The results indicate that the concentration varied from 6.25 to 19.12 ng/ml (mean = 11.73 ng/ml) for Se in meat samples and from 0.27 to 9.23 ng/ml (mean = 1.94 ng/ml) in fish samples as shown in (Table 1, Figure 1). It is observed (Table 2, Figure 2) that fresh meat, has lower concentration of Se than the canned meat, while the concentration of Se in the fresh fish is about four times that observed for the canned fish.

As well as the results indicate that the concentration varied from 0.002 to 2.1 mg/l for Hg in meat samples and from 0.1 to 3.5 mg/l in fish samples, the limits set by US- EPA for mercury was 0.50 µg/g in fish [6]. Any study doesn’t record mercury exist in meat samples [11]. The results indicate the concentration of Hg in meat and fish samples exceed normal levels (Fig 1). Bioaccumulation of Hg by fish and shellfish in canned food item can be a rich source of metals, and of the serious contamination of foods that occurs from time to time during commercial handling and processing, most countries monitor the levels of toxic elements in foods [12]. Hg has been recognized as severe environmental pollutant, with high toxicity even at low concentrations it has the ability to enter into biological systems [13], it has strong tendency to accumulate in aquatic food chain and about 95% of the methylmercury in humans is originated from the ingested fish [14]. Mercury and methylmercury are neurological toxicants to humans [15]. However, the levels the metals in fresh meat and fish are higher than the canned meat and fish as shown in (Table 2 and Figure 2). The high level of this metal in fresh food may be connected with environmental factors such as polluted soil and polluted waste water used for irrigation of the farms.

Determinate mean concentrations of pb in meat and fish were 0.53 mg/l and 0.5 mg/l respectively (Table 1, Figure 1), this results are higher than acceptable Concentrations of pb limits in fish according to FDA [16], but concentrations in canned meat and fish was below the prohibited limits for this element (Figure 2), which is 0.5 mg/ kg as given by (FDA), while found high concentration of Pb in fresh meat and fish (Table 2). An exposure to (pb) for a long time can increase (pb) in human body and lead to cause many serious diseases
such as anemia, Pale skin, abdominal pain, Nausea, Vomiting and Joints paralysis, exposer to (pb) for a long period may cause kidney filler and reducing fertility and increasing probability of pregnant or Incidence of congenital malformations [17].

Figure 1. Concentration of metals (Se, Hg and Pb) in fresh and canned (Meat and Fish).
Conclusion

In this study, the levels of Se, Hg and nickel and Pb in fresh and canned food samples were investigated. The result of the analysis showed that these heavy metals were present in the selected canned and fresh foods. Considerable differences were found in the levels of these metals among the samples. The level of Se was found within acceptable limit set by World Health Organization (WHO). However, Pb and Cd call for concern as they were found to be above permissible acceptable limit set by World Health Organization (WHO).

The canned samples generally, recorded lower concentration of heavy metals as compared with the fresh fish and meat samples and could be considered safer for consumption. Consumption of fishes grown in rivers and fish ponds within the study area should be avoided in order to prevent Hg or Pb poisoning due to accumulation over time, which could pose a risk to human health due to the accumulation of these elements in the sensitive internal organs such as liver, kidneys, and brain. So we recommend tightening health control methods and ways of breeding fish caught and processed water that equips fish farms and methods of disposal of industrial waste, which has the main reason for the pollution of fish and meat and determine the extent of the safety and validity of these fish and meat for human consumption.

Profile of Contralateral Patent Processus Vaginalis in Pediatric Patients with Unilateral Inguinal Hernia

Sapta Prihartono Rachman1,2, Kustiyo Gunawan1, I.G.B. Adria Hariastawa1

1Pediatric Surgery Division, Department of Surgery, Faculty of Medicine, Universitas Airlangga – Dr. Soetomo General Academic Hospital, Surabaya, Indonesia, 2Pediatric Surgery Division, Department of Surgery, Navy Hospital, Surabaya, Indonesia

Abstract

Objective: Reporting the incidence of contralateral patent processus vaginalis (CPPV) in pediatric patients with unilateral inguinal hernia. Methods: The study was conducted from November 2010 - February 2012. Patient’s identity were recorded for registration number, name, age, gender, address and date of examination. The surgery was conducted by a trainee pediatric surgeon as a researcher and resident. High ligation procedure and diagnostic of contralateral PPV. Results: This study included 40 pediatric patients of various ages diagnosed with lateral inguinal hernia. There were 31 male patients (77.5%), 24 patients (60%) with right inguinal hernia patients, and 14 patients (35%) aged 0-1 years. Conclusion: The transinguinal laparoscopic contralateral PPV technique is helpful in diagnosing the presence of contralateral PPV. The incidence of contralateral PPV in this study was 27.5%. Furthermore, early age increased the incidence of contralateral PPV.

Keywords: laparoscopic transinguinal technique, Patent Processus Vaginalis, unilateral inguinal hernia,

Introduction

Inguinal hernia surgery is the most frequent procedure performed by pediatric surgeons, and is a frequent case that referral patient consult to pediatric surgeons(1). Most children have unilateral hernia. Only a small proportion have metachronous contralateral hernias(2).

Lateral inguinal hernia in children arises because of the delay or failure of closure of peritonei processus vaginalis known as the Patent Processus Vaginalis (PPV). Abnormalities of the closure of the processus vaginalis can cause various kinds of disorders including lateral inguinal hernia, communicating or non-communicating hydrocele fungiculi, testicular hydrocele, cryptorchidism. The incidence rate of lateral inguinal hernias in infants or children is 1-4.4%, in which it is mostly found in boys than girls, and 10-15% are bilateral(3).

The diagnosis of inguinal hernia in children can be enforced based on clinical conditions, namely anamnesis in the form of a lump in the groin, especially when the patient cries or strains, and disappears when the patient sleeps. Moreover, a silk glove sign appears on physical examination. Examination of the silk glove sign is difficult because it depends on the examiner’s experience. Therefore, this causes a less accurate diagnosis of PPV based on physical examination, especially on the contralateral side(4, 5).

Contralateral hernia in the future will cause higher disadvantages, twice the risk of anaesthetics, and doubled parental anxiety and patient’s stress level. Some investigators undertake routine contralateral exploration to avoid those disadvantages. However, there are several harms reported regarding contralateral exploration, including the risk of testicular injuries and vas deferens, prolonged operative duration and negative exploration(6).

Over the past 60 years, contralateral inguinal exploration procedure in pediatric patients with unilateral lateral inguinal hernia is still under debate. Since 1950, there have been many reports on how should
contralateral inguinal exploration be indicated because of the contralateral PPV. Pediatric surgeons can take many options to treat PPV. First, observing and correcting should clinical symptoms of inguinal hernia appear. Second, a routine contralateral inguinal exploration during unilateral inguinal hernia repair surgery. Third, performing a contralateral exploration only if the PPV is found per laparoscopy during unilateral inguinal hernia surgery. Fourth, only performing selective contralateral exploration in preterm infants, low birthweight and significant anaesthetic risk.

Based on these considerations, the decision to explore contralateral has been preceded by several attempts to diagnose the presence of contralateral PPV. Some of preoperative examinations are intra-operative pneumoperitoneum (Goldstein test), herniography, ultrasonography and laparoscopy. Laparoscopic technique has grown rapidly as a diagnostic tool to look for the presence of contralateral hernia or PPV, while at the same time prevents the second surgery and is a minimally invasive technique.

This study was conducted to explore the benefits of transinguinal laparoscopy in patients undergoing unilateral inguinal hernia surgery by a single surgeon and to identify the presence of a contralateral PPV in children of various ages.

Methods

The population of this study were all patients undergoing lateral inguinal hernia surgery at Dr. Soetomo General Academic Hospital, Surabaya, Indonesia, from November 2010 to February 2012. The samples of this study were pediatric patients of unilateral inguinal hernia who met the inclusion and exclusion criteria. Inclusion criteria included children ≤ 12 years who suffered from unilateral inguinal hernia and patients who had never had hernia surgery, either left or right. Exclusion criteria included lateral inguinal hernia patients with comorbid diseases such as ascites, hydrocephalus post VP shunt, gastrochisis, sex anomalies, support muscle tissue disorders, incarcerated lateral inguinal hernia patients, and bilateral inguinal hernia patient (duplex).

All unilateral inguinal hernia patients who would undergo high ligation procedure from November 2010 to February 2012 who met the inclusion and exclusion criteria were included in the study. Patient’s identity was recorded including register number, name, age, gender, address and date of examination. The surgery was conducted by a trainee pediatric surgeon as a researcher and resident. High ligation procedures and contralateral PPV diagnostics were carried out in accordance with standard surgery procedures applicable at Dr. Soetomo General Academic Hospital, Surabaya, Indonesia. The surgical procedure includes when the hernia sac is opened, the probe is attached and tied so that compressed abdominal air does not come out, and a laparoscopy camera is inserted with a 30-degree lens unruly peeking at the PPV counterpart.

The research was conducted at Dr. Soetomo General Academic Hospital, Surabaya, Indonesia, from November 2010 to February 2012. Data were collected from samples and processed as descriptive data. Statistical analysis was carried out using IBM SPSS Statistics software version 23.0 (IBM Corp., Armonk, NY, USA).

Results

This study included 40 pediatric patients of various ages diagnosed with lateral inguinal hernia, with 31 male patients (77.5%), 24 patients (60%) with right inguinal hernia (Figure 1), and 14 patients (35%) aged 0-1 years (Table 1 & 2).

**Discussion**

In this study, the highest incidence of lateral inguinal hernia was found in male participants (31; 77.7%), which is in accordance with previous literatures. The incidence of lateral inguinal hernia in men is 4–6 times that of women\(^3\). Other studies stated the ratio of men: women 3: 1 and 10: 1. However, there was no significant gender difference in the group of preterm infants\(^4\).

Participants in this study mostly had right inguinal hernia (60%), which is in accordance with previous studies that approximately 60% of hernias occur on the right side. This condition was found in both men and women due to the slower process of closing the processus vaginal\(^1\).

From age distribution, the incidence of lateral inguinal hernia was mostly found on the age group of 0-1 year (35%), followed by 1-3 year (25%) and 3-6 year (25%). The incidence decreased at over 6 years old (15%). There were 11 cases of contralateral PPV or 27.5% for all ages, contrary to the finding of Rothenberg and Barnet that stated that the incidence of <1 year contralateral hernia was 100% and 68.5% for ages >1 year\(^2\). However, the finding of this study is closer to the results of previous studies that pointed out 14–41% incidence of contralateral hernias\(^21\). Unlike previous studies that only mentioned the incidence of contralateral
hernias at 11%, this study had a nearly double higher result(2, 4, 10).

The graph above showed that contralateral PPV incidence mostly occurred in cases of right lateral inguinal hernia (20%), while the left side was only 7.5%. A study conducted by Surana and Puri found that the incidence rate of contralateral hernia was 10.3% in infants aged 1 week to 6 months, while patients with left hernia who developed right hernia was 16.6%(10, 22). Meanwhile, previous study conducted for 20 years found that 41% of patients with left inguinal hernia would experience future right inguinal hernia, whereas only 14% of patients with right inguinal hernia would develop left inguinal hernia(21). Compared with the two studies, this study found that the incidence of contralateral PPV in cases of right hernia was higher. This finding could become a consideration that in cases of unilateral lateral inguinal hernia, diagnostics must first be performed prior conducting contralateral exploration(23).

This study found that transinguinal contralateral laparoscopy was very helpful in diagnosing contralateral abnormalities. Therefore, appropriate action could be taken at the time of the first surgery, as well as knowing the certainty of contralateral PPV to reduce morbidity due to negative contralateral exploration. The disadvantages of this surgery require more expensive costs and a relatively longer time.

Conclusions

The transinguinal technique of contralateral PPV is very helpful in diagnosing contralateral abnormalities. Therefore, appropriate action could be taken at the time of the first surgery, as well as knowing the certainty of contralateral PPV to reduce morbidity due to negative contralateral exploration. The disadvantages of this surgery require more expensive costs and a relatively longer time.

Conflict of Interest: The authors declare that they have no conflict of interest.

Ethical Approval: All procedures performed in studies involving human participants were in accordance with the ethical standards of the Ethics Committee in Dr. Soetomo General Academic Hospital, Surabaya, Indonesia.

Medicolegal Analysis of Sodomy Cases at Beni-Suef Governorate From January 2011 to December 2015 – A Retrospective Study

Sarah A. Khater¹, Sherien Salah Ghaleb ², Lamiaa Ewis Abd Alfatah³, Manar .A Ahmad³

¹Researcher of Forensic Medicine And Clinical Toxicology department, Faculty of medicine, Misr University for Science And Technology, 6ᵗʰ of October, 12566, Egypt , ²Professor of Forensic medicine and clinical toxicology department, Faculty of medicine, Cairo University, Cairo, 11865, Egypt , ³Researcher of Forensic medicine and clinical toxicology department, Faculty of medicine, Beni- Suef University, Beni-Suef, 62514 Egypt

Abstract

Sodomy is anal intercourse between 2 men (homosexual sodomy) or a man and a woman (heterosexual sodomy) also known as buggery, when the passive agent is a child, sodomy is referred to as paederasty. This study sheds some light on one sensitive Egyptian issue, sodomy cases, with quantification of the demographics and medico legal findings, related to female child and male cases presenting to Beni Suef governorate Forensic Medical Authority, Egypt, between 2011 and 2015. 51 cases of sodomy were analysed, the mean age of victims is 9.79 years in children and 24.30 years in adults. 74.19% of cases were male children while 85% were adult females. Cases occurred mainly in urban areas for both child (61.29%) and adult (55%) victims. Frequency of sodomy cases shows an ascending manner. Most child victims had primary education 77.42%, unlike 35% high education in adult victims. 96.67% of assailants had no relation to children, 50% were relative in adult cases. Multiple assailants were present in 13% of child victims, 30% in adult victims. Physical force was the commonest in child 51.62% and adult 50% victims. assailants were guilty in 54.84% of child victims, 50% in adult victims. Forensic examination of children took (2-5 days) in 61.30%of child cases and (1-2 weeks) in 50% adult cases. Semen was detected in 19.35% of child cases and in 15% of adult cases. Genital Injuries were found in 45.16% of children and55% in adult cases. Rape accompanied sodomy in 19.35% of child cases and 25% of adult cases. Conclusion—these analyses demonstrate that the very low incidence may also suggest gross underreporting; making awareness of importance of reporting of sexual offences is mandatory.

Key words: Sodomy; Assailants; Forensic examination; Physical force; Genital Injuries

Introduction

Sexual assault (SA) is any sexual behavior or contact occurs without a distinct consent from the recipient or any exposure to an inappropriate sexual content (¹). Sexual abuse, affecting children and women of all ages and socio-economic levels, is considered a major human rights violation and a worldwide problem (²³). Sodomy is anal intercourse between 2 men (homosexual sodomy) or a man and a woman (heterosexual sodomy) also known as buggery, when the passive agent is a child, sodomy is referred to as paederasty (⁴). Age of consent for sexual intercourse in Egypt is 18 year and sodomy is illegal (⁵). The legislation in Egypt makes no straightforward mention of homosexuality, they frequently use other laws to criminalizes the act and punish the perpetrator (⁶). Sexual violence and especially sodomy in Arab-Muslim societies depend mainly on the cultural and religious norms; which is a neglected area of research (⁷). Egypt’s Forensic Medical Authority

affiliated to the Ministry of Justice that is responsible to provides a medico-legal investigations and reports, divided into two parts in Beni Suef; Beni Suef morgue, clinic and Laboratory which cover Beni Suef, Ehnasia, Beba, Elfashn, Somosta, Naser & Elwasta provinces.

This study sheds some light on sodomy cases, with quantification of the demographics and medico legal findings, related to child and female cases presenting to Forensic Medical Authority between 2011 and 2015.

**Materials and Methods**

This is a retrospective study of all alleged sodomy cases in Beni-Suef province from the start of 2011 till the end of 2015.

**Data collection**

The data was collected from archived reports of medico legal authority registered in Beni-Suef province. Data was collected from all reports contain claims of sodomy cases in a collection sheet based on available information of medico-legal reports. The study included closed claims only since the claims that were not yet closed were not available. The claims ‘files included the statement of the claim, medical reports, experts ‘opinions and the decision of the court.

A total number of 51 registered sodomy cases were studied according to police forwarding letter and Medical officers form which included all the relevant information such: Date, Case result, Victim mentality, Age, Residence, place of the assault, Relationship of assailants to the victim, Time between the sexual assault and forensic examination, Educational status of the victims, Internal examination, External examination and injuries, Number of assailants, Type of sexual assault , Method to overcome the resistance of victim, Presence of semen.

**Ethical considerations**

Number Ethical concerns need to be addressed, due sensitive study nature especially in our country. No identifiable personal information on the Victims, witnesses, or the suspect was included in the coding or analysis. This study was performed according to guide lines of Ethical Committee at Beni-Suef University, Egypt.

**Statistical Analysis**

The data was coded and entered using the statistical package for Social Sciences SPSS version 21. The data were summarized using a descriptive frequency and percentage for quantitative values, relation between data grouped was tested by Chi Square test for quantitative variables. Statistical differences (P-values) less than or equal to 0.05 were considered statistically significant.

**Results**

A total number of 51 registered sodomy cases were analysed, the mean age of child victims is 9.79 years while the mean age of adult victims is 24.30 years. Amongst sodomy cases, we found that male children were more exposed to sodomy (74.19%) than female children (25.81%), while adult females go to court (85%) more than adult males (15%). The relation between gender and age of victims was highly significant (p <0.001, Table1) The prevalence of sodomy cases in urban areas in the governorate was more than rural areas for both child (61.29%) and adult (55%) victims with no statistical significance (p =0.656, Table1) Frequency of sodomy cases shows an ascending manner over the 5 years. On plotting years and age of victims, 2015 has the highest percent of child Cases (32.26%) while 2015 and 2014 has the highest percent of adult Cases (30%) The relation between victim number and age over years was not significant (p= 0.607, Table1) Most child victims had primary education (77.42%), in comparison to high education in most adult victims (35%). That relation was highly statistically significant (p <0.001, Table1) All child victims show average mentality (100%), while (10%) of adult victims were mentally retarded with no statistical significance (p =0.072, Table1)

The majority of assailants had no relation to child victims (96.67%), unlike (50%) of relative assailant in cases of adult victims. That relation was highly statistically significant (p <0.001, Table2) Multiple assailants were present in child victim cases (16.13%) and adult victim cases (30%) also in the least percentage with no statistical significance (p =0.240, Table2). 61.29% of child assaults were at unknown place, unlike 50% of adult cases that occurred at victim residence. That relation was highly statistically significant (p <0.001, Table2) Physical force was the commonest type of force used in child (51.62%) and adult (50%)
victims, while weapons used only in (16.13%) of child victims and in (20%) of adult victims. This relation was found none statistically significant (p =0.758, Table2). (54.84%) of assailants in case of child victims were found guilty, while in cases of adult victims, 50% of assailants were also found guilty. That relation has no statistical significance (p =0.735, Table2).

The majority of forensic examination of took place few days (2-5 days) after assault in (61.30%) of child cases, while in adult cases (50%), it took few weeks (1-2 weeks). That relation was statistically significant (p =0.016, Table3) Forensic examination can detect semen in (19.35%) of child cases and in (15%) of adult cases. That relation was statistically non-significant (p =0.690, Table3) Genital Injuries with a skin tear were the commonest type of injuries in both; child (45.16%) and adult (55%) cases, while no injuries were found in of child (32.26%) and adult (15%) cases. That relation has no statistical significance (p =0.585, Table3). Rape accompany sodomy in (19.35%) of child cases and (25%) of adult cases. That relation was statistically non-significant (p =0.632, Table3).

**Discussion**

This is a retrospective study of all alleged sodomy cases in Beni-Suef province from the start of 2011 till the end of 2015. The data was collected from archived reports of medico legal authority registered in Beni-Suef province. A total number of 51 registered sodomy cases were analysed, this number is most probably due to under reporting of cases; making determination of accurate incidence numbers not possible (8). Under reporting cases including younger and cognitively delayed children suffering severe and repeated abuses within the family (9), 83% of young adults experiencing sexual assault won’t reach the police (10).

This study revealed that, the mean age of child victims is 9.79 years while the mean age of adult victims is 24.30 years, consistent results were stated by (Peterson; Melkman et al.; Office for national statistics) (9,10,11). These findings can be explained by underreporting to police and health authorities by the older survivors who may fear loss of societal respect (12). Older children have the language, attention and cognitive skills necessary to provide clear and detailed evidence of suspected abuse (13).

Amongst sodomy cases, we found that male children were more exposed to sodomy (74.19%) than female children (25.81%), Kloppen et al. (14) findings are different as between 6% and 30% of girls and 1–12% of boys in the Nordic countries are estimated to fall victims to contact child sexual abuse. These differences may be due to the nature of sodomy. In our study adult females go to court (85%) more than adult males (15%).

Regarding gender, studies generally indicate that in cases of sexual abuse, male victims are more reluctant to disclose events of abuse, are less consistent in their accounts, and that their testimonies are less likely to be viewed as credible by investigators (9,15,16).

The prevalence of sodomy cases in urban areas in the province was more than rural areas for both child (61.29%) and adult (55%) victims. According to WHO (17) some people do not trust police, especially in rural areas where other authorities are not accessible.

Frequency of sodomy cases shows an ascending manner over the 5 years. On plotting years and age of victims, 2015 has the highest percent of child Cases (32.26%) while 2015 and 2014 has the highest percent of adult Cases (30%). These results are consistent with (10). That increase may be attributed to the improvement in reporting after the Egyptian revolution of 2011.

Most child victims had primary education (77.42%), in comparison to high education in most adult victims (35%). Our results are consistent with Patterson & Campbell (18). Lippert et al. (19) explained as, preschoolers are less likely to disclose abuse, both initially as well as in the forensic interview and if they do disclose, their testimony tend to be shorter and less detailed than testimony from older children. On the other hand high education usually increases awareness about the importance of abuse reporting.

All child victims show average mentality (100%), while (10%) of adult victims were mentally retarded. Similar findings were mentioned and explained by Ghatti et al.; Connolly et al.; Office for national statistics (10,16,20) as Cognitive delays exert effects on children’s ability to provide informative evidence and hence on the ability to assess their veracity, though existing findings are mixed. Assessments of their credibility concerning allegations of abuse are made with less certainty.
The majority of assailants had no relation to child victims (96.67%), unlike (50%) of relative assailant in cases of adult victims. Roye et al.; Melkman et al. (9,21) agree with our results, the convenient explanations could be of Rizzo et al. (22) that the database was formed by forensic examiners after filling a charge in police station by the legal guardian of the child that is considered a family scandal especially if the offender is a family member. Female victims of physical intimate partner violence are more likely to report anal intercourse according to Roye et al. (21).

Multiple assailants were present in child victim cases (16.13%) and adult victim cases (30%) also in the least percentage. The findings of Melkman et al.; Office for national statistics (9,10) are in agreement with our results. The possible explanation of our results could be due to threats of violence or death which has been found in this study (12).

Physical force was the commonest type of force used in child (51.62%) and adult (50%) victims, while weapons used only in (16.13%) of child victims and in (20%) of adult victims. Similar results were reported by Cross et al.; Whitaker et al.; Office for national statistics (10,15,23). Disclosure may be easier for the child traumatized by an aggressive, one time sexual act. Existing evidence suggests higher rates of affirmation concerning reports of more severe abuse (15).

61.29% of child assaults were at unknown place, unlike 50% of adult cases that occurred at victim residence. Office for national statistics (10) reported similar results. The possibility of being caught in the act is quite slim especially when the assailant majority had no relation to child victims (12). Unlike 50% adult victims with relation to the assailant; there is increasing evidence that anal intercourse is more common among female victims of physical and/or sexual intimate partner violence (24).

Nearly 50% of assailants in case of sodomy victims; children and adults were found guilty. Consistent results reported by Priebe and Svedin; Melkman et al. (9,25). The explanation stated by Talwar & Crossman (27) were the most likely, as, elementary school children’s developing cognitive skills are also related with a greater capacity for telling and maintaining lies. Priebe and Svedin & Meyers (25,26) have established that timely delayed disclosure, greatly decreases the likelihood that the case will be reported, investigated and that charges will be filed and the abuser most likely won’t be convicted.

The majority of forensic examination of took place few days (2-5 days) after assault in (61.30%) of child cases, while in adult cases (50%), it took few weeks (1-2 weeks). Forensic examination can detect semen in (19.35%) of child cases and in (15%) of adult cases. Akinlusi et al.; Rizzo et al. (11,22) reported similar results and explain this delay by the longer duration to disclosure. Children particularly believe assailants’ threats and would not report until parents discover. The fear of stigmatization could be responsible for delayed disclosure in adult. Individual differences at the level of forensic examiners (e.g., years of experience or attitudes) may explain considerable variance in their assessments (9).

Genital Injuries with a skin tear were the commonest type of injuries in both; child (45.16%) and adult (55%) cases, while no injuries were found in of child (32.26%) and adult (15%) cases. These findings are consistent with the study of Office for national statistics; Rizzo et al. (10,22). Appropriate explanations are that; older girls possibly try to physically defend themselves and the bodily lesions could be the results of a physical opposition, whereas children don’t attempt to fight back. In addition, less invasive acts as touching and fondling are known to occur much more frequently than penetration in cases of younger children (28). Moreover, the delay in seeking medical examination may also explain the absence of evident genital or bodily lesions (29). It is possible that in less severe events, common motivations underlying intentional fabrication of accounts of abuse, such as taking revenge at a third party, a cry for attention or help, or concealing consented sexual activity with the accused or another for fear of parental retribution (30).

Rape accompany sodomy in (19.35%) of child cases and (25%) of adult cases. Office for national statistics (10), reported similar results. Past research has shown that anal intercourse is associated with intimate partner violence victimization among women. Female victims of physical intimate partner violence are more likely to report anal intercourse. (21,24)
Limitations

This study has a limitation; the Number of cases was relatively small; the very low incidence may also suggest gross underreporting. Our analyses include only the referred cases to Forensic Medical Authority by law enforcement accompanied by family members or on their own. Sexual assault cases, like sodomy considered a shame especially in Upper Egypt governorates and can be scandalous if the offender is a relative. In case of child abuse many guardians refuse to go to police, so these cases are missed out. Despite that limitation, we report important results supported by data collected by law enforcement. A joint forensic physician and nurse team performed all the examinations in order to secure objective information. Our results can be used as effect-size estimates to power future clinical prospective studies in hospital abuse cases.

Conclusions

The standard of clinical management of sexual violence involves documentation and treatment of injury, getting forensic materials, detecting prior pregnancy, screening for sexually transmitted infections including HIV and provision of adequate contraception, post exposure prophylaxis and supportive psychosocial counselling. National awareness about sexual offences reporting importance to public and about the standard of clinical management of sexual violence among health care providers is a must.

Abstract

Mitochondria is one of the most energy source in the cells, in addition to DNA encoded to several genes which relatively associated with several disease, researchers proved the role of mitochondrial in energy demand to tumor cells in addition to mitochondrial DNA role in cancer initiation and development. The present review explained different objectives related with the mitochondrial role in tumor incidence ; these included Tumor cells energy demands, Mitochondrial Mutations redundancy and allocation, Genetic disparate natural Selection in Tumor initiation, Mitochondrial Modifications Clinical Translations in Cancer, Association Mitochondria, epigenetics and Cancer and finally Injury of Mitochondria in Cancer. The present review concluded that the most important role of mitochondrial as cells an organelles for energy suppliers to tumor cells metastasis and immorality also the mutations of mtDNA and their role in carcinogenesis were well proved in different cancer types.

Key words: mtDNA, cancer, mutation, role mtDNA, energy source.

Introduction

Mitochondria is one of the most important organelles in the cell, the biogenesis and roles are regulated by nucleus by a stable bidirectional crosstalk, mitochondrial DNA (mtDNA) encoded 1% of mitochondrial proteins, while the others encoded by nuclear genomic including the replication and transcription proteins [1]. The mitochondrial genome in human is circular double strand consist of 16.6 kb encoded two ribosomal RNA (12S and 16S), 22 tRNA and 13 essential subunit of protein associated oxidative phosphorylation system (OXPHOS) , Other proteins involved in The electron transport chain (ETC) and the pathway of primary metabolic generating energy carrying molecule ATP which formed of five protein complexes (I-V), involving the complex II is exclusively coded via nuclear genome [2].

The nuclear genome encoded to all proteins subunit that formed the rspiratory systems included 7 subunits of the enzyme in Com I, one subunit of the ComIII, 3 subunits of Com IV and 2 subunits of ComV. As formerly indicated, the mitochondrial proteins, included the mtDNA processing like transcription and translation proteins and replication, encoded by the nuclear genes and are subjected to the mitochondrion by particular transport systems, about 2000 small non-coding RNAs (mitosRNAs) were detected, that have role the natural mitochondrial gene expression control, showed an underestimated scale of mitochondrial functional complexity [3].

Otherwise, the investigations deal with antisense anti-termination tRNAs and delRNAs focus a de nova facts on incoming processing extending the coding prospect of mitochondrial genome [4, 5]. The ETC byproducts of the steadily create reactive oxygen species (ROS) which may seriously harm the mitDNA that cusses different types of mutation and the these lesions accumulation in the mtDNA molecules result in subsequent the dysfunction in mitochondria , like number changes, morphology and functioning, as
noticed in tumor cells \[^6\].

The mitochondrial DNA is more exposed to mutated than nuclear DNA, because of the absence specific proteins like histones and the loss of structure chromatin, rarity of introns, also the less effective recover mechanisms of mtDNA and a direct exposed to the damaging ROS created pending ATP generation within the mitochondria \[^7\].

In spite of low scales of ROS to organize the signaling in the cells and are substantial for normal endurance and reproduction of cells, thumbing ROS generation is repeatedly noticed in neoplastic cells. The theory of mitochondrial free radical of aging the cumulating of harmful mtDNA mutations, inhibition of oxidative phosphorylation, furthermore the disturbance in antioxidant enzymes expression leads to exponential overproduction of reactive oxygen species, This evaded situation consist vicious cycle which is the fundamental of a broad extent of pathologies, phrased as free radical diseases like tumor, atherosclerosis, neurodegeneration, chronic inflammation and diabetes mellitus \[^8\].

Substantially, alongside the apparent creation of oxidative nucleotide deterioration to the mtDNA, the free radicals triggered cancers by different ways, involving settlement of hypoxia inducible factor (HIF)-α, raised the flux of calcium, inhibition of key phosphatases \[^9–11\].

Tumor cells energy demands

Formidable proof now proposes that the energy demands of fast reproducing tumor cells and primary cells are supported by the glycolytic metabolism and the cell differentiation with high energy requested maximize the utilization of mitochondrial respiration \[^12\]. Additionally, the irregular division of stem cells and cancer stem cells have high reproductive potency preferentially utilize glycolysis \[^13\].

Nonetheless, several cancer cell lines possess so high respiration averages, and raising proof supposes a convoluted relation between the energy metabolism of tumor cells with the tumor formation and progression \[^12–15\].

The Motivating metastatic tumor cells without mtDNA (r0 cells) cannot used their mitochondria for respiration develop in culture medium affixed with pyruvate and uridine, though their development is usually extremely slower than the growth of parental cells. These cells display raised cell surface oxygen consuming through their plasma membrane electron transport, a compensative passageway intellect to correct for the setting up of intracellular reductants in respiration obscurity \[^16\], an agent that requires to be taken into consideration in estimating glycolysis participation to total energy metabolism.

Mitochondrial Mutations redundancy and allocation

The difficulty in mutation detection of cancer mtDNA related to small differences linked with the organelles genome. Most significantly, the vicinity of ROS created through normal metabolic events elevated the danger of mtDNA disturbance and insecurity \[^17\].

The impact of ROS in the modifications of mtDNA is upheld via common raise in somewhat cancers of transitions at purines \[^18\], this deterioration, associated with low repair mechanisms comparative to the genome of nucleus, cause an mtDNA mutation range greater than the nuclear genome \[^19\].

Empirical proof supposes that the operation of endogenous mutational are more effect in the range of mtDNA mutation, as dissenting to the exogenous carcinogens such as environment chemicals and UV light \[^20\]. Two additional features are pertinent to explicate the mtDNA disparate redundancy and allocate.

At first, in the cell the mitochondria and their genomes are found in high copy numbers hundreds or thousands. Secondly, the mtDNA is matrilineal heredity in humans, thus there was single mtDNA haplotype but it shows Heteroplasmic pattern due to the impacts of numerous copies). The mutation of germline mtDNA was inherited from mother and are constitutively existed over the offspring. Moreover The Germline mtDNA disparate are valuable for defining individuals to particular haplogroups \[^21\], that able to thereafter be correlated to ancestral matrilineal relations \[^22\].

The haplogrouping can be utilized in relations characteristic among individuals and populations, several haplogroups consist of sequences pattern may be found participates to cancer tendency \[^23–24\], some mutation
in somatic cell manifest haplogroup transmutation \[25\], some types of mutation in mtDNA reflect specific pattern in cancer cells.

Many cancer mutation \[20, 26\] observed specific pattern of mutation landscape in mtDNA related to tumor. Though this latter tendency different to presented in the nuclear DNA, it does make germline patterns shaping primate mutation of mtDNA, mtDNA of human in general includes mutation hotspots in both rRNA and genes coding for protein synthesis, expressing synonymous, non-synonymous, and non-expressed sites, with minimal changes in tRNAs \[27\]. Whole-genome analysis of somatic mutations related to cancer reflects this relative frequency of mutation in divers kinds of sequence \[28, 29\].

The mutation in nuclear and mitochondrial DNA of cancer types are observed as heterogeneous \[20, 26\]. Moreover, the somatic mutations relative rate varying in individual cases was 13 - 63% according to types of cancer and disparate the mtDNA may be found throughout cancer types or exist only in single kind of tumor \[30, 31\].

Lee et al, reviewed a differences between allocate and kinds of somatic mtDNA mutations \[32\]; they clarified express the patterns arising as pertinent throughout tumor kinds. Some genes of mitochondrial have reported somatic mutations that may engaged in tumor initiation. Somatic mtDNA changes throughout cancer types, are riches with non-synonymous disparate compared to synonymous disparate \[29, 30\].

The mtDNA genes coding proteins related to the different complexes of the mitochondrial respiratory chain. The Com I called NADH dehydrogenase is encoded by 7 mtDNA genes \(ND1-6\), including \(ND4L\), its most repeatedly includes disparate correlated to tumorigenesis \(33\). Like \(ND5\) is hardened for somatic mutations \[28, 30, 34\], that may modify development of tumor \[35\].

The Complex III, only \(CYTB\) gene is encoded by mtDNA, includes lower authenticated somatic disparate. the bladder cancer is exception, where this complex is importantly more affected than the others \[36\] and deletion seven amino acid observed in populations that linked with bladder tumor progression in experimental work \[37, 38\]. The Com. IV cytochrome c oxidase have 3 genes expressed in mitochondria \(COXI-3\), researchers found that the mutations in \(COXI\) that linked to colorectal tumor may decrease expression or reduce the respiratory chain effects \[39\].

The Com V or ATP synthase consist of double genes located on mitochondrial DNA \(ATP6 and ATP8\). The \(ATP6\) gene observed to possess more predisposition to mutation than \(ATP8\) in breast cancer patient, which may exhibits alterations in energy metabolism among tumor cells \[40\]. Throughout genes coding proteins, modifications to Complexes I and IV found to be the most effective in stimulating tumor initiation \[41\].

The genome of mitochondria involves 22 tRNAs, constituting small ratio attribution of the nucleotide sequence. The Somatic mutations in tRNA are not redundantly authenticated in correlation to tumor in human, in spite of they are generally engaged in a various other defect in primary respiratory chain \[42\]. As a result of low ration in tRNA mutations that correlated with tumor, they symbolize to show changes to secondary structures \[26\] also the disparate may lead to instability and modified mitochondrial labor \[28\].

In similar manner, the two rRNA genes mutated expressed via mitochondria have high relatively harmful impacts than alterations to genes coding protein \[42\]; though, alterations to the rRNA were low happened. While the genic sites of the mitochondrial DNA are a sensible goal for appreciating tumor mutations, hyper changeable (HV) regions in the non-expressed mtDNA also express common mutational hotspots. the somatic and germline mutations in the mtDNA happened preferentially in two sites of this site, HV1 and HV2 \[43\].

The cancer Researches interested massively on the genetic disparate in D loop, its long segment of control region. Also the non-coding region observed in several animal mtDNAs and is formed by insertion third linear Strand DNA, Given the linkage between control region and the mitochondrial molecular processing, the D-loop mutation can effect in mitochondrial copy number and organization \[44\].

In cancer the mutation in D-loop are well-studied to all mtDNA cancer disparate. This site has large alterations rang to appreciate cell lineages progression
and reproduction [45]. In cancer the D-loop Mutations are also more exist [46], and large scale of somatic D-loop mutations linked to poor prognosis in breast cancer [47].

In spite of possible engagements of D-loop mutations in function of mitochondria in cancer, it is unclear whether these disparate are a causal or simply correlated phenomenon [45, 47, 48].

Genetic disparate natural Selection in Tumor initiation

The theory of cancer initiation is focused on the genetic disorder inn some genes called [49]. Later accumulation of mutation in the genome as a consequence of these disparate in oncogenes, resulted to scan of features identifying tumor progression [50].

The theory of somatic mutation, is hard to reconcile to authenticated mtDNA disparate linked to tumor [51]. Raising proof engaging the tumor risk of mitochondria, initiation, and development contributed to a growing information’s of cancer as a mitochondrial metabolic disease. This phenomena constructed from different suggestions including the natural selection, heteroplasmy, and the combined impacts of genetic modifications throughout the DNA. After the initiation mitochondrial mutations, disparate are subsequently submitted to various molecular, cellular, and population level operations [52].

The carcinogenic intuition via evolutionary operations, the mutations in the genome initiate, then submitted to the natural selection and/or genetic divergence. The impacts of choosing are commonly separated into two groups in tumor investigation: 1st clarifying the negative selection, mean that the harmful alleles are deleted from the population, 2ed the positive selection, mean the beneficial alleles raise in redundancy in the population (may be toward fixation). the mutations may be neutral and not pass to selective forces but stayed reproduce stochastically by drift. Many datasets and applications have been applied to screen for mtDNA mutations selection linked with cancer. In human history, the germline mtDNA mutations consider as a negative selection [53].

According to large samples number of mtDNA suggested that the mutations are submitted to same selective features, in any case of the initiate in normal or cancer cells [54]. The harmful mutations head to be choose against [55], in some healthy tissues alternately express positive selection on mtDNA somatic mutations. a positive selection in liver eliminated mitochondrial labor to reduce damage ensuing from byproducts of metabolism [56].

The mutations selection associated to cancer initiation, reflected of somatic mtDNA mutations through oncocytic cancer types reflects that disparate linked with cancer are indiscernible from random [57]. Meanwhile, a linkage has been found between the number of somatic mtDNA mutations and the patients endurance in breast cancer, with proof for both positive and deliberate negative selection for somatic missense mutations [28].

The mtDNA Scanning studies using metastases in bone represented statistically high variation than metastases in soft tissue and primary [58]. These studies, though apparently paradoxically, accumulatively focus the light on two points in the impact on mtDNA mutations in cancer: the 1st one, the time grade and discrimination of somatic from germline mutations matters, and 2ed, the manners of selection

Mitochondrial Modifications Clinical Translations in Cancer

While the association between the mutation in germline mtDNA and cancer hazard is well discussed overhead (section Mitochondrial Mutations redundancy and allocate), also studies found that mtDNA disparate can apprise cancer disclosure, curing, and prognosis. Due to the presence of mitochondria in large copy number within the cells and are clonal by nature, the have capability to assist in disclosure and detection of some cancer kinds [59].

The usage of mtDNA as a genetic marker not bordered to cancer, yet, as mtDNA disparate correlated to tumor also can be revealed in lower invasive bodily fluids [60], like the usage of urine to diagnosis the cancer in bladder [36]. Also involve the utilization of serum and aspirate fluids for colorectal and breast cancer, diagnosis respectively [61, 62].

Multiple researchers have observed the interest of
mitochondria utilization to cure the cancer\cite{17, 63, 64, 65–67}, even declaring that “comprehension the mechanisms of mitochondrial labor throughout tumorgenesis will be crucial for the next descent of cancer remedies”\cite{68}. According to apoptosis is a major participator in lowering tumor cells in addition to cell death restraint is mitochondrial organized, it logically pursues that the mutations in mtDNA may modify restrains to cancer remedy\cite{69}.

Actually, the case study observed that the mutation in ND4 in ovarian cancer may be causes resistance to chemotherapy\cite{70} also mutations in D-loop have been found that related to chemo resistance in patients with colorectal cancer\cite{71}. Finally the reduction in mtDNA components is related with prognosis enhancement in breast cancer patients subjected to anthracycline-based chemotherapy\cite{72}.

Absolutely, the contrast stand claims for mtDNA gene expression and mutations have confined clinical features, as in ovarian cancer\cite{73}. The association of individualized metabolic operations with myriad diversity in the mtDNA genome and nuclear persuades more work into the used of personalized medicine in curing cancer\cite{74}.

Association Mitochondria, epigenetics and Cancer

The modern cancer researches focused on the mitoepigenetics that mean the epigenetic organization like alterations of mtDNA gene expression and the symmetric interactions with the nuclear genome\cite{75}. The variation in mitochondrial methylation was observed among natural human tissues\cite{76}. Furthermore, allover-genome methylation is correlated with various human diseases, of which the cancer disease\cite{77}. These basic features resulted to an expectation that mtDNA epigenetic assortments able to enhance development of tumor. The impact of mitochondrial give a global manners of gene expression\cite{78} adds credence to a possible linkage between mtDNA copy number and methylation\cite{75}. Furthermore, a study observed a mechanism for this association a mitochondrial disrupt checkpoint may stimulate to remedy injured mitochondria, the mitocheckpoint could prospect change epi-genetic manners and genomic stability when the signaling happens between the nucleus and mitochondria\cite{79}.

These proofs accumulatively suppose the relation of mtDNA epigenetics to cancer, have several benefit formerly evidenced the usage of mtDNA methylation as a biomarker for diagnostic objectives\cite{75, 80}. Yet, potential relations and implementation have yet to be quite explored, particularly when we have shortage in the methylation quantity throughout tumor kinds and stages\cite{81}. Filling these hiatus in acknowledgement may help in bearing down preceding discordant proof among cancer kinds.

Injury of Mitochondria in Cancer

In spite of mitochondrial injury was assumed by Warburg to be an occasion of tumors and this judgment is remain boosted by several investigations, massive proof directs to complexes nuclear genetic modification, some of the mitochondrial labor, being the main cause of cancer with environmentally commanded epigenetic alterations participating in methods that still to be completely understood.

The mtDNA modification happen in most tumors because of the elevation mutation ratio compared with DNA in nuclear and indigent repair mechanics, the involvement mtDNA mutation in the cancer progression has been resides in only a plain number of cancers\cite{82–84}. Another injury in mitochondria due to the oxidative deterioration generated from sustained inefficient respiration and oxygen radical creation, not directly correlated to genome injury may also happen, but how this deterioration plays out in terms of cancer formation and development is still unclear.

Though, the little alterations that participate to rebalancing the energy metabolism toward glycolysis may do a role in tumor inception and development. Many articles authenticate a function of mtDNA mutations in formation of cancer and metastasis. As example, HeLar0 cells which do not form tumors after xenotransplantation were altered into malignant cells able of carcinoma inception by informing mtDNA with particular mutations\cite{85}.

The mtDNA mutation was also presented to be significant for the these cell metastatic tendency\cite{86}. Interestingly, Ishikawa and colleagues reciprocated around the mtDNA between metastatic and non-metastatic cells in breast cancer, after which the original
non metastatic cells initiated metastatic tumors and vice versa [87]. This robustly refers that several mutations in mtDNA, in addition to nuclear mutations, can be significant for metastasis.

**Conclusion**

The present review focused on the association between genius of mtDNA mutations and tumor throughout numerous cancer types. Some Common manner of mutation are explanation by evolutionary operations impacting the existence of these mutations, supplying a significant basis for mtDNA and cancer studies.

