Further, suPAR has been involved in the kidney disease pathogenesis, particularly diabetic nephropathy and focal segmental glomerulosclerosis, via intervention with migration of podocyte and apoptosis despite the fact that those findings are nonetheless beneath research, they recommend a likely increase suPAR function in kidney disorder. We examined the hypothesis that levels of serum suPAR are related to early stages (1-3) of CKD.
Material and Method

The study was conducted on 105 Iraqi CKD patients, 52 females and 49 males, The age mean of 55.6 ± SE 1.13 randomly selected from those attending the to Baghdad Teaching Hospital /Medical City form between Nov. 2018 to Mar. 2019. A well-structured questionnaire was filled for every subject and patient after full clinical examination by their consultant physicians. Patients define by using both GFR and urinary ACR. For the purpose of comparisons, 30 Iraqi control subjects comparable to CKD patients in respect to age (35-59 year) and gender (16 females and 14 males), were included in the study. Blood and urine were collected at the same visit from each subject. Before clinical examination, a permission was taken from the about the following clinical examination and biochemical tests performance.BMI,PB,eGFR. GFR was calculated using the modification of Diet in Renal Disease (MDRD),and ACR estimated from dividing the value of urine microalbumin in (mg/L) to urine Creatinine (mg/dl). Serum after centrifugation was isolated for estimation of suPAR by Enzyme linked immune sorbent assay, creatinine, and urea by enzymatic method.

Result and Discussion

The mean (± SD) values, rang, and distribution of studied groups (number and %) for the groups, age (in years), gender, body mass index, SBP, DBP, stages of diseases and duration of the disease in years of the studied groups with their significanc are shown in Table 1. Primary diagnosis of CKD has been categorised as presented by the UK Renal Registry (UK Renal Registry, 2018) by the main diseases which cause CKD. As shown in table 1 below. The CKD groups had similar etiology of CKD, includes 90 CKD patients; of whom 35 (33.3%) type 2 diabetic patients, 35(33.3%) hypertension patients and 35 (33.3%) GN patients. The mean age for CKD group was (50. 1±10.0) which was comparable to that of healthy control mean (48.7±9.7) years which was statically non-significant (P >0.05). The highest proportion of the CKD patients were found to be in the age group of more than 60 years. For older patients with diabetic, raise BMI, higher systolic and diastolic blood pressure (BP), and higher levels of hemoglobin A1c, the prevalence of CKD is higher.4 of CKD patients were males while the rest were female compared to 6 females and 14 males in the healthy controls which statically was not significant (P <0.05), highest proportion of the CKD patients 51.5% were male. The findings matched previous study (8). The development of CKD may differ depending on sex. Male patients have a significantly higher prevalence of CKD and occurrence of ESRD than female patients (9). ACR incidence and decreases in eGFR may be higher for men with diabetes than for women with diabetes(10). Chang et al (2016) concluded that maintaining blood pressure at normal levels may prevent the development of ESRD in both male and female patients. Regarding BMI, the table shows that mean BMI for CKD group was (27.21±3.65) which was comparable to that of healthy control mean (27.02±2.91) years which was statically non-significant (P >0.05). High proportion of patients (41.9%) were overweight. Patients with CKD groups clearly showed that BMI had no significant difference in comparison with controls, and no significant differences were observed in BMI between the (normal, overweight and obese) ranges as in table 1.

These results are consistent with Tian-Jong Chang et al 2018. The incidence of hypertension and DM in overweight and obese patients with CKD (all stages of CKD) was significantly higher. This clinical correlation may not reflect cause and effect; because obesity as a whole is correlated with multiple adverse sequelae of metabolic syndrome, It is consistent with CKD as well as with comorbidities like DM and hypertension(12). Obvious variation in means of systolic blood pressure between CKD and controls(127.6±20.1) and (116.3±7.7) with range (99.9-180) and (100-130) receptivity. Patients subjects showed a significant elevation in diastolic BP Hypertension affects ~30% of the general adult population and up to 90% of those with CKD(13).
Concerning the stages and duration of CKD, table 1 shows that mean ±SD was 7.4±4.9 with range from 1 to 16, highest proportions of CKD cases were mainly in stage 3 and duration more than 15 years. Elaine et al (2018) noted that the majority of patients spend a considerable amount of time in stage 3a of CKD, the presence of specific risk factors such as proteinuria diabetes, and uncontrolled systolic BP, significantly reduces the time invested at this stage. Aggressive management of such risk factors in stage 3a of CKD could be correlated with significant absolute gain (in years), and identifying patients at risk of progression at this early stage of CKD can encourage more concentrated efforts to prevent progression of CKD (For example, by avoiding non-steroidal anti-inflammatory drugs or iodine contrast), even though it’s early and mild (14).