Present study recommended using best practices in estimating mtDNA modifications linked with tumor and suppose promising fields for a new research. Modifications to mitochondrial dynamics through tumorigenesis manage the total gamut of possibilities, metabolism, impacting biogenesis and virtually all other quarters of mitochondrial role.

to data concerning the somatic mutation in mtDNA correlated with tumor cumulate, it is clear that modification in the mtDNA contributed in tumorigenesis trigger while others simple fund with cancer develops. Mutations in nuclear-encoded genes, along with corresponding alterations to the cellular labor of ambient cells, could enhance additional mtDNA modifications or applies qualification to what alterations may reproduce.

Defining particular mutations valuable as genetic marker, for this reason, will crave wider sampling of mitochondrial genomes from varied tumor kinds at numerous phases of development, and cautious resolving to estimate the redundancy to mutation in tumor. Mitochondria related with normal and cancer cells show a microscopic tale of two cities. Mutation observed in each genomes, but different were be observed of cellular and molecular powers in the destiny of such disparate. This duality applies the chance to mark both basic acknowledgement of cellular labor and translational medicine.

Influence of Melatonin in the Treatment of Experimental Enterobius Vermicularis Infection

Shaimaa A. Shlash¹, Noor M. Hasnawi ², Hussein A. Kadhum³, Ali A. Al-fahham⁴

¹Professor / Pharmacy College / Kufa University, ²Research Scholar / Pharmacy College / Al-kafeel University, ³Research Scholar / Dentistry College / Al-kafeel University, ⁴Professor, Basic Medical Sciences Department / Faculty of Nursing / University of Kufa, Iraq

Abstract

This study aims to realization the conceivable therapeutic of melatonin effects experimental against Enterobius vermicularis in rats. Implement this experiment during the period from August 2019 to January 2020. E.vermicularis infected with male wistar rats orally with dose 15mg/kg melatonin former of body weight for 30 day showed significantly reduction in the number of eggs and worms compared with rats orally with dose 15mg/kg melatonin accompanying and untreated rats for 30 day (P < 0.05).Histologically in intestine examined show increase numbers of leucocytes produce, necrosis significant scatter and reduction this parasite of tissue in rats treated with melatonin. This results show influence of melatonin in the control on Enterobiosis and suggestion that this drug usefulness in Enterobius vermicularis infection therapy.

Keyword: Eggs, Worms, Enterobius vermicularis, Melatonin, Former.

Introduction

Enterobius vermicularis is helminthes more common human parasitic Nematoda infected the bowel but the children worldwide may reach to 40 million infestations in USA and Europe especially school students (¹). Infection may be associated with poor hygiene or behavioral environments in family overcrowded and orphanages where transfer the eggs pinworm from person to another by finger polluted or via anus into mouth directly may transmit by eat contaminated food indirectly (²). The clinical symptoms occurs because the migration of the gravid female worst at night when lays eggs lead to excitement, lack sleep, appetite and weight decrease, vomiting and abdominal pain (³).

There are many drugs can be help in eliminated on pinworm else will not be beneficial, most common drug is mebendazole family these killed the adult worms only addition to increased resistance these drugs wherefore need for the development of new methods for control and enucleate of the parasitic disease (⁴).

Recently studies suggests that melatonin immune enhance function through presence of melatonin receptor in immune organs, Melatonin is biological processes recurring naturally hormone synthesized in most the pineal gland to blood of mammals also is synthesis in deferent cells, tissues and organs like lymphocytes, skin, eyes and gastrointestinal duct (⁵). Melatonin has been examination studies in parasitic, virus and bacterial infestations (⁶). Act the melatonin to promote antigen display, phagocytic activities and production of monocytes (⁷). Melatonin have important immune-modulatory effects e.g. Plasmodium that hepatocytes colonies and red blood cells will causes in death of malaria through that melatonin have precursors derived from the tryptophan will calcium release and modulate the cell cycle of P. falciparum (⁸). The melatonin treatment with Schistosoma mansoni act on decrease oxidative injury and increase permanence of hamster infected (⁹).
The goal of this study to specify influence of melatonin drug against *Enterobius vermicularis* by examined in rats.

**Materials And Methods**

**Collection eggs of *Enterobius vermicularis***:

Eggs were collected from infected children of school in Al-Najaf city, gathered in anus they suffer from anal itching by transparent adhesive tape (10), these eggs incubation at 36ºC in wet flask for 5 days, most eggs were ivied released through vexation of the body, these eggs contained within larva notice circulation movement after three from incubated inside shell, some of them hatch naturally as expressed (11) kept unit used in the experiment.

**Preparation of Melatonin Solution**

Consider melatonin slightly soluble in water so used dimethyl sulfide and ethanol (DMSO/Germany) to dissolve. Take 2 mg / milliliter 99.9 DMSO-melatonin were prepared as stock solution (12).

**Preparation and Infection Animals**

90 male wistar rats were weight 100-110 g kept under light period 12h light and 12h dark where divided into three groups each group contain 30 rats were placed in plastic cages contain food and water with a floor furnished with sawdust, good ventilation and continuous cleaning of the cages, 500 eggs number within movement larva examined under microscopic were counted from eggs sedimentation by slide chamber, group one were 30 rats infected with 500 egg of *E.vermicularis* only orally as control without drug, group two (Former) were 30 rats inoculated melatonin pretreated for 7 days before the infection daily orally at dose of 15 mg / kg body weight where dissolved in distilled water then give oral 500 eggs for 30 day and group three (Accompanying) inoculated melatonin with eggs daily at dose of 15 mg / kg body weight give oral 500 eggs for 30 days. Three groups were examining the stool after 10, 20 and 30 days of infection by microscope.

**Histology Animals**

Rats were numbness with 2.5 pentobarbital and postmortem, intestine were reapers then inglorious 10 formaldehyde to make a histological section of the infection and treated, eosin-haematoxylin stain then examined by microscope in magnification of 100x (13).

**Statistical Analysis**

Results were calculated by analyses data the one way by ANOVA test and statistical significance between groups analyses when (P < 0.05).

**Results**

As shown in table (1), there is a significant reduce in *E.vermicularis* infection in rats treated with melatonin former at the dose of 15 mg/kg which were 1 and 0 for eggs and worms respectively, while there is a significant decrease in *E. vermicularis* infection in rats treated with melatonin accompanying at a dose of 15 mg/kg which were 21 and 10 for eggs and worms respectively, both after 30 day of treatment compared with control without treated were 390 and 495 for eggs and worms respectively after 30 day of infection. This may due to protective effect of melatonin is put off the appearance of disease, retard death and reduce the mortality rate.

LSD : Least Significant Difference
Discussion

Enterobiosis is a human intestinal parasitic disease caused by pinworm infects a lot of people especially children causes symptoms e.g. anal itching, painful or difficult urination, irritation, insomnia repeated infection causes weakened immunity and may lead to death in the absence of treatment (14). Because of resistance to conventional drug and repeated infection, must search for alternative drugs and low toxicity (15). In the present study used melatonin drug is suggested that can therapeutic differ agent like immune enhance functions, antioxidant effect, bacterial, fungi viral, and parasites infections, shown significant reduce *E. vermicularis* with melatonin former when dose 15 mg/kg were 1 and 0 for eggs and worms respectively while significant decrease *E. vermicularis* with melatonin accompanying when dose 15 mg/kg were 21 and 10 for eggs and worms respectively, both after 30 day of treatment compared with control without treated were 390 and 495 for eggs and worms respectively after 30 day of infection, this indicates that give melatonin former enhances of the immune response, as in Table 1.

This may due to protective effect of melatonin is put off the appearance of disease, retard death and reduce the mortality rate (16), these study consistent with (17) that melatonin have control through of experimental the *Trypanosoma cruzi* infection and lead to reduce the parasitemia levels in rats. Another reported by (18) that melatonin drug cellular immunity activity by increased production lymphocyte in *Toxoplasma gondii* infected in rats. As in other study show reduce *Leishmania* infection to 40 in hamsters infected during the when serum melatonin being high compare to animals infected when melatonin level being low, this indicates that melatonin receptors plays an important role in leishmaniasis treatment (19).

As shown in the current study, it have been seen in histological analysis for untreated section granuloma fashioning in the intestine, necrosis, adenoma and hemorrhage of the bowel (20).

There was a statistically increased numbers of leucocytes production which observed in both the accompanying and former melatonin treatment observation tissues necrosis scatter among regions and inflammatory cells sneak shrill comparison with *E. vermicularis* infection only (P < 0.05) may due to melatonin increased immune-modulatory activates and have ability on stimulate innate immune cells in positive attachment between melatonin and phagocytic efficacy with infected (21).

This study agreed with (22) showed that exogenously manage melatonin significant reduced the amoebic necrosis areas also increased of leukophagocytosis and number of the dead amoebae.

In other study *Trypanosoma brucei* parasite was given the melatonin infected rats make histological changes in pineal gland where caused in reduce plasma level which may due to release of inflammatory mediators and become not inroad cell (23).

Dynamic Changes in Salivary Cortisol and Protein among Dental Students

Shaimaa Hamid Mudher¹, Elham Hazeim Abdulkareem ², Hanaa Abdul Jabbar Saleh³
¹Lecturer Dr., Department of Oral Medicine, ²Assistant Professor Dr., Department of Oral and Maxillofacial Surgery, ³Lecturer, Department of Conservative, College of Dentistry, University of Anbar. Ramadi. Iraq.

Abstract

Background: Student assessments are the traditional methods of assessing academic success, and they are considered to affect one’s career. This study evaluated the levels of salivary stress biomarkers represented by cortisol and total salivary protein during final academic assessments of dental undergraduates.

Methods: Saliva samples were obtained, one before the exam another afterwards. Concentrations of salivary stress biomarkers were obtained by enzyme-linked immunosorbent assay (ELISA).

Results: Before the exam, the two parameters were dramatically higher than afterwards, with a substantial difference between the levels of salivary protein and cortisol (p=0.000, 0.000 consecutively).

Conclusion: Stress induced by academic examinations may increase the level of salivary stress biomarkers in the short term.

Keywords: Academic stress; cortisol; ELISA; saliva; salivary stress biomarkers

Introduction

Academic exams are considered to be among the most challenging experiences for students, since passing or failing typically has implications for career development. In particular, two primary systems or locations in the brain are involved in the stress response: the sympatho-adrenomedullary and system hypothalamus-pituitary-adrenocortical axis. Increased secretion of cortisol in the adrenal cortex occurs due to the activation of HPA. Therefore, salivary cortisol represents the activity of HPA and is a more effective assessment than blood collection in stress research, which can induce spurious increases in cortisol secretion, representing the hyper-stress component. A wide range of data has revealed that several kinds of psychological stress can result in HPA activation, leading to cortisol release and subsequently significantly higher salivary cortisol levels than resting baseline levels. The principal glucocorticoid in the human adrenal cortex is cortisol, which is synthesised from cholesterol. Higher levels of cortisol as a response to biochemical stress contribute to the well-characterised suppression of HPA related to health events and cognition. Salivary cortisol is present in a stable, unbound form and is the only fraction of hormones that display metabolic activity in combination with unbound plasma cortisol in the blood. Unbound cortisol reaches cells through passive diffusion due to lower of molecular weight and lipophilic nature, making it is possible to measure free cortisol in many body fluids. Up to 95% of secreted cortisol attaches to large protein molecules, like albumin and it is transported in the blood in the body. Salivary proteins have important functions, including the health of the oral cavity; the nutrition, survival and colonisation of microorganisms; and the adhesion and aggregation of microorganisms. Moreover, greater concentrations of total protein in response to stress lead to changes in saliva chemical properties, including oral surface adhesion or lubrication,

and viscosity. Stress levels vary in different areas of education and learning, and higher stress levels could undermine the cognitive functions and learning abilities of students. Moreover, the prevalence of depression, anxiety and psychological distress among medical students is increasing. To investigate this phenomenon, this study used salivary cortisol as a biomarker for stress assessment during academic examinations, with higher levels found prior to a written test and its anticipation. Many studies have reported a rise in stress hormones (levels of cortisol) in anticipation of stressful experiences, such as oral exams, cardiac surgery and dental treatment. Moreover, the response to physical or psychological stress in the body increases the cortisol secretion. Stress can be beneficial, of course, as it can boost drive and energy to get through stressful situations, such as examinations and work deadlines. Students face numerous academic problems in today’s highly competitive world, however, including exam stress, lack of interest in a class and failure to understand a subject. Exam stress is the feeling of fear or anxiety over one’s performance in examinations, and academic stress can increase students’ anxiety levels. Interest has been rising in identifying and using biomarkers in saliva as a more evaluative way to measure stress. The investigation of stress biomarkers has achieved recognition because saliva sample collection is standardised, non-invasive and easy to manage. Studies have shown that saliva can be used in chair-side tests for many oral and systemic diseases. Saliva is useful because of its many analytes that are affected by a variety of conditions and physiological and pathological stressors. Therefore, this study was designed to confirm salivary cortisol and total protein levels during psychological stress among undergraduate students in a dental college.

**Materials and methods**

From 2016–2017, a cross-sectional study has been conducted at the College of Dentistry, University of Anbar, Iraq. A total of 12 undergraduate students (6 males and 6 females) aged 21–23 years were randomly selected and recruited from different academic years to study. The study’s objective and protocol were explained to all the recruited students, and their voluntary consent was obtained prior to participation. Two unstimulated saliva samples were collected from each student. In order to decrease the presence of food debris and consequent salivation stimulation, students were asked not to eat and drink water only about an hour prior to sample collection. The first sample was taken 30 minutes before a written examination at 8:30 am, and the second sample was taken at 12:00 pm after the examination was complete. Each student was instructed to rinse his or her mouth to remove debris. De-ionised water was used to rinse the mouth, and the participants were then asked to spit for 5 minutes in a special sampling container. The container was labelled with a collection number (1 or 2), date and time. All salivary samples were centrifuged at 3,000 rpm for 10 min to isolate pure saliva. Total protein and cortisol concentrations were calculated using a special kit (SPINREACT, Spain) with an enzyme-linked immunosorbent assay, as directed by the manufacturer.

**Statistical Analyses**

The data analysis was performed using version 11.0 of SPSS. A *p*-value smaller than 0.05 was determined as statistically significant. To check for discrepancies in the categorical variables, a Chi-square test was used.

**Results**

A total of 12 dental students (6 male, 6 female) from different academic years were recruited for this research to measure their levels of total free salivary cortisol (ng/ml) and total protein content in saliva. As shown in Figures 1 and 2, both parameters were significantly higher before the exam than afterwards, with a substantial difference between salivary protein and cortisol levels (*p*=0.000, 0.000 consecutively).
Discussion

Saliva plays an important role in the maintenance of oral hygiene. Various studies have shown that salivation changes often occur due to stress. In this study, we correlated the levels of certain parameters in saliva with the stress induced by an examination in medical students. Protein levels in saliva were significantly higher before the examination than afterwards, a finding consistent with that of Nauvoma et al., who also showed a significant increase in protein concentrations in saliva immediately after stress exposure\(^\text{10}\). Another study by Al-Nuaimy et al. showed similar findings by estimating protein concentrations before an oral academic exam and after one month of holiday break\(^\text{11}\). To understand the mechanism behind this increased protein concentration, the activation of salivary glands as a sympathetic intervention during exposure to stress to control protein secretion has also been explored\(^\text{10, 12}\). The autonomic nervous system primarily controls protein secretion mainly by three salivary glands: parotid, sublingual and submandibular. The release of protein from the submandibular glands and parotid is elicited by stimulating the sympathetic system, and protein release from the sublingual gland is usually elicited by stimulating the parasympathetic system\(^\text{13}\).

We also measured free salivary cortisol levels during a stress condition before and after the academic exam. During chronic stress, alteration in cortisol levels is prominent. Cortisol is a stress hormone that is synthesised in the cortex of the adrenal gland\(^\text{14}\). As discussed earlier, the measurement of cortisol in saliva is superior to that in serum because a salivary assay enables the measurement of unbound cortisol.

We observed significantly higher cortisol levels in saliva before the academic examination in both males and females than afterwards, showing a direct correlation between saliva cortisol levels and stress.
Other studies have reported similar findings, indicating that training during medical courses causes higher incidences of psychological stress in students and that academic examinations are major stressors for students, likely because their performance affects their future careers\(^2\,\!15\). This increased stress leads to increased levels of cortisol\(^10,11,16\). The increase in cortisol levels is attributed to HPA axis activity, which is more intense during stress reactions. Hypothalamus-level stressors activate the secretion of CRH and AVP, which stimulate the frontal lobe of the pituitary gland to release adenocorticotroic hormone (ACTH). ACTH stimulates the synthesis of cortisol and its secretion in the adrenal cells. Stress reactions are exhaustive and damaging to the body; indeed, cortisol limits and minimises the catabolic and immunosuppressive effects of stress reactions through a negative feedback mechanism\(^17,18\).

This study therefore demonstrates that the stress of academic examination affected important components of saliva, including protein and cortisol, which decreased after the exam was over. This suggests that these levels are a short-term response to stress.

**Conclusion**

This study has shown increased protein and cortisol concentrations in saliva before the commencement of an academic exam, which decreased after the exam was over, suggesting that stress precipitates short-term changes in saliva composition. Higher levels of cortisol during an examination can reduce stress during the examination.

Abstract

**Background:** Cigarette smoking is the largest preventable risk factor for morbidity and mortality in developed countries. Healthcare providers who smoke are less likely to advise patients to quit smoking. Being a female and smoker adding more burdens on society.

The objective of the study is to assess the prevalence of smoking among Iraqi female medical provider. A descriptive cross-sectional study with an analytic element. Data collection was done via electronic questionnaire forms distributed online to contact list for 450 easy to reach female health providers (doctors, dentists, pharmacists) who work in different hospitals, PHCs and health institutes in Iraq. Nearly 15.3% of the samples were smokers, 53% of sample was 20-29 years while nearly 62% of sample was married. About two third of sample had bachelor degree (66.2) while nearly half of the sample (52.9) were doctors. Regarding the place of work about (55.6) of sample were working in hospital and the years of service were equally distributed between <5 years and >5 years. Nearly half of the sample has husbands or friends who are smokers. The smoking environment was significantly affecting the smoking status while there is no association between age, marital status, education, field of work, place of work and years of service. The percentage of female smokers among medical service providers is high, and female doctors got the highest rate. With regard to age, the age group between 20-29 was the highest among female smokers. The results also showed a higher percentage among those who work in hospitals, and the largest proportion of female smokers was among those who had spouses or friends who smoked.

**Keywords:** smoking, Iraqi female, medical provider

Introduction

Worldwide, tobacco use represents one of the major causes of death and the main preventable cause of lifestyle-related diseases, such as lung cancer, chronic obstructive pulmonary disease, and coronary heart disease (1). Smoking is a major preventable cause of morbidity and mortality (2). Smoking for anyone, at any age, is dangerous and can lead to preventable disease, and even death. But, for women, smoking carries certain additional risks (3). About 250 million women in the world are daily smokers. About 22 percent of women in developed countries and 9 percent of women in developing countries smoke tobacco. In addition, many women in south Asia chew tobacco (4). The tobacco industry promotes cigarettes to women using seductive but false images of vitality, slimness, modernity, emancipation, sophistication, and sexual allure. In reality, it causes disease and death. Tobacco companies have now produced a range of brands aimed at women. Most notable are the “women only” brands: these “feminized” cigarettes are long, extra-slim, low-tar, light-colored or menthol (4). Health care professionals play a prominent role in promoting tobacco control and smoking cessation programs. However, their smoking habits may prevent them from providing unbiased advice on smoking cessation and may even prevent them from being efficiently involved in cessation programs designed for patients (5). Physicians who smoke are less likely to advise patients to quit smoking. Also, it is less expected from them to assess patient’s will to refrain from smoking (6). This research throws a light on
smoking among female medical providers in Iraq, and aims to estimate its prevalence.

It is vital to assess health professionals’ smoking habits for two reasons. First, they have a direct effect on their health and wellbeing. Secondly, it has been shown that physicians who smoke tobacco are less likely to advise their patients regarding the health hazards of tobacco smoking (7).

**Methods**

A descriptive cross-sectional study with an analytic element. Data collection was done via electronic questionnaire forms distributed online to contact list for 450 -easy to reach- female health providers (doctors, dentists, pharmacists) who work in different hospitals, PHCs and health institutes in Iraq. The questionnaire included sociodemographic & occupational information’s of participants: age, marital status, no. of children, education, field of work, place of work, and years of service. Collected data were fed, statistically analyzed, presented using SPSS V.20.

**Results**

The distribution of the sample by sociodemographic variables is presented in table 1: About 53% of sample was 20-29 years old while nearly 62% of sample was married with nearly (69.1%) of the sample had number of children between (0-2). About two thirds of sample had bachelor degree (66.2%), while nearly half of the sample (52.9%) was doctors. Regarding the place of work (55.6) of sample were working in hospital and years of service were equally distributed between <5 years and >5 years. According to table 2: (15.3%) of the sample was smokers. Nearly half the sample has smoking husbands or friends. The smoking environment was significantly affecting the smoking status, while according to table 3 there is no statistical association between smoking with age, marital status, number of children, education, field of work, place of work or years of service.

Nearly half (53.6%) smokers reported enjoyment as the main reason for smoking, while non-smoking reasons for the majority (64.6%) were fear from health risks (table 4).

Vast majority of smokers (72.4%) were smoking any time, 55.07% of smokers were smoking at home only. Nearly half of the smokers have tried to quit. Regarding symptoms suffered, 31.9% have teeth discoloration, 18.8% have changes in mouth odor, and 16% have shortness of breath. Both dry mouth and night cough were encountered in 14.5%, while only 13% have voice changes.

**Discussion**

Tobacco smoking is responsible for >7 million deaths per year, nearly 80% of which occur in low- and middle-income countries\(^8\). The percentage of smokers among studied sample was relatively high compared to (1.9\%) and (13.2\%) in Hilla city/Iraq\(^9\) and India\(^10\) respectively.

Doctors show the highest percentage of smokers (50.7\%). While the higher percentage of smoking (52.7\%) was in (20-29) years old. This may be due to the fact the young female medical providers have liberal thoughts about smoking and do not consider it as stigma, besides the openness to neighboring countries, in addition to spending more time on internet. In this study the minority of the sample were postgraduate, this due to the fact that the majority of the sample were young in age. About (55.6\%) of the sample are working in hospitals this also can be due to the same reason which is the smallest age of the doctors, dentists and pharmacists the higher possibility of working in hospitals as interns or permanent resident. That is also applicable on years of service.

Coming to the smoking environment, it was the only significant variable associated with smoking status. This agrees with a study in USA in which they found that having two ever-smoking parents, in comparison to zero or one, was associated with higher nicotine dependence scores, cigarettes per day\(^14\) which may be explained by the strong influence of family and friends on customs and temperament.

The present study reveals that the higher percentage of smoking reason (53.6\%) was enjoyment. This agrees with a study in Saudi Arabia\(^12\). This may be explained by the fact that doctors’ life is stressful.

Regarding the smoking characteristics about (65.3\%) of smokers smoked cigarettes. About half of them smoked at any time while 55% smoked at home. Smoking at home is more convenient for female doctor’s giving privacy, and is more suitable than morning medical work, or afternoon clinic work. Nearly 55% of smokers have tried to quit. This is higher than a study in Armenia.

Coming to the side effects of smoking reveled in this study, the highest was (32\%) teeth discoloration, the rest of side effects were change of mouth odor, shortness of breath, dry mouth, night cough and voice changes.

Abstract

Background: Acute poisoning in children is a crucial pediatric emergency and may be a worldwide problem. This study aims to acknowledge the incidence of acute poisoning by household products in children regarding demographic factors, common clinical presentation and outcome of management.

Methods: this is often a descriptive retrospective study conducted on patients admitted to the Poison Control Centre of Ain-Shams University Hospital. The duration of the study was one year, from the beginning of January, 2016 till the top of December, 2016. the entire number of cases was 846 cases collected and analyzed regarding the demographic data, condition of poisoning, common clinical presentation, and management plan. Data was analyzed using computer software package SPSS 15.

Results: a complete of 846 cases were reviewed, the varied age groups involved ranged from but one year to 18 years, with a mean age of 10.22 ± 6.83 years. Most cases were females (67 %), living in urban areas (52.4 %) and therefore the majority of cases were accidental (74 %). the foremost common offending agent was pesticides (71%). Most of the patients were vitally stable on admission and therefore the commonest clinical presentation was gastrointestinal symptoms (31.3%). Most of cases received medical treatment within the inpatient wards (80.5%) and (96.7%) improved while (3.3 %) died.

Conclusions: Acute poisoning by household products is common among adolescents and pre-school age children. Pesticides were liable for the bulk of cases. Supportive and symptomatic therapy is that the main method for treatment.

Keywords: acute poisoning, children, household products, pesticides.

Introduction

Acute poisoning is a common situation in the emergency departments (EDs) all over the world and involves high medical attention and significant costs.¹ Childhood poisoning is a significant public health problem and a preventable cause of morbidity and mortality.²

The most important difference between pediatric and adult poisoning is types of agents. In adults, higher percentages of poisoning cases are due to psychopharmacologic drugs (sedatives, tranquilizers and antidepressants), whereas in children, there is a much higher frequency of exposure to household items and personal care products and plants.³

Many studies indicated that a variety of social and demographic factors like family size, socioeconomic condition, attention to child as well as storage place of poison are important risk factors which significantly influence the acute household poisoning cases in children.⁴

Accidental poisoning has a strong age predilection. This problem is particularly common in toddler and
Materials and Methods

This is a descriptive retrospective study. Data of all acute toxicity cases by household products among children (total number of cases was 846), who were admitted to the Poison Control Centre of Ain-Shams University Hospital (PCC- ASUH) during one year study period, from January, 2016 to December, 2016 were collected and analyzed. Cases were categorized according to age, sex, residence, time of poison exposure, manner of toxicity, type of poison, presentations, management plan and final outcome of the cases. Patients were divided into 4 age groups; these are infancy (< 2 years), preschool age (2-6 years), school age (7-12 years) and adolescents (13-18 years). Residence of the patients was also classified into urban and rural areas. According to type of poison, the patients were also divided into 4 groups; these are pesticides group, cleaning and disinfectant products group, hydrocarbons group and miscellaneous group. General management steps (ABCs), Specific measures like decontamination, gastric lavage, administration of activated charcoal and antidotes were also recorded. Data was coded and entered using the statistical package for Social Sciences (SPSS version 15). The data were summarized using a descriptive frequency and percentage for quantitative values. Relation between data grouped was tested by Chi-Square test for quantitative variables. Statistical differences (P-values) less than or equal to 0.05 were considered statistically significant. Data was collected after obtaining consent from the chef of the PCC of ASUH and from the ethical committee of scientific research, Faculty of Medicine, Beni-Suef University.

Results

This study was conducted on 846 children. The various age groups involved ranged from less than one year to 18 years, with a mean age of 10.22 ± 6.83 years. The adolescent age group had the greatest representation (52.7 %), followed by pre-school age children (37.5 %), infants (6 %), and school age children (3.8 %) figure (1). Females were more common than males (67 %) figure (2). Most of children were living in urban areas (52.4 %).

As regard the type of agents involved, the pesticides group was the most common (71 %) and was distributed as follows: rodenticides (66.4 %), insecticides (33.6 %). Followed by cleaning and disinfectant products group (18.9 %) which was distributed as follows: bleaches (70 %), sulfuric acid (15 %), carbolic acid (6.2 %) and flash (8.8 %). Then the group of hydrocarbons (5.2 %) showed that the cases of kerosene were 95.5 % and those of other hydrocarbons were 4.5 %. Lastly the miscellaneous group (4.9 %) and was distributed as follows: cosmetics and personal care products were 92.7 % and others were 7.3 % figure (3).

Regarding the manner of toxicity, the majority of cases were accidental (74 %) while suicidal poisoning was in (26 %). Accidental poisoning was more common than suicidal among all age categories and was more common in males (85.7 %) than females (68.3 %) while suicidal poisoning was more common in females (31.7 %) than males (14.3 %). Suicidal cases were reported only during Adolescence table (1). It was found that all types of household products toxicity was more common in females than males except for hydrocarbons group; males were more common than females (66 %) Vs (34 %) table (2).

Regarding the clinical manifestation, the most common clinical presentation was gastrointestinal symptoms (31.3 %) figure (4), neurological symptoms was in (22.3 %) of patients, respiratory symptoms (10.8 %), Cardiovascular symptoms (3.3 %), Multiple symptoms (5 %) and others (1.8 %).216 (25.5 %) patients were asymptomatic.

Most of the patients were vitally stable on admission and had normal serum sodium, potassium and blood glucose level at presentation time. However, hypokalemia was detected in (26.7 %) figure (5).

According to the place of admission, the study revealed that most patients received medical treatment in the inpatient wards (80.5 %) followed by the intensive care unit and those observed in emergency department without admission (15.7 % and 3.8 %) respectively table (3).
Treatment of cases mainly depends on supportive and symptomatic treatment, elimination of the poison from the body and the use of antidote if available. For airway and breathing, oxygen was used in (4.8 %), endo-tracheal tube was inserted in (5 %) and only (3.4 %) of patients were put on mechanical ventilation. For circulation, majority of patients received IV fluids (97.3 %), steroids (11.7 %) and dopamine (0.9 %). For symptomatic treatment, antibiotics were used in (0.2 %), anti-emetics (56.8 %), H2 blockers (29 %), bicarbonate (8.9 %), sedative hypnotics (1.9 %) and epanutin (0.1 %).

Regarding GIT decontamination and the use of physiological antidote, Activated charcoal was used in (5 %) of patients and Gastric lavage (13.1 %). Antidotes were given to treat 42.2 % of cases. Atropine was the most common antidote used in 26.5 % of cases, Toxoguonin (15.4 %) and NAC (0.3 %).

Regarding the outcome of the patients, (96.7 %) improved when received medical treatment and discharged while (3.3 %) died. The highest mortality was in hydrocarbons group (9.1 %) followed by pesticides group (3.3 %) then cleaning & disinfectant products group (2.5 %).

**Discussion**

The demographic data of the present study revealed a highly significant increase within the incidence of acute poisoning by household products among patients in Adolescence period aged 13-18 years (52.7%) followed by Pre-school group aged 2-6 years (37.5%) an equivalent as observed in other studies.6,2 the bulk of cases were females (67%), while males were (33%) this is often almost like other studies.7 Children belonging to urban areas were more exposed (52.4%) compared to those in rural areas (47.6%) this might flow from to the very fact that mothers in populated area are busier in their jobs and resulting in neglect of their child during this area. The toxic agents can also be more available within the cities than within the rural areas.8 this study indicated that the pesticides group was the foremost common explanation for poisoning (71%) followed by cleaning and disinfectant products group (18.9%) These results are approximately almost like other studies8. Regarding time of poisoning, most of poison cases were in evening (46 %) then afternoon (32 %) This agrees with other studies.10,11 Accidental poisoning was more common than suicidal among all age categories while suicidal poisoning was more common in females (31.7%) than males (14.3%). These results agreed with other studies.12 The bulk of patients were vitally stable. Gastrointestinal symptoms (vomiting, abdominal colic, diarrhea, dysphagia & hematemesis) were the foremost common symptoms (31.3%) followed by neurological symptoms (22.3%). These results are almost like previous study.5 The majority of patients had normal sodium, potassium and blood sugar level. However, hypokalemia was detected in (26.7 %).13 Most of patients received medical treatment within the inpatient wards (80.5%) followed by the medical care unit and people observed in emergency department without admission (15.7% and 3.8%) respectively.14 activated carbon was utilized in (5 %) of patients and lavage (13.1 %). Antidotes got to treat 42.2 % of cases. Atropine was the foremost common antidote utilized in 26.5 % cases, Toxoguonin (15.4 %) and NAC (0.3 %) (15). while 28 (3.3 %) of our patients died, (96.7 %) improved when received medical treatment an equivalent as observed in other studies.16

**Conclusion**

Acute poisoning is a crucial explanation for emergency unit admissions. The incidence of poison exposure was highest among adolescents and pre-school age children. Intentional poisoning was more common in older girls and accidental poisoning was more common in younger boys. Pesticides and household cleansing products were liable for the bulk of cases of poison exposure. Gastrointestinal symptoms were the foremost common clinical presentations in acute toxicity by household products. In most of cases, treatment was non-specific, including general decontamination and supportive-symptomatic therapy. The utilization of physiological antidote is restricted to pesticides toxicity.

Maternal Comorbidities Associated with Preterm Deliveries in Comparison with Full Term Delivery in Al-Zahraa Teaching Hospital in Al Najaf City

Shymaa Nema Hamed Alsaltani¹, Samer Nema Yassen Alkemawy²

Abstract

Background: Preterm birth is one of the major conditions that affect on infant mortality and morbidity, many of maternal comorbidities effect on the fetus outcome, in this study we evaluate some of maternal condition that effect on preterm birth and compare them with full term birth to know the most common factors associated with this condition to decrease the rate of preterm birth and reduce neonatal mortality and morbidity.

Methods: A case control study was conducted at first of April to thirty of September 2018, in Al Zahra Teaching Hospital in Al Najaf City, 300 delivered pregnant women were participated divided to 100 cases as preterm delivery women and 200 controls as full term deliver women enrolled in the study, maternal comorbidities were recorded and binary regression analysis was used for analysis of the study.

Results: The study show many significant association between preterm birth and maternal risk factors include, urinary tract infection (OR = 7.32), lower number of antenatal visit (OR=2.52), interval between pregnancy ≤2 year (OR =1.973), premature rupture of membrane (or =6.55), oligohydramnios (OR =6.55), gestational diabetes (OR =3.45), abruptio placentae (OR = 5.06) and previous preterm labor (OR=3.68).

Conclusion: Based on the results in the study the most determinants that affect on preterm birth were urinary tract infection, premature rupture of membrane and abruption placenta.

Keywords: Antepartum hemorrhage, Gestational Diabetes mellitus, Gestational Hypertension, Premature rupture of membrane, Preterm birth, maternal comorbidities, fetus outcome, oligohydramnios, abruptio placentae

Introduction

Preterm delivery defined by The World Health Organization (WHO) as infant delivered at time below 37 completed weeks of gestation. It was divided into the following categories depending on mother gestational age, extremely preterm (<28 weeks), very preterm (28–<32 weeks), moderate or late preterm (32–<37 completed weeks of gestation) [¹].

An about fifteen million babies are deliver too early every year. Nearly one million children die every year because of the complications of preterm birth [²].

Preterm birth (PTB) considered as a major cause of morbidity and mortality and its percentage are increasing with time in many countries [³, ⁴].
The majority of global preterm births occur in Asia and Africa with (85%), where the health systems are inadequate and weak [5, 6].

The rate of mortality, morbidity and the costs of Preterm labor are higher at lower gestational ages, in babies that survive, the risk is rise in form of short – and long term morbidity [7, 8].

Obesity may not directly lead to preterm birth [9] however; it may associate with diabetes and hypertension which are risk factors by them [8]. Marital status is also associated with risk for preterm birth [10]. Pregnancy outside of marital status was associated with a 20% rise in adverse outcomes [11].

Subfertility is another factor associated with preterm birth, Pregnancies after used in vitro fertilization confers a high risk of preterm birth after more than 1 year of trying [12].

A number of systemic maternal bacterial infections are associated with preterm birth this including pneumonia, appendicitis, pyelonephritis [13].

In study done in Iraq showed that risk of preterm birth increase with history of multiple pregnancy with (OR=7.5), history of cervical incompetence with (OR=4.7), and history of abortion with (OR=6.3) in comparison with pregnant women did not had previous history to such condition, heavy manual work with (OR = 1.70), and direct trauma to the abdomen (OR = 3.76) were also significantly associated with preterm birth [14].

A study done in Iran to measure risk factors of preterm birth found that history of preterm rupture of membrane, preeclampsia, and multiple pregnancies had increased risk of preterm birth with odd ratio equal 5.1, 4.6, and 17.4 respectively. In the same study the investigator found history of infertility and previous history of abortion were not statistically significant with preterm birth [15].

Another studies done in Ethiopia revealed that many factors associated with preterm birth include preterm rupture of membrane, maternal age more than 35 years old, poor antenatal care, and infection of pregnant women with HIV [16, 17].

A case–control study done in western part of China appeared that number of antenatal care four or less are more significantly associated with preterm birth with (OR=4) in relation to pregnant with adequate antenatal visit, while income of family, age of pregnant mother, and level of education were not significantly associated with preterm birth [18].

In Northwestern Russia study was investigate associations between preterm birth and selected maternal factors and found young pregnant with age (<18 years) or older (≥35 years), underweight, obese mothers, smoking status, abuse of alcohol and history of diabetes mellitus or gestational diabetes were more likely associated with preterm birth [19].

Approximately 45–50% of preterm deliveries are without cause, 30% are caused by (PROM) and other 15–20% is due to indicated or elective preterm deliveries. [20]

Although many years of research to determine the etiology, epidemiology, and management of preterm birth. The incidence of it has continued to increase. There are a lot of hypothesis found to explain the increase in preterm as a technology of assisted reproduction and the desire of obstetricians to use elective delivery of infant of pregnant in whom medical, fetal, or obstetrical complications happen preterm [21, 22, 23, 24].

Subjects and Methods:

Study design:
A case control study.

Study setting and time:
Study was carried out in Al Najaf city and data were collected from post delivery ward in Al-Zahraa Teaching Hospital which is a major teaching and referral hospital for obstetrics and gynecology receive pregnant from central and peripheral area, handles with uncomplicated and complicated deliveries, data collected in period between 1st of April 2018 to 30th of September 2018.

Sample size:
To achieve the aim of the study, a case control study use with sample size calculated according to equation below:
Sample size=
\[
\frac{r+1}{r} \frac{(P^r)(1-P^r)(Z_\beta^2 + Z_\alpha^2/2)}{(P_1-P_2)^2}
\]

Data collection:
The inclusion criteria include:
- Female at reproductive age 15-45 years.
- Singleton pregnancy determined by ultrasound.
- Pregnant know her LMP or had U/S at 1st trimester.

Exclusion from this study:
- Multiple gestations.
- Those who are using assisted conception.

Statistical Analysis
Data were entered, and analyzed using the statistical package for social sciences SPSS version 25.

Results
The parity of the women in both study groups showed no significant association between both groups, 34% vs. 26.5%, respectively in nulliparous women, and 66% vs.73.5% respectively in multiparous women (P = 0.224) with CI 95% of OR=(0.84 - 2.40).

The interval between pregnancies was 2 years or less in 44 women (66.7%) out of the 66 parous women (parity one or more) in preterm group and it was more than 2 years in the remaining 22 (33.3%), while the corresponding frequencies in the term group were 74 (50.3%) and 73 (49.7%) out of 147 parous women in this group respectively, statistically significant difference had been found (P= 0.027) (OR=1.97). History of preterm labor was significantly frequent in preterm than term group, 24.2% and 12.9%, respectively, (P=0.039) with (OR=2.15).

Previous cesarean sections (CS) was not significantly different between studied groups, 37.9% in preterm and 36.1% in term group, (P>0.05), CI 95% of OR= (0.59 - 1.97).

Number of antenatal visit was significantly lower in preterm than term group (P=0.037) where 21% of women in preterm had no antenatal visit compared to only 14% in the term group, additionally, 35 women (35%) in the preterm group had 1-3 visit compared to 58 (26.5%) in the term group while 44% preterm women and 59.5% term women had 4 or more visits. All findings regarding the obstetrical history of the studied groups are demonstrated in (Table 1).

*Primi women were excluded from calculation
In (Table 2) no significant differences had been observed between both groups regarding the mode of delivery or the sex of the neonate, (P>0.05) with CI 95% of OR= (0.75 - 2.02) and (0.41 - 1.08) respectively. Furthermore, all neonates in preterm group had birth weight of < 2500 gm. compared to only 6 (3%) in term group with a statistically significant difference (P<0.001).

Table 3 shows the comorbidities reported in both studied groups; where no statistically significant differences had been found in the frequency of chronic hypertension; 3% vs. 1.5%, (P>0.05), CI 95% of OR=(0.46 - 11.76) , gestational hypertension found in 14% and 11% of preterm and term groups, respectively, (P>0.05), CI 95% of OR=(0.72 - 3.04). Preeclampsia/eclampsia status was significantly more frequent in preterm group, (8%) compared to only (0.5%) in term group (P = 0.001) with (OR=18.56). Presence of cardiovascular disease was not significantly different between the studied groups, (P>0.05). Preexisting diabetes mellitus was not significantly different between both groups, (P>0.05), CI 95% of OR= (0.11 - 13.14), while gestational diabetes mellitus was significantly more frequent in preterm group (19%) than term group (10%), (P=0.001) with (OR=4.46). Frequencies of thyroid diseases and anemia were not significantly different between both groups (P >0.05) , CI 95% of OR= (0.22 - 8.33) and (0.67 to 1.76) for hypothyroidism and anemia respectively. Frequency of antepartum hemorrhage due to abruptio placentae was significantly higher in preterm than term group; 27% vs. 6%, (P=< 0.001) (OR=6.07) , APH due to placenta previa was not significantly different between groups, 7% in preterm and 5% in term group (P>0.05), CI 95% of OR=(0.69 - 5.16). Preterm rupture of membrane was significantly more frequently occurred in preterm group, (25%) than in term group (15%) (P<0.001) (OR=21.89). Polyhydramnios amniotic fluid status was not significantly different between both groups (P>0.05), CI 95% of OR= (0.56 - 6.39) while oligohydramnios was significantly more frequent in preterm than term group, 15% vs. 6%, respectively (P = 0.016) (OR=2.48).

Cervical incompetence was significantly more frequent in preterm group, (11%) compared to only 3% in term group, (P=0.005) (OR=4). Uterine abnormalities were not significantly frequent in preterm compared to term group, 2% vs. none, respectively (P=0.209). No significant difference between both groups in the presence of genital infection (P>0.05), CI 95% of OR= (0.57 - 1.49). Finally, higher proportion, 62%, of women in preterm group had (UTI) compared to 21.5% among women in term group, the difference was statistically significant, (P<0.001) (OR=5.96).

Further analysis had been performed to assess the predictor factors of preterm labors, therefore, the factors that appeared to be significantly different between both groups were entered as independent factors (covariates) in
the bivariate regression analysis, and the status of birth (term or preterm) used as dependent variable and the test was run. Results of binary regression analysis and odds ratio (OR) are shown in (Table 4), where eight factors still significant and were the predictors associated with preterm labor after adjustment of other variables; these are interval between pregnancies less than 2year (OR = 1.973), previous preterm labor (OR= 3.68), lower no. of antenatal visit (OR =2.52), gestational diabetes mellitus (OR = 3.45), Abruptio placenta (OR = 5.06), preterm rupture of membrane (OR =6.55), oligohydramnios (OR = 3.53) and urinary infection (OR = 7.32), in all these factors, (P<0.05). Other factors showed no significant association (P>0.05).

Discussion

In current study there is no significant association between PTB and parity, similar result present in Iraq [14], other study done in Iran had different result [25]. Also study done in Cairo found mothers with first baby had higher risk of preterm birth with (p=0.018) [26]. Other study done on preterm births which found that nulliparity is an important risk factor for preterm delivery in South Nigeria [27]. The discrepancy of finding in different countries may be attributed to the difference of the factors between the countries.

Interval between pregnancies of ≤ 2 year was found 2 fold more likely to cause PTB. This agree with study in Iran [25], these presentation may suggest that increase spacing between pregnancies could help to prevent the adverse pregnancy outcomes [28], while in Palestine no association present between PTB and interval between pregnancy [29].

The study also revealed a significant association of cervical incompetence and previous preterm delivery to cause PTB and this agree with study done in Palestine [29], and this could be the fact that the cervix is unable to maintain pregnancy to term.
In this study there is a significant association between number of antenatal visit (no visit) and the PTB in which 21% of preterm mother had no antenatal visit in comparison with 10% of full term mother, this agree with study done in Iran, with (p0.036) \[25\]. In a study done in Nigeria on the determination of preterm births, no booking of pregnant women in antenatal care program was found to be one of the strong determinants\[30\], while different result present in Kenya that found no association with preterm birth and attendance to antenatal care (p=0.621)\[31\].

The current study also investigate the possible association of preterm birth and history of HTN, in which preeclampsia/eclampsia was 19 fold more likely to cause PTB, while chronic and gestational hypertension not significantly associated with PTB, this agree with result in Iran found that the risk of preterm labor in mothers suffering from preeclampsia is 4.6 times higher than in other mothers\[32\]. Also other study in Tehran found preeclampsia and gestational HTN strongly associated with preterm birth\[33\]. Study done in japan demonstrated that the risk of preterm labor is higher in mothers suffering from preeclampsia or chronic hypertension \[34\]. The chronic and gestational HTN not appear as a risk factor this may attributed to well control of HTN in participant women.

In this study, from a statistical significance viewpoint, anemia was not associated with PTB p-value= (0.734), this agree with study in Palestine (p value=1.0) \[29\],also with study in Iran (P= 0.47) \[25\]. Disagreement appears in study done in Ethiopia \[35\] and in Cairo\[26\], the difference in significance of result may be attributed to degree of severity of anemia in studied women.

Previous cesarean section not significantly associated with pregnancy outcome (p=0.798), regarding to uterine abnormality, in this study was no statistically significant (P < 0.209) with PTB, and this result different from study done in Tehran\[33\]. Also no significant association between cardiovascular disease with (p=0.157) and thyroid disease (hyperthyroidism, hypothyroidism) with (p=0.208, p=0.889) respectively and pre term birth. No association in these factors may be due to need larger sample and more early investigations and fellow up.

The effect of gestational diabetes, it 4 fold increase risk related to preterm outcome p(0.001) while preexisting diabetes not significantly associated with preterm birth with (p=0.618). This agree with study done in china, found GDM is a significant risk factor with (OR=3.441) \[36\], and disagree with study done in Frances that found, pre-existing diabetes was strongly associated with PTB as a comparison with gestational diabetes \[37\]. In study done in al Mosul, no significant association present between diabetes mellitus and preterm birth \[14\]. In this study the preexisting diabetes not a risk factor, this my due to small number of participants detected .

Regarding antepartum hemorrhage the study found a significant association between placental abruption with preterm delivery, in contrast with placenta previa in relation with preterm delivery. Results also agree with study done in Iran that found no significant association between placenta previa and preterm birth \[25\]. Other study done in Palestine appeared that placenta abruption and placenta previa were found to be a significant risk factors for preterm birth\[29\]. In Nigeria study found a complication of pregnancy including antepartum hemorrhage was significantly associated with preterm birth \[38\]. Other research in Mosul reported that antepartum hemorrhage was not considered as a risk factor for preterm birth \[14\]. Placenta previa not significantly affect preterm this may attributed to the type of placenta previa like in study done by Dola et al. Found that preterm birth was more happened in pregnant women with complete placenta previa\[39\].

**Conclusion**

- Maternal Urinary tract infection is a significant factor effecting PTB, fellow by PROM and abruptio placentae.

- There is a strong association between preterm birth and oligohydramnios, gestational DM, no antenatal visit, previous preterm labor and short interval between pregnancies.

Abstract

Background: Indonesia started to implement the Shorter Regimen (STR) since 2017, but not all of MDR/RR-TB patients were treated with STR until the end of treatment. The presence of side effects of one or several drugs in the STR and the resistance to fluoroquinolone and or 2nd line injection drug after starting treatment caused a switch in regimen from STR to a longer regimen. This study was conducted to evaluate the factors that caused switch STR to the longer regimen.

Methods: This was a descriptive study in MDR/RR-TB patients who received STR from October 2017 to December 2019. Patients who switch their regimen were analyzed and determine the factors cause of switching STR to a longer regimen.

Conclusion: The major cause of switching was due to the presence of resistance to fluoroquinolone and 2nd line injection drugs and incidence of prolonged QT. A diagnostic rapid test such as the line probe assay 2nd line TB drugs is absolutely a screening tool to determine MDR-TB patients, pre-XDR-TB or XDR TB as soon as the regimen is given. Monitoring and efforts to overcome prolonged QT side effects are also needed to prevent switch regimens that can affect the patient’s psychological condition.

Keyword: Shorter MDR/RR-TB Regimen, MDR-TB Longer Regimen, Switch Regimen

Introduction

Multidrug-resistant tuberculosis (MDR-TB) is a public health crisis. Indonesia is one of 30 countries with the highest MDR or Rifampicin Resistant (RR)-TB cases in the world with 24,000 cases.¹ MDR-TB defined as TB caused by strains Mycobacterium tuberculosis that are resistant to at least isoniazid and rifampicin.² The treatment of MDR-TB is challenging. Patients with MDR/RR-TB are treated with a different combination of 2nd line drugs, usually for 18 months or more. Its long duration is associated with high cost, greater incidence of adverse reactions, and a high rate of lost-to follow up.³ Therefore, the finding of a shorter regimen (STR), more effective, lower-cost treatments for MDR-TB remains a priority. WHO updated its treatment guidelines for drug-resistant TB in May 2016 and included a recommendation on the use of the shorter MDR-TB regimen under specific conditions.³

Unfortunately, not all of STR patients were treated with STR until the end of MDR-TB treatment. The presence of drug side effects and the DST (drug
susceptibility test) results that showed resistance to fluoroquinolone and 2nd line injection drug (SLID) after the starting treatment caused a switch in regimen from STR to the longer regimen.

If phenotypic DST result shows resistance to fluoroquinolone and SLID, it must be reviewed and switched to the longer treatment regimen and also in consideration of using new drugs (bedaquiline, delamanid). Patients with QTc prolongation from baseline also concerned to decrease Mfx dose to 400 mg or may switch to drugs with a least cardio-toxic side effect.4 Programmes and their stakeholders using the standardized shorter MDR-TB regimen should intensify clinical, safety and microbiological monitoring in order to rapidly switch patients to new longer MDR-TB regimens upon first signs of non-response, ototoxicity or drug intolerance and also upon the first signs of non-response or drug intolerance.5

At present, no evidence exists on the effects of implementing the STR in the medium and long term. Information is missing on the regimen’s efficacy under programmatic conditions, the durability of its effectiveness (eg, no additional drug resistance generated), and its potential to increase numbers of patients who are ineligible for treatment because of additional resistance.6 No studies have reported the number of MDR/RR-TB patients who switched their regimen from STR to longer regimen. This study was conducted to evaluate the factors that caused switch STR to a longer regimen.

Material and Methods
A study conducted from October 2017 to December 2019 in Dr. Soetomo Hospital Surabaya, Indonesia. Based on the medical records, all RR-TB cases both new cases and previously treated cases diagnosed based on geneXpert included in this study. MDR-TB was defined as resistant to rifampicin and isoniazid. RR-TB was defined as resistant to rifampicin based on geneXpert and as the first diagnosis of MDR-TB. As most rifampin-resistant isolates are also resistant to isoniazid, rifampicin-resistant can be used as a marker for MDR M. tuberculosis7 and as the program policy for all RR-TB were directly treated with MDR regimens without waiting for the results of 1st line TB DST. Patient’s medical history, laboratory, chest X-Ray, and phenotypic DST results to the constituent drugs were analyzed to determine their eligibility for a shorter treatment regimen. Patients who switch their regimen during treatment were analyzed and determine the factors cause of switching STR to a longer regimen.

Findings
There were 224 MDR/RR-TB patients who received STR in this study with a mean age of 44.61 years old. There were 134 men and 90 women in this study as presented in table 1.

Of the 224 MDR/RR-TB patients who received STR, 40 (18%) were switch their regimen to longer regimen because of the presence of prolonged QT, resistance to ofloxacin (Ofl), resistance to kanamycin (Km), resistance to amikacin (Amk), adverse effect of increased serum creatinine, intolerance to Km and Cm, and adverse effect of hepatitis as presented in table 3.

Of the 16 MDR/RR-TB patients who switch their regimen caused by prolonged QT, it was found that the average of potassium level was decreased, 4.06 mmol/l at the baseline test to 2.92 mmol/l when presence prolonged QT. This was presented in table 4.

</tr>
</tbody>
</table>

Adverse effects of shorter regimen caused switch to longer regimen also occurred in some patients, 2/224 (0.9) switched their regimens because of increased serum creatinine and 1/224 (0.5%) because of hepatitis. Intolerance to Kanamycin and Capreomycin also caused the switch to longer regimen in 1/224 (0.5%) patient. This result suggested that allergy test before determining shorter regimen is critical to prevent the switch of regimen.

Based on the history of previous TB treatment, of the 20 patients who switch to a longer regimen caused by the presence of resistance to Off, Km, and Amk, 4 (20%) were new cases and 16 (80%) were previously treated cases. This was presented in table 5.

Discussion

There were 224 MDR/RR-TB patients who received STR in this study, consisted of 134 men and 90 women. In Indonesia, TB is significantly more common among men than among women.8 Previously treated cases was 172/224 (77%) and new cases was 52/224 (23%) in this study. Previous anti-TB treatment was by far a strong predictor of drug resistant.9 Globally at the world level, it is estimated that there are 484,000 RR-TB cases in 2018 with a composition of 3.4%, new cases and 18% previously treated cases. In Indonesia, the percentage of new cases of MDR/ RR-TB is 2.4% and previously treated cases are 13%.1 At the Dr. Soetomo hospital since the programmatic management drug-resistant (PMDT) was implemented from 2009 to April 2019 there were 1,080 MDR/RR-TB patients with 94 (8.6%) new cases and 995 (91.4%) previously treated cases.10 Previously treated TB patients were 8.1 times more likely to develop an MDR-TB infection compared with newly diagnosed TB patients.11

MDR/RR-TB patients from recurrence cases was found higher with 94/224 (42%) in this study. Recurrence cases terminology was used due to an uncertain whether it was re-infection or relapse cases. According to several studies, recurrent TB patients are defined as patients who have previously been treated for TB, were declared cured or treatment completed at the end of their most recent course of treatment, and are now diagnosed with a recurrent episode of TB (either a
true relapse due to reactivation of the disease or a new episode of TB caused by a new strain of *Mycobacterium tuberculosis* or reinfection).12,13 Bacteriological relapse is defined as the reappearance of bacterial activity in a patient who has followed and completed a correct treatment and, therefore, been cured of TB. However, there can be a certainty that a patient has completed all their medication only when treatment administration is directly observed. If the treatment was not supervised, the authenticity of a relapse can be questioned. A study by Shen et al., 2017 conducted in China reported that there were 5.3% (710/13,417) of successfully treated cases had a recurrence and among 141 recurrent cases that had paired isolates, 59 (41.8%) were indicating reinfection and 82 (58.2%) were relapsed.14

Our study found 40/224 (18%) MDR/RR-TB patients who switched their regimens from shorter regimen to longer regimen. 20/224 (9%) MDR/RR-TB patients switched their regimens caused by the presence of resistance to fluoroquinolone (FQ) and or 2nd line injection drug (SLID). Resistance to Ofloxacin were 17/224 (7.6%) and resistance to Kanamycin and or Amikacin were 3 (1.3%). These patients were diagnosed with pre-XDR/XDR-TB according to drug susceptibility test (DST). Extensively drug-resistant TB (XDR-TB) defined as MDR-TB plus resistance to a fluoroquinolone and at least one 2nd line injectable agent: amikacin, kanamycin and/or capreomycin, pre-XDR-TB defined as MDR-TB plus resistance to a fluoroquinolone or one 2nd line injectable agent: amikacin, kanamycin or capreomycin.2 Pre-XDR/XDR-TB patients were not eligible to receive STR because STR was recommended by WHO only for MDR-TB patients. Of the 20 patients who switch their regimen due to resistance to FQ and or SLID, 16/20 (80%) of them were previously treated cases. WHO guideline (2016) stated that until more evidence is available, WHO recommends that the shorter MDR-TB regimen not be used in patients who have been previously treated with 2nd line drugs for more than one month or who have documented or are likely to have strains resistant to medicines in the regimen. Preferably, resistance to at least fluoroquinolones and the injectable agent used in the regimen is excluded before starting treatment by in vitro testing. In the absence of such testing, patients who are highly unlikely to be infected with resistant strains based on history of exposure, use of 2nd line medicines at country level or recent representative surveillance data may also be eligible for the shorter MDR-TB regimen.3

There were 16/224 (7%) MDR/RR-TB patients switched their regimens because of the presence of prolonged QT. Moxifloxacin (Mfx), one of drug in STR was considered to cause prolonged QT. There is evidence that Mfx is more likely to cause both QTc prolongation and a longer QTc prolongation than the other fluoroquinolones (FQs), although it is also the FQ likely to be most effective against MDR-TB. The risk of QTc prolongation with the FQs is higher when there are electrolyte abnormalities and when other QTc prolonging medications are used.15

However, the previous study reported that in adults with pulmonary TB without any cardiac risk factors, Mfx 400 mg given daily for up to 4 months did not cause an increase in the QTc interval. The study indicates that Mfx, at a dose of 400 mg given once daily, is well tolerated and without any adverse cardiac events.16 In this study, Mfx was given as national program: bodyweight <30 kg with 400 mg, 30-50 kg with 600 mg, and >50 kg with 800 mg. A study of clinical trial reported that moxifloxacin was well tolerated and not associated with increased risk of adverse reactions including prolonged QT. The study suggests that moxifloxacin could be safely used for even longer periods, though this needs to be confirmed in additional studies that are large enough to detect small but important rates of toxicity.17 A study in London also reported that Mfx is well tolerated in treating TB.18

The mean value of potassium level at the baseline test in patients who switch their regimen caused by prolonged QT was 4.06 mmol/l. This level decreased to 2.92 mmol/l along with incidence of prolonged QT. This result showed that most of patients who experienced prolonged QT were also experienced hypokalemia. Hypokalemia was defined as serum potassium level of <3.5 mmol/l. A study in France reported that hypokalemia seems to be one of the most important risk factors for QT prolongation.19

**Conclusion**

There are 40/224 (18%) MDR/RR-TB patients who switched their regimen from shorter regimen to longer regimen. The major cause of switching in this study
is due to the presence of resistance to fluoroquinolone and 2nd line injection drugs and incidence of prolonged QT with 20/224 (9%) and 16/224 (7%), respectively. A diagnostic rapid test such as the line probe assay 2nd line TB drugs is absolutely a screening tool to determine MDR-TB patients, pre-XDR-TB or XDR TB as soon as the regimen is given. Monitoring and efforts to overcome prolonged QT side effects are also needed to prevent switch regimens that can affect the patient’s psychological condition as a result of treatment, which must be started again using the longer regimen.

Abstract

The study aims to learn the efficacy combination of *Phyllanthus niruri* and *Andrographis paniculata* to improve the performance of laying hens infected with *Escherichia coli* pathogen. Fifty laying hens of Isa Brown strain were randomly divided into 5 treatments, each treatment was divided into 10 replications (n=10). Treatment P0- (control group without infected), P0+ (hens group infected with Avian Pathogenic’s *Escherichia coli* without given extract), P1 (hens group infected with Avian Pathogenic’s *Escherichia coli* with 10% *Phyllanthus niruri* extract and 30% *Andrographis paniculata*), P2 (hens group infected with Avian Pathogenic’s *Escherichia coli* with 20% *Phyllanthus niruri* extract and 20% *Andrographis paniculata*) and P3 (hens group infected with Avian Pathogenic’s *Escherichia coli* with 30% *Phyllanthus niruri* extract and 10% *Andrographis paniculata*). Performances observed were feed consumption, Hen Day Production, eggs weight and feed conversion. Data analyzed by ANOVA and tested with the F test. The feed consumption showed in P1 was different from P3, P2, P0+ and P0-, P1 was different from P2 but not with P3, P0+, and P0- showed significantly different in each treatment. In P3 showed no differences with all treatments. The eggs weight showed different in P0+ for all treatments, while the other treatments in P1, P2, P3 and P0- showed no differences. The feed conversion showed in P0+ was different for all treatments, while other treatments showed no difference. P0+ treatment compared to (P0-, P1, P2) was significantly different, P0+ treatment compared to P3 treatment was not significantly different, between P3 and P1 treatment was not significantly different, and between P1 and P2 with P0- was not significantly different, also between P3 with P2 and P0- treatments was significantly different. Supply of *P. niruri* extract, and *A. paniculata* in laying hens can improve the performance of laying hens infected with *Escherichia coli* pathogen.

**Keywords:** *Phyllanthus niruri, Andrographis paniculata, performance of laying hens, Escherichia coli*

Introduction

The Laying hens are susceptible to colibacillosis which is caused by avian pathogenic *Escherichia coli* (APEC) as a primary or secondary agent. Colibacillosis causes growth problems, decreased production, increased number of abandoned chickens, decreased quality of carcasses and eggs, and supports the emergence of complex diseases of the respiratory, digestive and reproductive tracts which are quite difficult to treat⁴. The use of antibiotics in APEC really needs to pay attention toward the different sensitivity characteristics of *Escherichia coli* serotypes, some *Escherichia coli* serotypes are resistant to several antibiotics⁵.
Safe handling of bacterial diseases is to use medicinal plants. Indonesia as a tropical country has wealth of plants that have potential to become medicine. *Phyllanthus niruri* and *Andrographis paniculata* are plants that can be used as prevention and alternative treatment for APEC[3]. *P. niruri* is a plant that belongs to the genus *Phyllanthus* known as *P. niruri* which has antibacterial activity against APEC. *P. niruri* contains several chemical substances such as lignin, flavonoid, alkaloid, terpenoid, saponin and tannin[4]. *A. paniculata*’s constituent active compounds are lactone, tannin, saponin, alkaloid, flavonoid, and andrographolide which can increase immunity. The content of Andrographolide in *A. paniculata* can interfere the transfer pathways of viral and bacterial genetic material so it is effective against infectious agents[5].

This study aims to learn the efficacy combination of *P. niruri* and *A. paniculata* to improve the performance of laying hens (in the form of feed consumption, Hen Day Production, egg production, and feed conversion) infected with *Escherichia coli*.

**Materials and Methods**

The fifty laying hens of Isa Brown strain were randomly divided into 5 treatments, each treatment was divided into 10 replications (n=10). Treatment P0- (control group without infected), P0+ (hens group infected with Avian Pathogenic’s *Escherichia coli* without given extract), P1 (hens group infected with APEC with 10% *P. niruri* extract and 30% *A. paniculata*), P2 (hens group infected with APEC with 20% *P. niruri* extract and 20% *A. paniculata*), and P3 (hens group infected with APEC with 30% *P. niruri* extract and 10% *A. paniculata*). Performances observed were feed consumption, Hen Day Production, egg production, and feed conversion. Data analyzed by ANOVA and tested with the F-test.

* Different superscripts in the same column show significant values (p <0.05)

Based on ANOVA statistical analysis, there was significant difference in feed consumption (p <0.05), then continued with Duncan test with a significant level of 5% to compare the differences obtained in other treatments. The results of Duncan test showed that P1 was different from P3, P2, P0+ and P0-, P1 was different from P2 but not with P3, P0+, and P0- showed significantly different in each treatment. P3 showed no differences with all treatments.

*P. niruri* and *A. paniculata* contains tannin, flavonoid, saponin dan alkaloid compounds[6]. *P. niruri* contains terpenoid, flavonoid, alkaloid, saponin and tannin compounds. According to Gunawan immune cells to increase the immune system[7]. Flavonoids inhibit the function of cell membrane by interfering with the peptidoglycan constituent components in bacterial cells so that the cell wall layer is not formed completely which causes cell death[8]. Alkaloids in *P. niruri* are alkaline compounds containing nitrogen atoms that function as antimicrobial, antimalarial, antiarrheal and antidiabetic. Alkaloilds work by destroying the peptidoglycan constituent components in the bacterial cell wall and inhibiting the synthesis of nucleic acids, thereby inhibiting the energy metabolism of bacterial cells[9]. Saponins are antimicrobial, these compounds can reduce the surface tension of the cell walls which causes the cell walls to lysis and eventually bacterial death[10]. Tannin compounds, which are compounds of *P. niruri*, have mechanism of action to inhibit and kill bacteria that react with bacterial cell membrane and destroy or inactivate the function of genetic material in bacterial cells[11]. The mechanism of tannin compounds is that they enter into the cell walls of bacteria that have been lysed due to the action of saponin and flavonoid compounds so tannin compounds can easily enter the bacterial cell wall and coagulate the protoplasm of bacterial cells. Tannins also have target on cell wall polypeptides so the formation of the cell walls becomes imperfect which causes bacterial cells to become lysed due to osmotic or physical pressure, so the bacterial cells will die. The improvement in egg production is also influenced by terpenoids which act as antibacterial inhibitors of *E. coli*[12]. *A. paniculata* has an active component, namely andrographolide which has an antibacterial effect against various microbes by damaging the bacterial cell membrane resulting in inhibition of specific enzyme biosynthesis and enhancing the immune system[13]. Tannins are included polyphenol compounds that can inhibit bacterial cell adhesion, inhibit enzymes and disrupt protein transport in the cell layer so bacterial cells become lysed due to osmotic pressure and physical pressure, while flavonoid compounds can inhibit bacterial growth by damaging the arrangement of the plasma membrane and cause changes in the permeability of the bacterial cell wall at low concentrations[14]. Saponins have antibacterial mechanism by reducing the surface tension of the bacterial cell walls so that they interfere with the survival of the bacteria. Alkaloid compounds function as antibacterials and have mechanism of destroying the components of peptidoglycan in bacterial cells so the bacterial cell wall is not formed completely and causes cell death[15]. Supply of *A. paniculata* and *P. niruri* extracts combination causes healing in layer hens infected with APEC and results in returning to the normal process of egg formation and egg production. Supply of combination dose 20%:20% of *P. niruri* and *A. paniculata* extracts improves the performance of laying hens.

On the other hand, Indonesia is an archipelago with approximately 17,508 islands and is covered by tropical rain forest, seasonal forest, swamp, subalpine shrub vegetation, coastal vegetation, and mountain vegetation. With its reflective mixture of Asian and Australian native species, Indonesia is stated to possess the second largest biodiversity in the world, with around 40,000 endemic plant species including 6,000 medicinal plants. Consequently, Indonesia is rich in medicinal plants which were used by its population traditionally from generation to generation in curing. Therefore, natural resources in Indonesia are very supportive for the use of herbal medicine-based therapies in in vitro or in vivo tests[16,17,18,19,20].

**Conclusion**

In conclusion, from the result of this study, it can be concluded that *P. niruri* and *A. paniculata* combination improves the performance of laying hens infected with *E. coli*.

Abstract
Prokaryotic bacteria are microorganisms that can be beneficial as normal flora, but also can have health due to disease pathogens and is for the host. The purpose of this study is to find compounds in extract ethanol bidara leaves those compounds and activities against bacteria Enteropathogenic coli. This study shows the flavonoid compounds and tannin in extract ethanol bidara leaves (Ziziphus spina-Christi L) to minimum inhibitory zone at concentrations 50% and minimum bactericidal at concentrations 75%. The higher concentration extract ethanol Bidara leaves the larger the drag zone produced. The research is experimental study looking the extract ethanol antibacterial activity Bidara leaves with the methods in vitro test diffusion. This study found a chemical compound which is found in extract ethanol Bidara leaves (Ziziphus spina Christi L) is flavonoid and tannin have antibacterial activity10⁶ CFU/ml against bacteria Enteropathogenic coli to minimum inhibitory zone at concentrations 50% and minimum bactericidal at concentrations 75%.

Keywords: antibacterial, bidara leaves (Ziziphus spina-Christi L), EPEC, MIC, MBC

Introduction
Prokaryotic bacteria are microorganisms that can be beneficial to health as normal flora, but it could also impact because it is detrimental to the host pathogens and cause disease¹.

Antibacterial is a substance that can interfere with growth or kill bacteria by the mechanism of disturbing the metabolism of bacteria. An antibacterial ideal having been selective toxicity, antibacterial substance that was only harmful to bacteria causing infections but are not dangerous for host Hospes or body².

Antibacterial substance is compounded capable of inhibiting the growth of microbes and can be used in the treatment of in humans, animals and plants. Based on the nature of selective toxicity, antibacterial divided into two, bakteriostatic is working in a way inhibits the multiplication of bacteria and which is a bactericidal which kills bacteria. Bakteriostatik can act as a bactericide in high concentration³. An antibiotic among bactericide among them are penicillin, cephalosporin, aminoglikosida, kotrimoksazol, and isoniazid rifampisin. While among those targets are a sulfonamide bakteriostatik, tetracycline, kloramfenikol, erytromisin, trimetropin, linkomisin, klindamisin peraminosilat and acid².

Treatment of diseases caused by bacteria could be done with the purpose of hinder/kill pathogenic bacteria infecting humans in synthetic antibiotic. But research finds treatment with antibiotics this risk having synthetic resistant so as to cause treatment failure and patients being infected for a long time⁴. When viewed from risk of antibiotic resistance to bacteria, synthetic pathogenic it takes to find alternative solution medicine safe, cheap, easily obtained a new drug and better as a substitute for
synthetic antibiotic. Of compound substances can be obtained antibacterial of microbes, herbs and animals. The opportunity to obtain antibacterial natural material in Indonesia very large, considering that Indonesia is a rich in biodiversity\textsuperscript{5}. The use of traditional medicines in Indonesia is substantially is part of the Indonesian nation, culture this will require the existence of the development and research new drugs are derived from plants. The advantage of the use of traditional medicines is easy to get around us and empirically traditional medicine’s ability to heal various kinds of diseases, but efficacy and their ability not proven clinically\textsuperscript{6,7}.

Antibacterial activity can be measured by in vitro methods to determine the antibacterial a substance in solution and sensitivity to concentration presented by a bacteria. Bacterial sensitivity to an antibacterial can be tested by diffusion and dilution methods. The diffusion method is an antibacterial activity test that is often used because it’s relatively easy, affordable, a stage of work does not require special skills and the result are obtained faster\textsuperscript{8}.

Bidara (\textit{Ziziphus spina-Christi L}) has been proven could heal some diseases as indigestion, weakness, complaints, hearts obesity, bladder problems, diabetes, infections of the skin, lost appetite, diarrhea, fever, insomnia, as a tranquilizer and cancer\textsuperscript{9,10}. In Saudi Arabia, this plant has been used for the treatment of various diseases such as indigestion, obesity, their complaints, infections of the skin, fever, diarrhea, bronchitis, diabetes, anemia and insomnia\textsuperscript{11}.

The bidder is an evergreen tree that grows wild throughout the islands of Java, Bali, Madura and Sumbawa (Nusa Tengara Barat) at an altitude below 400 meters above sea level. All parts of bidara are used in traditional medicine (leaves, fruit, seeds, roots, and stems) now supported by several research found plant bidara contain the alkaloid, glycoside, tannin, flavonoid, quinone, saponin and steroid/terpenoid\textsuperscript{12,13,14}. Other research also found that stems, leaves and seeds bidara having antibacterial activity, anti-inflammatory, anti-fungal, anti-cancer by in vitro and in in vivo\textsuperscript{15,16,17,18}.

To the best of our knowledge, there have been no reports on the effects of the species on the antibacterial activities of the \textit{Ziziphus spina-christi L}. Thus, the aim of the present study was to i) estimate the levels of total tannin compounds and total flavonoids of leaves, ii) study the antibacterial activities of \textit{Ziziphus spina-Christi L} leaves to \textit{Enteropathogenic coli} $10^6$ CFU/ml \textit{in vitro}.

**Materials and Methods**

**Site of the study:** The study was carried out at the biochemistry laboratory, Faculty of Medicine, University of Airlanga, Surabaya.

The design of this study was an experimental study by looking at the antibacterial activity test result of bidara leaf ethanol extract carried out by the diffusion test method in vitro. Diffusion test using \textit{disk diffusion} as a medium for ethanol extract of bidara leaves using
EPEC $10^6$ CFU/ml as a test bacterium. The required data is the diameter of the inhibitory zone formed on the MHA media when conducting the sensitivity test of the disk diffusion method.

**Sample collection and Preparation**

Bidara leaf extract is made from 3 kg of fresh bidara leaves harvested from Madura Island-East Java, cleaned and dried leaves at the temperature of an oven 70°C to dry. Simplicia dried bidara leaves are blended and sieved using 40 mesh sieve to form 560 g of powder, powder obtained used for making extract ethanol bidara leaves. Next the process maceration simplicia Bidara leaves by soaking 560g of Bidara leaves with 2.300 ml ethanol 96 % and left be closed for three days and placed in a sheltered from direct sunlight. During the soaking, marinade stirred several times with the purpose of improving the effectiveness of the process diffusion compound dissolved in a search liquid. Simplicia and the search fluid are filtered and squeezed to get the first macerate liquid. The pulp is soaked again with 750 ml ethanol for three days to get the second macerate. The second macerate then combined with the first macerate. Macerate obtained settled for 1x24 hours and deposited. Macerate concentrated using an evaporator rotary at a temperature 50°C order to obtain extract viscous bidara leaves free from a solvent. Next included to Erlenmeyer plus a solvent ethanol 96 % and whipped 2-3 hours. Next undergone a filtering Phytochemistry the flavonoid and tannin.

**Making Suspense Bacteria Test**

1 ml of *E. coli* stock cultured on nutrient agar (NA) media at temperatures 37°C for 24 hours. Then will be the manufacture of suspension bacteria culture test by taking *E. coli* and dissolved in solution copy (0.9% NaCl) in aseptic in the tube different, each 5 ml solution NaCl 0.9%. A suspension that is formed equalized with a standard McFarland No. 0.5 that is 1.5 x 108 CFU/ml. For the manufacture of the media MHA (*Muller Hinton Agar*) to do with how to weigh 9,5 g Muller Hinton Agar/MHA (38 g/L) with a composition medium (Beef infusion 300 g, Casamino acid 17,5 g, Starch 1,5 g) dissolved in 250 ml aquades then heated to boiling then sterilized in an autoclave for 20 minutes with the air pressure 1 ATM temperature 121°C.

**In Vitro Antibacterial Study**

The antibacterial activity undertaken using pathogenic bacteria *Escherichia coli* (EPEC) in aseptic with the methods disc diffusion. Suspension bacteria test spread evenly in a media MHA by using a swab, sterile cotton, then settled for a few minutes until suspension bacteria percolate in a media. A next paper strain that serves as the accommodates extract Bidara leaves lay on plate agar and incubated at a temperature 37°C among 24 hours. The result of the observation obtained of the whereabouts of zone clear formed all over paper discs which indicates the presence of zone obstruct in the growth of bacteria. The greater cleared zone, the large the ability obstruct extract ethanol Bidara leaves against bacteria. Zone category obstruct as on a table 2.

Determination of Minimum Inhibitory Concentration (MIC) and Minimum Bactericidal Concentration (MBC)

The determination of minimum levels of the barriers do with the antibacterial activity leaves extract ethanol Bidara diffusion tests with a method of in vitro culture with bacteria to the media and be counted in a paper disc with bacteria test Enteropathogenic coli $10^6$ CFU/ml. The determination of minimum levels of kill characterized by the whereabouts bacterial growth in a media culture (nutrient agar) by looking at the number of colonies of every series extract. Concentration The colony incubating expressed by growing or do not grow.

Data Analysis

Data analysis was conducted in descriptive having acquired an obstruent minimum data concentration and kill minimum concentration extract ethanol leaves Bidara against bacteria EPEC $10^6$ CFU/ml. The results of the study and compared with parameters and identified as an obstruent kill zone and the ability to see minimum antibacterial activity Bidara leaves extract ethanol as an antibacterial against Eschericia coli.

Results

The Results Of The Phytochemistry Extract Ethanol Bidara Leaves (Ziziphus spina-Christi L).

The Phytochemistry conducted in this research is the flavonoid tannin and. Tannin, on the 0.1 g extract ethanol leaves bidara added 5 ml aquades then simmer for a few minutes. Filtrat strained and added FeCl$_3$ 1%. Change colors become a deep blue color or black, greenish formed show positive results in the compound tannin extract leaves bidara tested. In the flavonoid, as many as 5 mg extract leaves bidara dissolved in 5ml hot water, simmer for 5 minutes, and strained. Filtrate obtained them added MG powder, 1ml of concentrated sulfuric acid plus 2ml ethanol. Beaten and let separate strong. Formed red, yellow or to the ethanol, orange showed flavonoid compounds

Extract ethanol Bidara leaves could impede the bacterium Escherichia coli, with a diameter of 11,1 mm at 100% concentration, 75% concentration with a diameter of 11 mm and 25% concentration with a diameter of 7 mm. From the research is found in the bacterium *Escherichia coli*, each concentration extract ethanol leaves bidara have differences in Obstruent Zone. At concentrations extract higher having a zone obstruent larger compared by an astronaut with zones around paper disk with low extract lower. This proved that the higher concentration extract ethanol leaves bidara the more high zone obstruent produced.

**Image 1. Antibacterial Activity Extract Ethanol Bidara Leaves a Method of Paper Discs to Escherichia coli.**

</table>

Note: + = growth; - = not growth

Table 5 showed Minimum Bactericidal Concentration had been incubated for 18-24 hours at temperature 37°C. Based on the results of the antibacterial activity extract ethanol leaves bidara against *Enteropathogenic coli* the results concentration of 75% and 100% there is no bacterial growth, on the concentration 6,25% to 50% is the growth of bacteria.

**Discussion**

The extract ethanol leaves bidara have diameter obstruent of different suits distinction concentration. The greater the concentration of the larger the diameter obstruent that the establishment, in order to know the concentration and diameter obstruent is directly proportional each other. In table 4 it is evident that concentration 50% extract ethanol leaves bidara obtained diameter obstruent zone of 7 mm, 75% concentration of 11 mm and concentration of 100% 11,1 mm, it can be said that the higher concentration extract used the more diameter obstruent formed zone. These facts in accordance with statements from Pelczar and Chan$^{22}$ that the higher concentration antibiotic substances the more a fast growth microorganisms killed and impeded.

In the levels of kill minimum found that bacteria *Escherichia coli* can not grow in a mediaNA given extract ethanol leaves bidara concentration 75% dan 100%. This indicates that extracts ethanol leaves bidara have the ability kill bacteria *Escherichia coli* at concentrations 75% dan 100% but has no power killed at concentrations 50%, 25%, 12.5% dan 6.25%. The results of the study is based on research conducted Edy *et al*$^{15}$ who discovered the methanol extract bidara could hinder growth some pathogenic bacteria.

From the observation of MIC and MBC show positive results, this is caused by the existence of a metabolite secondary in extract ethanol leaves bidara so as to give the effect on the growth of bacteria test. Working mechanism substance flavonoid as an antibacterial is form a compound complex with a protein extracellular and dissolved order to be able to destructive the cell membrane bacteria that followed release of intracellular compound$^{23,24,25}$. According to Cushnie and Lamb$^{26}$, apart from its role in inhibitory in DNA – RNAsynthesis by intercalation or hydrogen bonds with the accumulation of a nucleic acid, flavonoid would play a role in resisting energy metabolism. Compound with protein through flavonoid locks down into hydrogen bonds resulting in protein structure being broken, instability and the cytoplasm of a cell wall destroyed. Causing integrity destroyed cytoplasm makes macromolecules of ions and the lost its shape and become lysis$^{27}$. 

Tannin have antibacterial activity associated with its ability to activate adhesion the microbes also activation enzyme, and interfere with the transport protein in bacterial cells. According to Sari, the tannin will have targets in polypeptide the wall of the cells so that the formation of the cell walls into less than perfect that causes bacterial cells be lysis because of the pressures of osmotic and physical and the bacteria would die. Microorganisms growing under conditions aerobic need iron for various function, including reduction from a precursor ribonukleotida DNA. This is caused by capacity a fastener solid steel by tannin. Working mechanism tannin as an antibacterial is by means hinder an enzyme reverse reverse transcriptase and DNA topoisomerase and the bacteria from being can be formed. According to Nahak, compound mechanism tannin show antibacterial proline bonded with activity in which are rich in protein leakage and damage occurs bacterium cell wall and lead to the death of the bacteria. At low concentration phenol work with destructive membrane cytoplasm and can cause to leak the cells. While in large concentration the substance coagulated with protein cellular, activation is very effective when bacteria in the division, where the phospholipid around cells are on the very thin and phenol penetration and can easily destroy cells.

**Conclusion**

The research is from a chemical compound which is found in extract ethanol left bidara (Ziziphus spina Christi L) is flavonoid and tannin have antibacterial activity as against Enteropathogenic coli with zones inhibitory was at concentrations 75 % and 100% and minimum bactericidal at concentration 75%. The higher concentration extract ethanol leaves bidara, the greater the obstruent and the kill against bacteria Enteropathogenic Coli.

**Suggestion**

Necessary other experiment by changing concentration treatment to find concentrations of MIC and MBC more effective and antibiotic as comparing and control.

The Chemical and Physical Parameters as Indicator of Office Air Quality at PT X Coal Mining Company

Tiara Nurhafizhah¹, Indri Hapsari Susilowati², Bonardo Prayogo Hasholan³, Abdul Rohim Tulaeka⁴

¹Bachelor student of Occupational Safety and Health, Faculty of Public Health, Universitas Indonesia, ²Assistant Professor of Occupational Safety and Health Department, Faculty of Public Health, Universitas Indonesia, ³Master student of Occupational Safety and Health Study Program, Faculty of Public Health, Universitas Indonesia, ⁴Professor of Occupational Safety and Health Department, Faculty of Public Health, Airlangga University

Abstract

**Background:** Coal still ranks the second largest source of total global energy demand, which is complemented by the high-risk nature of coal mining activity. Therefore, it is important to discuss the health issues of coal workers. One of the risks associated with coal mining activities is poor indoor air quality (IAQ) due to the high concentration of airborne pollutants. **Methods:** This study aims to evaluate the results of air quality measurements in the PT X office, and the method used was a descriptive approach with quantitative secondary data. Furthermore, the measured variables are NO2, SO2, CO2, CO, Pb, PM10, temperature, humidity, and noise. **Conclusion:** The results showed that there was an IAQ problem, namely noise, temperature, and humidity which exceed the recommendations. Therefore, the IAQ management implemented by PT X was still systematically and comprehensively developing.

**Key Words:** Coal mining, office air quality, chemical parameter, physical parameter.

Introduction

Coal mines air are well known for its air pollutant namely sulfur dioxide (SO2), nitrogen dioxide (NO2), VOC (volatile organic compound), PM10, and PM2.5. Various health impacts arise due to the risks contained in mining air, one of which is pneumoconiosis, which includes both black lung and silicosis. Meanwhile, in America, it was noted that black lung is the latent killer for 4,118 mining workers from 2007-2016. Significance of the problem of air health risks in the coal mine is greater in the indoor and outdoor work areas. However, the number of indoor air pollutants is 2-5x greater than outdoor air. In addition, it was reported in the late ‘80s that humans spent 90% of their time indoors. As a result, people that work in offices, as well as perform their main work indoors are at the highest risk of being exposed to air pollutants.

These pollutants cause poor indoor air quality and also have various impacts, which include, affecting the cognitive performance of workers and subclinical disturbances that leads to a decrease in work productivity. Furthermore, health problems such as eye irritation, headaches, and allergies, as well as discomfort effect results in high absenteeism.

In addition to disrupting cognitive performance, worker productivity, and a high rate of absenteeism, poor air quality causes the ‘typical’ disease of this problem, which includes, SBS (Sick Building Syndrome) and BRI (Building Related Illness). SBS is a term used to describe a situation where the occupants of a building experience acute health problems and discomfort associated with the length of time spent in the building, but no disease was identified and the complaint disappears once someone leaves the building. Meanwhile, BRI is a condition in

Corresponding Author:

Building C, 1st Floor Faculty of Public Health
Universitas Indonesia, Depok
Email: indri@ui.ac.id
which symptoms of health problems are diagnosed and are known to be related to indoor air contaminants. PT X is inseparable from the health risks caused by poor indoor air quality. In an office located in the middle of the mine site, it is possible to infiltrate mine air into the room. PT X performs four main business processes, namely mining operations, hauling operations, coal processing, and barge loading (CPBL) Kelanis, as well as supporting facilities. Meanwhile, there are more than 155 contractors who work to assist PT X in its business processes in Kalimantan (Borneo). Therefore, the discussion of managing health risk control due to indoor air quality in PT X’s coal mine needs attention.

**Materials and Method**

The method used was a quantitative data with a descriptive approach to evaluate the results of air quality measurement in the office rooms at the PT X coal mining location. Furthermore, the data were collected by reviewing secondary data in the form of documents on the results of air measurements for the work environment at the Kalimantan office PT X site in 2019 and primary data in the form of interviews with informants, such as OHS managers and environmental staff. The variables studied consisted of two parameters, namely chemical parameters such as NO2, SO2, CO, CO2, Pb, and PM10, as well as physical parameters such as noise, temperature, and humidity. Secondary data for the measurement of chemical and physical parameters at the PT X offices were collected from July-December 2019.

**Result and Discussion**

All the rooms measured have the similarity, namely their main function as office room to manage administration. However, the characteristics of each building and room are varies depending on its location and the presence of other factors that affect the IAQ. The SM, Plant and Main Office are located in the SEG III work area, namely in the CPBL (Coal Processing & Barge Loading) area, which is located close to the coal crushing work process as well as in the stockpiling and loading of coal into the barge. The Main Office is a building that is the center of administrative activities at SEG III and uses split AC. There is an Office Plant not far from the main office, which also has administrative activities and is very close to the equipment maintenance process that involves welding. In addition, the Office Plant is also located not far from the landfill (TPS) and uses split AC. Office SM has similar characteristics to other rooms in the SEG III work area.

The KM 69 Office, Mine Office, and the MIA Logistics Office on the first floor are located in the SEG II work area, namely hauling or coal transportation routes using trucks/trailers. Furthermore, the KM 69 Office room serves as a checkpoint for the 80 km coal haulage route. Therefore, there is a parking area around this building that can accommodate up to 10-15 trailers. This building is located in the middle of a tree-free field which consists of two floors with a generator, landfill (TPS), and a smoking area. The characteristics of Mine Office are similar to KM 69 Office, because of its location in the middle of a transportation route, which is a field without trees. However, this building is made of a container that has only one room with an air conditioner without ventilation. In addition, this room is only for administrative activities and is used by officers responsible for transporting coal. The logistic office on the first floor of the MIA is located close to a heavy equipment repair workshop, and the building only has one room with administrative activities as well as spare parts inside and outside. Also, the type of air conditioner used is split.

The result shows that the highest NO2 concentration is in the Main Office room at 0.01 ppm, but this result is still below the TLV of Permenaker No. 5 of 2018. The highest SO2 concentration is in the Office Plant room at 0.03 mg/m3, and the highest CO concentration in the KM 69 Office room is 8 ppm, which is close to the 10 ppm requirement regulated in Permenkes No. 48 of 2016. Furthermore, the highest Pb concentration is 1.3 µg/m3 at the main office, and the highest PM10 concentration is reported in the Office Plant room with 0.016 mg/m3, while the highest CO2 concentration in the Mine Office room is 327 ppm, but these two values are still below the requirements of Permenkes No. 48 of 2016.

The measurement results of physical factor variables reported that several variables exceed the requirements of Permenkes No. 48 of 2016. The temperature variables in all rooms, namely Office SM is at 31.6°C, Plant at 31.9°C, Main Office at 29.8°C, KM 69 is at 29.1°C, Mine Office is at 29.6°C, and the MIA 1st Floor Logistics
Office is at 28.4°C, which exceeds the requirements of Permenkes No. 48 of 2016, namely 23-26°C. The humidity problems only occur in the Main Office by 61-67%, exceeding the requirements of 40-60%. Also, the highest noise occurs in the MIA 1st Floor Logistics Office by 65.8 dBA, which exceeds the standard of 55-65 dBA for office activities.

The measurement results for Office SM of 31.6°C and Plant of 31.9°C were included in the hot category. Furthermore, the measurement results for the Main Office at 29.8°C, Office KM 69 at 29.1°C, Mine Office at 29.8°C, and the MIA 1st Floor Logistics Office at 29.8°C are included in the warm category. This heat source is estimated to be derived from the characteristics of all measured buildings located in the middle of the mine area with few or no trees. Therefore, there is a need to identify the source of the problem in further research, such as AC.

Offices that are too hot causes residents to feel tired. Therefore, it is necessary to take corrective measures to control the IAQ issue related to temperature to achieve thermal comfort which is important for worker productivity. Thermal comfort is a condition where a person wears normal clothes without feeling too cold or too hot, and it is important to a person’s well-being and productivity. Although everyone’s temperature preferences are different, the American Society of Heating, Refrigerating, and Air Conditioning Engineers (ASHRAE) Standard 55 - 2013 recommends a temperature of 23-26°C, with thermal Environmental Conditions for Human Occupancy that satisfies 80% of building occupants.