Consider table 2 and a histogram 1 derived from suPAR concentration values representing various early stages of the CKD group. Within this distribution a suPAR levels of 5.570 is associated with the 50th percentile. In other words, 50% of the measured suPAR values are less than 5.570 as shown that the median is a strong estimate of the central direction while 50% of the controls fall below the level of 2.530 of suPAR. Moreover the percentile means below the level of 11.210 in CKD are 99% of sample fall while 99% of the controls fall below the level of 2.855 of suPAR. Serum suPAR level ranged between (1.210-2.855) and (3.450-12.340) ng/ml in healthy controls and CKD cases respectively, statistically significant differences were found between mean serum suPAR level of CKD patients and healthy controls. Biomarkers are still scarce for risk assessment in early stages of CKD patients. Recently, suPAR has been correlated with deteriorating renal function, the
risk of ESRD progression. Besides its function in activating αV β3 in podocytes, suPAR can mediate renal damage in several molecular pathways. Blocking β3 integrin with the use of a monoclonal antibody was protective in animal models of diabetic kidney disease. Therefore, suPAR can associate with several other molecules to cause podocyte dysfunction and mediate CKD progression under a wide range of conditions(15).

Table 3 shows that the mean suPAR was higher in patients with age from (55-59) years, in males compared to females. Result was agreement with recently study. Schulz et al (2017) who stated that higher baseline levels of suPAR are linked with increased incidence of CKD and hospitalization as a result of impaired kidney function in the middle-aged cohort(16). Regarding the anthropometric measurements, mean was found to be higher in those with overweight and centrally obese. Existing evidence suggests that suPAR in the obese patients may be correlated with macrophage accumulation in adipose tissue and is strongly influenced by adiposity (17). Also in the present study the mean suPAR level was higher in obese individuals than the overweight and lean individuals.
Table 3 shows the mean (± SD) value of serum suPAR level by epidemiological variables in CKD and healthy control groups.

Cancello et al found that the total amount of suPAR protein was significantly higher in obese individuals, compared to lean controls. suPAR was significantly more expressed in white adipose tissue of obese individuals, compared to lean controls\(^{(17)}\).

The mean suPAR concentrations were determined for all the different stages after classifying patients according to the proposed KDIGO classification of CKD. As shown in table 3 the suPAR concentrations increased significantly with increased albuminuria. (p<0.005). Interestingly, a total of 11 of the patients had no signs of kidney damage (i.e., eGFR >90 ml/min/1.73m\(^2\) and albuminuria <30 mg/g creatinine) together with suPAR levels > 3.5 ng/ml.

In this research, the consequence was an inverse relation of the suPAR level with the eGFR. Previous research has shown an inverse correlation between suPAR and eGFR; \(^{(18)}\) consequently, the present observation is aligned with the Wei et al results, in their analysis of two large populations, found inverse relationship between eGFR and suPAR\(^{(19)}\). Because the major suPAR fragment's molecular weight is 22kDa, which should be sufficiently low to cross through the glomerular filtration barrier, the correlation of suPAR levels with kidney function inversely seems reasonable. While a kinetic analysis will be needed to verify this hypothesis, suPAR is likely to accumulate in patients with renal disease\(^{(20)}\).

ROC analysis allowed the estimation of the utility of suPAR as the indicator of the patient’s progression. A suPAR concentration equivalent to 3.5 ng / mL has been identified as the best fit cutoff value with a sensitivity of 93 % but a precision of 91.5 % (p=0.001).That means, the test value higher than 3.5 ng/ml represents the abnormal case (CKD), whereas the value is less than 3.5 ng/ml consider healthy condition as shown in Figure2. ROC analysis further demonstrated that suPAR was a sensitive indicator for the stage of CKD, suggesting that serum suPAR could be a valuable biomarker for early diagnosis of CKD:

The comparative ROC analysis is presented in Fig 3, we took the area under the curve as a measure of assay efficiency, i.e., 0.89(P <0.001), for the suPAR assay and 0.68( P=0.032) for S.Cr assay in the case when the two assays used to predict cases with CKD differentiating them from healthy control, by this measure, the suPAR assays was clearly more valid than S.Cr, the difference statistically significant between them correspondingly when the two assays used to predict CKD progression, from the area, the suPAR assays was valid and efficient and the suPAR area seems to be slightly bigger than S.Cr.
Conclusion

The suPAR is significantly more effective and also more comprehensive to CKD clinical assessment and can be supported with creatinine blood analysis.