The 61-67% humidity in the Main Office room is categorized as high because it exceeds the requirements. The estimated source is the use of the building which is the center of administrative activity in SEG III. Also, there is the possibility of workers to enter and exit the hot mine area in sweaty conditions. However, the identification of a source with high humidity content needs to be conducted more deeply in further research. High humidity makes the room stuffy, increases the perception of heat felt in the room, and supports the development of microorganisms. Therefore, the humidity of the Main Office also needs to be controlled because humidity with temperature (air and radians), clothing, and body metabolic rate are factors that affect thermal comfort.

The results of noise measurements at the MIA Logistics Office on the 1st floor show a value of 65.8 dBA which exceeds the Permenkes No. 48 of 2016. The source of this noise may be from an office located near a heavy equipment repair workshop. Furthermore, the impact caused by noise that exceeds the requirements in the office is distracting concentration at work because of divided auditory attention. This disruption in concentration also causes an increase in annoyance which in the long term will result to stress.

Office KM 69 which shows the highest CO measurement results has a trailer parking area, a smoking area, and a generator. The existence of these facilities and equipment is thought to be the source of the high CO concentration in this room. Although the CO at Office Km 69 does not reach the highest recommended concentration, the exposure of low CO concentration causes fatigue and heaviness in the chest for people with heart disease, while the impact on moderate concentration exposure is angina, reduced vision ability, and reduced brainpower.

Townsend, Robert, and Maynard reported that CO exposure of 9 ppm causes the formation of 2.5% COHb (carboxyhemoglobin) in the blood. A total of 2-20% COHb content in the blood causes subtle effects on visual perception, hearing, motor and sensorimotor performance, alertness, and other measures of neurobehavioral performance. Therefore, the measurement result in the KM 69 Office room of 8 ppm is already a number that needs to be considered and controlled.

**Conclusion**

The measurement of air quality in PT X offices shows the result of the evaluation results of several variables that exceed the standard. Furthermore, the variables that exceed the standard, however, are based solely on the physical parameters, such as noise, temperature, and humidity. The temperature that exceeds the requirements is reported in the six examined rooms. Meanwhile, humidity that exceeds the requirements is only in one room, namely the Main Office. Also, noise that exceeds the requirements only occurs in the MIA 1st
floor Logistics Office. Despite being in the middle of a coal mining process area, there are no chemical factors that exceed the standard.

The Relation between Exercise Duration and Intensity on Phosphocreatine (PCr) Level: an Article Review

Trias Mahmudiono¹, Aprilia Durotun Nasikhah², Roy Januardi Irawan³
¹Department of Nutrition, Faculty of Public Health, Universitas Airlangga, Surabaya, Indonesia, ²Bachelor of Nutrition Program, Faculty of Public Health, Universitas Airlangga, Surabaya, Indonesia, ³Doctoral of Public Health Program, Faculty of Public Health, Universitas Airlangga, Surabaya, Indonesia

Abstract

Exercise is a physical activity that planned, structured, and sustainable. Exercise has 4 criteria, that is frequency, intensity, type, and duration. During exercise, phosphocreatine (PCr) depletion increases, and early intracellular acidosis has occurred. These changes contribute to a decrease in training capacity in terms of training duration. This literature review aimed to determine the relationship between the intensity and duration of exercise with the concentration of PCr and recovery factors. The literature study has carried out by selecting an Experiment research design. The results of the review showed that PCr was the largest energy contributor in the first 10 seconds of exercise in the heavy-intensity exercise where phosphocreatine triggers energy without oxygen or anaerobic. The recovery of PCr influenced by a person’s health condition and age. The concentration of PCr in children was higher than in adults because of the relatively high rate of oxidative ATP formation. It proved that there was a significant relationship between PCr and the duration and intensity of exercise.

Keywords: Exercise duration, Exercise intensity, PCr, Phosphocreatine

Introduction

Health is considerable for humans. Everyone must be healthy to maintain physical fitness so that they can carry out daily activities. According to the Indonesian Law No. 23 of 1992 concerning health states that health is a state of well-being of body, soul, and society which enables everyone to live productively socially and economically(¹). Health can be pursued in various ways, one of which is by exercising.

Exercise is a physical activity that planned, structured, and continuous by involving regular and repeated body movements to improve physical fitness and achievement(²). Exercise is useful for maintaining and increasing mobility and independence to move in human bio-psycho-sociologic life(³). Exercise has four criteria, that is frequency, intensity, type, and duration(⁴).

Exercise can stimulate the disruption of homeostasis and change the physical and chemical environment of cells. Exercise can cause body temperature to increase, increase blood acidity, decrease oxygen in fluids, and increase CO2. Environmental changes in the body start at the receptors, namely body cells that will stimulate complex response pathways. This pathway causes changes in nerve activity (nerve pathways), hormonal changes (hormonal pathways), and exchanges in specific pathways (intrinsic pathways). Also, chemical, mechanical and thermal stimuli affect changes in metabolic, cardiovascular, and ventilator functions to meet increased demand(⁵).

Exercises of longer duration (2-3 minutes) that rely primarily on oxidative metabolisms, such as swimming and long-distance running, are classified as aerobic activities. Many sports activities require a combination of anaerobic and aerobic metabolism. In stop and go sports, about 60% -70% of energy comes from ATP storage from phosphocreatine (PCr) and anaerobic glycolysis, the remaining 30% from oxidative processes(⁶).
Phosphocreatine (PCr) is a high-energy compound that has a high-energy phosphate bond that can be hydrolyzed into energy and can resist ATP. In physical activity or strenuous exercise such as sprinting, PCr in the skeletal muscles makes a big contribution for the first 10 seconds. The storage of PCr will quickly run out but, in the first few seconds of exercise, PCr provides a significant buffer before other aspects of metabolism are activated(7).

During exercise, physical activity, or exercise, PCr depletion increases, and early intracellular acidosis has occurred. These changes contribute to a decrease in training capacity related to exercise duration(8).

**Material and Method**

This study used a literature review method. The article search strategy has carried out by using international or national journal articles that were searched through Google Scholar and PubMed. Through the keywords searched were exercise duration, exercise intensity, phosphocreatine, and PCr, from Google Scholar website founded 31 articles of search results and on the PubMed website as many as 13 articles. Then, screening has carried out by selecting articles that were relevant to the topic, namely the effect of exercise duration on phosphocreatine (PCr) levels. The articles selected were articles with inclusion criteria using Experiment research methods. The exclusion criteria in this literature review were articles that were not related to the topic of the effect of exercise duration and intensity on phosphocreatine levels.

![Consort diagram of research articles Effect of Exercise Duration and Intensity on Phosphocreatine Levels (PCr).](image)

**Results and Discussion**

Various types of sports can be an option to maintain body fitness. However, it is considerable to note in planning exercise activities that at least four criteria are met, namely the frequency of exercise, intensity/weight of exercise, type of sports activity, and length of time exercising(4). In sports, various kinds of metabolism will produce different types of waste products, one of which is creatinine.
Creatinine is a chemical waste molecule that results from muscle metabolism. Creatinine has produced from creatine, a molecule that is essential for energy production in muscles. About 2% of keratin in the body is converted to creatinine every day. Creatinine is transported through the bloodstream to the kidneys. Creatinine levels are determined by the amount of muscle mass (protein catabolism rate), in addition to how our body’s metabolic activity, for example, increases when we are sick (heat/infection). Creatinine is produced during skeletal muscle contraction through the breakdown of creatinine phosphate. Muscles use phosphocreatine during the first few seconds of intense muscle contraction, such as during weight lifting or sprinting. Unlike aerobic contraction, which utilizes oxygen to produce energy, phosphocreatine triggers energy without oxygen or is anaerobic.

Bogdanis et al. stated that aerobic metabolism provides a significant part (~ 49%) of energy during the second sprint, whereas PCr availability is important for high power output during the initial 10 s. This is supported by the statement of Hall and Trojan that creatine monohydrate can improve muscle performance in a short duration, and high-intensity resistance training will rely on the transport of phosphocreatine to become adenosine triphosphate so that an increase in the level of total creatine in cells will allow for the faster synthesis of phosphocreatine. Increasing the creatine level in the body can delay fatigue because creatine can be re-synthesized and sent back to the site of ATP use more quickly. Fatigue during short-term high-intensity exercise is related to the availability of PCr because PCr can regenerate ATP at very high rates, and its concentration in muscle is limited.

The energy at the start of a workout or exercise that uses very high-intensity muscle work (85% -100% of maximum capacity) and has a short duration (up to 10 seconds) has determined from the small amounts of ATP and PCr stored in muscle cells. The total energy available in the stored ATP-PCr is sufficient for short duration exercises, such as lifting weights, high jumps, or 10-second sprints.

The amount of energy generated from the PCr has limited because of the intramuscular pathway. The high anaerobic demands on the muscles can decrease muscle PCr concentration. At the same time, in a short period of maximum exercise, the anaerobic utilization of muscle PCr and glycogen will trigger muscle contraction. Short-term contractions are associated with metabolic changes in the muscle so as decreased muscle phosphocreatine.

According to Haseler, Hogan, and Richardson, in skeletal muscle, PCr recovery from submaximal exercise is a measure of muscle-oxidative capacity. PCr recovery was significantly altered by FIO2 and after submaximal exercise, in normoxic conditions, PCr recovery was limited by O2 availability. Also, The PCr recovery time constant is prolonged in patients with the symptomatic peripheral arterial disease (PAD), whether differences in PCr recovery time result entirely from changes in tissue blood flow, alterations in skeletal muscle at a cellular level, or a combination of both deserves further investigation.

In patients with PAD symptoms, the PCr recovery time constant is longer than that of ordinary people, so it is recommended for PAD sufferers to do sports with a long duration of intensity. Also, there is the notion that phosphate regulation and muscle O2 utilization is fully mature in peri-pubertal children, which may be due to the comparable capacity for mitochondrial oxidative phosphorylation in child and adult muscles.

The relatively higher rate of oxidative ATP build-up in children’s muscles to mask the ATP demand from high-intensity intermittent exercise compared to adults, allows children to start each exercise interval with a much higher concentration of PCr and lead to more muscle acidification. Low overall.

**Conclusion and Acknowledgement**

**Conclusion**

From the review above, it can conclude that PCr has a significant relationship with exercise duration and intensity. PCr is the largest energy contributor in the first 10 seconds of exercise in a heavy-intensity exercise where phosphocreatine triggers energy without oxygen or anaerobic, so with an increase in creatine phosphate capacity, very high-intensity exercise performance can be improved. PCr concentration is not only influenced by the duration and intensity of exercise, but also by

Abstract

Introduction: QTc interval prolongation is one of the adverse drug reaction of several drugs used in DR-TB patients treated with STR regimen. Drug-induced QTc prolongation can predispose patient to develop life-threatening arrhythmia, increasing hospital length of stay and mortality. This study aims to determine factors that contribute to QTc prolongation in DR-TB patients on STR regimen.

Methods. This was an observational retrospective study using medical records of DR-TB patients who received STR regimen from August 2017 to March 2019 in tertiary hospital DR Soetomo, Surabaya, Indonesia. QTc interval was calculated by Fredericia formula. The influence of risk factors (age, body weight (BW), body mass index (BMI), gender, comorbid, potassium, sodium and QTc baseline) with QTc prolongation was analyzed using multiple regression. The relationship between Moxifloxacin dosage and ΔQTc was analyzed using Chi-Square test.

Results Out of the 113 DR-TB patients who received the STR therapy regimen, 98 patients were eligible for this study. They consist of 62 (%) male; 36 (%) female. Thirty-five (35,7%) of them had Diabetes Mellitus as a comorbid disease. The mean age of the patients was 44±11 years, with the mean of BMI was 20.20±3.73. Potassium and Sodium levels at the baseline were 4.192 ± 0.58 and 138.05 ± 4.562 respectively. The QTc baseline before receiving STR regimen was 431.9±30,617ms. Patients received a dose of moxifloxacin 400 mg (5.1%), 600 mg (59,2%), and 800 mg (35,7%) according to body weight. There were no correlation between age, BW, gender, comorbid, potassium, sodium and QTc baseline with ΔQTc. There were correlation between potassium (p=0,001), BMI (p=0,006) and QTc baseline (p <0,001) with ΔQTc.

Conclusion QTc baseline and potassium level are factors that contribute to the prolongation of the QTc interval.

Keywords: QTc interval prolongation, STR regimen, Drug Resistance Tuberculosis (DR-TB)
with stagnant treatment success rates of roughly 54% and 30%, respectively. Despite adverse events associated with several DR-TB drugs, newly developed drugs and shorter regimens are bringing hope (1). However, it leads to a possibility that some factors may contribute to QTc prolongation in DR-TB patients on Shorter-Term Regimen (STR) treatment. A QTc >500 ms is considered a risk factor for ventricular arrhythmias, such as torsades de pointes (TdP), increasing hospital length of stay and mortality (2, 3). Overall, 10-20% of patients with drug-induced QTc prolongation have genetic predisposition, and >70% have at least two other risk factors (4). This assumes clinical importance in the presence of QT prolongation risk factors.

Drug-induced QTc prolongation is characterized by acquired QT interval prolongation and may be followed by potentially fatal proarhythmias known as torsades de pointes, which can result in sudden cardiac death (5, 6). Drug-induced QTc prolongation is often dose-related (7). Depending on their dosages, certain drugs may prolong the duration of ventricular action potential and the QT interval by means of different ionic mechanisms. Most drugs that prolong the QTc interval act by blocking hERG-encoded potassium channels, although some drugs modify sodium channels (8). Hypokalemia might be one of the most important risk factors for QT prolongation since some studies revealed that hypokalemia were associated with lengthening of the QT interval (9-11). As a result of Hypokalemia, high level of sodium (Hypernatremia) may cause the same effect (12). In the previous study, baseline of QTc was an important predictive marker of QTc prolongation in patients with Diabetes Mellitus during Severe Hypoglycemia (13). Age is other factor that may cause QTc prolongation in DR-TB patients on STR regimen. In a healthy subjects, age significantly correlated with QT and QTc interval (14). Prolonged QTc is more prevalent in older age (15). QT Interval prolongation is common in obesity and shortens with weight loss (16, 17). In line with body weight, those with higher BMI have a significantly longer QTc (18, 19). In many studies, patients with Diabetes Mellitus comorbid had QTc prolongation as compared to those without it (20, 21). Last but not least, gender is a factor that can also be one of QT prolongation risk factors. The relationship between gender and QT interval using administration of cardiovascular drugs showed that women are more prone than men to develop TdP (22).

Better knowledge of the QTc prolonging in relation to risk factors is needed to improve decision-making. Even though there are data on some factors that may contribute to QTc prolongation, but very little information about the risk factors in Drug-Resistant Tuberculosis (DR-TB) patients, especially during Short-Term Regimen (STR). In this study, we analyzed the effect of the risk factors on the length of the QTc interval in a hospital population. This study aims to determine factors that contribute to QTc interval prolongation in DR-TB patients on STR regimen. Besides the use of TB drug that are known to prolong the QTc interval, we analyzed the effect of the additional risk factors on the QTc interval, such as age, gender, electrolyte disturbances, comorbid (Diabetes Mellitus), body weight (BW), Body Mass Index (BMI), drug dosage, and the baseline of QTc.

**Methods**

**Study population and design**

We performed a retrospective observational study. The study population was recruited and analyzed from the medical records of Drug-Resistant Tuberculosis (DR-TB) patients who received Short-Term Regimen treatment, diagnosed from August 2017 to March 2019, was undertaken at Dr. Soetomo General Academic Hospital, Surabaya, Indonesia. The diagnosis of pulmonary TB in hospitals and TB clinics is made on the basis of clinical examination, chest radiography, rapid test molecular, and sputum smear microscopy and/or sputum culture (23).

**Data collection**

Medical records of Drug-Resistant Tuberculosis (DR-TB) patients who received Short-Term Regimen treatment, diagnosed from August 2017 to March 2019 at tertiary hospital DR Soetomo, Surabaya, Indonesia were used as the data source. We collected and divided data of following risk factors on the length of QTc interval into groups: gender (female and male), age, comorbid, Body Mass Index (BMI), potassium, natrium, baseline QTc. Patient with missing serial ECG, incomplete medical record are excluded from this study

**QTc interval measurement and interpretation**

ECGs were recorded at baseline or pre-treatment, two weeks post-treatment. increase of 10mm/mV and
paper speed of 25 mm/s. Standard supine 10 s, 12-lead resting ECG was recorded with a digital ECG Biolight E30 channel with interpretation. The ECG parameters/ intervals that were assessed at each visit were heart rate (beats/minute), PR, QRS, QT, and QTc intervals (ms). All QT values were double checked by visual examination.

QT interval was measured from the beginning of the QRS complex to the end of the T-wave in the derivation where the QT interval was the most visible. QTc interval (baseline and follow up QTc) was calculated by Frederica formula (QTcFri = QT/RR\(^{1/3}\)) used to count QT correction \((24)\). QTc prolongation classified according to the Common Terminology Criteria for Adverse Events (CTCAE) guidelines version 4.03 (grade 0, QTc <450; grade 1, QTc 450-479 ms; grade 2, QTc 480-499 ms; grade 3, QTc > 500 ms; grade 4, QTc >500 ms with life-threatening signs or symptoms \((25)\).

Single delta QTc interval denoted as ∆QTc. It estimates the differences in QTc of two ECG signal. In this study we measured QTc pre dose or baseline QTc and QTc Postdose. The formula of ∆QTc is QTc\(_{\text{day0}}\) minus QTc\(_{\text{day14}}\). Based on ICH E14 Guideline divided ∆QTc as QTc interval increases from baseline >30 msc and >60 msc \((26)\).

**Study Drug**

STR is 9-month regimen consists of kanamycin, ethionamide, moxifloxacin, clofazimine, ethambutol, and high dose isoniazid \((27)\). Moxifloxacin of 400 mg/tablet (Avelox®, Bayer HealthCare) was used. Dosing moxifloxacin based of body weight. The dosing material were stored at 25° in a dry location.

**Data Analysis**

The statistical package SPSS 20.0 (IBM Corp., Armonk, NY, USA) was used to analyze data. The influence of risk factors (age, body weight (BW), Body Mass Index (BMI), gender, comorbid, potassium, sodium and QTc baseline) with ∆QTc prolongation was analyzed using multiple regression. The relationship between Moxifloxacin dosage and ∆QTc was analyzed using Chi-Square test. Slope test between ∆QTc and baseline QTc using scattered plot.

### Results

#### Study Demographics and Disposition

The study population was composed of 62 males and 36 females. The mean age of subject was 44±11 years old (males 44±12; females 44±10), and their body mass index was 20.2±3.7 kg/m\(^2\) (males 20±3.2; female 20±4.4). Several factors could modify the risk of ∆QTc prolongation such as gender, comorbid, BMI, potassium, sodium, and baseline QTc. Based on multiple regression model, there is no significant correlation between age, gender, comorbid, and sodium level \((p<0.05)\). Interestingly subject with underweight BMI statistically significant with ∆QTc prolongation \((p=0.006; \ CI 95\% -0.07 – -0.13)\) rather than overweight patients. It probably due to distribution of drug in fat tissue.

Subject with low potassium level 3.8±0.7 will increase ΔQTc prolongation \((p=0.001; \ CI 95\% -0.53 – -0.15)\). Low baseline QTc also \((p<0.001; \ CI 95\% -0.015 \ -0.008)\) statistically significant with ΔQTc prolongation (table 1).

#### Categorical analysis of QTcF

The result of categorical analysis of the QTcF and ΔQTcF are summarized in table 2. QTcF of >500 ms observed in two subject with 800 mg of moxifloxacin. QTcF of >480 and <500 observed in three subject with 600 mg of moxifloxacin. ΔQTcF of >60 ms observed in one patient with 400 mg moxifloxacin and nine with 600 mg. ΔQTcF was >30 and ≤60 ms in 21 subject receiving moxifloxacin with one patient in 400 mg, 12 subject with 600 mg and eight subject in 800 mg dosage.

There is no substantial variation prolong ΔQTc between moxifloxacin 600 mg and 800 mg, but the incidence of prolong ΔQTc is higher in 600 mg moxifloxacin (nine patients ΔQTc >60 msc). Based on statistical analysis, there are no significance between baseline QTcF with moxifloxacin dosage \((p=0.283)\) and ΔQTcF \((p=0.176)\).

The linear relationship between baseline QTc prolongation and ΔQTcF with 95% CI are shown in figure 1 which demonstrating negative slope for total subjects. Data showed low baseline QTc would increased ΔQTcF.

Discussions

QT interval on the electrocardiogram (ECG) represents the action potentials in ventricular myocytes. Mechanism of QT interval prolongation is result from an increase in inward current (e.g., through sodium or calcium channels) or a decrease in outward current (e.g., through potassium channels) into action potential prolongation (28). From this study, we found several risk factor might contribute ∆QTc prolongation. Low BMI, hypokalemia, and baseline QTc can cause ∆QTc prolongation.

Low body mass index affected QTc prolongation possibly by decreased left ventricular mass and cardiac chamber dimension (29). Abnormal ion transport may also occur in malnourished cells independent of absolute serum electrolyte concentrations (30). Mischisita et al was finding that the QTc interval was significantly longer in the low BMI groups compared to the moderate BMI group in both genders (31). It has been well known that a prolonged QTc interval is reflected in the dysfunction of the cardiac autonomic nervous system, while the cardiac autonomic nervous system is influenced by eating disorders.

Hypokalemia induced changes in ECG are probably qualitatively similar with action potential duration (APD) (32). Low extracellular potassium enhanced inactivation and reduces IKr or increase competitive block by sodium. As a result, hypokalemia prolongs the QT interval (28).

Prolongation of QT interval may be noted when there is a delay in myocardial repolarization secondary to ionic currents from electrolyte abnormalities. Phase 3 of myocardial repolarization is predominantly mediated through delayed outward rectifier potassium currents (IKr and IKs) which are in turn dependent on extracellular potassium concentration. In case of hypokalemia, there
is decreased expression of these channels resulting in prolongation of repolarization (33).

The QTc interval may confirm the hypothesis that a low potassium leads to the occurrence of future cardiac sudden death and the incidence of CVD. Based on our results, we consider that it is necessary to perform dietary counseling, especially focusing potassium intake, depending on the body mass.

This study didn’t had significance relationship between dosage of moxifloxacin with ∆QTc. We suggest that every dosage moxifloxacin can occur QTc prolongation. Previous reports have suggested that patients developing drug-induced long QT syndrome with one drug are more likely to develop drug-induced long QT syndrome with exposure to other drugs (34). Other drug might contribute to QTc prolongation in shorter regimen is clofazimin (35).

**Conclusions**

Based on the results of this study, low body weight, hypokalemia, QTc baseline and QTc after 1-week after drug admission had significance effect for ∆QTc prolongation. We suggest frequent ECG monitoring to individual on STR therapy especially patient with risk factor that contribute ∆QTc prolongation.

Abstract

Background: Rapid molecular diagnostics have potentially revolutionized early detection of drug-resistant tuberculosis (DR-TB) in Indonesia. However, there is discordance between conventional culture using drug susceptibility test (DST) and rapid diagnostic tools using GeneXpert and line probe assay (LPA). This discordance result can cause confusion to clinician in determining diagnosis of DR-TB. Objective: This study aimed to identify discordance between GeneXpert, LPA, and DST. Methods: A retrospective study was conducted at Dr. Soetomo General Academic Hospital, Surabaya, Indonesia. Data were collected based on medical record between third to fourth quarter of 2018. Rifampicin-resistant-tuberculosis (RR-TB) proven by GeneXpert, were further analyzed with second-line LPA and DST. Discordance result between it was analyzed using McNemar. Results: Among 81 patients diagnosed with DR-TB, 59 patients RR-TB were eligible in this study. There were 13 (22.0%) DST rifampicin result showed sensitive but resistant to GeneXpert. Among 53 samples from LPA, there were 3 (5.7%) result showed LPA fluoroquinolone resistant but sensitive to DST ofloxacin; 10 (18.9%) result has LPA fluoroquinolone sensitive but resistant to DST ofloxacin; 2 (3.8%) has LPA second-line injectable drug (LPA SLID) resistant but sensitive to DST kanamycin; 5(9.4%) has LPA SLID sensitive but resistant to DST kanamycin. The McNemar analysis showed discordance between GeneXpert and DST rifampicin was 13 (22.0%; p=0.046); LPA fluoroquinolone and DST ofloxacin was 13 (24.6%; p=0.042); LPA SLID and DST kanamycin was 7 (13.2%; p=0.183). No variable that can be used to analyze discordance result between GeneXpert and LPA. Conclusion: There is significant discordance between GeneXpert and DST; LPA fluoroquinolone and DST ofloxacin, while neither LPA SLID nor DST kanamycin shows no significant discordance.

Introduction

Worldwide, tuberculosis (TB) is one of the top 10 causes of death and the leading cause of curable single infectious agent1. It is an infectious disease caused by the bacillus Mycobacterium tuberculosis (MTB)2. Now we stand at Sustainable Development Goals (SDGs) for 20303. TB is the only disease ever declared a global emergency by the World Health Organization (WHO)2. Integral to this transition, the world community is launching accelerated fight against TB3.

Globally in 2017, around 10.0 million people (range 9.0 – 11.1 million) developed TB disease in 2017: 5.8 million men, 3.2 million women, and 1.0 million children. Drug resistant-tuberculosis (DR-TB) continues to be a public health crisis1. The emergence of DR-TB is further complicating the situation and is threatening
to jeopardize all the prior gains by global TB control programs in recent years. The best estimate is that 558,000 people (range 483,000 – 639,000) developed TB that was rifampicin resistant-tuberculosis (RR-TB), the most effective first line drug, and of these, 82% had multidrug resistant-tuberculosis (MDR-TB). Globally, 3.5% of new TB cases and 18% of previously treated cases had MDR/RR-TB. Among cases MDR-TB in 2017, 8.5% were reported to have extensively drug resistant-TB (XDR-TB).

DR-TB surveillance data show that an estimated 160,684 cases of MDR/RR-TB were detected and notified. Of these, a total of 139,114 people (87%) were enrolled on treatment with a second line-regimen. In spite of increased testing from 129,689 cases in 2016, but still only 25% of the estimated 558,000 people who developed MDR/RR-TB.

TB is an age old disease, but even today the diagnosis of TB remains elusive. Urgent action is required to improve the quality of diagnosis for people with DR-TB. Indonesia accounted for countries for 11% from 80% of the 3.6 million global gaps in the detection and treatment of TB cases. In 2017, Indonesian national study found that although about 80% of new cases were detected, 41% of these cases were not reported. Gaps between the estimated number of new cases and the number actually reported due to underdiagnoses. Closing gaps in detection require much higher coverage of drug susceptibility testing among people diagnosed with TB, reducing underdiagnoses of TB.

Only one in every six estimated cases was being detected worldwide. Gap remains of the estimated MDR/RR-TB cases still undetected. For the diagnosis of TB, a large number of tests are available, each one having its advantages and disadvantages.

Culture based-methods remain the ‘‘gold standard’’ for TB diagnosis in developing countries as these techniques have been greatly improved and routinely used over the past decade. However, the time for bacteriological culture-based diagnosis of TB may require several weeks to months. To address such delay in TB diagnosis as well as to discretely upgrading the speed and quality of MTB diagnostic accuracy.

Worldwide emphasizing the need to be considered for the early detection of MTB which involves the detection of the mutation in specific genes imparting against resistance. Molecular methods have led to the development of rapid and reliable diagnostic and drug susceptibility testing. GeneXpert and Line Probe Assay (LPA) are two which approved standard molecular diagnostic methods that have been developed for the rapid detection of drug resistance by scanning the DNA for associated mutations. GeneXpert is an urgent necessity for tests that can quickly diagnose TB. Introduction of newer and rapid diagnostic tools have increased the detection of RR-TB cases. RR-TB is crucial for proper control of TB disease. In the present study comparative analysis of the conventional method and molecular method like LPA for diagnosis of MTB and detection of MDR TB is carried out.

However, there is a discordance between conventional culture with DST and rapid diagnostic tools with GeneXpert and LPA. This discordance result can cause confusion to the clinician in determining diagnosis DR-TB. Here, this study was observed the rapid molecular diagnostic validity of GeneXpert and LPA whether the results will or will not be in accordance with the results given by DST.

Methods

Study Design and Setting: A retrospective study conducted between third to fourth quarters of 2018 at Dr. Soetomo General Academic Hospital, Surabaya, Indonesia. The subjects were 81 patients diagnosed with DR-TB. Only 53 patients were eligible for this study (figure 1).

Figure 1. Study flow diagram

This study reviewed based on medical records of diagnostic tools in DR-TB. DR-TB definition adapted from WHO guidelines. This study obtained data on demographics, gender, age, comorbidities, acid fast bacilli (AFB), GeneXpert, second line LPA, and DST. The inclusion criteria were men and women aged between 20 and 65 years. The exclusion data were that patient sample with incomplete GeneXpert, LPA, and DST data.

Procedure: Each sample data was initially examined with smear AFB sputum specimens. AFB data
were conducted from microbiology sputum examination result in the medical record. Positive AFB stains were quantified into 4 groups as scanty (1–9 AFB/100 fields), 1+ (1–9 AFB/10 fields), 2+ (1–9 AFB/fields), and 3+ (>9 AFB/fields).

Then sputum specimens were screened for DR-TB. Diagnostic tests for DR-TB disease include rapid molecular tests and culture based methods. The rapid test for diagnosis of TB currently recommended by WHO is the GeneXpert and LPA.

GeneXpert data were conducted from medical records. GeneXpert can provide results within 3 days, and was for diagnosis of pulmonary TB in adults. RR-TB proved by GeneXpert. GeneXpert RR-TB result was quantified into 4 groups as very low, low, medium, and high.

The further analyzed with second-line LPA. Second-line LPA data were collected from TB03. Second-line LPA sample comes from Balai Besar Laboratorium Kesehatan (BBLK) Surabaya. Second-line LPA can provide results within 14 days. Second-line LPA result was targeting two drugs for its resistance, LPA fluoroquinolone (LPA FQ) and LPA second line injection drug (LPA SLID).

DST was performed on the culture-based methods to identify *Mycobacterium tuberculosis* complex (MTBC) strain. DST has carried to all the culture positive samples by Standard Proportion method. The drugs were used for DST, rifampicin, Isoniazid, ethambutol, streptomycin, kanamycin, amikacin and ofloxacin (Ofl), for DR-TB detection. DST form the current reference standard and can take up to 12 weeks to provide results2.

We compared DST as the gold standard with GeneXpert. We wanted to see concordance or discordance for detection of rifampicin resistance. We compared DST with second-line LPA. We wanted to see concordance or discordance for detection of fluoroquinolone and second line injection drug resistance.

Statistical Analysis: All of the patient’s data were collected on Microsoft Excel. Categorical variables were expressed as an absolute number. Statistical analysis was analyzed using IBM SPSS software 20.0 (IBM Corp., Armonk, NY, USA) for Windows. The cross-tabulation with McNemar formula was performed to analyze concordance or discordance between GeneXpert, second line LPA, and DST. The probability levels p < 0.05 were considered as statistically significant.

Results

The study has enrolled 81 patients diagnosed with DR-TB at study entry. Only 59 patients with RR-TB were eligible in this study.

Their demographic data are summarized in Table 1. In this research, baseline characteristic stratified by gender, approximately 69.5% of patient were men. The mean age of patients was 44.47 ± 11.27, range between the youngest ages was 22 years, while the oldest was 62 years. Around 72.9% of patients self-reported had common comorbidities. The most frequent patient comorbidities were smoking (54.2%) and diabetes mellitus (38.9%).

Sputum microscopy AFB showed 74.5% has a positive result. GeneXpert was stratified according to four categories very low, low, medium, and high rifampicin resistance. Most of sample 42.4% has a medium result. Second line LPA and DST were stratified according to two categories resistant and sensitive. 53 samples were analyzed for DR -TB by second-line LPA by targeting two drugs for its resistance, LPA fluoroquinolone (LPA FQ) and LPA second line injection drug (LPA SLID). It was found that 84.7% of samples were found to be sensitive by second-line LPA. Also, only 5.1% of the
samples were found to be resistant by second-line LPA. DST component was isoniazid rifampicin, ethambutol, streptomycin, kanamycin, amoxicillin, and ofloxacin. Resistant DST rifampicin was 78.0%, resistant DST kanamycin was 8.5%, and resistant DST Ofl was 18.6%. The other laboratory result is summarized in Table 2.

The analysis showed discordance between GeneXpert and DST rifampicin was 13 (13.2%) samples with \((p=0.046)\). Discordance between LPA fluoroquinolone and DST ofloxacin was 13 (24.6%) samples with \((p=0.042)\); LPA SLID and DST kanamycin was 7 (13.2%) samples with \((p=0.183)\). There is no variable that can be used to analyze the discordance result between GeneXpert and second line LPA (table3).

**Discussions**

In the recent years, major importance has been given on rapid diagnosis and quick initiation of accurate treatment for DR-TB\(^8\). Resistance to anti-TB drugs can occur when these drugs are misused or mismanaged\(^{10}\). Late diagnosed DR-TB leading to diagnostic delay with associated exacerbation of transmission, amplification of resistance, and increased mortality\(^{11}\). Precise and early diagnosis of DR-TB is extremely beneficial as it interrupts further transmission of the disease and avoids addition of life-saving drugs and consequently increases of drug resistance. It also avoids unnecessary cost of administration and occurrence of serious side effects of second line anti-TB drugs in case one is dealing with drug sensitive MTB strains\(^2\).

The best method of diagnosing an infectious disease is to demonstrate the causative organism in representative samples of tissue or fluid by either staining and or by culture. Sputum microscopy by the AFB staining is accepted worldwide as the first line test as it is simple, convenient, rapid, inexpensive and can be done in field condition. However, it is less sensitive as it requires bacterial load at least 10\(^4\) bacilli per ml of sputum to be positive and it may be falsely positive in many conditions including environmental mycobacterial infection\(^6\). AFB cannot distinguish between dead and live bacteria and is unable to identify different species of MTB\(^2\). Culture is the reference golden standard for TB diagnosis but they are time consuming. Culture and drug-susceptibility testing (DST) using solid media can take up to 8–12 weeks for results and faster liquid-based culture techniques still take at least 4–6 weeks\(^5\). DST based on the estimation of growth or no growth of an MTB strain in the presence of a single critical concentration of one drug. The critical concentration of an anti-tuberculosis drug represents the lowest concentration of the drug in the medium that indicates clinically relevant resistance if growth is observed. Susceptible wild-type strains are inhibited by this concentration. Resistance is defined if over 1% of the bacterial population of a strain is able to grow\(^2\).

The development of rapid molecular diagnostic tests for the identification of MTB and drug resistance has consequently become a research and implementation priority\(^5\). Rapid and accurate diagnosis of pulmonary TB remains a great challenge. There is an urgent necessity for tests that can quickly diagnose TB. Hence the most promising approach was to demonstrate remnants of the TB bacilli in representative samples. Detecting even small amounts of bacterial DNA was feasible due to the development of various molecular diagnostic tests for TB\(^6\).

Molecular techniques have revolutionized the diagnosis of pulmonary tuberculosis (PTB), as well as DR-TB. Rifampicin resistance is considered as surrogate marker of DR-TB\(^6\). GeneXpert and LPA are recommended for diagnostic testing for the presence of MTB and detection of mutations associated with rifampicin resistance\(^12\).

GeneXpert is a novel integrated diagnostic system for major change in the speed, simplicity and accuracy of not only diagnosis of TB but also drug resistance to rifampicin in TB, which is accepted as a surrogate for DR-TB. The rapidity and robustness of diagnosis in-turn breaks the chain of transmission in addition to early institution of treatment and improved chances for cure\(^13\). GeneXpert can simultaneously identify MTB and rifampicin resistance within two hours. The GeneXpert has been approved by the WHO in 2013. It adopted a GRADE system approach to arrive at recommendations on the diagnostic value of the assay in PTB patients on therapy for less than seven days. This test has the potential to dramatically reduce the time to diagnosis and the time to initiation of effective therapy\(^6,13\).

GeneXpert advantage is simple and automated to perform with minimal training, is not prone to cross-contamination, and requires minimal biosafety facilities\(^4,6\). GeneXpert requires a reliable power supply and operating temperatures below 30\(^\circ\)C. Sputum should be of good quality, and it should be concentrated by usual laboratory methods\(^6\). The specificity and sensitivity of GeneXpert for detection of rifampicin resistance are
more than 98% and 99%, respectively\textsuperscript{4,14}. GeneXpert is designed to identify rifampicin resistance\textsuperscript{6}. Rifampicin is a widely used first line anti TB drug that works by inhibiting the mycobacterial ribonucleic acid (RNA) synthesis\textsuperscript{4}. The vast majority (around 95 to 98%) of rifampicin resistance associated mutations using DNA probes in an 81-bp region (codons 507 to 553) of the RNA polymerase β subunit (rpo-β) gene known as the rifampicin resistance determining region (RRDR). Rifampicin resistance detection in the GeneXpert is based on hybridization or the absence of five molecular beacon probes complementary to the wild type sequence of rpo-β gene\textsuperscript{14}. Most of the RIF resistance mutations are of the first kind hence are easily detected\textsuperscript{15}.

In our study, there is discordance between GeneXpert and DST Rif, but the percentage is low. The accuracy for identification of rifampicin resistance was 98%. However, a study done in Swaziland demonstrated that the assay may not be able to detect wild type mutations for rifampicin resistance outside the rpo-β I491F domain\textsuperscript{6,4}. GeneXpert detected four samples discordant with culture DST. On sequencing, two showed mutations [517,519 [dual mutation] and 533CCG], while two others had no mutation in the RRDR. The mutations at probe ends might be missed\textsuperscript{13}.

Another study revealed mixed MTB infections have been suggested to be responsible for false negative and positive results for rifampicin resistance. Several studies have reports of mixed infections, its interference with drug resistance detection. For the same reason, GeneXpert cannot be used for assessing the emergence of rifampicin resistance during treatment. Hetero-resistance MTB populations is often suggested to be responsible for discordant DST results\textsuperscript{13}.

LPA are rapid molecular diagnostics that can detect MTB and drug resistance. Although LPAs are more technically complex and take longer to perform than the GeneXpert. First line LPA detect drug resistance by identifying mutations in the rpo-β, katG, and inhA genes. By targeting mutations in the 81-base pair “core region” of the rpo-β gene, more than 95% of all Rifampicin resistant strains can be detected. Although mutations in katG and inhA account for approximately 80-90% of INH resistant strains\textsuperscript{5}.

LPA targeting resistance to second line anti TB drugs are under evaluation. Second line LPA detect fluoroquinolone (moxifloxacin) and SLID (aminoglycosides, kanamycin, and capreomycin) resistance by identifying mutations in gyrA, and rrs. Sequencing of the gyrA, and rrs genes was performed on a representative sample of isolates with discrepant second line LPA and DST results. These assays detect mutations in the gyrA gene as fluoroquinolone resistance and detected mutation in rrs gene as kanamycin, Amk, and Cm resistance\textsuperscript{11}.

In the present study we have performed a comparison of the conventional method of DST and a newer molecular method that is LPA for the detection of DR-TB from the sputum samples\textsuperscript{2}. In Indonesia we have only check second-line LPA. The second-line LPA detects resistance to fluoroquinolones (LPA-FQ) and second-line injectable drugs (LPA-SLID), and it may be used as an initial test for second-line drug resistance\textsuperscript{6}. The results of LPA were then compared to the DST, which is still a gold standard\textsuperscript{2}. A positive result is reliable for detection of drug-resistant TB but a negative result may not always rule out the presence of drug-resistant TB, and that should be confirmed by conventional culture and drug sensitivity test (DST)\textsuperscript{6}.

LPA is capable of indicating hetero-resistance but the limit of detection of LPA is at least 5x10\textsuperscript{3} bacilli per ml of sample, hence the bacillary load would need to be high enough for detection using reverse hybridization by LPA. The LPA also may not detect all mutations at position 533; the probes are so designed that the mutation does not always affect the loss of binding of probes\textsuperscript{13}.

Another study discordance between LPA and DST may be due to DNA extraction protocol of LPA. In LPA, DNA extraction was done directly from the sputum samples; hence even the DNA of dead bacilli may have contributed. Higher percentage of TB positive in LPA may be attributed to the limitation of the technique that cannot differentiate between live and dead bacilli\textsuperscript{2}.

Depending on the specific region interrogated by SL-FL and SL-LPA, one or more follow-up diagnostic actions are either recommended or suggested as optional to better guide the choice of the treatment regimen. The decision to perform the optional follow-up diagnostic actions should be guided by considerations on the individual patient’s risk for resistance and by the
prevalence of resistance in the specific geographical setting, as these factors affect the positive predictive value of the test\textsuperscript{16}. Genotypic testing is much faster than phenotypic methods, as these are not growth based tests. Drug sensitivity test results by solid Lowenstein Jansen media has a turnaround time of up to 84 days, liquid culture up to 42 days, LPA up to 72 hours and GeneXpert by 2 hours\textsuperscript{6}.

However, it should be remembered that a positive result suggest but a negative result do not exclude TB as well as DR-TB. At present GeneXpert and LPA has not totally replaced the traditional smear and culture for TB\textsuperscript{6}. Molecular tests are not recommended for treatment monitoring. DST may be used during treatment to assess for any acquisition of additional resistance or reinfection. Given that decisions on the treatment of patients depend to an important degree on the bacteriological findings\textsuperscript{12}.

**Conclusions**

Bacteriological examinations in patients with DR-TB include sputum smear microscopy, culture and DST as well as rapid test such as GeneXpert and LPA. Genotypic assays though offer rapidity and most often a good sensitivity when the probes designed can cover all possible mutations responsible for resistance but could give false positive results due to detection of mutations not responsible for resistance. There is significant discordance between GeneXpert and DST; LPA fluoroquinolone and DST ofloxacin, while neither LPA SLID nor DST kanamycin shows no significant discordance.

Abstract

Complex posttraumatic stress disorder is a diagnostic construct which tries to capture complex trauma reactions in face protracted and repeated psychological trauma. These reactions which compromise specific symptom constellation may be missed if there is focus on classical posttraumatic syndrome. Iraqi population endured four decades of instability which created atmosphere of protracted repeated trauma situation which necessitate examining complex trauma reactions. The aim was to create a tool for examining complex trauma reactions within Iraqi population and examining rates and nature of these reactions in a sample of Iraqi population. Random sample of medical students were examined for exposure to traumatic events and complex psychological trauma reactions. The tool used for examining complex trauma was made according to criteria of disorders of extreme stress not otherwise specified; validity and reliability of the tool was verified and rates of traumatic events and rates and nature of reactions were examined. Most of participants confirmed exposure to more than one traumatic event and 25% fulfilled criteria of complex trauma syndrome. Rates of complex trauma reactions are high in this study. Large population studies are needed to confirm this fact, which means extensive efforts are needed at clinical and social levels for proper help to be provided to traumatized individuals.

Keywords: CPTSD, PTSD, DESNOS

Introduction

Posttraumatic stress disorder PTSD was first introduced as psychiatric diagnosis in DSM III at 1980. Its introduction was based on available literature about psychological trauma of adults at circumstances of war and natural disasters and over later years research has confirmed PTSD as diagnostic category and supported its validity, reliability and applicability to clinical demands of trauma population. In the same time, such research continuously brought new looks at the diversity of psychological trauma reactions. The aims of this study are to build new questionnaire for complex psychological trauma reaction suitable for Iraqi population according to the six domains of DESNOS. Another aim is to detect the rates of complex trauma syndrome and its constituting symptoms in a sample of Iraqi medical students.

Literature Review

While the classical PTSD concept requires the triad of trauma re-experience, emotional numbing and over arousal, an increasing amount of literature found that such triad do not capture many other psychological reactions of trauma and reactions to trauma were found to be variable according to developmental age at exposure as well as to nature, frequency, duration and context of the trauma. Patients exposed trauma at early age or those exposed to frequent serious traumatic events of long duration or patients traumatized within the context of intimate relationship were found to show more complex reaction than the initial triad introduced with PTSD. It was found that co morbidity was common among patients with PTSD. Questions were
aroused whether this indicates that PTSD could lead to other conditions or there is need to review the diagnostic construct of PTSD. Soon then the concept of complex trauma reactions was described. DSM IV delineated a syndrome named disorders of extreme stress disorders not otherwise specified (DESNOS) This syndrome which was also called Complex posttraumatic stress disorder is composed of six groups of symptoms which are: I alteration of regulation of affect, II alteration in attention and consciousness, III alteration in self-perception, IV alteration in relationship with others, V somatization and VI alteration in system of meaning. Although this syndrome was first thought to occur at early age with repetitive traumatic events at context of care giving relationship then the concept was thought to be applicable to repetitive long duration traumas occurring within war situations or under totalitarian political regimes. ICD 10 on other hand described long living personality change upon long traumatic stress exposure. A recent conceptualization recognizes that more complex cases of PTSD involve deficits in regulating emotional distress that in addition to the core PTSD symptoms, complex presentations are more difficult to treat because they involve acting out, self-harm, and self-destructive relationships and behaviors. Although it was thought that complex trauma reactions can develop without necessity for presence of classical trauma syndrome yet recent empirical evidence found that only 8% of DESNOS patients don’t fulfill criteria of PTSD. For this reason complex PTSD was not included as separate disorder in DSM V while it was included in ICD 11 as disorder fulfilling criteria of both classical and complex trauma symptoms. From other perspective it is thought that cultural factors may have role in shaping reaction to psychological trauma and the application of Euro American view of this subject to traditional cultures need further evidence. The Iraqi Mental health survey found low rates of classical PTSD among Iraqi population (INHS 2007). Iraqi population sustained long and repetitive traumatic events through long war years and economic sanctions since 1980. The current study proposes that complex trauma reactions could have happened within Iraqi population and possibly overlooked if focus is on classical PTSD as trauma reaction within Iraqi culture. This study tries to examine the presence of complex trauma reaction (DESNOS) among Iraqi population.

Methodology

Design: cross sectional study arranged to examine complex PTSD construct in study subjects

Sample: Random sample was made of medical students at Al Nahrain University College of Medicine, Baghdad, Iraq from the academic year of 2018-2019. 131 students from fourth, fifth and sixth classes agreed to participate in the study and were provided with study forms. College adopts 6 years training system and total number of students within the last three classes was 450 students

Study tools: Study questionnaire form included three parts

§ Part one: demographics; this includes age, gender, marital status and level at medical school

§ Part two: include questions about any current or past psychiatric treatment, current physical disease and treatment. Participants who have such experiences were excluded from further analysis of trauma reaction.

§ Part three: questionnaire of past traumatic events. It examines the types and rates of variable psychological traumatic events. The questionnaire was already used as part of Iraqi National Mental Health Survey 2007 (INMHS 2007) It includes 27 questions to be answered by yes or no. Exposure to traumatic events was considered a precondition to be involved in further data analysis and 27 participants were excluded from data analysis, as they did not report any exposure to traumatic event while the other 127 were included as they reported such exposure

§ Part four: Complex trauma questionnaire: This self-rating questionnaire was based on the six groups of symptoms and criteria needed for DESNOS diagnosis. Questions were written according to criteria provided. The questionnaire included 45 items about the six symptom categories. Each of the six items includes variable number of questions to be answered according to the Likert questionnaire format. The 45 items of complex trauma part and the 27 items of the past trauma events part yield a final 72 items questionnaire for this study. The process of validity and reliability of the questionnaire were arranged according to the following steps.
Validity: The questionnaire was sent to 7 experts in psychology and psychiatry. Items which got 80% or more agreement among experts were kept as they are. Others needed simple changes according to notes of experts and the whole questionnaire was accepted as it is and was finally composed of 72 items.

Reliability: Test retest reliability was found to be of 0.79 while alpha Cronbach coefficient was 0.76 for the questionnaire.

Statistical analysis: SPSS software was used. Percentages, T test for independent variables, Pearson correlation coefficient, alpha Cronbach coefficient, T correlation equation were used at relevant data analysis process.

Results

1. Questionnaire: aim was accomplished and the final questionnaire is composed of 72 items; 27 being for traumatic events part while 45 items belong to complex trauma symptoms part. validity and reliability was confirmed as mentioned above.

2. Rates of traumatic events experience out of the 131 participants, 129 confirmed exposure to one or more traumatic event (98.4%). Data of these 129 participants were then further examined. The number of traumatic events was variable with one participant having 18 events and one other having 17 events. Rates of other traumatic events are further described in table 1.

Complex trauma: Of the 129 participants who have experienced traumatic events, 13 were further excluded for presence of psychiatric history or being under psychiatric treatment or having chronic physical disease or treatment. 116 participants were further examined for complex trauma syndrome. As a whole 29 person (25%) of study sample fulfilled the criteria of DESNOS. Of these 73% confirmed the presence of criteria Criterion VI. Of complex trauma, (Alterations in Systems of Meaning), 39% confirmed the presence of criteria Criterion II (Alterations in Attention or Consciousness), 25.3% confirmed the presence of criterion IV. (Alterations in Relations with Others), 25.2% confirmed the presence of criterion V. (Somatization), 25.1% confirmed the presence of criterion I (Alteration in Regulation of Affect and Impulses), and 22.17% confirmed the presence of criterion III (Alterations in Self-Perception). Conclusions

1- The rate of DESNOS found in this study is high (25%). the Iraqi Mental Health Survey IMHS (2006-2007) found the life time and 12 month prevalence of classical PTSD to be 3.9 % and 1.6% within Iraqi society respectively. (12) Although the current study’s population is restricted to medical students and cannot be representative to whole Iraqi population but the high rate reported may indicate that complex trauma reaction can be wide spread. The current evidence shows that DESNOS is reported in variable rates among patients with classical PTSD (13) yet small percent of DESNOS do not suffer from the disorder. (14) This notion that complex trauma reactions occur in accompaniment with classical PTSD among traumatized populations is further prompted by evidence which support the validity of ICD 11 CPTSD as sibling yet separate disorder from PTSD. (15) The high rates of DESNOS as reported in this study in comparison to IMHS PTSD rates needs then to be explained from other perspective. Although the time interval between 2006 when IMHS was arranged and time of the current study was accompanied by continuous unstable circumstances in Iraq yet whether these circumstances lead to higher rates of PTSD this then need to be confirmed. DESNOS was considered a very useful construct by mental health professionals who have worked with adult non-Western patients exposed to forced migration or torture although there has been little research in this area. (16) The DESNOS construct raises questions about whether repeated exposure to trauma lead to a different pattern of symptoms than those included in PTSD and whether DESNOS model is useful in a cross-cultural context. (8) DESNOS emphasizes both dissociation and somatization, two symptoms not included in the DSM-IV PTSD diagnostic criteria that are frequently observed in traumatized non-Western cohorts? (17) The relevance of the PTSD diagnosis has been criticized from a cross-cultural perspective as a Euro-American construct that has little relevance to posttraumatic syndromes encountered in traditional societies. (18) Somatization and dissociation, two cardinal symptoms of posttraumatic reactions in traditional societies, are missing from DSM-IV diagnostic criteria for PTSD (but not DESNOS). (17) The current study shows that most of individuals in the sample had experienced several traumatic events and interestingly both dissociation and somatization are very highly reported. There may be culture-specific idioms of distress that provide a better characterization of posttraumatic distress syndromes found in one ethno cultural context or another. (19) The results of the current study suggest that DESNOS can be very common trauma reaction in Iraqi population. One limitation of the current study is that it did not examine possibility of occurrence of classical PTSD within studied sample. Further studies are needed on large-scale population samples to confirm whether DESNOS is common trauma reaction in Iraq and to conclude more whether DESNOS in Iraq occurs as separate diagnostic category regardless presence of classical PTSD syndrome. Findings from these studies can modify the attitude towards the impact of psychological trauma in Iraqi population. The low rates of PTSD in the IMHS were explained by possible inherent resilience present in Iraqi people. (20) If DESNOS is proved to be as such highly prevalent then we will need to modify our strategy towards impact of trauma at epidemiological, clinical, social and cultural levels. Improved detection
will help implement necessary treatment strategy that is different from that implemented in classical PTSD. (8)

Abstract

This study aims to identify the potency of bioactive compounds of sweet potato leaf as inhibitory agent to dengue virus (DENV) NS2B/NS3 protease by using computational study. The 3D structure of NS2B/NS3 protease was collected from PDB and the 2D structure of several bioactive compounds of sweet potato leaf were obtained from PubChem. The visualization and data analysis were performed by using the PyMol software. According to the in silico analysis, result demonstrated that dehydroabietanol had the lowest free energy binding. However, based on the protein-ligand analysis, all the compounds showed the hydrogen bond and hydrophobic interaction. All the compounds with hydrogen bond could not be interacted with catalytic domain, but hydrophobic interaction could be interacted to the target domain via Ser135 by δ-Selinene and His51 by α-Caryophyllene. In summary, we conclude that δ-Selinene and α-Caryophyllene might have potencies as a therapeutically drug for dengue.

Keywords: Dengue virus, in silico, Ipomoea batatas, protease

Introduction

Indonesia is a tropical country and home of mosquito vector species of dengue virus (DENV), Aedes aegypti and Aedes albopictus[1]. DENV is infectious agent dengue fever-causing epidemic diseases, current antiviral drug cannot succeed against this entity. Therefore, the development of the drug is required to treat DENV infection[2]. DENV is member family from Flaviviridae and consist of four serotypes (DENV 1-4)[3].

Indonesia is a large country in Southeast Asia and has a high plant diversity in the world. There are more than 5,000 medicinal plants that available all around us[4]. Consequently, medicinal plants used by its population in curing many diseases[5,6]. The medicinal plants generate a variant of chemical composition with the potency to prevent viral replication and probable resource for controlling viral infection[7]. Plants have been described to have antiviral action and some have been accustomed to manage viral taints in humans and animals[8]. Medicinal plants were found for antiviral compounds, such as Convolvulaceae[9].

DENV is a single stranded and positive polarity RNA virus with a genome of about 11,000 bases in length. The genome encodes for three structural proteins and nonstructural proteins, its activated by trypsin-like NS2B/NS3 protease. This enzyme has a catalytic triad domain,
it contains a specific amino acid residual His51, Asp75, and Ser135 required for catalytic activity\[10\]. Protease complex NS2B/NS3 have a key role in viral replication and make it’s as a therapeutic target to development of protease inhibitor for DENV infection\[11\]. In addition, sweet potato bioactive compounds reported as a potent inhibitor of the virus\[12\]. Previous research by Pochapski et al. (2011) explained that chemical compound contained in sweet potato have potency as a drug but this mechanism action is unknown\[13\]. Therefore, we identified the potency of bioactive compounds of sweet potato leaf as inhibitory agent to DENV NS2B/NS3 protease by using computational study.

**Materials and Methods**

**Collection of NS2B/NS3 serine protease**

The target protein in this research is DENV NS2B/NS3 protease. Therefore, the 3D structure of NS2B/NS3 serine protease was obtained from protein database or RCSB with ID 2FOM. Furthermore, the protein was validated the model quality by using Ramachandran plot.

**Collection of sweet potato leaves compounds**

Various bioactive compounds from sweet potato leaves referred to previous research\[14\] were retrieved from PubChem. The 3D structure of compound has collected in structure data format (SDF). Therefore, it must be converted by Open Babel software to produce flexibility 3D structure with protein data bank (PDB) format.

**Molecular docking of NS2B/NS3 serine protease with sweet potato leaves compounds**

Screening the potency of sweet potato leaves compounds by using virtual screening was conducted with molecular docking. There are several methods which could be applied by using molecular docking, such as specific docking and blind docking\[15,16,17\]. This research was conducted by using blind docking by PyRx software to identify the potency of bioactive compound from sweet potato leaves as inhibitor NS2B/NS3.

**Visualization of interaction between NS2B/NS3 serine protease with sweet potato leaves compounds**

Then, we were using PyMol to visualize 3D ligand-protein structure of NS2B/NS3 serine protease and various compounds of sweet potato. Furthermore, those interaction were analyzed by using LigPlot to compared chemical interaction\[18,19\].

**Results and Discussion**

DENV is a single stranded and positive polarity RNA virus with a genome of about 11,000 bases in length. The genome encodes for three structural proteins and nonstructural proteins, its activated by trypsin-like NS2B/NS3 protease. This enzyme has a catalytic triad domain, it contains a specific amino acid residual His51, Asp75, and Ser135 required for catalytic activity\[10,11\]. Protease complex NS2B/NS3 have a key role in viral replication and make it’s as a therapeutic target to development of protease inhibitor for DENV infection.

The 3D structure has been obtained from PubChem, around thirty-six of a bioactive compound that’s contained in the leaf essential oil of sweet potato, then its minimize by Open Babel because then its minimize by Open Babel because it’s will making this ligand have lowest binding energy and generate structure flexibility NS2B/NS3 serine protease (2FOM) obtain from PDB, and then validating structure has been done using RAMPAGE, the result of structure validation showed by Ramachandran plot. Structure validation aims to evaluate the structure quality of targeted protein which is quantify by the number of favored amino acid that reach more than 90%\[19\]. In this study, targeted protein was visualized based on surfaces structure. Furthermore, the NS2B/NS3 structure is arranged from two chain, A and B which contain α-helix, β-sheet, and coil.
Molecular docking is a part of in silico analysis that has main objective to identify the energy binding size and the interaction pattern between protein and its ligand according to the chemical interaction within the complex\[^{[16]}\]. Molecular docking has performed by PyRx software to know binding affinity level with grid positions x: -0.4637 y: -15.1662 z: 16.1087 and dimensions (Å) x: 52.1952 y: 56.6277 z: 46.8960 refer to catalytic site domain on NS2B/NS3 serine protease with amino acid residual is His51, Asp75, and Ser135, that be visualized by PyMol software as stick in cartoon structure with surface on target protein (Figure 1). After we know the positions of the catalytic site, then docking grid was directed to its. Docking result indicated that compound has a lowest binding affinity is dehydroabietinol around -7.1 kcal/mol. We revealed another results, such as abiadiene (-6.9 kcal/mol), cembrene (-6.6 kcal/mol), δ-selinene (-6.5 kcal/mol), δ-cadinene (-6.4 kcal/mol), spathulenol (-6.2 kcal/mol), β-euvebeene (-6.0 kcal/mol), γ-gurjunene (-5.9 kcal/mol), α-bergamotenol (-5.8 kcal/mol), β-caryophyllene (-5.8 kcal/mol), β-elemene (-5.8 kcal/mol), allo-aromadendrene (-5.7 kcal/mol), β-chamigrene (-5.7 kcal/mol), β-panasinsene (-5.7 kcal/mol), trans-α-bergamotene (-5.7 kcal/mol), caryophyllene oxide (-5.6 kcal/mol), γ-elemene (-5.6 kcal/mol), longifolene (-5.6 kcal/mol), α-caryophyllene (-5.5 kcal/mol), α-thujene (-5.5 kcal/mol), octadecanoic acid (-5.5 kcal/mol), bicyclogermacrene (-5.4 kcal/mol), limonene (-5.3 kcal/mol), terpinen-4-ol (-5.3 kcal/mol), eugenol (-5.2 kcal/mol), n-hexadecanoic acid (-5.2 kcal/mol), α-farnesene (-5.1 kcal/mol), α-santalol (-5.1 kcal/mol), γ-terpinene (-5.1 kcal/mol), p-cymene (-5.1 kcal/mol), p-menth-1-ene (-5.1 kcal/mol), bicycloelemene (-5.0 kcal/mol), α-pinene (-4.8 kcal/mol), β-pinene (-4.8 kcal/mol), cis-sabine (-4.8 kcal/mol), and 1-octen-3-Ol (-4.5 kcal/mol). Binding affinity is energy bonding formed from the interactions some molecule with other, several parameters affect binding affinity such as amino acid residues and type of chemical interaction between ligand-protein such hydrogen, hydrophobic, and Van der Waals. Binding affinity commonly used as indicator of binding energy to determine the complex interaction which is considering as biological activity outcome\[^{[16]}\].
Based on results of molecular docking, a bioactive compound from sweet potato leaves have a potency to bind NS2B/NS3 with lowest binding affinity and possible formed stable complex of ligand-protein. The amount of free energy (ΔG) indicating as an ability of binding for a bioactive compound to the target protein. In this condition, the ligand bind to target protein and making of energy alteration such Gibbs free energy (ΔG), it has negative value when the system in equilibrium condition with constant pressure and temperature, because the widely of protein-ligand association can be determined by negative ΔG, so its determination of the protein-ligand complex or ligand binding affinity\[20\].

Figure 2. Targeted domain and δ-Selinene interaction. The ligand was shown as yellow stick structure, while the specific residual amino acid was shown as red color. The hydrophobic interaction was occurring in Ser135 area shown in black circle.

Figure 3. The α-Caryophyllene interaction to targeted domain. The ligand was shown as purple stick structure, while the red color is the residual amino acid in NS2B/NS3. The hydrophobic interaction was occurring in Ser135 which shown inside the black circle.
Potency as inhibitor NS2/NS3 serine protease in the oil essential of sweet potato leaves showing dehydroabietinol have lowest free energy binding, but refer to the result of analysis of protein-ligand domain interaction of the all compound showing, it’s had two type of chemical interaction between ligand with protein domain as hydrogen bond and hydrophobic. All of the compounds have hydrogen bond cannot be interacted with catalytic domain, but hydrophobic interaction can be interacted to target domain, via Ser135 by δ-Selinene (Figure 2) and His51 by α-Caryophyllene (Figure 3). Catalytic triad (Ser135, His51, and Asp75) can be found in NS2B/NS3 and required to protease activity which functions as a mechanism for activation of DENV replication\(^{[11]}\). So, it is predicted that the two compounds are very possible to interact with the catalytic site domain in NS2B/NS3. Therefore, it can be potentially as an inhibitor compare to dehydroabietinol which has lower binding affinity without chemical interaction site in targeted domain in NS2/NS3 serine protease.

**Conclusion**

In summary, the δ-Selinene and α-Caryophyllene are predicted to have potency as dengue disease medication through the inhibitory mechanism against DENV. Specifically, the ligands are binding to one of catalytic triad of residual amino acid. This interaction inhibits the targeted protein activation when the virus replication occurs.

The Role of EMMPRIN in Perirenal Fat Invasion Clear Cell Renal Cell Carcinoma

Vira Yasmina Ramadhani¹,²,³, Anny Setijo Rahaju⁴,⁵,⁶, Nila Kurniasari⁴,⁵,⁶

¹Student, Department of Anatomical Pathology, Faculty of Medicine, Universitas Airlangga, Surabaya, Indonesia, ²Student, Universitas Airlangga Hospital, Surabaya, Indonesia, ³Student, Dr. Soetomo General Academic Hospital, Surabaya, Indonesia, ⁴Lecturer, Department of Anatomical Pathology, Faculty of Medicine, Universitas Airlangga, Surabaya, Indonesia, ⁵Lecturer, Universitas Airlangga Hospital, Surabaya, Indonesia, ⁶Lecturer, Dr. Soetomo General Academic Hospital, Surabaya, Indonesia

Abstract

Renal Cell Carcinoma (RCC) is a common malignancy of the kidney, and Clear Cell Renal Cell Carcinoma (CCRCC) is the most common type. Accurate prediction of prognosis is valuable for therapy and follow up. EMMPRIN is a transmembrane protein of the immunoglobulin family and is associated with tumour proliferation, invasion and metastasis. This study aims to prove the role of EMMPRIN in perirenal fat invasion CCRCC. This analytic observational study with a cross-sectional approach conducted in Anatomical Pathology Institute of Dr. Soetomo Hospital, Surabaya that used 44 samples of paraffin blocks from radical nephrectomy preparations for CCRCC patients at the period of January 2013-December 2018, which were divided based on perirenal fat invasion status. The analyzed was using Spearman test. EMMPRIN expression is positively correlated with perirenal fat invasiveness (\( p = 0.019 \)) in clear cell renal cell carcinoma. EMMPRIN expression is related with perirenal fat invasiveness, in clear cell renal cell carcinoma.

**Keywords:** Clear cell renal cell carcinoma, EMMPRIN, perirenal fat invasion

Introduction

The Renal Cell Carcinoma (RCC) is the sixth most common malignancy diagnosed in men and tenth in women and accounts for approximately 85% of malignant kidney tumors and 2% of all malignant tumors. In Europe and North America, the lifetime risk for developing renal cell carcinoma ranges between 1.3% and 1.8%. According to the latest data from the World Health Organization (WHO), there are more than 140,000 deaths related to renal cell carcinoma each year, with renal cell carcinoma ranking as the 13th most common cause of cancer death worldwide.¹,²

Tumor staging (TNM), defined by the disease’s anatomical involvement, is recognized as one of the strongest prognostic factors in the clinical outcome of patients with RCC, as described in the eighth edition of the American Joint Commission on Cancer (AJCC) Cancer Staging Manual. The system currently used is according to the 2016 WHO classification system. This system concerns tumor size, tumor growth through the renal capsule, tumor invasion of the renal veins, lymph nodes, and metastases to the adrenals, and distant metastases. These factors indicate a poor prognosis compared to tumors confined to the kidney.³,⁴

EMMPRIN/CD147, also known as Basigin (BSG) or Extracellular Matrix Metalloproteinase Inducer (EMMPRIN), is a transmembrane glycoprotein belonging to the immunoglobulin superfamily that is highly expressed on the cell surface of various types of tumors, including breast, lung, mouth, esophageal cancer, larynx and kidney.⁵ EMMPRIN expression was positively expressed by 88.7% in advanced RCC.⁶ EMMPRIN is known to induce the production of various Matrix Metalloproteinases (MMPs) in cancer cells and

Corresponding author:

Email: anny_sr@fk.unair.ac.id
fibroblasts after epithelial-stromal interactions. MMP is a major protease in degrading the extracellular matrix, which leads to cancer cell invasion and metastasis.⁷

EMMPRIN binds to Cyclophilin A (CypA). A previous study showed that the CypA-EMMPRIN interaction-initiated growth was signaling via a variety of pathways, including the MAPK, ERK1/2, and p38 signaling pathways that induce G1 to S transitions via cyclin D1 and p-RB in cholangiocarcinoma.⁸

Correlation between EMMPRIN expression in cell carcinoma kidney has not been reported. Therefore, this study was conducted to analyze EMMPRIN expression with perirenal fat invasion status in renal cell carcinoma. This study aims to prove the role of EMMPRIN on the status of perirenal fat invasion in Clear Cell Renal Cell Carcinoma (CCRCC).

**Materials and Methods**

**Preparation and Sample of the Study**

This study’s research design was an analytic observational study with a cross-sectional approach, which was carried out in the Anatomic Pathology Installation of Dr. Soetomo General Academic Hospital Surabaya, Indonesia. The study sample used 44 blocks of paraffin radical nephrectomy preparations for CCRCC patients at the Anatomical Pathology Institute of Dr. Soetomo General Academic Hospital, Surabaya, for the period January 2013-December 2018. The samples were divided into two groups based on perirenal fat invasion status. The parameter of assessment was the expression of EMMPRIN, which streaked positively on tumor cells. This study was approved by the Health Research Ethics Committee of Dr. Soetomo General Academic Hospital, Surabaya, Indonesia (Ethical Clearance No.1705 / KEPK / XII / 2019).

**Immunohistochemical Procedures**

EMMPRIN expression in samples was observed using immunohistochemical staining. Paraffin blocks were cut 4 µm, deparaffinized, and rehydrated with graded alcohol, then warmed with citrate buffer pH 6 for 20 minutes in the microwave. The primary antibody, namely EMMPRIN (sc-71038, Santa Cruz Biotechnology, Inc.), was dripped by diluting 1: 250 at 40°C overnight. The secondary antibody is then dropped and incubated for 20 minutes. The final step, diaminobenzidine (DAB), was dripped, and counterstain was carried out with Meyer Hematoxylin.

**Immunohistochemical Staining Analysis**

EMMPRIN expression was assessed using an Immunoreactive Score (IRS), which is the multiplication of the percentage of tumor cells stained (A) and the intensity of staining (B). The percentage is divided into a score of 0 = no positive tumor cells, score 1 = positive tumor cells < 10%, score 2 = positive tumor cells 10 - 50%, score 3 = positive tumor cells 51 - 80%, and score 4 = cells positive tumors > 80%. Intensity was divided into a score of 0 = colorless, score 1 = weak intensity, score 2 = moderate intensity, and score 3 = strong intensity. The IRS (AXB) was divided into four groups, namely negative (score 0), weak (score 1 - 3), moderate (score 4 - 8), and strong (score 9 - 12). EMMPRIN expression was observed in the membrane and cytoplasm of tumor cells.⁹ EMMPRIN expression was observed using a binocular light microscope and evaluated by two pathologists.

**Statistical Analysis**

The correlation between perirenal fat invasion status and EMMPRIN expression was tested by the Spearman correlation test. The test results are said to have a significant correlation if the *p*-value is <0.05.

**Results and Discussion**

The patients’ average age was 53.89 years with a male to female ratio of 2:1. In this study, clear cell, non-perirenal fat invasive (non-PFI) renal cell carcinoma was found in 59.1% (26/44) of cases, whereas clear cell, perirenal fat invasive (PFI) type renal cell carcinoma was only 40, 9% (18/44) of cases. The highest grade in this study was grade 3 (54.5%) cases (24/44). The clinicopathological characteristics of the patients are shown in Table 1.
Table 1. The clinicopathological characteristics of the patient.

EMMPRIN expression in this study was stained on the membrane and cytoplasm of tumor cells (Figure 1). The results of this study indicated that EMMPRIN expression with a strong IRS score was more common in clear cell renal cell carcinoma with perirenal fat invasion, namely 66.7% (Table 2). The Spearman correlation test results showed a significant correlation between perirenal fat invasion status and EMMPRIN expression ($p < 0.05$) with a value of $r = 0.352$ (Table 3). These results indicate that the higher the EMMPRIN expression is in line with the perirenal fat invasion status.

Most of the patients in this study were in the age range 51 - 60 years with 17 cases (38.6%), with a male to female ratio of 2:1 where the number of male cases was 32 cases (72.7%). This is in accordance with previous research which states that the highest incidence is found in the sixth and seventh decades of life and about 80% are between the ages of 40 - 69 years with the distribution of men more than women. The results of this study are in line with the research conducted by Zheng et al., which stated that the increased expression of EMMPRIN was significantly correlated with tumor size, depth of invasion, lymph vessel invasion, MMP 2, MMP 9, and tumor VEGF ($p < 0.05$) in gastric carcinoma. This study showed that the abnormal expression of EMMPRIN can increase tumor cell invasion and angiogenesis by increasing the expression of MMP and VEGF in stromal fibroblasts and gastric carcinoma cells so that increased EMMPRIN expression could be used as an effective and objective marker in predicting invasion and prognosis in gastric carcinoma. A study by Nakamura et al. also found that high EMMPRIN expression is a significant marker of poor prognosis in endometrial cancer. EMMPRIN affects the proliferation, migration, and invasion of tumor cells.
through the expression of TGF-β, EGF, VEGF, MMP-2, MMP-9. The binding between growth factors such as TGF beta, EGF, IGF, and TNF alpha with their receptors can activate cadherin E inhibiting factors such as Snail. The decrease in E-cadherin expression resulting in the loss of bonds between cells is an early stage of EMT.13

Various studies have shown that EMMPRIN plays an important role in the invasion and metastasis of various tumors, such as hepatocellular carcinoma, astrocytic glioma, retinoblastoma, and oral squamous cell carcinoma through increased MMP production. EMMPRIN has also been found to play a role in urothelial carcinoma invasion through the secretion of MMP2, MMP9, MMP14, and VEGF.14

The multifunctional role of EMMPRIN in advanced RCC is not only as an adhesion molecule involved in Cell-Matrix-Extracellular interactions (ECM) but also as a mediator for tumor invasion and angiogenesis through stimulation of VEGF production. Multivariate analysis showed a strong association between EMMPRIN and VEGF expression and poor prognosis in advanced RCC.6 EMMPRIN expression was found to be significantly associated with increased tumor invasion. These observations strongly suggest that EMMPRIN may be actively involved in the growth, invasion, and metastasis of OSCC. In addition, measurement of EMMPRIN levels can help predict a patient’s prognosis.15

EMMPRIN is a transmembrane glycoprotein belonging to the immunoglobulin superfamily that is highly expressed on the cell surface of various types of tumors, including kidney cancer.5 EMMPRIN acts as a cellular adhesion molecule and induces the secretion of matrix metalloproteinases (MMPs) and the release of cytokines.16 EMMPRIN stimulates cancer cells and fibroblasts peritumoral to secrete matrix metalloproteinases (MMPs), which are capable of lowering extracellular matrix protein (ECM), and EMMPRIN directly promotes tumor proliferation, invasion, and metastasis.17

EMMPRIN has been shown to be involved in the regulation of tumor cell invasion and metastasis. First, EMMPRIN combines with the alpha6beta1 integrin into the FAK P13K-Ca (2+) pathway and the MARK signal, which then produces interstitial collagenase (MMP-1), forming a CD147-MMP-1 complex on the surface of tumor cells, thus modifying the pericellular cell matrix tumor to promote invasion. Second, EMMPRIN is a receptor for platelet GPVI and mediates platelet movement through the GPVI-EMMPRIN Combination, thereby increasing the potential for metastasis. High EMMPRIN expression can be used to determine the TNM stage, histopathological stage, metastases, and worse survival in patients with kidney cancer.18

Another study investigated the effects of EMMPRIN on prostate cancer proliferation. EMMPRIN is expressed on the cell surface of most tumor cells, which results in proliferation, invasion, metastasis, and angiogenesis of cancer cells. Previous studies have shown that EMMPRIN can increase prostate cancer invasion and metastasis. The study showed that the inhibition of the EMMPRIN gene had a significant effect on the prostate cancer cell cycle, where a decrease in EMMPRIN expression resulted in an increase in the G0/G1 phase and a significant decrease in the S and G2 phases, indicating the cessation of the G1 phase. The G1 phase, the cell cycle phase in which cells grow and synthesize mRNA and protein for DNA synthesis, is very important because it determines whether the cell is committed to division or escape the cell cycle. The study states that EMMPRIN suppresses the progression of cancer cells by resting the cell cycle in the G0/G1 phase of cancer by suppressing cyclin D1 expression, thereby inhibiting cell proliferation.19,20

**Conclusion**

In conclusion, EMMPRIN expression was significantly correlated to the perirenal fat invasion. EMMPRIN expression has an important role in the Clear Cell Renal Cell Carcinoma (CCRCC).

Abstract

The study aimed to assess the physical and chemical condition of drinking water in El-Fashir city, Sudan. The parameters studied are; Electrical conductivity (EC), nitrates, pH, Total Dissolved Solid (TDS) and fluorine were analyzed at water points and in the laboratory. Results were processed on SPSS software. The study revealed the pH results, which were distributed between 6.8 to 8 for samples from hand pumps 1 and 2 and tank water, respectively. The residual chlorine concentration (RC) in the water supply system of the selected stations ranged between 0.2 to 0.6 mg /L. The concentration of nitrate level ranged from 3.4.5 mg/L, which is within the acceptable range of the standards for WHO and SSMO standards. The study also determined the level of fluorine, which ranged between 0.17 - 0.41 mg/L, which is within the acceptable range of the standards for WHO and SSMO standards. This study found that all results fall within the permissible limits of the standards of WHO and SSMO standards except the hand pumps.

Keywords— Water Quality, Drinking Water, TDS, Nitrate, Conductivity, Turbidity, Fluoride.

Introduction

Water is one of the most vital of all-natural resources known on earth. It is essential to all living organisms, human health, food production, most ecological systems and economic development (¹). The safety of drinking water is vital for the health issues. The safety of drinking water is affected by numerous impurities, which included physical, chemical and microbiological. Such impurities cause serious health problems (²). Water is vital to maintain life, and it must be accessible, safe, adequate and available. Improving the accessibility to safe drinking water can result in appreciable benefits for human health. Major efforts should be made to achieve high quality drinking-water (²,³).

Water covers 75% of our planet, yet, only a small fraction is available as fresh water. Where the majority of water (97%) is found in the oceans (too salty), the remaining 3% of water is fresh where 99.9 % of this water is locked up in the poles, or is so deep (buried) underground that it is too costly to extract (¹).

Sources of Water categories of naturally occurring water resources as groundwater, dug wells, borehole wells, spring water, rainwater and surface water. Potable or drinking water “defined as the water delivered to the consumer that can be safely used for drinking and domestic’s purposes”. In Sudan, the main sources of water are ground water, surface water (rivers and streams) depending heavily on the rainfall. Furthermore,
the clean water supplies are managed by specific water cooperation, and the quality of the water is monitored by authorities (3).

Access to water supply is an essential need and a human right. Joint Monitoring Programmers for water supply and sanitation stated that billions of people worldwide are lasting to suffer from poor access to water, sanitation and hygiene and according to UNICEF and the World Health Organization (WHO) reports (4). One of the targets of Sustainable Development Goal (SDG) 6.1, which is concerned mainly with water supply, “is to achieve universal and equitable access to safe and affordable drinking water for all by 2030” (5–7). Water quality considered safe and fit for human consumption if all parameters being in standards and according to national and international guidelines as explained in the bellow table1, which expressed the standards for selected parameters include among others EC, pH, R. Chlorine, Turbidity, TDS, Nitrate ……. etc. These parameters can affect the drinking water quality if the concentrations higher than the safe limits seted by the World Health Organization (WHO) and SSMO (8).

During the last years, it has been observed that water sources were exposed to pollution due to the increasing urbanization and human activities. These pollutants are classified as organics, inorganics, radionuclides, disinfectants and microorganisms (4). The inorganic chemicals are the major pollutant in drinking water (5). Heavy metals accumulate in human organs and nervous system which hinders the normal functions where it causes health problems (2). Moreover, the heart diseases, kidney-related problems, and cancer are related to the traces of metals such as chromium (Cr) and cadmium (Cd) reported as water-related diseases (6). Fluoride can have an adverse effect on tooth enamel and may give rise to mild dental fluorosis. In general, dental fluorosis does not occur in temperate areas at concentrations below 1.5–2 mg/L of drinking-water (9).

The present study aimed to assess the physio-chemical characteristics of water samples collected from diverse drinking water sources in the study area El-Fashir Sudan, and to compare the results obtained with the local (national) and international standards and guidelines.

Material and Methods

Study area description

The research was conducted in El-fashir city “which ‌is the capital city of North Darfur, Sudan” (1). The geographic coordinates are Latitude: 13° 37’ 40” N and Longitude: 25° 20’ 57” E Lat/Long (dec): 13.62793,25.34936 Köppen. With an estimated population of over 500,000 people, (2013), It considered as the capital city as while as the economic hub of North Darfur. and an agricultural marketing point in the surrounding region.

Sampling and analytical procedure

The samples were collected during August 2017, from 7 sources, such as tap (piped) water, tanks water, tape-stand and Hand pumps used for domestic purposes. Samples were treated using standard methods (collected, stored and transferred to the laboratory). The collection was in clean screw caped glass bottle, insulated ice chest with ice packs was used from the collection of samples. The collected samples were labelled with date and code and kept at 4°C until analyzed. Immediately after sample collection, taste, turbidity, temperature, pH, conductivity and TDS, Residual chlorine, were tested on sites. Nitrate and Fluorine were analyzed at the lab. The physio-chemical parameters were determined according the Standard Methods for the Examination of Water WHO and SSMO. Then comparing the results with SSMO and WHO.

Determination of Physio-chemical Parameters

- Analysis of pH levels: the measurement of pH was done on site by using a portable pH meter. Calibration was by standard buffer solutions; pH= 4 and 7, with temperature adjustments.
- Conductivity and TDS were carried out at 25°C by conductivity meter (Jenway 470) after calibration with calibration solution.
- Determination of Turbidity: Turbidity was measured using Palin test Portable Turbidity Meter.
- Free Chlorine measured by using color comparator; with added one DPD No 3 tablet, crushed and mixed to dissolve, and then stands for few minutes allowing full colour development; Free chlorine reacts
with diethyl-p-phenylene diamine (DPD) in buffered solution to produce a pink coloration. The intensity of the colour is proportional to the free chlorine concentration, then the reading was taken in the usual manner.

- Nitrate and Fluoride concentration: Nitrate and Fluoride values were determined by using spectrophotometer 7500. Procedure is mentioned in Chen et al., 2016 \((^{10})\).

### Results & Discussion

The results of water quality analysis for the various samples collected from different sources of water are shown in the table 2. The results are illustrated in table 2. pH values were all the samples ranged between 6.8 and 8, the lowest and the highest values are from samples (hand Pumps 1&2) and (tank water), respectively. According WHO and NDWQS pH range is between 6.8 and 8.5 which consistent with our results (Table 1). This result is consistent with the study conducted in the State of Perak, Malaysia the pH values ranged between 7.01 and 8.21 \((^{8})\). pH is classified as the most essential parameter of water quality; pH measurement is related to the alkalinity or acidity of water. Acidic water causes corrosion of the metallic plumbing system and pipes. Whereas, alkaline water shows disinfection properties \((^{11})\).

The study showed the concentrations of residual chlorine (RC) in the study area water supply system for the selected stations which were varied between 0.2 to 0.6 mg/L. Most RC concentrations of these hand pumps and ground tanks were zero, while the tap-stand was 0.2 mg/L which is less than acceptable limits in WHO, and in the tap of the public net was 0.6 mg/L which is higher than acceptable limits in WHO. In general, the concentrations of Residual Chlorine are likely to be less in the far distance points from Water Supply Plant (WSP) comparing with near points to WSP. According to WHO, municipal potable water supplies are usually chlorinated to provide a residual concentration between 0.5 to 2.0 ppm to provide continual protection throughout the distribution system from the treatment plant to consumer taps (12). Figure 1 shows a comparison between RC and pH for different water sources in El-fashir.

![Figure 1 Comparison between RC and pH for different water sources in El-fashir.](image-url)
The present study pointed out the level of Electrical Conductivity represents the number of dissolved salts in the water. The presence of dissolved solids included chloride, calcium, and magnesium in water samples to enhance carrying the electric current. According to NDWQ, the maximum acceptable level of conductivity is 1000 $\mu$S/cm. The results ranged from 440 $\mu$S/cm to 2130 $\mu$S/cm, and the average conductivity value is 982.6 $\mu$S/cm (Table 3). The lowest and highest conductivity values correspond to Hand Pumps 1&2 and Public net samples, respectively.

It is expected to find high mineral contents in mineral water, resulting in higher conductivity values. The hand Pumps values cross the acceptable limit in WHO but still within acceptable limits in other references. Conductivity does not have a direct impact on human health but high conductivity affects the quality of the water by giving mineral taste to the water (2,8). Figure 1 shows the Comparison between RC and pH for different water sources in El-fashir.

Total Dissolved Solids (TDS): contains mainly of inorganic salts such as carbonates, bicarbonates, sulphates, phosphates and nitrates of calcium, magnesium, sodium, potassium, iron and a small quantity of organic matter diluted in water. The values of TDS ranged from 550 to 1495mg/L. The levels of TDS exceeded the allowed lowest limit recommended by WHO and SSMO (< 300 mg/L), where the hand pumps samples exceed the highest allowed limit (1000 mg/L) recommended by WHO and SSMO for drinking water. The mean total dissolved solids concentration in the study area was found to be 830.6 mg/L. The concentration of TDS in the present study was in contrast to the results found in the study conducted in Ethiopia where it ranged between 114.7 and 121.2 mg/L. The mean total dissolved solids concentration in the Wondo Genet campus was found to be 118.19 mg/l, which is within the limits of WHO standards (13). High values of TDS in groundwater are generally not dangerous to human health, but the high values of TDS may affect people health who are suffering from chronic kidney diseases, heart diseases and may cause laxative or constipation effects (13,14). The finding indicates that the relation between EC and TDS in drinking water was statistically significant, p <0.000.
The level of turbidity shown in Table 2. Turbidity is related to the cloudiness of water caused by a variety of particles. All the results below the maximum standard limit set by WHO and SSMO (5). Nephelometric Turbidity Units (NTU), where the lowest value was 1 NTU, and the highest value was 2 NTU which represents the samples from taps and hand pumps. These results were consistent with the result observed from the study conducted in Jordan where the turbidity value ranged between 0.05–4.8 NTU (15). High-quality drinking water must have a low level of turbidity to maintain human health. The study also revealed the level of Nitrate in raw water, and mainly it is a form of N₂ (of its oxidizing state). The values were 3 - 4.5 mg/L it is in the range of acceptable levels of WHO and SSMO standards (10 mg/L). Nitrates in water indicate the presence of entirely oxidized organic matter. The excess level of nitrates can cause Methemoglobinemia as a blue baby disease. Although nitrates levels that affect infants do not posture a direct threat to older children and adult people, they do indicate the potential presence of other more serious residential or agricultural pollutants such as bacteria or pesticides (16). The study also pointed out the level of fluoride the values ranged between 0.17-0.41 mg/L (mean= 0.31±0.12 mg/L), it is in the range of acceptable levels of WHO and SSMO standards (1.5mg/L). This result consisted of the results of a survey conducted in Behshar City the values ranged from 0.12 to 0.39 mg/L (mean 0.25±0,06 mg/L) (17). Figure 2 shows the exceedance values for Nitrate and Fluoride above WHO limit for water samples from El-fashir.

![Figure 2 Exceedance values for Nitrate and Fluoride above WHO limit for water samples from El-fashir](image)

**Conclusion**

The levels of water quality parameters such as pH, temperature, turbidity, fluoride and nitrate were found for all samples collected from different sites in the city of El-fashir within the limits recommended by WHO and SSMO, while the conductivity and TDS were found to be at the acceptable levels in all locations except for hand pumps were it exceed the recommended limits. It is also important to conduct further tests to check for other potential water contaminants such as chemicals, microbial and radioactive materials to complete the study on water quality at El-fashir city.

Incidence of *Toxoplasma Gondii* and Relationship with Some Inflammatory Factors in Babylon Province

Widad Hashim Yahya Almuhana¹, Ahmed Khudhair Al-hamairy²

¹M.Sc, Lecturer, Biology Department, College of Education for Girls, kufa University,  
²Ph.D, Professor, College of Science for Women, University of Babylon, Babylon, Iraq.

Abstract

The study included collecting (60)-blood samples from people who were attending the Children’s Maternity Hospital in Babylon Province, then the Latex test was used to diagnose Toxoplasmosis. The results of the study showed that the percentage of infection with toxoplasmosis in Babylon Province was (11.66%), the infection (IgG) for females was (9.61) out of (52)-samples, and the injury (IgM) for females was (3.84) out of (52) samples, whereas the infection was for males in relation to:

IgG (0%) out of (8 samples) for the total percentage of IgG-against is (8.3%)

IgM (0%) out of (8 samples) and the total percentage of IgM-antibody is (3.3%).

Upon detection of (CRP)-proteins, the study included collecting (60) blood samples for people who were referred to the Children’s Maternity Hospital in Babylon Governorate, and then the (CRP)-test and its relationship to toxoplasmosis were used. The study results showed that the total percentage of active phase proteins for people with toxoplasmosis in Babylon Province, it reached 50% ((the percentage was in females by (53.84%) while the percentage in males was 25%)). The current study showed that the percentage of sensitivity of (IgG, IgM)-antibodies is (8.3%, 3.33%) respectively while the percentage of specificity of (IgG) and (IgM)-opposites was (91.66%, 96.6%) respectively.

Objectives of The Study: Because of the recent spread of toxoplasmosis infection and the increase in miscarriage rates among pregnant women, the present study aimed to determine the infection of this parasite in Babylon Governorate between males and females alike, as well as to know the prevalence of toxoplasmosis and its relationship to the active phase proteins CRP

Keywords: Toxoplasmosis, IgG, IgM, Toxoplasma, gondii, AIDS, CRP, spread, pregnant, female.

Introduction

Toxoplasmosis is an infection caused by a single-celled parasitic organism called a pimping or *Toxoplasma gondii*, which is transmitted to humans through meat that has not been adequately cooked, or through direct contact with animals (especially cats)¹. Usually its symptoms and signs are mild, but in people who suffer from (AIDS) it may lead to severe infection in the brain, while in fetuses that have suffered injuries in early stages of pregnancy may lead to blindness or underdevelopment².