Interventions on Women Under Intimate Partner Violence: An Integrative Review

Elaheh Asadi-Bidmeshki1, Jamileh Mohtashami2, Foroozan Atashzadeh-Shoorideh2, Meimanat Hosseini3

1PhD Student in Nursing, Student Research Committee, 2Associate Professor, Department of Management and Psychiatric Nursing, 3Assistant Professor, Department of Community Health Nursing, School of Nursing & Midwifery, Shahid Beheshti University of Medical Sciences, Tehran, Iran

Abstract

The present study is aimed to determine the interventions on women under intimate partner violence. This integrative review was performed by searching in international (Web of science, PubMed, Scopus Science direct, and EMBASE) and national (SID and magiran) databases were searched from inception to December 31, 2018. The keywords used included “interventions” OR “IPV” OR “intimate partner violence”. The search of studies, data extraction and screening conducted by two researcher. Of 2782 studies 30 studies included in final stage. These studies were mainly investigated the effect of the intervention type on domestic violence against women. Of these, 17 studies focused on victims of domestic violence, of which 7 focused on supporting and empowering victims of violence, and 7 were interventional studies, and the remaining 3 studies were online and computer-based interventions. Another category of interventions focused on training and empowerment of health professionals and providers (7 studies), and two studies focused on both groups of DV victims and care providers. In addition to the DV victims and care providers, 4 studies included community factors in interventions. It also seems that carrying out comprehensive and adequate interventions on women under domestic violence is needed.

Key Words: Domestic Violence; intimate partner violence; Interventions; Women; integrative review

Background

IPV is one of the most common problems in the world today, so eliminating it is one of the Sustainable Development Goals (SDGs) [1]. According the Centers for Disease Control and Prevention (CDC) the term “intimate partner violence” describes physical, sexual, or psychological harm by a current or former partner or spouse. IPV includes four types of behavior: Physical violence, Sexual violence, Stalking, and Psychological aggression [2]. According to the latest WHO statistics in 2013, the global prevalence of IPV is 30% [3]. Women with IPV are at high risk for immediate and long-term psychological depression (the most common violence-induced psychological consequence [4-8], low level of social support [4], post-traumatic stress syndrome [5,6], anxiety, sleep disorders, emotional disturbances, memory loss, poor self-esteem, fears, worries, and poor social communication [6], substance abuse, digestive disorders and chronic pain syndrome [8], more alcohol consumption, more unwanted pregnancies, and increased violence-induced abortions [7]. There has been a growing attention, at the international level, to the potential role played by health services in identifying and supporting women who have experienced violence and facilitate their referral to specialized services [6,9]. To meet the multiple complex needs that women experience with IPV in low-income and middle-income countries, the health sector needs to show a coordinated, comprehensive, and integrated response [10]. As a common worldwide health problem, preventing and combating violence against women requires interaction between different strata of society. To improve the quality of life as well as the mental health status of women with DV, gender and culture-based cultural and security interventions are also necessary [11]. To ensure their effectiveness, interventions seeking to reduce IPV and its consequences should consider the complexity of women’s experiences.
of IPV. Despite the greater recognition of IPV as a major public health problem and evidence suggesting women victims of IPV use healthcare services more frequently, little effort has been made to develop interventions aimed at reducing IPV or its consequences. A number of reviews have concluded that there is weak evidence that supports specific interventions for women victims of violence, especially interventions in health centers or those to whom health care providers can refer women [12]. Previous meta-analyses on violence interventions show that these interventions have a limited efficiency since they are all in one form and do not pay attention to the diversity of characteristics, needs, and levels of risk that distinguish IPV victims [13]. Considering the global importance of domestic violence against women and its high prevalence [14,15] and multiple IPV-induced physical and psychological consequences [4-8,16], and consequently the need for comprehensive interventions for the prevention and treatment of domestic violence victims, the present study was conducted to review the previous studies on interventions for women with domestic violence.