Gondii curvature (*Toxoplasma Gondii*) is a unicellular parasite that spends most of its life in the carrier of the cat family, especially domestic cats. One of these cat-carrier parasites can transmit huge amounts of it daily, through feces and secretions, which may come in contact or contact with the human being. In addition, toxoplasmosis can travel between all pets that live in one place of residence. The curvaceous parasitic parasite (or *gondii*) parasite is transmitted to the human body by mouth, when eating. A person who is not keen on washing his hands well after touching pet supplies, exposes himself, to a large extent, to this infection. Another additional possibility of contracting toxoplasmosis is eating meat that has not been properly cooked. Because the condylomed parasitoid (*Gondii*) multiplies in the digestive system, it can spread throughout all body tissues, including the brain (3) and blood circulation. The main organs targeted by the parasitic condyloma (*gondii*) are: skeletal muscles, heart muscle, eyes, lymph nodes and lungs. As for patients who suffer from a weak immune system and suffer from diseases, such (AIDS), cancer, or who are being treated with drugs that suppress the immune system, they are more susceptible to infection with toxoplasmosis, in its effective and dangerous form, as a result of exposure to the (*Toxoplasma gondii*) parasite again, or due to viruses in Dormant (dormant) has been developed since a previous infection. This situation is especially dangerous for AIDS (4) patients who, if they have a dormant virus (in the dormant phase) and not treated as it should, could cause severe and severe infections of the brain (encephalitis) that could eventually lead to seizures, convulsions and neurological complications (5).

**Literature Review**

The Toxoplasma gondii parasite is known to cause Toxoplasmosis. It was discovered for the first time before the knowledge that it was a disease in humans was by Laveran in (1900), as explained, but the most important and detailed discovery occurred in the year (1908) by Nicolle and Manceaux confirmed its name in the year (1909) and that During their studies on the northern African biting, Jerusalem, called *Cteriodactylus gondii*, in the Pasteur Laboratories in Tunis, who gave the currently known name to this parasite, the parasite was described in great detail. Around the same time and elsewhere, the scientist Splender described the parasite in a laboratory bunny in São Paulo, Brazil. The first discovery of this disease in an adult human was by the researcher Darling in the year (2) (1908) in Panama, but the first case of toxoplasmosis in an infectious fetus Toxoplasmosis was recorded in humans in (1923), when
he was suffering from a deformed head Hydrocephalus and a small size of the eyes micro–phthalmia. In the late(1930s) and early forties, toxoplasmosis was considered an important infectious disease that affects humans, while Dubey and Beattie stated that the first offensive case of toxoplasmosis in cats was recorded in(1942), when the parasite was identified in the feces of cats after contact with mice infected with the Toxoplasma gondii parasite. The infection occurs through the formation of egg sacs inside the intestines of cats, and from it the role of cats in the transmission and spread of the disease was emphasized(3). In Iraq, Toxoplasma gondii was recorded for the first time by Machattie in(1939) when he observed the parasite in the spleen and lung swabs of a loose dog in Baghdad conducted an epidemiological study in Baghdad to determine the rate of infection with toxoplasmosis in women suffering from Miscarriages, the number of serum wave cases reached (128), i.e.34.7%, for (369) serum mammograms for women suffering from miscarriages through the use of the (IFAT) selection, the yeast linkage for immune absorption (ELISA) and the use of the (LAT-latex) test. Classification of The Parasite:

The final classification of the parasite, as noted(3) by researchers:

**Kingdom** : Protista

**Phylum** : Apicomplexa

**Class** : Sporozoa

**Sub class** : Coccidia

**Order** : Eucoccidia

**Sub order** : Eimeria

**Family** : Sarcocystidae

**Sub family** : Toxoplasmatinae

**Genus** : Toxoplasma

**Species** : gondii

Parasite Forms:

The parasite exists in three stages:

**Tachyzoites:** The name of the active phase with this name is due to the rapid reproduction of the parasite asexually by way of internal budding in the gaps between the cellular tissues of the different host body, This phase is characterized by its crescent shape with a pointed front end and a circular back ground with dimensions of (2-4) micrometers in width (4-8) micrometers in length, and this phase is observed in the acute stages of infection as well as in the chronic stages during re-infection. The parasite is surrounded by an outer envelope composed of an inner and outer membrane, a central nucleus, as well as mitochondria, the collagenous system and ribosomes. This phase is found in different body fluids for the middle and final host such as cerebrospinal fluid, peritoneal fluid and fetal fluid. It is also found in urine, milk, eye secretions, and mucous secretions of the host(1).

**Slowly proliferating shunts and histocysts:** Bradyzoites and Tissue cysts, Tissue cysts form inside the host’s cells to grow and remain in the cytoplasm of its cells with the continuation of the division of the slow-reproducing stages of Bradyzoites inside the cyst. The slow-split phase is similar in appearance to the fast-split phase except for the nucleus of this slow-phase, as it lies near the posterior end of the accurate and surrounds these phases. These phases are also called tissue cysts and that these bags vary in size, ranging in sizes between (100-200) micrometers depending on the numbers of slow-multiplying phases contained in a view that may reach (3000) organisms(1).

These cysts are commonly found in almost all organs during chronic authenticity and have spherical or semi-spherical shapes in the brain (central nervous system) and are compatible with the shape of muscles in the heart and skeletal muscles as well as in the liver, lung, and Czech. Activation cysts activate the ablation of the previous episode, so that the cysts exit the preceding proliferative episode. As well as they contain the red granules that take a red dye(1) when applying pyrodecics-Acid Schiff PAS(2).

**Oocysts-Unsporulated**

They are spherical or semi-spherical in shape with a diameter of (10x12) microns. The bag wall consists of two transparent layers and no polar granules. The sporont often fills the egg bag and sporulation occurs outside the final host body within (1-5) days of its release depending
on moisture and heat. Whereas, the followed bags are semi-spherical to spindle-shaped with a diameter of (11-13) micron. At sporulation, each spore is divided into two splendid sporoblasts, which elongate to form a sporocyst inside each of them creating four spore cells. Egg sacs are the outcome of the sexual process that occurs in the intestine of the final host only \(^2\).

Unsporulated cysts are spherical or nearly spherical in shape and have a diameter of (12x10) micrometers, and the cyst wall consists of two transparent layers and no polar granules, and the two transparent layers form a durable double layer membrane. These cysts form in the epithelial cells of the final host intestine (cats). Unpaired cysts with feces are excreted to the outer circumference and those cysts may grow inside the cat’s intestine to be the active phase. To two sporoblasts that elongate to form the sporocyst, within each of them, four sporozoites of (8×2) microns arise. Egg bags are the outcome of the sexual process that occurs for La Asal, The ovum bags are characterized by their resistance to harsh brown conditions for a long period of up to 18 months in humid \(^2\) environments. It was also noticed that they are not affected by most disinfectants, but they are quickly affected by drought and high temperatures \(^2\). Some insects such as flies, ants, and cockroaches, as well as air currents and rain, play a major role in contamination of human and animal foods. They also work to transfer these ovarian bags from one place to another. It was also found that only ten bags are sufficient to cause infection in humans, while the presence of (100 egg) bags is required for the events of infection \(^2\).

**Life Cycle:** Knowing the parasite’s life cycle is important for controlling the parasite and giving treatment to the patient as well as controlling its vectors and limiting its spread. Although the parasite was described early, knowing the full life cycle was not known until (1970) when Frenkel \(^2\) and his group were the first to assume the life cycle that we know is present for this parasite. Figure(1) shows the existence of two life cycles that include the sexual cycle or the enteroepithelial cycle and it occurs in cats only and the sexual cycle or the extra-intestinal cycle and occurs in cats and intermediate hosts that include many numbers of animals, including rodents, birds and all mammals, including humans \(^3\).

**Sexual Cycle:** Most cats become infected after eating a bird or mouse (infected with a container of tissue cysts) or by eating food or water contaminated with followed (mature) egg sacs excreted in advance with the feces of other sucking cats, so the wall of these cysts will dissolve by proteolytic enzymes in the stomach and intestines and thus slowly proliferating spores and sporozoites are released in the gastrointestinal tract, which penetrate into the epithelial cells of the small intestine and then suffer from asexual reproductive divisions through endodyogeny and schizogeny, resulting in Merozoites, and after several generations, some moles develop by the process of forming large garretogametes, producing large gametes, and female gametes Schoondermark-van de\(^{3}\) in 1995.

After (3-10) days of infection, the segments spread along the small intestine, but they are more in the ileum, and these gametes unite to form a zygote or called a fertilized egg that becomes within a solid wall of development \(^4\). The ungrown egg sac will be thrown with the feces of infected cats for different times between (207) days of infection, as the egg sacs continue to be thrown until about the twentieth day, and the number of egg sacs reaches (100,000 eggs/g) of feces, and these cysts are strong and hard, not infectious, and it is possible to be kept in an outdoor environment for several months. Significantly resistant to dehydration, freezing and disinfectants, but may not be able to survive at (37 °C) for ten minutes. As for the dormant period, which is the period that precedes the laying of the egg sacs, it varies depending on the source of the infection, as it ranges between (3-5) days \(^4\) when the infection \(^3\) is by the tissue cyst, but when the infection occurs with rapidly reproducing vines, it is between (5-10) days and the egg sacs develop. If suitable environmental conditions are available to it, such as oxygen, suitable temperature and humidity, as these cysts swell and reach maturity within (1-3) days, as during this period the vascular vesicles are formed inside the egg sac by a process called sporogony and each sac contains Two spore sacks, each containing four sporophytes, are a source of new infestation \(^3\).

**Asexual Cycle**

The sexual cycle begins in humans and the rest of the other intermediate hosts, as well as cats as an
The intermediate and final host is compulsory at the same time, when humans and other hosts eat the tissue bags found in the meat of infested animals that are not cooked well or egg bags that contaminate water and crops or when in contact with contaminated soil\(^4\). The sporophyte is released from the egg sacs and the slow-growing zygotes from the tissue sacs, and the intestine starts to turn into the rapidly proliferating venules that spread through the blood and lymph to the vital organs and tissues as the first reach of the mesenteric lymph nodes, followed by the liver and the rest of the other tissues, these organisms reproduce within cells by endogenous evolution, as their number reaches \((6-18)\) of rapidly reproducing venules, and as a result, the host cells infected with the parasite are destroyed (causing necrosis and inflammation)\(^5\). After about three weeks of infection, the presence of the parasite is reduced, and that humoral immunity develops. Tissue cysts begin to appear and locate in the nervous, muscle, and cardiac tissues, the diaphragm and the rest of the organs, and these cysts can remain throughout the life of the host, and when the body’s immunity decreases, as in the case of pregnancy or infection with (AIDS), for example, or in people who are immunosuppressed as a result of giving them immunosuppressive drugs. In the case of organ transplantation, these cysts explode, and the slow-multiplication phase that is the beginning of a new asexual\(^5\) cycle is released:

![Figure (2): The Parasite Life Cycle](image)

**Epidemiology**

After toxoplasmosis is one of the most common diseases worldwide, as a study showed that nearly a third of the world’s population is infected with this disease. It has become known that there is a close relationship between chronic toxoplasmosis and the ages of affected persons, as the rates of cationic seroposity appear as the age of those affected\(^6\) increases. Toxoplasmosis is one of the common diseases that are not clinically distinguished, as this disease is widespread (5-95%) in human societies, and it is also an important disease that causes miscarriage, recurrent miscarriage, premature birth as well as malformations. Studies have shown that infections are more common in hot areas than in cold
regions or mountainous regions, and that the variation in the prevalence rate of infection between geographical areas and between population groups within one area may be due to the difference in non-injury. In France\(^{(6)}\), a study conducted on both sexes, it was found that the high prevalence of infection, which amounted to (85%), was related to the population’s preference for eating raw meat, which is the highest rate recorded in Europe, in Central America and in the United States. The incidence increases with the age of the injured to increase by an average of 0.5% to 1% per year of age & Krick. Although clinical toxoplasmosis usually affects only scattered individuals, but small epidemics may occur from time to time. An example of the same occurrence of toxoplasmosis among students of American medical colleges because these students used to eat undercooked pork from the college restaurants as well as what happened from another epidemic in one of the Canadian cities where it was found to be the result of contamination of the source Major Drinking Water for Egg Bags\(^{(7)}\).

In Turkey found that the percentage of the eight positive pregnant women examined was(61.3%) \(^{(7)}\), and in another serological study in Turkey, the percentage of positive tests was(36.4%) of the people. Suspected toxoplasmosis. In a study to investigate antibodies in the serum of aborted women in Turkey, it found an(63.06%) immunoglobulin(g:A) in their serum. While in Iran, there was a variation in the incidence rate, as it reached in its north (70%), while in its south it reached 12%. But in some neighboring countries, including the Kingdom of Saudi Arabia, a study conducted among residents of the Eastern Province in Saudi Arabia showed that the incidence of toxoplasmosis\(^{(9)}\) (25%). Many local studies also indicated an increase in the incidence of toxoplasmosis in Iraq. In Baghdad, recorded an estimated incidence of (34.7%) in aborted women. In the year 2000, Al-Sammani recorded in Mosul an infection rate (39.33%) using the Latex test\(^{(10)}\) and(45.33%) using the indirect telegraphy test. The highest infection rates were recorded among women. Among the women under study, aborted survivors showed the highest incidence of latex grief test. (82.6%) and Daoud and his group (2009) also showed that the incidence of this parasite reached 85% in a study conducted on the group of women in Al-Diwaniyah Governorate.

Al-Nasiri and Daoud also clarified that the incidence was(42% and 41%) among women who had abortions and women who delivered normally, respectively. The study also showed that the percentage of congenital anomalies reached (7%) in children born to mothers with toxoplasmosis\(^{(11)}\).

In Baghdad governorate, a study was conducted to find out the prevalence of infection among males and females, as(2012), Al.khushali found that the infection rate was(40%) and in males and females, respectively(46%).

**Methods of Spread of Toxoplasmosis Infection:**

There are many ways of transmitting the infection, which increases its spread in most of the developed and poor countries of the world alike the methods of transmission of infection to humans can be summarized according to their importance as follows\(^{(11)}\):

1. **Contaminated Food:** This mechanism is one of the most important sources of protection, as it is possible for a person to acquire infection in one of the following methods: eat undercooked and colored meats, especially sheep and pigs, using contaminated food tools such as knives and cooking utensils, eat foods contaminated with uncooked and contaminated meat, eating infected sheep without heat treatment, eating fruits and vegetables contaminated with the excrement of infected animals or grown in soil contaminated with the parasite that causes the disease\(^{(12)}\).

2. **From Animals to Humans:** After human exposure to pets, especially cats, is one of the most common causes of parasite transmission, as the appropriate environment is prepared for its living and reproduction, and then its transmission to humans, and the person becomes ill while cleaning places where colored cats stay or comes into contact with contaminated cleaning equipment, and infection can also occur as a result of contact with contaminated soil when cleaning the garden. The usual presence of cats in it, also showed that a pig or a large sheep may become an important epidemic source at any time, and certainly beef is one of the strong sources of infection, as the sanctuary pigs and sheep are the most vulnerable to pollution, even if it is freezing below (14 °C) for several hours will kill most tissue cysts. Domestic cats will remain one of the dire sources of human infection. As for loose cats, they will lead to multiple problems due to the many
diseases that cats are reservoir hosts for their types. The prevalence of evening cats in rural areas compared to urban families led to a higher\(^{13}\) incidence of infection in rural families (54%) compared with urban (27%) \(^{14}\), and that the spread of the disease in animals was attributed to the high excretion of white sacs by cats. The infected ones that lead to the pollution of the surrounding environment, as pastures, water sources and fodder are contaminated, so the sheep seen in areas without cats do not become infected with toxoplasmosis, while those grazed in the same surroundings and in the presence of cats, the rate of infection with this disease was high and reached (12) in sheep and goats, it was observed that infection occurred due to exposure to stored feed contaminated with cat feces\(^{16}\). Although domestic cats are subject to good supervision and protection by kittens, whether in their food or their livelihood, they may not be free of taking infection indirectly from their environment, and it is possible to lay eggs for several days after injury. That these possibilities are a precursor to a pregnant woman to avoid direct and indirect contact with the necessity to stay away from her locations during at least the period of pregnancy\(^{15}\).

3. **Congenital Transport:** The parasite is transmitted from the infected mother to the fetus, causing congenital toxoplasmosis, when the mother acquires the infection during pregnancy, but in the case of a woman’s infection before pregnancy, the transmission of the parasite to the fetus through the placenta is less likely except in the case of immunosuppressed women. This method is considered one of the most dangerous methods of infection with this disease, especially in the first months of pregnancy, as the disease is transmitted to the fetus through the mother’s sucking placenta for the first time during pregnancy, and the rate of disease transmission from the infected mother to her fetus by the placenta method is (45%) but (60%) of the cases of infection. The newborn has no symptoms, while miscarriage occurs in (9%) of cases, such as abnormalities of the nervous system, eyes and enlarged head\(^{16,17}\).

4. **From Human to Another:** The disease is transmitted from one person to another in very rare cases by organ transplantation, blood transfusion from an infected person to a healthy one, or laboratory personnel coming into contact with contaminated blood or accidentally acupuncture. These cases are by means of preventive treatment until the disappearance of antibodies to the parasite is confirmed. Toxoplasmosis is treated by taking special drugs in doses according to the sex of the infected person. A growth-stopping effect and an influencing activity on the Toxoplasma gondii parasite encouraged its use in the treatment of toxoplasmosis., Therefore, it is considered one of the drugs of choice and common in the treatment of toxoplasmosis in pregnancy.

   In the event that the fetus is infected with the disease, it is necessary for the mother to take appropriate antibiotics such as Pyrimethamine or Sulfadiazine at low doses\(^{78, 79}\) of (25-50) mg per day for a full month, and (10mg) of folic acid should be taken daily\(^{18}\).

**Experiments and Methods:**

**Study Location:** The study was conducted in the Parasitology Laboratory in the Department of Life Sciences of the College of Sciences for Women, University of Babylon.

**Sample Collection:** 30 blood samples were collected from reviewers of both sexes for the laboratories of Maternity Hospital for Children. Use sterile plastic tubes to collect the samples (blood samples), then they are numbered and some private information is recorded for each references. The blood was separated by using a centrifuge at 3000 rpm for five minutes. Keep the work in numbered plastic tubes at a temperature of 25 °C until the examination is done.

**Serological Examination to Diagnose Toxoplasmosis:**

**Latex Agglutination Test CLAT:** In this test, several commercial tests produced by a company called (S.A.SPAIN) and (SPINREA) were used to detect the presence of specialized antibodies against the parasite Toxoplasma gondii ,and the kit consists of the following components\(^{19}\):

1. **Latex Reagent** is a suspension of latex granules made from Polystyrene fertilizer and covered with antigen dissolving the parasite in a circulating saline solution that contains a preservative Sodium azid with a concentration(0.95%), that the latex granules enables to notice the correlation resulting from the interaction The antibody and the antigen with the naked eye or under
the microscope with a magnification power (10), as the clumping appears in the case of the presence of the serum antibodies to be examined.

2. **Positive Control Reagent:** It is a human serum that energizes the specialized antibodies against the anti-Toxoplasma parasite and contains (0.95%) of sodium azide.

3. **Negative Control Reagent:** It is animal serum free of specialized antibodies against the parasite, it contains (0.95%) of Sodium Azide. The kit should be kept in the refrigerator (19), in degree 4” until use.

**The Methods (19):**

1. (10 μl) of the sample was taken
2. This sample was mixed with latex reagent (5μl).
3. Then put Latex-cell slice
4. Then wait for (10) minutes until you notice the presence of the line or the mark by which the color changes to a red color or a red line

**Note:**

A . The line indicating (T1-Toxo IgG) indicates that the test is positive for this antibody.

B . The line indicating (T2-Toxo Tgm) indicates positive for this antibody.

C. If neither of the above statements appears, this indicates that the sample is negative

D. But if it appears to both of them, it indicates that both of the two opposites (Igm, IgG) are positive.

---

**Figure(3): Latex Cassett agglutination test for IgG and IgM**
Methods for CRP

C-Reactive Protein: The concentration of the activity proteins is measured by the latex method. Latex, if detected by means of the Slide agglutination test, if the qualitative estimation and quantification of the quantitative ratio are used to measure the active phase protein and that the positive result is agglutination as a result of the removal of human antibodies working with the active phase protein with the active phase protein present in the patient’s serum sample(20).

Qualitative Method for Measuring of Protein Concentrations:

1. The reagent components and samples are left at room temperature.

2. A drop of serum was placed in the designated chamber on the test strip.

4. The two drops (serum+ reagent) were mixed well and then we spread well the circuit on the test strip(87).

5. The slide was moved in a circular motion for two minutes, as the result was shown in clumpy form.

Results and Discussion

The following table shows that the total number examined is 30 patients. If the percentage of infection was (IgG and IgM), as well as the total number examined and the number infected with toxoplasmosis and not infected:

The results in Table.(1), showed that the percentage of positive cases that appeared when using (C-Reactive Protein) for infected and non-infected cases of toxoplasmosis is (50%) of the number of samples of (60) samples., Between the percentage of infection with toxoplasmosis and its relationship to the sex of the patient in (IgM), it was noticed that the infection was also concentrated in females by (3.84%), while it was also Table No.(1) act (0%) for males.

Calculation of Average for Sensitivity and Specificity Rates

The percentages of sensitivity and specificity were extracted according to the rates shown below:

Sensitivity = number of Real positive cases / number of Real positive cases + number of false negative cases x 100%

IgG = 5/5 + 55 X 100% = 5/60 = 8.3%
IgM = 2/60 X 100% = 3.33%

Specificity = number of Real Negative cases / number of Real Negative cases + number of false Positive cases x 100%

IgG = 55/5 + 55 X 100% = 55/60 = 91.66%
IgM = 58/60 X 100% = 96.66%

Toxoplasmosis is an epidemic disease of global prevalence, especially in tropical and subtropical regions. Also, toxoplasmosis is spread in the environments in which it is spread and other animals that are domestic with humans. The unhealthy environmental conditions in
these areas are among the most important factors for the spread of this disease, in addition to the loss of personal hygiene factors, mixing with domestic animals and cats, and eating meat of animals that are not well cooked are among the most important factors in the spread of the disease, especially in Iraq. It was found from the current study that the ratio of (IgG) antibody in the current study and (IgM) antibody is consistent with the study and not consistent with the study. Perhaps these ratios are due to the difference in the size of the sample taken and the method of work used and it appears from the results. Compared with (IgM), this confirms that most of the infections are acute, given that the (IgG) antibody is associated with chronic infections, and (gM A) is associated with acute injuries. The results showed that the percentage of (IgG) antibodies to (IgM) was the highest in females in disease resistance respectively compared to males (5%) for both antibodies and this is consistent with the study and not consistent with the study of both the studies, this is due to the size of the sample taken in the current study, as the number of samples examined was out of (30 samples) from different people, so this ratio appeared as we conclude that females are less immune than males in fighting germs and diseases. Finally, the current study showed that acute (CRP)-proteins and their association with toxoplasmosis appeared high with (IgG) antibodies and then (IgM). It is known that these proteins are immune proteins that are increased with chronic infections, which are mainly associated with (IgG) antibodies because they are associated with chronic infections. This is in agreement with the study and not in agreement with studies(21,25).

Phylogenetic Analysis of TTV (Torque Teno Virus) in Iraqi Woman Suffering of Failure Kidney Disease

Yasameen Hasan Ali1, Tariq M Quasim2, DBEL Wahab R. Alshaikly3

1Assistant Professor, College of Nursing, 2Tutor, Department of Pharmacy, Al-Rasheed University College

Abstract

There are still very few studies of the Torque Teno virus infection rate between hemodialysis patients in Iraq. Thus, the aim of this study was to assess the frequency of TTV viremia in hemodialysis Iraqi patients. This study has carried out in Baghdad city from October 2019 to February 2020 and included 150 patients with kidney failure disease undergoing hemodialysis and 50 control subjects. Blood samples have been obtained for serological TTV detection. The result shows PCR has been used to detect TTV, isolates have been identified through N22 region sequencing and phylogenetic analysis has also been performed. Of the 150 patients, 2 (1 male and 1 female) were TTV positive. The results show in (isolate 14) substitution four Transversion A>C, C>G, A>T, and T>A three Transition T>C, A>G, and T>C of Specific region within TTV(N-22) and showed 94% identified with a standard in Gene Bank while having 99% identified with a standard in Gene Bank with (isolate 17) substitution five Transversion A>T, A>C, T>A, A>T and C>G three Transition A>G, A>G and T>C. The phylogenetic analysis showed that identical among themselves and the world with 100% compatibility values.

Key words: kidney failure disease, Torque Teno virus (TTV), PCR- Sequencing.

Introduction

The Torque Teno virus (TTV) was initially isolated from a post-transfusional non-A-G hepatitis patient in Japan (1). The virus is an omnipresent negative stranded DNA virus which has been listed as an Anelloviridae family member (2). Though considered a hepatotropic virus, with different transmission modes (3). TTV is classified as into seven genogroups including many genotypes according to sequence analysis (4), of which genotype 1 is the most prevalent. The virus is spread globally according to geographic location with variable seropositivity levels (5,6). TTV usually infects patients exposed to blood transfusion as patients with thalassemia and haemodialysis, also intravenous users of the drug (7). The virus has been rendered pathogenic and is also considered a virus flora, but its significance stems from its capability to demonstrate the combined capacity from the innate and acquired immunity (8). Despite the innumerable utility of haemodialysis in chronic renal failure patients, it has been attributed as a high danger setting for blood-borne infections, that may be appliances, surfaces and staff of various origins in haemodialysis units (9). Besides HCV and HBV, TTV are among the frequently transmitted viruses in patients with haemodialysis, the frequency of which varies greatly contingent on virological, demographic and clinical factors (10). Thus the aim of this study were to assess the frequency of TTV viremia in hemodialysis Iraqi patients.

Materials and Methods

This study has carried out in Baghdad city from October 2019 to February 2020 and included 150 patients with kidney failure disease undergoing hemodialysis and 50 control subjects who were apparently healthy. Five ml of whole blood was collected from each subject. Blood sample was allowed to clot naturally then centrifuged at (3000 rpm) for 5 minutes and serum was separated from packed RBCs. Serum was divided into 2 parts in sterile Eppendorf tubes which then stored in deep freeze at -20°C, one part was used for DNA extraction from TTV, and the second part for detection of TTV by ELISA.
Detection of TorqueTeno virus by ELISA

Detection of TTV were done firstly by ELISA (Cat. No: MBS9313728, MyBioSource, USA).

Amplification of TTV by using PCR

Specific region within TTV(N-22) amplified by using PCR with forward primer 5'-GTC AAG GGGCAA TTC GGG CWC-3’ and reverse primer 5'-GTC TGG CCC CAC TCA CTT TCG-3’. The program of PCR as seen in table (1), PCR products were verified in 1.5% agarose gel.

Phylogenetic analysis

Two TTV isolates from this samples were utilized for phylogenetic analysis to establish the genetic relationship between Iraqi human TTV strains and the NCBI data base strains. Using the MEGA6 software, the nucleotide sequences were aligned based on the amino acid sequences to prevent nonsense from being introduced.

Results

The distribution of the samples according to gender showed insignificant distribution ($\chi^2=5.9017 , P>0.206$), the negative samples showed 63 females and 85 males while the two positive samples were divided equally into one male sample and one female sample. The control samples were 23 males and 27 females.

The results of aligning the sequences results of TTV are illustrated in table (4) which showing the variation of each sample. Each sample showed different variations. The first sample showed 7 variations which are; at nucleotide 112 (TTT > TTA), at nucleotide 178 (AAC > ACC) missense, a nonsense at nucleotide 182 (AAT > AAC), at nucleotide 194 (GGC > GGG), at nucleotide 196 (TAC > TCC), at nucleotide 200 (GTA > GTG) and at nucleotide 206 (TAT > TAC). The other sample showed 8 variations at which are; at nucleotide 50 (AAC > GAC), at nucleotide 127 (TAC > TCC), at nucleotide 123 (AAC > GAC), at nucleotide 176 (AAC > ACC), at nucleotide 179 (ATC > ACC), at nucleotide 198 (TTT > TTA), at nucleotide 201 (TAC > TTC) and at nucleotide 219 (GGC > GGG). Those variations resulted after aligning the sequence of our isolates to the reference sequence (ID: AF123933.1) which showed the highest similarity to our resulted sequence NCBI.

The phylogenetic tree diagrammatic by Molecular Evolutionary Genetics Analysis (MEGA) software version 6.0 the phylogenetic trees of these species are shown in Figure (1). These alignments appeared the TTV between Iraq and others in the world by Specific region within TTV (N-22) for translating specific region. Hierarchical cluster analysis determine the following clusters including TTV Iraqi isolate (14,17) the identical 100 % it is close to Egypt (ID: KY750545) the identical 100 %.

![Figure 1: Neighbor-joining tree from TTV sequence alignment.](image-url)
Discussion

The patients with chronic renal failure suffering from hemodialysis (HD) are at risk of TTV infection (11). Data on TTV infection in peritoneal dialysis patients was very rare; these results indicated the prevalence of TTV in a population with continuous ambulatory peritoneal dialysis is close to that of healthy controls (12). At worldwide distribution, torque teno virus was found to be more widespread in men (13). Spandoleet al (14) reported that the distribution from TTV in males and females did not notice any difference, this agreement with our study. At the other hand, Mohamed et al (15) recorded that TTV-positive patients were 66.7 % and 33.3 % respectively in age groups 20-40 and 40-60 years, 3.7 % TTV-positive DNA were males compared to 6.1 % of females with no noticeable difference between males and females. Al-Hamdaniet al (16) found that 29.2 % from thalassemia patients with predominance of males over females were detected with TTV (64.4 % vs. 35.6 %). Takemoto et al (17) reported that patients with dialysis were mostly males (55 %) with a mean age of 53.8 years. The current study showed the relationship between TTV infection and patients suffering from hemodialysis in a population of kidney failure. The discovery of TTV and its parenteral mode of transmission resulted in the idea of its potential inclusion in a category of viral hepatitis that is not A-G (18). Sequence analysis shows that there is a high degree of genetic variation in the TTV genome and can be categorized into at least six main genotypes (groups 1–6) and multiple subtypes (1a, 1b, 2a and 2b) (19, 20). Direct UTR region amplicon sequencing revealed extensive mix-infection of different TTV strains within the infected person. The divergence among various detecting regions indicated that TV is due to the coexistence of multiple phylogenetic groups (4). In the current study the sera samples from failer kidney disease patients and control were were assayed for the existence from TTV-DNA utilizing PCR and amplifying specific zone of TT genome. To determine the phylogenetic relationship of Iraqi isolated strains among human TTV, sequences from GenBank and isolates from the present study were included for phylogenetic analysis. The findings of the ELISA technique showed that 21 samples were positive (out of a total of 150 samples), has low Specificity specificity (31.58%) as compared with the PCR diagnosis of the Sanger Sequencing technique for Torque teno virus with high results specificity. The polymerase chain reaction diagnostic techniques is rapid, easy, inexpensive protocol becoming the most commonly utilized of all molecular genetics ways for detecting important genes. Irshad’s analysis found that Torque teno virus DNA genotype 1 was the principal genotype of TTV DNA in patients with hemodialysis (21). In contrast, genotype 2 was reported to be more pathogenic than other genotypes (22, 23). Likewise, a study carried out in Turkey to examine the N22 region found that genotypes 1 and 2 were the most common in the different groups investigated and the only one identified in the population of blood donors (24). Torque teno virus has been spread worldwide, with a high prevalence of TTV infection in various populations including liver disease patients, HIV patients, drug users and healthy individuals (25). Irshad et al (18) reported that PCR fragment molecular and phylogenetic analyzes detected that TTV could be divided into many genotypes found worldwide, without any direct connection to the geographic distribution of diseases. This disparity in the prevalence of TTVs in various geographic areas can be explained by the presence of different roads of this virus spreading across different geographic areas. Castro et al (23) represented a molecular epidemiological study examining a large number of Brazilian isolates and reported that TTV was identified among 11.9% of Brazilian blood donors through the study of the TTV genome ORF-1 region close to that found between German and Japanese blood donors.

Abstract

Background and Objective: Pulmonary tuberculosis(PTB) is a serious disease that mainly affects the lungs. The aim of this study was a Comparison between conventional, and molecular methods to diagnose M.tuberculosis complex (MTBC) and using serum TNF-α levels as a biomarker for evaluating the severity of the disease. Methodology: The study analyzed 586 sputa collected from suspected pulmonary tuberculosis patients (217 female and 369 male) their ages ranged from 16 to 66 years for mycobacteriological study, while the immuno-study included 85 blood samples that collected from eighty patients and five healthy persons (45 male,40 female) their ages (18-66) years. We tested all sputum samples by AFB direct stain and GX methods, while we cultured sputum restrictively for Patients who have two different outcomes by AFB direct stain and GX methods. TNF-α levels have been measured by sandwich ELISA in patients and healthy persons. Results: Our result showed detection of (135/586) patients infected with M.tuberculosis complex (MTBC) and (1/586) patient infected with non-mycobacterium tuberculosis(NMT) by AFB direct stain and GX methods comparing with culture method as a gold standard. Sensitivity and specificity for AFB direct stain and GX techniques for diagnosis PTB were (15.0% and 100% ) and (95.0% and 66.7% ) respectively. On the other side, TNF-α levels were elevated in inpatient groups compared with healthy persons. The mean of TNF-α levels measured in multidrug resistance tuberculosis (MDR-TB) patients was higher than in other cases. Conclusion: Our findings demonstrate that the sensitivity of the GX technique is higher compared to other techniques, and serum TNF-α levels can be used as a biomarker for evaluating the severity of pulmonary tuberculosis.

Keywords: Pulmonary tuberculosis, MDR-TB, TNF-alpha, GeneXpert MTB\RIF, BACTEC MGIT960.

Introduction

Tuberculosis (TB) remains the single largest infectious disease, a total of 1.5 million people died from TB in 2018 (including 251 000 people with HIV). This disease occurs as a result of infection by a group of bacteria such as M.tuberculosis complex(MTBC) and non-mycobacterium tuberculosis(NMT).1,2

Diagnosis of pulmonary tuberculosis by conventional diagnostic techniques is difficult and required a long time for detection. AFB direct stain technique is still commonly used, especially in developing countries, although it has low sensitivity and normally requires (3,000-5,000) bacilli per ml of sputum to be positive. The culture method is a gold reference that provides a definitive diagnosis of tuberculosis by establishing the viability and identity of the pathogens.3

GeneXpert MTB\RIF technique developed by Cepheid, USA, that is a fully automated system that can be easily used, and it depends on 81 bp sequences located within the core region of rpoB gene which coded for Beta-subunit of RNA polymerase enzyme, it can detect MTBC and determines whether they are resistant to rifampicin simultaneously in a short time.4

TNF-α is a cytokine that mediates mainly the intercellular communication and plays a major role in the protection against M. tuberculosis and regulates the cellular immune response, especially in the early stage of infection. Also, this cytokine participates in the processes of the host’s defense against pathogens, inflammatory, and reparation of tissue.5

The course of tuberculosis is dependent on the interactions of the M.tuberculosis and the immune system of the host. When person inhalants air droplets containing mycobacteria and arrive at its target(epithelial cells of the lung), innate immunity such as macrophages are rapidly activated and the adaptive immune system such as T-lymphocytes synergistically cooperates for preventing of growth and spreading of the bacteria.6,7

Material and Methods

2.1- Participants groups and Clinical Samples Collection

We conducted a cross-sectional study from September 2019 to February 2020 in the International Center for Chest and Respiratory Disease in the Kurdistan provinces of Iraq ( Erbil, Dohuk, and Sulaymaniya cities). A total of 586 sputum samples collected from suspected PTB patients to identify MTBC. Positive patients with PTB classified into two groups; (114/136) recently diagnosed patients (63 male, 51 female) and (22/136) multidrug resistance M.tuberculosis patients (11 male, 11 female), their ages ranged from 16 to 66 years for mycobacteriology study, while the immunological study was included collect five milliliters(5 ml)of blood from eighty patients from the following groups; (48/80) under-treatment patients(26 male, 22 female), (10/80) patients from recently diagnosed patients (5 male, 5 female), (22/80) patients with MDR-TB (11 male and 11 female), as well as five healthy persons (3 male, 2 female) their ages, ranged from 18 to 25 years.

In this study, we identified MTBC and NMT by AFB direct stain and GX methods comparing with culture method to evaluate the accuracy-test of these techniques. On the other hands, we used TNF-α levels as a biomarker for evaluating severity of PTB.

The following methodology was followed for samples processing ;

2.1.1-AFB direct stain: All specimens were stained by Ziehl-Neelson staining according to manufacturer’s recommended method (Kimadia, Iraq).8

2.1.2-Culture method: We cultured sputum restrictively for the following candidates; Patients with two different outcomes by AFB direct stain and GX techniques (e.g., GX - ve cases but AFB + ve or vice versa) as well as 10 of 46 sputum samples were GX +ve and AFB +ve and 10 of 510 samples were AFB -ve and GX –ve to check the positive and negative of these techniques respectively” Diagram 1”. Only 115 sputum samples cultured according to the laboratory standard procedure for primary isolation.8,9

Diagram 1: Flow work of all diagnostic techniques. GX: GeneXpert, AFB: acid-fast bacilli method.

2.1.3-GeneXpert MTB\RIF technique:

For identifying MTBC and RIF resistance by GX technique, we tested all suspected sputum samples according to method recommended by the manufacturer 10,11,12

2.1.4-Differentiation between MTBC, MTB, and NMT:

We used niacin accumulation, nitrate reduction and ability of MTB to growth on L.J medium contains 500 µg/ml of Para-nitro benzoic acid to differentiate between M.tuberculosis and MTBC (Kits provided from HIMedia [India] for niacin acumination and L.J medium with PNB kits, while nitrate reduction kit provided from COTREZ[USA] )

While, IS6110&ITS method used to differentiate between MTBC and NMT[RealLine Extraction 100 kit provided from BOIRON, Germany] for Extraction DNA, and prime TB/NTM detection kit provided from [GeNet BIO, South Korea] for the amplification) according to method recommended by the manufacturer.13,14,15
2.1.5- **Drugs susceptibility test (DST):** After 4 weeks of incubation on the L.J medium, DST was performed for first-line antitubercular drugs according to the working method recommended by Becton Dickinson’s product and procedure manual (BD Biosciences, MD, USA) by BACTEC MGIT960 and SIRE kit procedure.  

2.1.6- **Measurement of serum TNF-α levels:** 5 ml of blood were collected from 85 participants. We measured serum TNF-α levels for 80 patients comparing with five healthy persons. The quantitative sandwich ELISA method has been used for assessment of TNF-α serum levels, the kit provided from (Al-shkairate establishment, Jordan), and the procedure of kit recommended by the above company has been followed.

---

### Statistical analysis

We used IBM SPSS 22.0 to analyze the study data. To compute the statistical difference between all the sensitivities of the diagnostic techniques, we used the Chi-square test at a confidence interval (95%), while the T-test was used to account for the differences between the levels of TNF-α. Also mean±standard deviation (SD) used to represent TNF-α levels. A p-value less than 5% was considered statistically significant. All graphs were generated using Microsoft Excel, 2010. Sensitivity, specificity, positive predictive value (PPV), negative predictive value (NPV) and accuracy test for all diagnostic techniques were calculated based on Baratloo et al.  

### Results

#### 3.1-Isolation and identification of M.tuberculosis complex (MTBC)

Our results showed a diagnosis of 135 (23.0%) patients infected with MTBC and one patient was infected with NMT (0.34%) of 586 suspected PTB patients by AFB direct stain and GX diagnostic methods, and compared these results with culture method (a gold standard) to confirm the diagnosis and calculate sensitivity, specificity, and accuracy test for AFB and GX techniques.

**GX= GeneXpert, AFB= Acid-fast stain**

AFB direct stain method was able to identify 51 (8.7%) samples out of 586 sputum samples (46 isolates were GX +ve, while 5 isolates were GX -ve). On the other hand, GX was able to detect (136/586) samples (90 of 535 were –ve AFB [5 of them were false-positive samples] and 46 of 51 samples were + ve AFB). It is worthwhile that the GX method could not diagnose five samples which were positive by AFB direct stain and culture techniques (false negative samples), p<0.05.

“Table 1 and Fig.1”.

The culture method was able to confirm diagnosis (100/115) sputum samples, including false negative samples that didn’t diagnose by the GX method (p<0.05), “Table 2 and diagram 1”. Sensitivity, specificity, PPV, NPV and accuracy test comparing with the culture (gold standard) for all diagnostic techniques showed in the “Table 3”

GX= GeneXpert, AFB= Acid fast stain PPV &NPV= positive & negative predicative value respectively.

3.2-Differentiation tests of MTBC and NMT

Our results showed that (91\100) isolates belonged to MTB, and (9\100) isolates belonged to MTBC other than MTB, while the IS6110&ITS method differentiated (1\5) isolate belonged to NMT, as well as (4\5) isolates were MTBC.
3.3-Drugs susceptibility Test(DST)

To find the accuracy test of the GX technique for detection RIF resistance isolates, we compared between GX and BACTEC MGIT960 techniques, the first technique detected (23\text{\%}) RIF resistant isolates while the second technique identified (22\text{\%}) RIF resistant isolates. The sensitivity and specificity for GX technique compering with BACTEC MGIT960 (gold of standard) were (100\% and 98.5\%) respectively (P < 0.05), “Table 4”. It is worth noting that (1/23) isolate which detected by GX technique was false resistance, this isolate did not detect by BACTEC MGIT960 technique.

3.4- Measurement of serum TNF-\(\alpha\) levels cytokine.

We measured serum TNF-\(\alpha\) levels cytokine in patients comparing with healthy persons. Our results showed that the serum TNF-\(\alpha\) levels were high in patients comparing with healthy persons. On the other hand, The mean serum TNF-\(\alpha\) levels measured in MDR-TB patients were higher than those of RD and UT patients (P < 0.05) “Table 5”.

Discussion

Diagnostic methods for detection PTB are constantly evolving to find fast and accurate techniques to directly detect MTB. Because both controls of PTB infection and management of patient are dependent on an early and accurate diagnosis of PTB. This study presented important information about the sensitivity of different diagnostic techniques and role of TNF-α cytokine for evaluating the severity of PTB.

Our findings showed that AFB direct stain technique has low sensitivity(15.0%) and high specificity(100%). These results were closely similar to Agrawal et al, who found low sensitivity(22.2%) and high specificity(100%) for AFB method, while Odubanjo & Dada-Adegbola, found that the sensitivity and specificity of AFB direct stain were (74.5% and 71.6%) respectively. This could be attributed to many factors affect the sensitivity of AFB stain as; Number of bacilli present in sputum that requires 3,000-5,000 bacilli per ml of sputum to be positive, prevalence and severity of the disease.

Also, our results showed high sensitivity(95%) and good specificity(66.7%) of GX technique comparing with culture, these results were similar to Bunsow et al, who found high sensitivity (97.1%), and specificity(99.1%) for Pulmonary specimens.

It is worth noting that the results of our study showed that five false positive cases (GX+ve\AFB-ve, and culture –ve), in addition, five false negative cases of GX method, which were positive by AFB direct stain and culture methods(one of them were NMT). The reason for these is attributed the GX can detect the DNA even for dead and fragmented bacteria which is considered as a major disadvantage of this technique, therefore, GX technique cannot be used for follow-up of patients after the treatment, as well as maybe due to presence of PCR inhibitors in the sputum, although GX included a positive control for detection the inhibitors, or maybe due to presence NMT in sputum.

On the other side, out of 91 MTBC isolates diagnosed by GX technique, this machine detected 23 RIF resistance isolates, while MGIT960 machine detected 22 RIF resistance isolates, Sensitivity and Specificity of GX machine were 100% and 98.5%, respectively. Our findings were similar to Laskar et al, showed that sensitivity and specificity of GX were 87.64% and 75% respectively. Also, we found one isolate was resistance for RIF that was detected by the GX technique, while it was susceptible to RIF by BACTEC MGIT960. This case may be attributed to the presence of a silent mutation within the rpoB gene core region.

In the immunological part of our study, we found that serum TNF-α levels were high in patients comparing with control and the elevation was higher in MDR-TB than other groups(UT and RD).
These results were closely similar to Shameem et al., 27 who found that serum TNF-α levels were high in MDR-TB and RD patients, while the levels significantly decreased in UT group comparing with healthy persons. Also, they found high levels of TNF-α in MDR patients comparing with recently diagnosed patients who were drugs susceptible.

Also, Andrade Júnior et al., 28 found that levels of TNF-α were high with significant differences between tuberculosis and control groups and There was a positive correlation between patients’ clinical severity and the serum TNF-alpha levels; but, they found a slight increase in TNF-α levels of patients with MDR-TB. The reason for the complete incompatibility between the results of the two studies may be due to the small number of subjects in their study compared with the number of subjects in our study(80 patients), as their study included 24 patients, three of them had MDR-TB only.

**Conclusion**

Our findings demonstrate that the sensitivity of the GX technique is higher compared to other techniques, especially in negative direct AFB smear, and TNF-α levels can be useful as an alternative biomarker for the evaluation of the severity of pulmonary tuberculosis.

Abstract

Objective: To analyze the effect of resveratrol to the expression of caspase-7 and density of retinal ganglion cells in a rat model with Traumatic Optic Neuropathy (TON) compared to control.

Methods: This is an experimental study using Wistar rats. Samples were divided into four groups. One normal control group, 1 TON control group and 2 TON resveratrol groups. TON induced by clamping the optic nerve retrobulbar with Hartmann Mosquito 2,5 inch. Resveratrol was given 10 mg/Kg and 20 mg/Kg in two resveratrol groups. Enucleation was performed 1 day after to evaluate the expression of Caspase-7 by immunohistochemistry and density of retinal ganglion cell by hematoxicilin eosin staining.

Results: Caspase-7 expression was lowest in the resveratrol 20 mg/kg treatment group (4.00 ± 2.00) compared to resveratrol 10 mg/kg treatment group (6.00±2.23), TON control group(6.00 ± 6.78) and normal control group(7.20 ± 2.58). Retinal ganglion cell density was highest in the resveratrol 10 mg/kg treatment group (27.23±2.75) compared to resveratrol 20 mg/kg treatment group (24.89±5.83), normal control group(24.19±2.39) and the lowest in TON control group (22.96±4.62). Based on the Pearson correlation test, it was found that there was no correlation between Caspase-7 expression and retinal ganglion cell density in a rat model with TON (p: 0.178; r = 0.314)

Conclusions: Resveratrol administration shows effect in lowering apoptosis marker caspase-7 and preserving retinal ganglion cell in traumatic optic neuropathy.

Keywords: Caspase-7, Traumatic optic neuropathy, Resveratrol, Retinal ganglion cell

Introduction

Retinal ganglion cell (RGC) death can occur due to apoptosis and necrosis mechanisms. Apoptosis is a cellular mechanism for programmed cell death but can be triggered by several factors including ischemia, toxic substances, and radiation1. Traumatic optic neuropathy (TON) is a disorder of the optic nerve caused by an acute injury with a clinical picture of a sudden decrease in visual acuity2.

The pathophysiology of TON involves several factors that are associated with the concept of primary injury and secondary injury that initiates retinal ganglion cell death2. Primary injury generally results from direct injury to the optic nerve, either compression or damage of the tissue, whereas secondary injury is a mechanism of optic nerve damage caused by inflammation or vascular disorders1.

Apoptosis can be lead by actvation of caspase. Caspase is a very interesting area of research on developmental disorders, cancer, infections, and
degenerative diseases. To date, two types of caspases have been defined, namely the caspase initiator and the effector / caspase executioner. As mentioned earlier, caspase-8 and -9 are initiator caspases while caspase 3 is effector caspases. Furthermore, other caspases such as caspase-2, -10, and -11 are included in caspase initiators while caspase-6 and -7 are included in the effector category. Still very little is known about caspase-7 in apoptosis of RGC. Caspase-7 was generally believed not exist in central nervous system. It was speculated that caspase-7 was acting as a redundant version of caspase-3 in apoptosis cascade. However, it was found that caspase-7 cleaves substrate different from caspase-3. Several non ocular studies suggest that caspase-7 play critical role in apoptosis and normal development. Decreased in caspase-7 protect the optic nerve from RGC death.

With apoptosis in research, the profound therapeutic potential of apoptosis has enabled researchers to develop promising therapeutic solutions that focus on the voluntary death of aberrant cells. A spectrum of drugs and therapies that exploit apoptosis has been shown to be effective against disease. Resveratrol (3,5,4-trihydroxystilbene) is a natural polyphenol found in grapes, red wine, berries and other plants. It has been identified as an inhibitor of carcinogenesis, cardiovascular diseases, neurodegenerative and aging. Many studies showed resveratrol effect on eye and related disorders. Similar effect in cancer, cardiovascular and neurodegenerative diseases, also seen in eye disorder including anti-oxidative, anti-apoptosis, anti-tumorogenic, anti-inflammation and anti-angiogenic.

Resveratrol can protect retina by inhibiting inflammation biomarkers interleukin-6 (IL-6) and interleukin-8 (IL-8), by transforming growth factor-β1 (TGF-β1), cyclooxygenase-2 (COX-2), and through VEGF accumulation. Resveratrol is known to activate sirtuins. The SIRT1 activating compounds promote longevity in different species and provide protective effects against acute or chronic neurodegenerative diseases, including retinal injury. Resveratrol prevented neuronal loss and delayed the visual decline.

Thus our study was aim to analyze the effect of resveratrol to the expression of caspase-7 and density of retinal ganglion cells in a rat model with Traumatic Optic Neuropathy.

**Material and Method**

This is an experimental study using rats. The research was carried out in the animal testing laboratory and the Anatomical Pathology Laboratory of the RSPTN UNHAS Makassar. The sample size was 24 rats.

**Work procedures**

a) Twenty-four rats were divided into 4 groups (6 per group), 1 normal control group without treatment, 1 TON control group without therapy and 2 groups of TON treated with resveratrol (10mg / kgBW and 20mg / kgBW).

b) TON induction is performed by clamping the optic nerve retrobulbar with Hartmann Mosquito 2,5 inch for 15 seconds until afferent pupillary response was negative.

c) Resveratrol was given post-induction orally at a dose of 10 and 20mg / kgBW using oral gavage to ensure drug distribution according to the expected dose.

d) The examination is carried out after going through the therapy interval. The induced eyeball then enucleated and prepared in a paraffin block with a sagittal cut and focuses on the inferior area of the optic nerve.

**Histopathological examination;**

Enucleated eyes were fixed with formaldehyde, embedded in paraffin and cut in 5µm thick section. For routine histological analysis. Section were stained with hematoxylin and eosin (H&E) and examined with light microscope. The number of retinal ganglion cell nuclei was counted in 40x magnification. The amount obtained is calculated per field of view and the average is calculated.

**Immunohistochemistry examination;**

a) Deparafinized the dried preparations with xylene 2 times (5 minutes each) and rehydrated with alcohol 96%, alcohol 80% and alcohol 70% (5 minutes each). Then wased for 5 minutes.

b) Put the preparation in TRS solution, and heated in microwave for 20 minutes. After cooling down, washed with PBS 2 times (5 minutes each).
c) Tissue margins were marked. Peroxide block was done for 15 minutes. Washed with PBS and put in protein block for 5 minutes and washed again in PBS twice (5 minutes each).

d) Antibody caspase-7 (Invitrogen) monoclonal antibody were diluted 1/100 and incubated in -20°C.

e) The preparation then washed with PBS twice (5 minutes each) and put in Ultratek anti-polyvalent (ScyTek) for 10 minutes.

f) The preparation then washed with PBS twice (5 minutes each) and put in Ultratek HRP (ScyTek) for 10 minutes. Then washed again twice (5 minutes each).

g) Preparation was incubated with chromogen Diaminobenzidine (DAB) and washed with PBS twice (5 minutes each), and soaked in hematoxylin solution for 5 minutes.

h) Preparation washed in running water. And dehydrated with alcohol 70%, alcohol 80%, alcohol 96% and clearing with xylol I and II 5 minutes each.

i) Slide then dried and prepared on the object glass.

j) The preparations were read under a light microscope. The number of caspase-7 expression based on brownish staining in sitoplasms and was counted in 40x magnification. The amount obtained is calculated per field of view and the average is calculated.

Data Analysis

All data obtained were processed using the SPSS program and analyzed with a significance level of ≤ 0.05. Independent t-test was used to compare two independent groups. Pearson’s correlation test was used to see the relationship between two different groups.

Result

Expression of caspase-7

Caspase-7 expression was lowest in the resveratrol 20 mg/kg treatment group (4.00 ± 2.00) compared to resveratrol 10 mg/kg treatment group (6.00±2.23), TON control group(6.00 ± 6.78) and normal control group(7.20 ± 2.58) (table 1). Figure 1 showed immunohistochemical staining of the rat retinal ganglion cell with caspase-7 antibody. The effect of resveratrol to the expression of caspase-7 in rat with TON showed that treatment with resveratrol decreased the expression of caspase-7 compared to TON control and normal control, treatment with higher dose (20 mg/kg) showed lower expression compared to 10 mg/kg dose. Although there was not significantly different (Table 2).

Figure 1

Microscopic description of caspase-7 expression in retinal ganglion cell (arrow) with immunohistochemistry.

Retinal ganglion cell density
Retinal ganglion cell density was highest in the resveratrol 10 mg/kg treatment group (27.23±2.75) compared to resveratrol 20 mg/kg treatment group (24.89±5.83), normal control group(24.19±2.39) and the lowest in TON control group (22.96±4.62) (table 1). Figure 2 showed retinal ganglion cell with hematoxylin eosin staining.

### Discussion

#### Effectivity of resveratrol on expression of caspase-7 in rat with TON

The results of this study showed that there was no difference in the expression of Caspase-7 in rats with TON between the TON control group and the normal control group, resveratrol at a dose of 10mg / kg, and resveratrol at a dose of 20mg / kg (p> 0.05). However, based on the average number, the levels of caspase-7 were at the lowest in the 20mg / kgBW resveratrol group compared to the other groups. This implied that resveratrol can decrease the expression or caspase-7 in TON rats compared to controls.

Resveratrol has an inhibitory effect on cell continuity signals by downregulating survivin, one of the inhibitors of apoptosis proteins (IAPs). In general, apoptosis will trigger caspase activation. IAPs inhibit apoptosis by directly blocking activation of caspase-3 and -7 and caspase-9. This is in accordance with the results of our study which showed that TON rats given resveratrol had lower caspase-7 expression than normal control and TON control mice, and caspase-7 expression in TON mice given 20 mg / KgBW of resveratrol was lower than TON mice given a dose of 10 mg / kgBW. Thus showed the effect of different dosages on caspase-7 expression. Although statistically there was no significant difference.

The evaluated the role of resveratrol in mitochondrial biogenesis in inhibiting apoptosis in retinal ganglion cells. Resveratrol therapy is thought to inhibit the apoptosis process, maintain mitochondrial membrane potential, reduce caspase and reduce the release of cytochrome C thereby maintaining cell continuity. In Parkinson’s disease, low-dose resveratrol (5 μM) was thought to reduce dopamine-induced cell death in neuroblastoma cells by activating the antiapoptotic factor Bcl-2 and inhibiting caspase-3/7. Resveratrol’s effect on the pancreatic cancer cell renewal system by activating caspase-3 and -7 and inhibiting the expression of Bcl-2 and XIAP in cancer stem cells.

Apart from a role in apoptosis, caspase-7 also has a role in inflammation. For example, low mortality rates in mice low in caspase-7 were associated with significant protection against salivary cell death. The role of caspase-7 in apoptosis and inflammation indicates its function in cell death and / or inflammation that contributes to pathological conditions including neurodegenerative diseases.

On the other hand, this study showed the highest caspase-7 expression in normal control mice. This implied the role of caspase was not only in the regulation of apoptosis, but also in the phenomenon of non-apoptotic cells. And caspase-7 has a function in the progression of cell mitosis. This stated that caspase-3 and -7 are functionally present in cells in excessive amounts. This is also consistent with research.

#### Effectivity of resveratrol on retinal ganglion cell density in rat with TON

This study shows the effect of resveratrol on retinal ganglion cell density in TON rats at the highest dose of 10 mg / kgBW compared to the dose of 20mg / kgBW. This is probably due to the bioavailability of resveratrol in experimental animals. Resveratrol is very easily absorbed in humans and experimental animals but is quickly metabolized into sulfo- or gluco- or hydrogen derivatives, which will then be excreted in the urine. Resveratrol, which was taken orally at a single dose (25 mg = 110 μmol), the absorption was around 70%, with the concentration of resveratrol and its metabolites peaking at 2 μm after 1 hour.
Price et al found that low and moderate doses of resveratrol were required by AMPK activation and increased NAD +. However, at high doses, this effect is independent, indicating that the mechanism is dose dependent. Resveratrol shows its effectiveness even at low concentrations. The specific dose of resveratrol required for maximum effect is unknown. With regard to the method of administration of resveratrol therapy orally, several studies in mice have indicated that after oral administration of resveratrol, there is significant bioavailability in the cardiovascular system and binding to the kidneys and liver. Another study using mice, confirmed the same with mice regarding their bioavailability. It can even be said that resveratrol and its various derivatives can be found in various organs.13,14

This study showed no relationship between caspase-7 and retinal ganglion cell thickness in TON mice. This against previous studies which showed that caspase-7 has an important role in retinal ganglion cell survival in conditions of optic nerve injury, where the absence of caspase-7 protects against loss of retinal ganglion cells. However, this study also explains that caspase-7 is not the only mediator in the pathology of the injured optic nerve, caspase-3 may also plays a role.15

Conclusion

Resveratrol administration shows effect in lowering apoptosis marker caspase-7 and preserving retinal ganglion cell in traumatic optic neuropathy model in rat.

The Effect of Ascorbic Acid and Selenium intake on serum Cortisol in Rats Under Restraint Stress

Zahraa Abdel Al-Jawad¹, Ali A. Al-Fahham²

¹Research Scholar; Physiology and Pharmacology Department/ College of Veterinary Medicine/ University of Kufa, ²Professor, Basic Medical Sciences Department/ College of Nursing/ University of Kufa, Iraq

Abstract

Over the recent years, vitamin C and selenium have been a clear line of defense against the effects of stress. The goal of the study is to indicate the effect of restraint stress in rats on the serum levels of cortisol, the role of vitamin C and selenium supplement in stress relief by determining their effect on serum cortisol. Forty Wistar rats were divided randomly into four equal groups (n=10), all the animals except negative control exposed to restraint stress for six hours a day. The first group were supplemented with vitamin C in a dose of (50 mg/kg bw/day) orally, the second included selenium in a dose of (0.02 µg/kg bw/day) orally, the control included ten rats. Blood was collected on 20th days, and serum cortisol were measured by enzyme-linked immunosorbent assay (ELISA). Results showed that supplement of rats with vitamin C had high significant increase in serum cortisol in stressed rat (14.65 ± 5) compared to those with no stress (8.77 ± 4) which constitute the negative control. The study also revealed that supplement of rats with vitamin C, Selenium and (vitamin C + Selenium) have highly significantly increased serum cortisol level to be (10.42 ± 3.78), (10.29 ± 4.54) and (12.77 ± 3.57) respectively compared to stressed rats. It is concluded that chronic stress restriction can result in cumulative initiation of cortisol secretion in rats. Intake of vitamin C can relieve stress by increasing decreasing cortisol.

Keywords: restraint stress, cortisol, vitamin C, selenium.

Introduction

The World Health Organization has considered stress to be the “Health Epidemic of the 21st Century” and is estimated to cost American businesses as much as $300 billion a year (¹). The effect of stress on our physical and emotional health can be devastating. More than 50 percent of individuals in the USA study felt that stress had a negative impact on productivity at work. Between 1983 and 2009, stress levels in all demographic groups in the United States increased by 10–30 per cent (²).

The majority of people experience certain form of stress at any given time. The term stress was used to describe a number of negative feelings and reactions which follow hazard or challenge cases. But the reactions to stress are not all negative. In fact, life requires a certain amount of stress. For example, childbirth is one of the most stressful events of life. The high levels of hormones released during birth, which are also involved in the response to stress, are thought to prepare the newborn baby to adapt to the challenges of life outside the womb (³).

Several studies indicate the effect of stress on the economy; there is clear evidence of economic stress posing a risk to mental health and reduces life satisfaction and behavioral alteration (²). Stress does not only directly hamper well-being, but also negative effects on other areas of life which lead to economic pressures and economic hardship. Vitamin C is also believed to be involved in anxiety, stress, depression, fatigue, and mood (⁴).
Oral vitamin C supplementation has been hypothesized to elevate morale as well as decrease depression and anxiety. By its antidepressant role, too, vitamin C can play antioxidant properties (5). In older people, vitamin C status has been associated with increased symptoms of depression following acute illness. In addition, the importance of vitamin C in decreasing anxiety caused by stress. Anxiety is an adaptive reaction to unknown danger, but when disproportionate to danger, it is pathological and continues beyond the presence of the stressor. Another research showed that dietary vitamin C supplementation (1000 mg/day) along with vitamins (A and E) resulted in a substantial reduction in depression scores over a 6-week period (6).

Another anti-stress element is selenium (Se); it has been shown to have a beneficial effect on mood of the selenium stage, at least if selenium is small. Low selenium status in studies has been linked despite a slightly greater frequency of depression and other adverse mood disorders such as anxiety, frustration, and selenium supplementation, mood tends to be improving (7). In the US report, high doses of selenium (226.5 μg per day) and overall mood disruption were significantly improved in clearheaded / confused, confident / unsure, and compound / anxious sub-scores. Similar findings were obtained in a double-blind cross over test conducted in the UK, where a 100 μg selenium supplement significantly reduced anxiety, fatigue and depression (8).

**Material and Methods**

It was experimental study, conducted March 2020 to the end of April 2020 on department of Physiology. Forty fertile adult’s albino rats (Rattus norvegicus) were used in the present study, their ages average (10-12), the weight range was (150-300) gm, the animals were housed in the animal house in a typical situation, in well ventilated wire-plastic cages with dimensions design cages (50× 35 × 15 cm) with metal covers and containing bedding of wood shaving which was changed once per daily. The animals were maintained under controlled environment about 12-hour light and 12-hour dark with (degree of temperature 22-26 °C) and exact circumstances to the normal laboratory nutrition with profitable diet (pellets) and water provided to animals through the all-time of the experiment. For two weeks before the experiment started, to adapt rats to the new environment none of the rats had any clinically obvious contagions, the rats were divided into four groups (A, B, C and D) with five rats for each cage.

Forty adult (male and female) lab rats were divided randomly in to four equal groups as following: -

First group: included ten rats (five male and five female) exposed to restraint stress for six hours a day, and supplemented with vitamin C in a dose of (7.2 mg / day) orally by gavage.

Second group: included ten rats (five male and five female) exposed to restraint stress for six hours a day, and supplemented with selenium in a dose of (0.02 μg / day) orally by gavage.

Third group: included ten rats (five male and five female) exposed to restraint stress for five hours, and supplemented with vitamin C in a dose of (7.2 mg/ day) + Selenium in a dose of (0.02μg /day) orally by gavage.

Fourth group: included five rats (three male and two female) rats exposed to restraint stress for five hours a day and given 2 ml normal saline orally by gavage and served as positive control (PC), and five other rats (three male and two female) without exposed to restraint stress, and given 2 ml normal saline orally by gavage and served as negative control (NC).

Rats were placed in the restraint cage used to produce restrain stress in a glass container (12×5 cm), for six-hour a day (9). The rats were exposed to stress between 08:30 AM and 14:30 PM for twenty days of the experiment as seen in figure (3-2) and movement of the rats was highly restricted as they are in the restraint container, negative control was not put in the restraint container all the period of experiment (10).

**Results**

All animals in the study were monitored for their feed and well-being and found healthy and active throughout the study period.

The values and statistical difference of serum cortisol at the twentieth day of experiment between rat groups are showed in table (1). According to this table, serum cortisol level has shown a high significant increase (P< 0.01) in stressed rat (14.65 ± 5) compared to those with no stress (8.77 ± 4) which constitute the
negative control.

The same table shows that supplement of rats with vitamin C, Selenium and (vitamin C + Selenium) have highly significantly (P< 0.01) increased serum cortisol level to be (10.42 ± 3.78), (10.29 ± 4.54) and (12.77 ± 3.57) respectively compared to stressed rats.

Table (1) : Differences in serum Cortisol level among rat groups at the twentieth day of experiment.

**Discussion**

Stress is a well known health problem that negatively affects physical and emotional status of individuals and the economy of populations and countries (1). Physiologically, a wide range of hormones can be modulated in response to stress. For example, stress enhances the secretion of glucocorticoids, catecholamines, growth hormone and prolactin. Such physiological changes lead to mobilizing energy sources and tailoring individuals to their current circumstances (11). Importantly, cortisol. Represents the corner stone in psychological stress response, which in turn controls the systemic stress response components hence, cortisol is a main contributor in long-term homeostasis (12).

Consistent with the reported data, our findings showed that cortisol level is elevated in response stress as we found a significantly elevated level of cortisol in animals subjected to stress when compared to animals in the negative control group. The mechanism by which stress induces the release of cortisol. For example, blood samples collected from stressed rat showed increased ACTH/endorphins ratio. Elevated level of ACTH is significant characteristic of response to stress (13). Chronic use of glucocorticoid and stress induced release can modulate the activity of a wide range intercellular molecules resulting in altered cell homeostasis. It is suggested that stress can alter the response of the pituitary-adrenal axis to stress resulting in altered peptide processing or ACTH being selectively released (12). Our findings showed that vitamin C administration resulted in significantly decreased serum level of cortisol in stressed animals when compared to animals in the negative control group. Although it is studied in various models and study designs, several studies have shown a similar effect of vitamin C. For example, found that ascorbic acid (3000 mg a day) can enhance blood pressure and decrease salivary cortisol in patients exposed to acute psychological stress. Peters and colleagues observed that administration of 1000 mg of the vitamin C during a period of 8 days reduced post-race serum cortisol levels in athletes by 30 % reduction (14).
In terms of mechanisms by which vitamin C can reduce cortisol, several mechanisms have been proposed. Cortisol reducing effect of vitamin C may be attributed to its ability to inhibit enzymes responsible for steroidogenesis \(^{15}\). On an alternative way, cortisol released from the adrenals could be associated with oxidative stress-induced release of vitamin. Therefore, it is vitamin C supply with the vitamin may diminish its mobilization from its stores in the body, and consequently, attenuate the cortisol response \(^{16}\).

Responding to stress involves a wide range of biological processes by direct and or indirect actions of multiple systems. The hypothalamic pituitary-adrenocortical (HPA) axis plays a central biological response that is important to maintain homeostasis during dynamic changes. Both cortisol and DHEA are secreted and released by the HPA and serve as signaling molecules as a part within the hormonal cascade. In addition, they act as pleiotropic molecules centrally and peripherally \(^{17}\).

Gene Expression and Serum IL-23 in Asthmatic Iraqi Children

Zahraa Tahsen Abdulkareem¹, Basima Q. Hasan AL-Saadi²

¹Analytics Technologist, ²Assist. Prof. Institute of Genetic Engineering And Biotechnology for Post Graduate Studies / Uni. of Baghdad

Abstract

Asthma is a non-communicable inflammatory airway disorder in which patients present with recurring bouts of breathlessness and wheezing. IL-23 is a proinflammatory cytokine its biological functions have been well known for the capability to enhance Th17 cell functions. Current study aimed to estimate the gene expression and serum level of IL-23 and to investigate whether IL-23 plays pivotal roles in the development of asthma in asthmatic Iraqi childhood. This study was conducted on two groups: seventy five asthma patients (27 female and 48 male) and twenty five apparently healthy as a control group (10 female and 15 male).The age of the samples ranged from (1-10) years old. Recruited from admitting the Central Teaching Hospital Pediatrics and Alzahra’a Center for Asthma Allergy in Baghdad during the period extended from October /2019 to last February/2020. Subject information’s were collected using a specific questionnaire form as a descriptive study; on the other hand, the present study was approved by the council of institute of genetic engineering and biotechnology for post graduate studies / University of Baghdad. The RNA was extracted from the blood sample of asthma patients and apparently healthy subjects by using TransZol Up Plus RNA Kit (blood). The acceptable purity of RNA in asthmatic patient is range between 1.84-1.99 and for apparently healthy group is range between 1.84-1.96. mRNA expression were determined by real time PCR assay and detect the concentration of IL-23 using ELISA technique. For IL-23 gene expression that showed the Ct of asthma patient group (22.82) and control group (23.33) and the 2-ΔΔCt of asthma patient group (5.35) and control group (3.70) and the fold of gene expression was statistically significantly (P≤0.05).

in the asthmatic group than healthy non asthmatic group that show in ratio (1.44:1.00). Human IL-23 concentration was estimated by ELISA, the results were statistically significant (P≤0.002), the level of IL-23 in asthma patient group (451.80 ± 91.80pg/ml) while the level of IL-23 in Control group(182.36 ± 58.21 pg/ml) as well as increase concentration of IL-23 in severe asthma patients than mild form asthma 726.91 ± 142.98 and 133.72 ± 79.56 respectively.

Key Word: Asthma Childhood, IL-23, qRT-PCR.

Introduction

Asthma of childhood is, a complex chronic disease, characterized by sever and chronic inflammation of airway, airflow limitation, wheezing, recurrent coughing, shortness of breath and chest tightness. Symptoms may occur several times in a day or week in affected individuals, and for some people become worse during physical activity or at night. During an asthma attack, the lining of the bronchial tubes swell, causing the airways to narrow and reducing the flow of air into and out of the lungs. Recurrent asthma symptoms frequently cause sleeplessness, daytime fatigue, reduced activity levels and school absenteeism. Asthma has a relatively low fatality rate compared to other chronic diseases¹. Asthma onset in children usually occurs before their fifth birthday. The majority of children with asthma are sensitive to household allergens and irritants, and they can benefit from a smoke-free, dust-free and pet-free environment ²,³. According to World Health Organization estimates that more than 339 million people had Asthma globally in 2016 ⁴. (IL-23) a member of the IL-12 family of cytokines, is a heterodimeric cytokine. It is composed of subunits p40 (shared with IL-12) and p19 (an IL-12 p35-related subunit) and is secreted by several types of immune cells, such as natural killer...
cells and dendritic cells. And is a protein consists of 189 amino acids with a molecular mass of 20730Da, and its gene lies on human chromosome 12q13.3, IL-23 may contribute to the differentiation of macrophages, but also antigen-induced Th2 cytokine production and eosinophil recruitment in the airways. IL-23 induces Memory T Cell Secretion of IL-17, the Memory (CD4+CD45RO) T cells secrete IL-17 in normal peripheral blood after activation in vitro. Addition of IL-23 alone to cultured memory (CD4+CD45RO) T cells induces a slight increase in IL-17 secretion. However, when other factors, such as activating anti-CD3/anti-CD28, are added together with IL-23, the level of IL-17 secreted from memory T cells significantly increases consistently as in, intracellular IL-17 mRNA levels significantly increase in these conditions.

The increase in IL-17 concentration is accompanied by the enhanced concentration of IL-23 which is a critical regulator of IL-17.

As to our knowledge, this is the first study about the genetic aspect of child asthma disease in genetic engineering and biotechnology institute so that. The present study aims to increase knowledge about the occurrence of Asthma in child in Iraq to determining the gene expression of IL-23 in patient by Real time PCR as well as determine serum level of IL-23 using ELISA technique.

Subjects, Materials and Methods

Study consist of two groups, Seventy Five patients (27 female and 48 male) and twenty five as apparently healthy subjects (control) and personal information such as: age, season, gender, family history, sensitivity, incidence intensity, onset of disease, other diseases, the samples were admitting the Central Teaching Hospital Pediatrics and Alzahra’a Center for Asthma and Allergy in Baghdad during the period between October /2019 to February /2020. The study design was approved by the Institute of Genetic Engineering and Biotechnology for Postgraduate Studies/ University of Baghdad. Writing informed consents were obtained from all patients and apparently healthy control group; all patients were diagnosed according to clinical examination by a chest physician and selected according to the criteria of the global initiate of asthma.

Genomic RNA extraction and determine level IL-23 in serum

Three ml of peripheral venous blood samples were collected from the asthma patients and apparently healthy control using disposable latex gloves and syringes. Then,1 ml of blood was kept in EDTA anticoagulant tubes and then converted to 0.25 ml of EDTA blood in Eppendorf tubes that contain 1ml Trizol and freezer at -20°C to be a source for RNA extraction. The RNA was extracted from the samples of blood of asthma patients and apparently healthy subjects by using TransZol Up Plus RNA Kit (blood) company of kit (Transgen). Then, RNA concentration and purity were measured by nanodrop. The acceptable purity asthmatic patient of samples of RNA is range between 1.84-1.99 and for healthy group samples of RNA purity is range between 1.84-1.96. and level of IL-23 determining in serum of asthma patients and apparently healthy by using IL-23 ELISA kit, ELISA kit. MY BIOSOURSE COMPANY was used in this study.

cDNA synthesis for mRNA

Total RNA was reversely transcribed to complementary DNA (cDNA) using EasyScript® One-Step gDNA Removal and cDNA Synthesis SuperMix. The procedure was carried out in a reaction volume of 20 μl according to the manufacturer’s instructions. The total RNA volume to be reversely transcribed was (20μl).

Interleukin 23: Forward 5' AGTGGAAGTGGGCAGAGATTC-3' Reverse 5' CAGCAGCAACAGCAGCATTAC-3' GAPDH: Forward 5' TGAGAAGTATGACAACAGCC-3' Reverse 5' TCCTTCCACGATACCAAAG- Components of quantitative real-time PCR used in IL-23 (Transgen / China).
Real Time PCR Program

The expression levels of *(IL-23)*, and housekeeping genes *(GAPDH)* were estimated by RT-PCR To confirm the expression of target gene, quantitative real time RT-PCR SYBR Green assay was used. Primers sequences for *(IL-23)*, as housekeeping gene *(GAPDH)* were prepared according to 9. Optimal annealing temperature of qPCR reaction was found out after several try to 64˚C with a total volume of 50 μl. The reaction components are described in table (1).

Real Time RT-PCR analysis of *IL-23* gene expression:

1. DCT

The expression ratio was calculated without a calibrator sample 2-DCT according to the following equation:

\[
DCT (test) = CT \text{ gene of interest (target, test)} - CT \text{ internal control}
\]

Finally, the expression ratio was calculated according to the formula

\[
2^{-\Delta CT} = \text{Normalized expression ratio}
\]

2. DD CT

To compare the transcript levels between different samples the \(2^{-\Delta DCt}\) method was used 10.

The CT of gene of interest was normalized to that of internal control gene. And the CT was calculated as the following formula:
DCT (test) = CT gene of interest (target, test) – CT internal control

DCT (calibrator) = CT gene of interest (target, calibrator) – CT internal control. The calibrator was chosen from the control samples.

CT values ≥ 38 were considered unreliable and neglected

The DCT of the test samples was normalized to the DCT of the calibrator:

DD CT was calculated according to the following equation:

DD CT=DCT (test)- DCT(calibrator)

Finally, the expression ratio was calculated according to the formula

2-DDCT = Normalized expression ratio.

**Determination of IL-23 titer using Enzyme-Linked Immunosorbent Assay kit (My biosoure/USA)**

**Statistical analysis**

According to¹¹. (SAS) Program was used to determine the fold of gene expression. Least significant difference –LSD test (Analysis of Variation-ANOVA) or T-test was used to significant compare between means. Chi-square test was used to significant compare between percentage (0.05 and 0.01 probability) in this study.

**Result and Discussion**

**RNA Extraction**

Total RNA was successfully extracted from all samples. The concentration of total RNA ranged from 83-188 ng/μl and from 81-182 ng/μl in healthy group (non asthmatic). And the purity of total RNA samples ranged from 1.84-1.99 ng/μl in the patients asthmatic group, and from 1.84-1.96 ng/μl in the healthy non asthmatic group. With p-value 0.74.

There was no significant difference between the concentration of the total RNA of the two study groups, p=0.366. There was no significant difference between the RNA purity of the two study groups as well.

**Real time PCR quantification of IL-23 Expression:**

The mean Ct value of IL-23 cDNA amplification were (22.82) in the patients asthmatic group, and the mean Ct healthy non asthmatic group were (23.33). The results are shown in table (2). There was a significant difference in the mean Ct values between the different study groups ((P≤0.05).

This depends on normalization of Ct values calculating the ΔCt which is the difference between the mean Ct values of replica of IL-23cDNA amplification of each single case and that of the GAPDH.

Table (2) shows the mean of ΔCt (normalization Ct values) of each study group. ΔCt means in asthmatic patient group(0.57). And healthy non asthmatic group was (1.1). A significant difference was noticed between the study groups (P≤0.05)

Results of 2-ΔCt revealed significantly higher results for the asthmatic patient group from the healthy non asthmatic group (P≤0.05), mean of 2-ΔCt for asthmatic patient group (0.673) while In the healthy non asthmatic group a mean of 2-ΔCt was (0.466).

To calculate the gene expression folds in relation to the housekeeping genes the result of 2-ΔCt of each group was measured in relation to that of Healthy non asthmatic group .The results are shown in table (2). The fold of gene expression in asthmatic patient group was higher than Healthy non asthmatic group in 1.44 times. While the fold number in healthy non asthmatic group was1.00 times. as in table (2). These results indicate a significantly increase expression of B-actin gene in these groups.

* (P≤0.05).

When calculating gene expression it was significantly higher in asthmatic patient group than Healthy non asthmatic group 1.44 times. as shown in table (3). The above results demonstrate the significant gene expression in Healthy non asthmatic group.

The mean Ct values in healthy non asthmatic group were higher than those of asthmatic patient group .This is important in reflecting the original mRNAs present in the samples. It is evident from these results that the patients group is associated with the highest copy number of mRNAs reflecting its higher expression.
The results show convergence of Ct values between asthmatic patient group and healthy non asthmatic group it is important evidence that IL-23 gene expression so it is possible to use IL-23 gene as a biomarker for the early detection of asthma disease.

These results agreed with\textsuperscript {11}. Their result indicate IL-23 levels were higher in severe asthmatics than in control group Thus, it is presumably that IL-23 could be a suitable marker of allergic inflammation in asthma.

Figures (1),(2) show the amplification plots and dissociation curves for IL-23.

Abstract

Aim: To evaluate the effect of ultrasonic agitation for retrograde biodceramic root repair, MTA and biodentine filling materials on push-out bond strength to dentine walls.

Materials and Methods: Ninety extracted human teeth with single straight roots were selected randomly. After disinfection and cleaning, the coronal portions were sectioned to standardize the root canal length at 15mm. following root canal shaping, obturation and apical roots resection, retrograde cavities were prepared. Teeth were categorized depending on the filling material used into three groups, 30 teeth each. Group A filled with bioceramic root repair material, B with MTA and C with Biodentine material. These groups were divided in to three subgroup (n=10). Subgroups:A1, B1, and C1 cavities were filled with the aid of condenser. A2, B2, and C2 with ultrasonic agitation of material for 30 seconds. A3, B3, and C3 with ultrasonic agitation of material for 60 seconds. Push-out bond strength test was done for the samples to specify bond strengths at the cement/dentin interfaces. The specimens were examined using a stereomicroscope to estimate the mode of failure. Data were statistically analyzed using two-way ANOVA and Bonferonni test.

Results: Ultrasonic agitations increase the bond strength for all cements. Biodentine™, PD™ MTAWhite and TotalFill® RRM™ were significantly increased (P<0.05). While, increasing the time of ultrasonic was statically non-significant among groups.

Conclusions: Ultrasonic agitation of root-ending filling materials showed increase in push-out bound strength to dentine walls.

Key word: Retrograde-filling, bioceramic, biodentine, MTA, ultrasonic agitation.

Introduction

Retrograde root canal filling following apicoectomy is an important procedure, filling of root-end cavity with an adequate retrograde filling material is important to prevent the invasion of bacteria and apical microleakage.[1] Numerous materials were developed as root-end filling materials such as mineral trioxide aggregate (MTA), which induce cementogenesis and has noncytotoxic effect. Consequently, currently MTA is used as a root-filling material. However, MTA showed some disadvantages: long setting time, difficult handling, discoloration, high cost and inadequate antibacterial qualities.[2] To overcome these problems, new root-filling materials have been developed, they are bioactive which means when they come in contact with vital tissues they facilitate apical repair and biomineralization.[3]

Biodentine has many similar properties when compared to MTA but with a faster setting time and better consistency, therefore it is considered as an alternative to MTA. The absence of calcium sulfate and calcium aluminates in Biodentine formulation that are known to give a longer setting time and decreased mechanical strength is the major difference between this new material and MTA calcium silicates.[4, 5] Other
materials such as bioceramics root repair materials are used in root-end fillings, due to their better properties such as decreased moisture sensitivity, insolubility, and tissue inductive properties, they are the materials of choice in endodontics treatment. The addition of silicate-based materials supposed to decrease setting times. Thus it was overcoming the drawbacks of MTA.[6]

Push-out bond strength test was done for the samples to specify bond strengths between dentin interfaces the retrograde filling materials. It is a mechanical test used to measure the resistance of a material to dislodgment and its adhesive property.[7] Ultrasonic energy may be employed to enhance the introduction of root-end filling within the root canal aiming to improve root canal filling. Therefore ultrasound may be suggested to be an auxiliary tool for filling material introduction in root-end cavities.[8, 9]

The aim of this study was to evaluate the effect of ultrasonic agitation for retrograde bioceramic root repair, MTA and biodentine filling materials on the push-out bond strength. The null hypothesis indicates that no differences among bond strength values for used materials and the mode of application in retrograde filling.

**Materials and Method**

Ninety extracted teeth were randomly selected from the department of maxillofacial dentistry, University of Baghdad, all teeth were extracted for the purpose of patients’ treatment, teeth were collected according to the following criteria: Permanent maxillary incisors with single roots that: completed the root formation, without any anatomic variations and have patent canals.[10]

Preoperative buccolingual and mesiodistal radiographs of each root of studied teeth were taken to confirm that there was no internal or external resorption or calcifications. Teeth were autoclaved and stored in 0.2% thymol solution until they were used.[11] The teeth were cleaned carefully for any calculus deposits with air scalar and polished pumice.[12] The coronal portions were removed using diamond disc (0.2mm thickness) to standardize the root canal (15mm in length).[8] Then, the pulp tissue was removed with a barbed broach and a size 10 k-file (DENTSPLY Maillefer, Ballaigues, Switzerland), the tip of the file was 1mm visible from the apical foramen.

The root canals were prepared to the desired shape with the ProTaper rotary files (DENTSPLY, Maillefer, and Ballaigues, Switzerland). The preparation was started with SX file and followed by S1, S2, F1, F2 and F3 files. Between each two files, the canal was rinsed with 2mL of 5.25% sodium hypochlorite, then the canal was irrigated by 2mL (EDTA) at 17% concentration (Dental Produits Dentaires SA, Switzerland) for three minutes, finally canals wear rinsed by 2ml of distilled water and then dried using paper points (ULTRADENT UT,USA). Gutta-percha points and zinc-phosphate cement (Adhesor, Spofa Dental) were used to fill the canals. For complete setting of the filling materials, the roots were stored in 100% humidity at 37°C for 2days.

Then specimens were embedded in acrylic resin, the coronal surface of the root was fixed with sticky wax to the dental surveyor to ensure accurate sectioning at right angle to the long axis of the roots. The roots were carefully sectioned at right angle to long axis of the tooth (3mm from the apex) under continuous water cooling using a diamond disk (0.2mm thickness). Then, the root was fixed in an apparatus to acquire a root-end cavities and to obtain parallel dentin walls,[13] root-end cavities measuring 1.5mm in diameter and 3mm in depth were prepared,[9] and filled by the aid of Micro-Apical placement System (Produits Dentaires, Switzerland).

The teeth divided into 3 groups according to the filling material used:

**Group A:30 teeth**, the retrograde cavities were filled with TotalFill® BC RRM™ (Total fill bioceramic root repair material, putty (jar2.5g) FKG-Dentaire SA,Switzerland), this having 3 subgroups (n=10):

- A1:10 cavities filled with the aid of condenser (Trinity, São Paulo, SP, Brazil).
- A2:10 cavities filled with ultrasonic agitation of material for 30seconds (15seconds in the mesio-distal direction and 15seconds in the bucco-lingual direction), using a mini Irrisonic tip which was the prototype of an ultrasonic tip, it was commercially produced.
- A3:10 cavities filled with ultrasonic agitation of material for 60seconds (30seconds in the mesio-distal direction and 30seconds in the bucco-lingual direction),
using the same tip as in group A2.

**Group B:** 30 teeth, the retrograde cavities were filled with PD™ MTA White (Produits Dentaires SA Rue des Béosquets 18, Switzerland), this having 3 subgroups ($n=10$):

- B1: 10 cavities filled with the aid of condenser.
- B2: 10 cavities filled with ultrasonic agitation of material as in subgroup A2.
- B3: 10 cavities filled with ultrasonic agitation of material as in subgroup A3.

**Group C:** 30 teeth, the retrograde cavities were filled with Biodentine™ (Septodont, Saint Maur de Fosses; France), this having 3 subgroups ($n=10$):

- C1: 10 cavities filled with the aid of condenser.
- C2: 10 cavities filled with ultrasonic agitation of material as in subgroup A2.
- C3: 10 cavities filled with ultrasonic agitation of material as in subgroup A3.

Radiographs were taken to confirm proper filling of the material. For complete setting of materials, all teeth were stored at 37°C and 100% humidity for 7 days. During all sectioning, Struers minitom cutting equipment (Copenhagen/Denmark) was used. The slices were determined with digital caliper and marker to obtain 2 mm cut. Sectioning was carried out with the diamond disc (0.2 mm thickness) and water coolant. All samples were examined after sectioning and any slice with oval shaped canal or voids within the sealer should be discarded.

Push-out bond strength test was done for the samples (to specify bond strengths at the cement/dentin interfaces) via cylindrical plunger mounted on Universal testing machine (Tinius, Olsen, UK) managed by computer software (Figure 1). The plunger used was 1.4 mm. Micro push-out testing was done at a crosshead speed of 0.5 mm/minute until failure occurred.

**Push-out strength data were determined in MPa according to the following formula:**

\[
\text{Push-out strength} = \frac{\text{force of dislodgment in Newton}}{\text{bonded surface area in mm}^2}
\]

The area ($\text{mm}^2$) under load was calculated by the cylinder lateral surface area formula:

\[
\text{bonding area} = 2 \times \pi \times r \times h
\]

Where $r$ is the radius of the preparation circumference, $\pi = 3.14$ and $h$ is the thicknesses of the root slice (2 mm).

Two-way ANOVA and Bonferonni test with software SPSS Version 21.0. (IBM, Armonk, NY, USA) were used to statistically analyze the data, at a level of significance ($P<0.05$).

**Results:**

Tests were done to the teeth and push-out bond strength values were measured in Mpa for all groups.

The result of the two-way ANOVA showed that the largest effect size on push-out bond strength was between subgroups of group B followed by group C and the least effect size was in group A (Table 1). Bonferonni-test was used (Table 2) to find the subgroups responsible for the difference.

ANOVA analysis of variance was used at level of significance (0.05) as in Table 3. In order to determine materials effect on push-out bond strength. The result showed that the largest effect of ultrasonic on push-out bond strength was between ultrasonic agitation of material subgroups for 60 seconds followed by subgroups of the aid of condenser and the least effect size was in subgroups of ultrasonic agitation of material for 60 seconds. Bonferonni-test was used (Table 4) to find the subgroups responsible for the difference.

The analysis of failure modes for push-out bond strength, mixed failure were the most failure patterns that noted in groups (Table 5).

Discussion

Surgical apicoectomy followed by root-end filling is a choice to avert tooth extraction while conventional endodontic therapy has failed. It is clinically very important to minimize the microleakage at the periapical area. For this reason, thorough understanding in the material ability to bond to the tooth structure help in the selection of the material and in the prediction of the procedure outcomes. In many studies, the push out test was commonly done to determine the bonding strength between the root-end filling materials and the dentinal walls.

According to this study, all root-end filling materials showed bonding at the apical region, it was found that Group A (TotalFill® BC RRM™) exhibited significantly higher bond strength followed by Group C (Biodentine) and Group B (MTA). Ultrasonic agitation enhanced the push-out bond strength of materials. Consequently, the null hypothesis was rejected. Ultrasonic of retrograde filling has been previously tested by a study concluded that ultrasonic agitation of retrograde filling enhanced the bond to the dentinal wall of the retrograde filling materials. This study tested if ultrasonic agitation of three cements during its insertion at different times increases its bond strength. This may be due to high adaptation of the cement to the dentin. Ultrasonic agitation of material exhibit significantly higher bond strength especially for TotalFill® BC RRM™ group but the large effect of agitation was found in PD™ MTA White group. Biodentine had higher bond strength values than that of MTA groups and this agree with Eren et al. Increasing the time of ultrasonic increase the bond strength but statically is non-significant for all groups. Ultrasonic effect showed good results in terms of intratubular sealers penetration. The dentine uptake was more prominent for Biodentine than MTA which increased depth of silicon and calcium penetration into dentin, when compared to MTA, Biodentine possess a better homogeneity and smaller particles. Subsequently, the better bonding strength of TotalFill® BC RRM™ to dentin in this study could be explained by silicon and calcium uptake by the dentin. And this agrees with other study reported by Kadić. et al.