Materials and Method

Inclusion studies included descriptive, population-based, cohort, and case control studies that were conducted on women under IPV. Clinical trial, review, letter to editor studies, low-quality studies, studies that did not allow access to the full text version, and studies written in languages other than Persian and English were excluded from the study. The International (PubMed, Science Direct, WOS, Scopus, and Embase) and National (Scientific Information Database (SID) and Magiran) databases were searched for relevant studies without time limits in English and Persian languages from inception to 30 December 2018. The MEDLINE search strategy was adopted to search in other databases. Boolean operators (AND, OR, and NOT), Medical Subject Headings (MeSH), and related text words were used for search using the following keywords: “Interventions”, “Surveillance plan”, “intimate partner violence” and “IPV”. The last Search was conducted in 20 February, 2019. Extracted data items included: first author; year of publication; Age; Design; and intervention characteristics.

Results

A total of 2782 articles were retrieved in searched databases. Out of 2110 non-duplicated studies in the title and summary screening process, 2053 studies were excluded due to inappropriate titles. Out of 57 studies, 30 had eligibility criteria. Out of 27 excluded studies, two studies were letter to the editor, two studies were case report, 20 studies were published in Non-English and non-Persian language non from same data, and three studies did not meet the minimum quality requirements for inclusion in the study. Of the 30 studies reviewed, 17 were experimental studies (randomized controlled trial), 4 quasi-experimental studies, 5 systematic review studies, 3 mixed studies, and 1 qualitative study. Studies have mainly focused on the effect of the intervention type on IPV, of which 17 studies focused on victims of DV, of which 7 studies focused on the support and empowerment of violence victims, 7 studies on psychological interventions; and 3 studies on online and computer-based interventions. Another category of interventions (7 studies) emphasized the training and empowerment of health professionals and providers and two studies focused on both groups of DV victims and care providers. Four studies also included community factors in interventions in addition to victims and care providers [17-20]. The effects of interventions were evaluated as pre and post-intervention evaluations and often followed by follow-ups 3, 6, 9, 12, and 18-months after the intervention. Studies were carried out in various countries such as Uganda, Nepal, Canada, the United States, Mexico, the Netherlands, South Africa, Tanzania, Peru, India, Portugal, Ethiopia, England, Colombia, Denmark, Belgium, and New Zealand and encompassed diverse cultural backgrounds in relation to the DV phenomenon.

Discussion

The studies reviewed had implemented interventions in three groups focused on women victims of violence, care providers, community factors. In women-centered study group, some studies focused on empowerment and support. Fanslow’s intervention focused on raising women’s awareness of the cycle of violence, safety planning, and referral to supportive organizations such as shelters [21]. Constantino et al. carried out an intervention aimed to provide resources for women, including information about resources, time to access resources, if available, and an environment for dialogue with counselors and friends [22]. Similarly, Cripe et al. carried out an intervention to empower pregnant women under domestic violence by giving a referral card so as to use legal and social services, supportive counseling, training and guidance on safety issues [23]. Two studies
also included screening for IPV in the routine health screening, referral and supportive care, safety planning and counseling for harm reduction, and one 3-month follow-up counseling session was implemented for women subjected to domestic violence [24,25]. Findings of a systematic review carried out by Alvarez et al. who focused on interventions on women with DV have referred to interventions such as brochures, safety planning, referral, support, guidance, home visits, and group sessions for behavioral change [26]. A multi-dimensional systematic intervention carried out by Rhodes who targeted both women victims and men who committed violence, includes 3 preparation stages (social health assessment), implementation stage (social health distribution, creation of a social marketing campaign, social health distribution survey, creation of social marketing campaign, the presence of a trained family health advocate, presence an IPV advocate) and a stabilization stage (continued education of care providers, social marketing, and social health monitoring) [27].

An intervention called “DIL MIL” targeting young married women, their mothers, and spouses in India was implemented as a group session for each group and joint sessions on communication skills training, gender-based violence, family health, reflection of culture and gender roles, intergenerational communication, empowerment for change, culture, and leadership [28]. Van Parys’s intervention consisted of the following three sections: a questionnaire, a referral card at a size of a bank card, containing contact details of the IPV assistance services on one side and guidance for increasing safety behavior on the other side and a gift coupon, and two interviews [29]. Another category of women-centered interventions was based on psychological treatments along with supportive and safety measures. Kiley et al. carried out a psychological and evidence-based intervention that was carried out exclusively on any IPV-induced psychological risks with an emphasis on safety planning, and empowerment (raising awareness about violence and its cycle, risk assessment, and protection methods), taking into account a list of social resources along with the address and telephone number [30]. This model consists of four stages: 1) Start: Thinking about violence against women and HIV as issues that require health workers and community members to work together and strengthen their power to address these issues. 2) Awareness: Increased awareness about community acceptance of men’s exercise of power against women that increases violence against women and HIV. 3) Support: Support for women and men who are directly affected by these issues. 4) Action: Take actions to prevent violence against women and HIV [31]. Similar to the above intervention, a community-based study included holding sessions with local institutions and beneficiaries to examine barriers to implementing IPV interventions, as well as increasing beneficiaries’ engagement to prevent domestic violence against women, social mobilization, making women aware of gender equality, social rules and norms, raising the spouses’ level of awareness and participation and educating community representatives to engage them in changing traditional attitudes [20]. Clark et al. also conducted radio plays based on a social behavior change strategy, with interactive voice response and SMS service for listeners. They aimed to prevent IPV through three key approaches of support, social mobilization, and behavioral change (Clark et al., 2017) [19]. In his systematic review, Bouery stated that the following structural interventions are effective in preventing domestic violence: financial interventions (financing programs, support for women’s production, unconditional loans), social interventions (participatory learning, community mobilization, multimedia approaches), and economic / social interventions (gender training, livelihood education (creating the future), sexual health education, paired and gender training, cash transfers, support groups for women with gender dialogue for couples) [18].

**Conclusion**

It seems that carrying out comprehensive and adequate interventions for women under domestic violence requires a multi-dimensional perspective and integration of interventions based on the needs of women under violence, care providers, and social factors.

The Effectiveness Comparison of Valproic Acid 500 mg and Amitriptyline 15 mg in Reducing the Frequency of Headache Attack in Patients with Tension-Type Headache

Elsa Susanti1, Isti Suharjanti1

Abstract

Background: Tension-type headache (TTH) is the most common headache. Continuous analgesic use can develop into headache caused by drug abuse (medication overused headache); thus, the preventive therapy is necessary. Amitriptyline and valproic acid are drugs reported to reduce the frequency of headache in TTH patients.

Objective: To analyze the effectiveness of valproic acid 500 mg and amitriptyline 15 mg in reducing the frequency of headache attack in patients with tension-type headache.

Methods: The study applied a Double Blind Randomized Clinical Trial involving 50 TTH patients. The subjects were divided into two groups: amitriptyline 15 mg and valproate acid 500 mg. The period of drug administration was 6 weeks. The variables that were compared were the decreasing frequency of headache and the intensity of the pain.

Results: There was no significant difference in the decrease of headache frequency (p = 0.730) and pain intensity (p = 0.430) between the amitriptyline group and valproate acid group. However, each drug effectively decreased the frequency of headache and pain intensity in TTH patients (p = 0.000).

Conclusion: There was no significant difference between the effectiveness of valproic acid 500 mg and amitriptyline 15 mg in reducing the frequency of headache in patients with TTH.

Keywords: valproic acid, amitriptyline, pain, tension-type headache

Introduction

Tension type headache (TTH), previously called muscle contraction headache, is the most common headache where most people consider it a normal headache, compared with migraine. This is a complex disorder in which various heterogeneous mechanisms play a role. TTH often occurs daily. The prevalence of chronic TTH in one year in the general population ranges from 3% in females and 1.5% in males 1. Previous studies have suggested that the prevalence of headache is 78% in a population-based study in Denmark; however, episodic TTH (one day per month or less) is the most common that does not require special medical treatment. However, 24% to 37% experience headache several times per month, 10% experience pain per week, and 2% to 3% of the population experience chronic TTH that lasts for a longer period of time in their lives 2.

Chronic TTH is a risk factor for the occurrence of analgesic abuse that will develop into headache. Persistent headache and psychiatric comorbidity often cause this chronic TTH to be overcome. Although TTH is common, pathophysiology and mechanisms remain unclear. Pathophysiology is thought to be multifactorial, involving factors of central and peripheral nervous system as well as environmental factors 3. The vagueness