All materials showed mixed failures predominantly, which was reported by other previous studies. Cement materials showed some cohesive failures weaknesses in material itself, also adhesive failures in the bonding with the dentinal walls were present. However, TotalFill® BC RRM™ shows significantly higher bonding strength in relation to MTA and non-significantly higher bonding strength in compared to Biodentine.

This study showed ultrasonic agitation improved the bonding strength and adaptation between the dentinal wall and the restoration which can improve the clinical outcomes of the retrograde root-end filling. Failures were observed in the tested materials were from the mixed type which are of both cohesive failure (weakness in the materials) and adhesive failure (bonding to the dentinal walls). Also it should be noted that all tests were done under perfect laboratory condition with samples that are carefully selected with specific criteria, therefore, any other in vivo environmental factors such as temperature and saliva also teeth variation were excluded and could have an impact on the bonding strength thus, more research under clinical conditions should be done to deeper understanding of this technique to assess the true interaction between the dentinal wall and the materials.

Conclusion

According to methodology and results, the ultrasonic of retrograde cement materials showed higher bonding strength to the dentinal walls and the large effect of agitation was found in PD™ MTA White group.

The Effect of Drinking Water Quality on Some Hematological Parameters in Female Laboratory Mice

Zaman Subhi Madlool 1, 2, Sara Omran Issa1
1 lecture assistant at department of biology, College of Education for Pure Science, University of Thi-Qar/ Iraq

Abstract

The present study was designed to determine the effect of two sources of drinking water on some hematological parameters in female laboratory mice. The animals were divided into three groups: First group (control) it given a physiological solution, Second group: the RO water was given and third group: the river water was given.

Results: the results of the study showed a significant increase ($p \leq 0.05$) in the erythrocyte, leukocytes count, percentage of lymphocytes and granular cells, significant decrease in Hb concentration and PCV percentage in the second and third group when compared with the control group, while mean corpuscular volume insignificantly decrease in the second group and significantly increased in third group. Results also showed a significant increase in platelet count and monocytes percentage in the second group while it decreased in the third group.

Conclusion: we conclude from this study that the water source and its quality have a significant effect on the blood parameters of laboratory animals, and then influence on the animal’s health.

Keywords: Mice; Water; Hematological; RO; Pollution; Rivers.

Introduction

Water is the nerve of life and an important resource for humans, as it constitutes a large percentage of the content of the cell’s living matter in all organisms and a medium for biological reactions, as well as for this it contains many salts ions that causes the survive and continuation of organism in life (1).

As a result of water pollution, hundreds of millions of people around the world do not have access to an adequate supply of safe drinking water besides poor sanitation and hygiene, and polluted water causes the death of nearly 3.4 million cases annually, most of them are children and more than one billion people are still not they have access to good water sources despite the continuous efforts of governments, civil societies and the international community (2).

Consumption of water from poor sources along with the use of untreated water in agriculture is responsible for many disorders such as health damage to humans such as increased cases of diarrhea, for example Dokan river was the potential source of cholera outbreak in Sulaymaniyah (266 cases) and Kirkuk (160 confirmed cases) in October 2012 and is an example of the health risk of river water pollution as sources of drinking (3).

Monitoring and protecting water quality is an important issue, and the physical, chemical and biological characteristics of river water are important for assessing the effects that cause river water quality to deteriorate, and studying it is essential to water quality and reducing the effects of degradation (4).

Reverse osmosis water (RO) is a water purification process that uses a partially permeable membrane to remove unwanted molecules, ions from drinking water. In RO, an applied pressure is used for overcome osmotic pressuring a colligative property that is driven by chemical potential differences of the solvent, a thermodynamic parameter. RO can remove many types of suspended and dissolved chemical species as well as biological types (mainly bacteria) from water and is used in both industrial processes and the production of potable...
water. The result is that the solute is retained on the pressurized side of the membrane and the pure solvent is allowed to pass to the other side. To be selective, this membrane should not allow ions or large molecules through the holes, but should allow smaller components of the solution (such as H$_2$O) to pass freely (5).

**Material and Method**

**Animals preparation**

Eighteen healthy 10-12 weeks old female albino mice and weighing 22-25g were obtained from Thi-Qar University/College of Science. Mice were placed in a controlled temperature room (23-25) c° under a 12hour dark-12hour light cycle.

**Samples of water**

Water samples were collected from the Euphrates river in Nasiriyah / Dhi-Qar Governorate (the area located in front of the College of Education for Pure Science). Physical, chemical and biological characteristic were evaluated which have importance in determining the validity of the water whether it is river water or drinking water (6) as shown in table (1).

Study design: The mice were assigned into three group (each group contain 6 females):

1--First group (control group) : It was given normal saline 0.9% NaCl.

2- Second group : It was given drinking good water (RO) for a two-month experimental period.

3-Third group : It was given river water for a two-month experimental period.

**Hematological assay**

After the end of experimental period, the mice were anaesthetized and blood was drawn directly from the heart by cardiac puncture. The hematological tests were done by using Genux Auto Hematology Analyzer where the results read and printed automatically.

**Statistical Analysis**

The data were analyzed by using Duncan test to determine mean and standard deviation, p≤0.05 was considered as significant in this study (7;8).

**Results and discussion**

The effect of drinking water quality on some hematological parameter (RBC, Hb, PCV and MCV)

The results showed a significant increase (p ≤0.05) in the count of red blood cells (RBCs) in the second and third group when compared with the control group and the results also showed a significant increase in the third group when compared with the second group.

The results also showed a significant decrease (p≤0.05) in the concentration of hemoglobin in the second group while it was significant increase in the third group compared with the control group, as is the case for achieving a significant increase in the third group when compared with the second group.

The results showed a significant decrease (p≤0.05) in the packed cell volume(PCV) in the second and third group compared with the control group. The results also showed a significant increase in the third group when
compared with the second group.

The results showed a non-significant decrease in mean corpuscular volume (MCV) in the second group and significant increase in third group compared with the control group. The results also showed a significant increase in the third group when compared with the second group as shown in table (2).

Differences of letters indicate differences of significant at( P≤0.05)

The reason for this increase in the count of red blood cells may be due to the influence of bacteria and parasites where these organisms affect the bone marrow, (especially in the reddening colonies) which is the site of the formation of red blood cells or the reason for this increase is the direct effect of these organisms on the cell divisions that generate red cells as they differentiate into erythrocytes.

Erythropoietin which is excreted from the kidneys as a result of a decrease in the percentage of oxygen supply to the body’s cells, controls the formation of erythrocytes in the bone marrow by stimulating the production of red blood cells and its role in preserving the red ancestors from programmed cell death and stimulating them to grow and divide until the formation of reticulocytes which develops into mature red blood cells. The secretion of this hormone weakens a lot when the kidneys get sick, as bacteria may secrete toxins that affect kidney. Therefore, the increase in the number of red blood cells may be due to the effect of bacteria on erythropoietin through two side, either affecting the site of its secretion or affecting the way it affects, while the first side may be the result of the effect of toxins of organisms on the kidneys where the site of the secretion of this hormone, and the other side of the effect on the mechanism of action of erythropoietin may be a result of the influence of germs on the sensitivity of the target cells to erythropoietin, thus losing its effectiveness and the degree of its effect in those cells.

The effect of drinking water quality on some hematological parameter (WBC, Lymphocytes, Monocytes, granular cells and PLT)

The results showed a significant increase (p≤0.05) in the count of white blood cells in the second and third group when compared with the control group and the results also showed a significant increase in the third group when compared with the second group.

The results showed a significant increase (p≤0.05) in the percentage of lymphocytes in the second and third group when compared with the control group and the results also showed a significant increase in the third group when compared with the second group.
The results showed a significant increase (p≤0.05) in the percentage of monocytes in the second group while it decreased significantly in the third group compared to the control group and the results also showed a significant decrease in the third group when compared with the second group.

The results showed a significant increase (p≤0.05) in the percentage of granular cells in the second and third groups when compared with the control group and the results also showed a significant decrease in the third group when compared with the second group.

The results showed a significant increase (p≤0.05) in the count of platelets in the second group while it decreased significantly in the third group compared with the control group and the results also showed a significant decrease in the third group when compared with the second group as shown in table (3).

Differences of letters indicate differences of significant at (P≤0.05)

As for the increase of white blood cells in general and lymphocytes in particular in the blood of the second group, this increase may be a natural reaction to the threat represented by the entry of foreign bodies such as bacteria and parasites found in drinking water which was previously mentioned to prove their presence in such a type of water as it represents white cells are the main pillar of the immune system and the first to respond to combat any threat especially biological threats represented by this type of organism.

It is noted from the increase in the total count of white cells the difference of immune responses against such a type of threat, as the increase of lymphocytes becomes clear that there is a large activity in the production of antibodies by this type of cell or the increase in the numbers of killer lymphocytes while the increase in other cells, such as mono and neutral is Evidence of increased ingestion by this cell type against the bacterial species present in the water.

It has been observed from the results of the study that most of the increase is due to the count of lymphocytes and consequently an increase in their percentage compared to granular and monocytes which is observed to decrease in percentage (11).

The count of white blood cells may remain within the normal range or there may be an increase in parasitic infection (12).

(13) reported an increase in the count of WBC to more than 10,000 cells/mm³ in 11 patients out of 15 pinworm infections.

As for the reason for the decrease in the monocytes it may be due to the effect of toxins as some types of bacteria secrete a toxin called beta which analyzes the leukocytes, as well as the secretion of a toxin called kama, which causes the release of lysosome enzymes in the neutrophils. It leads to an increase in exudation by pumping the sodium element and thus an increase in
the flow of potassium ion. There are toxins that work to prevent the process of phagocytosis by phagocytosis, as well as remove the granules and consequently their angular death (10).

The results of the current study showed a decrease in the count of platelets in the blood of the third group when compared with the control group Platelets like other solid blood components result from the divisions, growth, and development of Megakaryocytes in the bone marrow under stimulation of the thrompoietin secreted by the liver which plays a major role in stimulating, multiplying and maturing those cells to form platelets (14) so low levels of thrombocytopenia may be caused by the presence of water-presenting organisms on the secretion of this hormone by decreasing its secretion as a result of the effect on the cells secreting it.

The results of the current study were in agreement with the results of a study (15) that showed an increase in the number of white blood cells while it was not consistent with them in the results of red blood cells which decreased in this study.

**Conclusion**

We conclude from this study that the water source and its quality have a significant effect on the blood parameters of laboratory animals, and then influence on the animal’s health.

Assessment of Nurses’ Knowledge Concerning Early Detection for Hypothyroidism/Hyperthyroidism in Baghdad Teaching Hospitals

Ahmed F. Hassan¹, Sabah A. Ahmed²
¹Assistant instructor, Fundamentals of Nursing Department, College of Nursing-University of Baghdad,  
²Prof, Fundamentals of Nursing Department, College of Nursing-University of Baghdad

Abstract

Hypothyroidism and Hyperthyroidism is the most common endocrine disorders in clinical practice. Critical illness is often associated with dysfunctions of thyroid hormone. Thyroid dysfunction is a serious matter if managed inaccurately; it early detection may decrease morbidity and mortality. **Objectives**: Assessment of nurses’ knowledge concerning early detection for hypothyroidism/hyperthyroidism in Baghdad Teaching Hospitals and to find out a relationship between nurses knowledge with some variables such as (age, gender, educational level, and marital statues). **Methodology**: A descriptive study was conducted in the period of December 20th 2019 up to the end of May 28th 2020. The sample consisted of (50) nurses who were systematically selected one by one. The data collected was analyzed using SPSS version 22.0. **Results**: The majority of the study were female who accounted for (72%) of the total participants while male constituted (28%). Most of the study participants (34%) were ages 26-30 years old. (44%) of the nurses were diploma graduate. Fifty percent of the nurses were married. More than half (58%) of nurses had experience years in nursing and (80%) of nurses had training course in hospitals, (66%) have number of training were 1-5 course and (80%) had location of courses in Iraq. **Conclusions**: Findings of study demonstrate that, nurses have good knowledge about early detection of Hypothyroidism/Hyperthyroidism. **Keywords**: Knowledge, Early detection, Nurses, Hypothyroidism, Hyperthyroidism

Introduction

The thyroid gland is regulated by the thyroid-stimulating hormone (TSH) which is secreted by the anterior pituitary and it’s very important for metabolism of the body through secretion of two hormones, thyroxine (T4) and triiodothyronine (T3) [1]. Hypothyroidism, which has affecting of 2% - 5%, is the most common form of thyroid dysfunction [2]. Hypothyroidism and hyperthyroidism are correct etiological, anatomical and functional diagnosis of the thyroid problem can be achieved by take history of patient, thorough physical examination include weight loss/weight gain, palpitation, change of bowel habits (diarrhea/constipation), sweating, sleep problems, menstrual irregularities, growth problems, delays in sexual maturation, infertility, hoarseness of voice, exophthalmos, tremors, atrial fibrillation and thyroid gland enlargement and by well-planned investigations that include serum T₃,T₄, and TSH [3]. Currently, neonatal early detection elevated levels of TSH that increase in response to the reduction in thyroid hormone. This early detection identifies 90% of cases of congenital hypothyroidism. Most patients have normal development after treatment with thyroxin. Besides assay of TSH, triiodothyronine (T3) and thyroxin (T4), other diagnostic tests include thyroid scanning with radioactive iodine, thyroid echography, and assay of serum thyroglobulin. These exams can help determine the causes of the disease and differentiate permanent and transient cases [4]. Early detection of thyroid disorder depended on physical examination and laboratory test of thyroid hormone. Differential diagnosis is based on absence of exophthalmos and presence of myxedema, anti-TSH antibodies and lymphocyte infiltration of the thyroid gland [5]. Undiagnosed thyroid disorder may put patients at higher risk for certain life threatening conditions such as cardiovascular disease, osteoporosis and infertility [6].

DOI Number: 10.37506/ijfmt.v15i1.13655
Materials and Methods

A descriptive study: Assessment of nurses’ knowledge concerning early detection for hypothyroidism/hyperthyroidism in Baghdad Teaching Hospitals. This study was conducted at Baghdad Teaching Hospitals between December 20th 2019 up to the end of 28th May 2020. A tool of knowledge questionnaire was developed and distributed to the participants in this study. The sample consisted of (50) nurses at Baghdad Teaching Hospital, AL.Kindy, AL.Yarmouk Teaching Hospital, Imamein Kadhimein Medical City. A questionnaire-interview format was designed and developed by the researcher for the purpose of the study; such development was employed through the available literature, clinical background and interview with nurses. All the items were measured on scale of (2) indicates that the know 2; don’t know 1. The questionnaire consisted of (2) parts. Part I: Demographic Information Sheet. Part II: Assessment of Nurses’ Knowledge Concerning Early Detection for Hypothyroidism/Hyperthyroidism. Rating scale was used to rate the frequency and extension of the problems. The content validity of the instrument was established through a panel of (14) experts. Test-retest reliability was determined through a computation of person correlations for the scales. The data were collected by using the questionnaire structured format through interview and inspection technique. The determination was conducted during the period from 15th January 2020 to 30th February 2020. The data were analyzed through descriptive data analysis and inferential data analysis the data were analyzed through the use of Statistical Package of Social Sciences (SPSS) version (22).

Results

*: P ≤ 0.05; *: P ≤ 0.01**

This table indicates that there is no significant association between age, gender, level of education, and martial statues with nurse’s knowledge.

**Discussion**

Through the course of the data analysis of the present study the finding showed that the majority (72%) of the study were female while the remaining was male. The highest percentage of age group in present study (34%) were 26-30 years old and lowest percentage(10%) were (31- 35,36-40) years old. Concerning marital status and level of education, (50%) of the sample were married, most of them are (44%) nursing had diploma graduate.

These results are agreement with the findings obtained from other study, who shows 69% of the study sample were females within age group that (23-27) years old from Iraqi Center, high percent of the three hospitals were married and divorced, (40%) of the sample nursing had diploma graduate[6].

Regarding experience years, majority (58%) of the study was experience years in nursing and (80%) of nurses had training course in hospitals, (66%) have number of training were 1-5 course and (80%) had location of courses in Iraq. These results are accordance with findings obtained from other study, shows that after the training course, high percent of nurses had (1 - 5) years of experiences in hospital,(73.3%) of nurses have theoretical training course in Iraq[7]. This study similarity with other researcher show that number of years in the health field, the majority of both groups of nurses have (1-5 years) of experience years in nursing field[8]. The result of accurate study that show early detection of hypothyroidism/hyperthyroidism domain in table (1) for nurses knowledge is fifty percentage were good knowledge, forty six percentage had fair knowledge and only four percentage poor knowledge toward early detection Hypothyroidism/Hyperthyroidism. A finding suggest the large number of patients to enter to medical word ,critical care unit ,and surgical word that suffering singes and symptom of thyroid disorder leads to frequent nurses cope with these problem to provide nursing care and to increase knowledge about these health problem concerning hypothyroidism and hyperthyroidism. The findings of the study disagree with result obtained from other study who reported that the most of the nurses had a fair level of knowledge (54%) and the lowest percentage (12%) of nurses’ knowledge in good knowledge toward hypothyroidism and hyperthyroidism. This finding difference to a study conducted by other researcher who stated that the not acceptable of nurses’ knowledge (43.3%), acceptable level (23.3%), fail level (25.0%), and no excellent level toward thyroid disorder management[10]. This finding are good agreement done which other researchers showed that the study finding total post knowledge means of score was higher than total pre knowledge mean of score[11]. Level of education ,experience of nursing in hospitals in comparison of the respondent’s total Nurses knowledge domain in table (2) ,there is non-significant association between age ,gender ,level of education , and
martail statues with nurses knowledge domains. This result of study are disagreements with other studies done by other researchers whose reported that the association between knowledge and education level shows there was high significant relationship between nurses level of knowledge and age of nurses at P = P ≤ 0.05 level [7]. These result were similar to those result obtained from other researcher who reported that no significant difference between study and control groups related to age group ,gender, level of educational, current work place with knowledge domain (P<0.0001) [8]. Other study show that no statistical significant relationships between nurses’ gender and nurse’s knowledge [9].

**Conclusions**

This study demonstrates that, despite good nurses’ knowledge regarding early detection of hypothyroidism and hyperthyroidism.

**Recommendations:**

1. The study suggested opening endocrine centre in Baghdad city to early detection hypothyroidism and hyperthyroidism.

2. Increases training course for nurses outside in Iraq that contributed to enhance nurses’ knowledge and practice about early detection hypothyroidism and hyperthyroidism.

This research was funded by Author. Moreover, we would like to thank the study participants and data collectors for their fully participation and responsible data collection.

Assessment of Employees’ Knowledge Concerning Contributing Factors and Early Detection for Prostate Cancer in Baghdad University Colleges in bab-Almudam

Haider M. Majeed¹, Hussein Hadi Atiyah²

¹Assistant instructor, Fundamentals of Nursing Department, College of Nursing-University of Baghdad,
²Prof, Adult Nursing Department, College of Nursing-University of Baghdad

Abstract

Worldwide prostate cancer is the second most frequent cause of cancer deaths. Screening techniques is useful for improving survival rates and treatment outcomes can be employed to detect the disease earlier in apparently healthy individuals, and increasing evidence shows that this can decrease morbidity and mortality of the disease.

Objectives: The objectives of this study was to assess the knowledge concerning contributing factors and early detection to screen for prostate cancer among male staff of the University of Baghdad Colleges in bab-Almudam Area, Iraq and to find out the relationship between employees’ knowledge and their demographical characteristic.

Methodology: This cross-sectional descriptive design study was carried out with 100 male staff working in colleges of Baghdad University in bab-Almudam region. Male staff who agreed to participate and were recruited on giving oral consent. Knowledge about prostate cancer and screening was operationalized through 28 items, including 12 items from the Knowledge about Prostate Cancer Screening Questionnaire, and 16 items assessing contributing factors and prostate cancer screening controversy. Data was collected by distributing structured a self-administered questionnaire, written in Arabic was used.

Results: The Majority of participants (36.0%) were ages between (38 -47) years, the median age was 36 years (range, 18-36) years (mean=41.8+ S.td =10.035). Regarding marital status, the majority (77 %) was married, followed by (19%) who were single and (4%) who were divorced or widowed. One third (38%) of participants had PhD education, following by (26%) secondary school, (18 %) university,(9%) intermediate, (5%) MSc and (4%) institute education. Furthermore, (89%) of study participants reported they had no family history of prostate only (11%) reported had family history PCa. A total of (94%) were living in urban area and reminder lived in rural area. About (48%, 35%) respectively, of respondents had a medium and high knowledge level about prostate cancer and early detection screening methods.

Conclusions: This study indicated that the staffs of University of Baghdad Colleges have appreciable knowledge regard contributing factors and early detection to prostate cancer screening. A significant proportion of staff however, exhibited poor knowledge of prostate cancer screening and contributing factors to prostate cancer.

Keywords: Assessment, Employees’, Knowledge, Contributing Factors, Early Detection, Prostate Cancer

Introduction

Prostate cancer is neoplasm of the male prostate gland and is one of the most common cancers in the world wide and it is the second leading cause of cancer related
deaths among men globally. The symptoms of prostate cancer may develop slowly, but some early signs include difficult and frequent urination, erectile dysfunction, pain in lower back, pain in lower pelvic area, and blood in urine. Uncontrolled risk of developing the disease such as age, race and family history are associated to prostate cancer, however PCa awareness and early detection may positively affect the life of adult male, and improve their life style (1). The American Cancer Society (ACS) recommend the prostate specific antigen test (PSA), and digital rectal (DRE) examination, as the common screening modalities for Prostate cancer for men at high risk such as a family history, racial differences regarding the lack of access to health services, and socioeconomic conditions should performing prostate-specific antigen (PSA) testing, also recommends that men older than 50 years old, should be informed about early detection of prostate cancer screenings. They should be advised at an earlier age about this risk. An early detection through screening and timely treatment provides the greatest chance for increasing the 5-year survival rate. If the cancer is diagnosed during the early stages, the PCa prognosis is more optimistic (1,2,3).

**Methodology**

A cross-sectional descriptive design study carried out in the four Colleges of University of Baghdad to determine employees’ knowledge concerning contributing factors and early detection for prostate cancer among employees in Baghdad University Colleges. The participants of this study were conveniently sampled from the four faculties of the University of Baghdad. Male staff who accepted to participate gave oral consent and was recruited. A total of (100) male staff participated in the study. Inclusion criteria for participants were a) employees at the age of 18 – 63 years old; b) those who communication was possible, able to read and write and no suffering from any psychiatric disorders) those who understood the purpose of research and allowed for such participation whereas the exclusion criteria were males who were then diagnosed as benign prostate hyperplasia, prostate cancer or were being treated for prostate cancer. The questionnaires were including the Knowledge about contributing factors and early detection methods screening condition on prostate cancer. Knowledge of prostate cancer questionnaire: a draft of the 28-item based on literature review and previous research related prostate cancer by researcher. Thereafter, the validity of the questionnaire was verified by 5 experts’ specialist in urology, 13 experts in adult nursing department with more than 10 years of experience. As a result of the tool’s test-retest reliability was $r = 0.84$. Each correct answer was scored two to a correct answer while an incorrect answer scored to one-point. Firstly, we conducted a questionnaire preliminary survey to 10 employees over 18 years old and then modified difficult or understood terms into easy ones in a questionnaire. Data was collected from 5$^{th}$ December 2019 to 3$^{rd}$ March, 2020. The data was collected through distribution of self-administered questionnaire. The instrument comprised 32 questions, which included (6) questions related participants demographic characteristics and (28) questions related contributing factors and early detection methods for prostate cancer. The collected data was analyzed using SPSS statistical package (version 22.0). Descriptive analyses were used to describe the characteristics of the participants related to prostate cancer knowledge: frequency, percentage (%), mean and standard deviation. one-way ANOVA were used to explore difference of knowledge of prostate cancer according to characteristics of the employees and prostate cancer at p < 0.05 was considered statistically significant for all test.

**Results**

Participants age range was from (38 to 47) years-old with an average age of 36 years (mean=41.8+ SD =10.035) for the study participants. Most participants had doctorate education (38%), (26%) secondary school, (18 %) university,(9%) intermediate , )5% MSc and (4%) institute education respectively and about (77%) of respondents indicated that they were married and, (11%) of them were single and reminder (4%) were divorced or widowed. The majority of the respondents (89%) indicated having no family history of prostate cancer and (11% ) had no family history of prostate cancer. Participants reported residing majority in urban (94%) areas. The mean and standard deviation of the knowledge was 43.60 ± 5.312, most of them 48% of the participants having a moderate level of knowledge about contributing factors and early detection tests of PCa.

Discussion

Throughout the course of the data analysis of the current study, the findings show the majority of the participants (36%) age groups ranged from 38-47 years, the average age was 36 years (mean=41.8, S.td =10.035). On marital status majority of employees (89%) were married. Most of respondents (38%) had doctorate education, (26%) secondary school, (18 %) university,(9%) intermediate , (5%) master and (4%) institute holder education, respectively. Majority of them (89%) have no family history of PCa. Finally high percentage of employees (94%) was living in urban area. These findings agreed with study done by Awosan, who reported the ages of the respondents ranged from 40 to 84 years (Mean = 53.13 ± 7.92) with a larger proportion (44.7%) in the 40-49 years age group. Most of the respondents were married (84.0%). Majority of respondents (55.4%) had little education (4). These findings are similar to Abuadas who reported the mean age of participants was 52.5 years (SD=8.5; range=40-75). A total of 42.1% had a primary educational level, 29.9% had a secondary educational level, and 28% had a university education. Regarding marital status, the majority (91.4%) was married, followed by 5.6% who were single and 3% who were divorced or widowed (5). The ages of the respondents ranged from 45-60. The mean age of the study respondents was 49.52 (SD=± 3.95), with the majority of them, 68.1%, in the age category 45-50 years. Most of the respondents, 87.5%, indicated that they were married and 12.5% were single. 90.6%, of the respondents indicated they had completed University education while 9.4% had a 3- year post-secondary education (6).

Twenty eight questions assessed general knowledge of employees concerning contributing factors and early detection methods. Most, 48 (48%) of the 100 participants had fair knowledge of prostate cancer, while 35 (35%) of them had good and only (17%) had poor knowledge about prostate cancer. The finding revealed that participants have scored 80% and above in only (8) questions. They scored between 50% and 79% in (13) questions and they scored less than 50% in seven questions. The highest score was 88%. These findings are similar to Kaninjing as he found A majority of participants (55.2%) exhibited medium knowledge of prostate cancer. In terms of awareness of the PSA test, 88.8% of participants were not aware of this screening method while 91.0% were also not aware of the DRE (7). The study was also supported by study done in Malaysia by Firzara, et al., who found a majority of the participants correctly answered the questions on ‘increased of age more than 50 years’ (97.4%) and increase the risk of prostate cancer ‘with person having a first-degree relative of PCa (82.7%). Only (31.1%) of respondents were aware the risk increases with individuals who having a first-degree relative of prostate cancer (8). This finding was in good agreement with that obtained by Morland who stated that the majority of men had an adequate knowledge about prostate cancer (82.1%) (9). A similar findings are accordance with another study carried out in Jamaica, with 96% of participants answered correctly to questions concerning prostate cancer (10). This finding is the same line with study done by Adibe that revealed the greater majority of male staff who demonstrated a high level of knowledge of prostate cancer had tertiary degree (94.9%, n = 356.0). Academic staff constituted the greater majority (77.1%) of staff with high knowledge level of prostate cancer (11).The association between socio-demographic and employees’ knowledge score was explored. There are significant association between ages, level of education, family history of prostate cancer and studied sample knowledge at p value ≤ 0.05 and also illustrate that no relationship found with rest of studied variables. These findings are disagreeing with findings obtained from Yeboah. Fisher’s exact test statistics revealed that there was no association between age, marital status, level of educational, current rank, family history of PC and knowledge about prostate cancer (12,13) . These findings good agreements with many studies study, those reported that the association between social –demographic characteristics’ and prostate cancer knowledge among the participants; All demographic data were significant associated with knowledge of prostate cancer except social status (there is no significant associated with knowledge about prostate cancer (p=0.337), While chi-square indicated there are significant association between age, marital status, and the prostate cancer knowledge (14, 15, 16, 17) .

Conclusions

In conclusion, the results of the current study show that the level of knowledge among the employees’ about prostate cancer is enough in general, but the
participants in the study demonstrated low knowledge in early detection of prostate cancer and early signs and symptoms. The study found the association between sociodemographic variables and knowledge of prostate cancer, except the marital status and residence which are not associated to the knowledge of prostate cancer. The study recommended the Ministry of health (MOH) should organize public health campaigns using the mass media, social media such as Facebook, twitter and hospital to improve knowledge, attitude and use of screening practices related to early detection methods of prostate cancer. Also we recommended establishing of educational program to improve knowledge and attitudes related contributing factors of and early detection of prostate cancer for university of Baghdad employees.

Abstract

Introduction: In healthy population, temporal parameters of gait like step time and stride time are frequently linked with gait cycle in healthy populations but can be obstructive, difficult and time taking to measure. This study is to check the efficacy of kinect azure for evaluating temporal parameters of gait in normal healthy people. A kinect based recording application was started & use to detect , tracks human post analytical motions. Kinect is low cost, unobstructive and accurate gait analysis application with various uses like monitoring, diagnosis, rehabilitation & management. The end result of this study is to fed a state system that analysis the present state from which the assessment are withdrawn.

Method: The research has been structured as an observational study. The total of 132 participants will be taken from AVBRH, sawangi Meghe for study as per inclusion and exclusion criteria. With intervention the period of study will be 6 months. It holds single period, concurrent validity evaluation comparing temporal gait parameters derived from the Kinect system.

Discussion: This study protocol aims to evaluate the Validity of evaluation of temporal parameters of gait using Microsoft Kinect Azure. The study’s expected outcome will concert on the evaluation of temporal parameters of gait using Microsoft Kinect Azure in normal healthy population.

Keywords: Kinect azure, temporal gait analysis, healthy individuals and projector.

Introduction

Research has shown the importance of measuring a person’s gait and that the parameters describing locomotion. Recovery of functional & independent ambulation is big rehabilitation goal. A complete gait analysis determine deviations & damage underlying decreased functions & so, this may assist in decision making as well as in evaluating rehabilitation usefulness . Gait analysis can be a effective tool to differentiate among disease structure & to determine health & danger of disease and injury like fall detection and prognosis among the elderly individual. Gait impairments prevail in abundant clinical populations and the senior citizen.

Recent studies have shown that the number of stride-to-stride variation in the calculation of stride length, velocity & speed are individual predictors of future falls ,thus can be handy to recognize high risk citizen. Wearable sensors are proposed under recent studies. Such devices are lightweight, small, less expensive & portable (Figure:2). Despite of there superiorties, wearable sensors have few disadvantage. Sensors should be placed securely and precisely, sensors are obstructive in a way that it needs daily routine changes for subject. It also requires service of charging battery, uplinking data & sanitary treatment. Accurate, unobstructive, low cost gait analysis structure have many uses like monitoring,
Recent evidence shows that the Kinect, which utilize depth and image sensor data merge with AI algorithms to recognize anatomical landmarks without need of sensors attached to the individual’s body (Figure:1). Further, research reveals that the Kinect is able to validly evaluate stride dynamics in walking. Present devices that have ability to precisely measuring spatiotemporal & kinematic gait variables are costly, prolong and less handy. Clinicians have lately used commercially accessible gait measurement device to evaluate the temporal & spatial parameters of the footstep pattern. Variables that can be evaluate include walking speed, single and double limb support duration, and stride width, cadence for steps and Step sequence.

The Microsoft Kinect azure is a cheap gaming device that has shown assurance as a clinical assessment tool. Thus, the objective of this study was to assess the validity and reliability of kinect when assessing spatiotemporal parameters of gait. The major limitation for the Kinect azure is that it keep good data quality only in the scale of few meters from the sensor and keep on degrading when goes further. Thus, the purpose of the study was to evaluate the validity and efficiency of kinect when evaluating spatiotemporal and gait parameters.

**AIM AND OBJECTIVE:**

**Aim:**
To assess the validity of stride time & step time in normal population.

**Objective:**
1) To evaluate stride time in normal individuals by Microsoft kinect azure.
2) To evaluate step time in normal individual by Microsoft kinect azure.

**Methodology**
This study will be managed in the Department of Community Health Physiotherapy at Ravi Nair Physiotherapy College, Sawangi (Meghe), Wardha, India, with the approval of Datta Meghe Institute of Medical Sciences, Institutional Ethics Committee and Deemed to be University.

**Study setting:** Ravi Nair Physiotherapy College

**study type:** observational type

**sampling technique:** simple random

**sample size:** 132 participants

**study duration:** 6 months

**Material Required:**
1) Consent form
2) Projector
3) Microsoft kinect azure
**Procedure:**

We were collecting images of 132 subjects (both male and female). Subjects are instructed to walk on straight line. Sensor is placed to record the image of the subject. The Kinect sensor is mounted at each experiment to capture the subject's image. The distances are compatible with the recommendation for achieving the highest data quality. This distance enables to record 1 full gait cycle (i.e., complete stride) per walking trial for each limb that does not include the initial step and final stage of the pathway.

The Kinect-based recording structure is developed and used for follow identification & capture the human pose & post analytical motion. The temporal gait parameters were extracted by Kinect: step time (both foot), step length (both foot), stance time (both foot), and velocity. If one limb is in swing phase the other foot is in single limb support phase than limb goes through a double limb support phase during stance phase. A single limb support phase (when the other limb is off the ground), which means another double limb support phase. Fig. 3 shows the flow chart of the study.

**FIGURE 3: flow chart of the study**

**OUTCOME MEASURE:**
Temporal parameter of gait.

**Participant selection:**

Exclusion criteria:

1) Individual with abnormal gait.
2) Lower limb fracture.
3) Traumatic injuries of lower limb.
4) Neurological problem.

Inclusion criteria:

1) Normal individual without gait impairment.
2) Subjects willing to participate voluntarily.
3) Both male and female patients.

**Discussion**

The purpose of the study protocol is to evaluate gait parameters with Microsoft Azure in normal individuals. Its expected outcome is based on the temporal gait parameter evaluation using Kinect Azure. This research helps to assess the efficacy of Kinect Azure in the assessment of gait parameters in healthy population.

**Result**

The study’s expected outcome will focus on evaluation of temporal parameter of gait in healthy individuals. After accomplishment of study result will be calculated by systemic data analysis by randomized control trial.

**ETHICS AND DISSEMINATION:**

The approval of the Committee on Institutional Ethics must be obtained prior to the start of the study. Patients must be treated with respect first. Upon meeting the requirements of inclusion and exclusion criteria, the patients are taken for review.

**Source of Funding:** There will be no direct support for this research from public and private organizations. The department of physiotherapy, at Datta Meghe Institute of Medical Science, Deemed to be University will provide material needed for research.

**Conflict of Interest:** Nil

Morphometry and Morphology of Acromian Process of Scapula

Kinjal Jethva1, Priyanka Sharma2, Nirali Chavda3, Hetal Vaishnani4, K.M.Parmar5, A.R.Gandotra6
1Associate Professor, Dept of Anatomy, 2Assistant Professor Dept of Anatomy, 3Tutor, Dept of Anatomy, 4Professor, Dept of Anatomy, 5Associate Professor, Dept of Anatomy, 6Professor & HOD, Dept of Anatomy, Smt. B.K.Shah Medical Institute & Research Centre Sumandeep Vidyapeeth and Institution Deemed To Be University, Vadodara

Abstract

Introduction: The acromian process of scapula is project forward from lateral end of spinous process of scapula. Coracoacromial ligament is extend between coracoid process and acromian process, it help in formation of coracoacromial arch, anatomy of this region is important for better understanding of pathology regarding subacromial bursa, impingement syndrome.

Materials and Methods: Present study was carried out on 74 dry, adult human scapulae 38 left side and 36 right side from teaching collection of anatomy department, sex of the specimen not known, Scapular length, width, acromian process length, width, thickness, coracoacromial distance, acromioglenoid distance was measured with the help of vernier caliper, we also found different shape of acromian process.

Results: We observed 74 scapula out of them 38 scapula are of type –I which was 51.35%, 13 scapula of type –II which was 17.57%, 23 scapula of type –III which was 31.08%, we observed mean value acromian length was 4.50±0.52cm, width of acromian process was 2.10±0.26cm, thickness of acromian process was 0.78±0.10cm, acromicoracoid distance was 3.45±0.53cm, distance between acromian process and supraglenoid tubercle was 2.48±0.40cm.

Conclusion: These findings suggest that the difference in various parameters related to acromian process help in better understanding of anatomy and pathology of coracoacromial arch, rotator cuff and also helpful to other clinician.

Key Words: Scapula, Acromian process,

Introduction

The acromian process projects forwards and continue from the lateral end of the spinous process of scapula on posterior aspect. In Spinous (process) projection lower border of the scapula becomes extend as lateral (posterior) border of the acromian process, this point is known as acromian angle that form a significant surface marking point.

The upper border of spine of scapula continue as medial border of acromian process, on acromian process having facet for with lateral end of clavicle bone form plane synovial joint acromioclaviclar joint. subacromial bursa located below the acromian process it separates acromian process and deltoid from supraspiantous tendon. coracoacromial arch formed coracoids process, coracoacromial ligament, anterior part of acromian process. Any pathology whether it is acquired or congenital, in this area reduce the area of this space can cause mechanical impingement.
This arch is fairly a non-elastic structure and it comprises of a subacromial space that is 1-1.5 cm wide and has the subacromial bursa, strong rotator cuff, and long head of biceps brachi muscle tendon. [2]

The anatomy of the acromian process, coracoacromial arch, coracoid process and other anatomical structures in this area is of clinical importance, to carry out analysis of scan, carrying out physiotherapy, and surgical aspect related with this shoulder joint. [3]

Knowledge of Acromian process anatomy provide better understanding in infringement syndrome and the pathology of rotator cuff. [4]

**Aim**

The aim of the current study was to measure the various parameters of acromian process of the scapula and to analyze the morphological aspect of the acromian process for better understanding and management of shoulder pathology.

**Material and Methods**

The present study was performed in Anatomy Department in Smt. B.K. Shah medical institute & Research center, Sumandeep Vidyapeeth university. A total of 74 dry scapula (36 right side and 38 left side) bones were deliberated from teaching collection of the Department of Anatomy. The bones are of belongs to adults and sex and age of the scapula were not recognized. Entirely scapula chosen were dry, showed normal anatomical features and deformed bones were excluded from study. All measurement was carried out by the digital vernier calliper. The data were then entered and scrutinize using the Microsoft software.

The following parameters of the acromian process were studied. All the measurements were taken manually by using of a digital vernier caliper and recorded in centimetres (cm)

- Acromion projection Length (AP diameter) - Distance along the longaxis from anterior to posterior
- Acromion projection Width (transverse diameter) - Distance between lateral and medial borders (maximum far points on this border)
- The coraco-acromial ligament was measured by using method of Edelson and Taitz [5]
- Coraco acromian distance (C-A distance) - Distance between acromian processes and tips of coracoid.
- Acromian thickness (breadth) - Thickness of anterior aspect was recorded at a point 1 cm lateral to medial border and 1 cm medial to lateral border.
- Acromio-glenoid distance (A-G distance) – Distance between two point glenoid tubercle superior aspect and inferior surface of acromian process.

**Result**

In present study we have taken 74 dry scapulae (36 right side and 38 left side) of unknown sex and age without any gross pathology, from teaching collection from anatomy department, we observed all 3 types of scapula. (table-1)

Figure -1 Length of acromian process measure by vernier calliper
In present study we found the length of the acromian was 45.0±0.52 mm’ the comparision of various parameters of acromian process with previous study done in table 5. The width (transverse diameter ) of the acromian projection in the current study shows much resemblance with previous studies. Edelson and Taitz\(^5\) had recorded that the thickness(breadth) and width(transverse diameter ) of Acromian projection have no relationship with pathological and physiological changes. We found thickness of acromian process was 7.8 mm which was compared with what recorded by Paraskevas et al\(^2\) (8.8 mm) that was higher as compared to the what observed by shilpi gosavi et al\(^8\) & Singh et al\(^7\) 6.9 mm and 6.6 mm respectively.

Sangiampong et al\(^{13}\) found pathology that reduce the subacromial space, causes impingement(compression) and the interval between the tendon of supraspinatous and the lower part of the acromian on front aspect , is decrease in position of 90 degree abduction with internal rotation .

Some of the parameters recorded of scapular morphometry shows difference with sex and age, and it clinically important.

**Conclusion**

The result of our study done on 74 dry scapula shows predominant type I scapula, we have measured various parameters of acromian process which was nearly similar to found in previous study ,the coracoacromian distance.
and coracoglenoid distance measured and compare with previous studies shows not much difference, this study helpful for orthopedics surgeon, physiotherapist, radiologist and other clinician for better understanding of anatomy and pathology of acromian process.

A Study Protocol for Checking Efficacy of Microsoft Kinect Azure for Evaluation of Spatial Parameters of Gait in Normal Healthy Population

Manpreet Kaur Bhamra¹, Waqar Naqvi²
¹ Student, Ravi Nair Physiotherapy College, Datta Meghe Institute of Medical Sciences, Wardha, Maharashtra, India, ²Head of Department and Professor of Community Health Physiotherapy, Ravi Nair Physiotherapy College, Sawangi (M), Wardha, 442001

Abstract

Introduction: In healthy population, spatial parameters of gait such as stride length and step length are frequently linked with gait cycle but can be obstructive, time taking and difficult to measure. This study is to check the efficacy of Kinect azure for evaluating of spatial parameters of gait in normal healthy population. Kinect is accurate, unobstructive, low cost clinical gait analysis systems have many uses like diagnosis, monitoring, management and rehabilitation.

Method: The research has been designed as an observational study. The total of 132 participants will be taken from AVBRH, sawangi Meghe for study as per exclusion and inclusion criteria. With intervention the span of the study will be 6 months. It holds single period, concurrent validity evaluation comparing spatial gait parameters derived from the Kinect system.

Discussion: This study protocol aims to assess the efficacy of Microsoft Kinect azure for evaluation of spatial parameters of gait. The study’s expected outcome will concentrate on the evaluation of the usability of Kinect to assess spatial gait on healthy individuals.

Keywords: Kinect azure, projector, spatial gait analysis, healthy individuals.

Introduction

Research has shown the importance of measuring a person’s gait and that the parameters describing locomotion. A major rehabilitation goal is recovery of functional and independent community ambulation. A gait analysis can detect deviations, thus this may help in assessing rehabilitation potency. A gait analysis can also use to differentiate between disease and to determine general health and disease and accident threats such as detection of fall and prognosis between the elder individuals. Many individuals and the elderly suffer from gait impairments.

This study also shows that stride-to-stride variation to evaluate velocity, speed and stride length are free of fall detection. Thus, it is convenient for recognizing high-risk individuals. Wearable sensors are proposed under recent studies. Such devices are small, portable, less expensive and lightweight (Figure 1). Despite their superiorities, wearable sensors have few drawbacks. Sensors should be placed securely and precisely, these sensors are obstructive in a way that it requires daily routine changes for subjects. It also requires maintenance of charging battery, uplinking data and sanitary treatment. Accurate, unobstructive, low-cost clinical gait analysis systems have many uses like diagnosis, monitoring, management and rehabilitation.

Recent evidence shows that the Kinect azure, which utilizes depth and image sensor data merge with AI algorithms to recognize anatomical landmarks without the need of sensors attached to the individual’s body (Figure 2). Furtherly, research reveals that the Kinect is able to validly evaluate stride dynamics in walking. Present devices are capable of precisely calculating spatial gait variables are much expensive, prologue and less handy.
The Microsoft Kinect azure is a cheap gaming device that has shown assurance as a clinical assessment tool. Thus, the objective of this study was to evaluate the concurrent validity and inter-day reliability of Kinect when assessing spatial parameters of gait.

**Aims And Objective**

**Aim:**
To assess stride length and step length in normal individual via Microsoft Kinect azure.

**Objective:**
1) To evaluate stride length in normal individuals by Microsoft Kinect azure.
2) To evaluate step length in normal individual by Microsoft Kinect azure.

**Methodology:**
This study will be conducted in the Department of Community Health Physiotherapy at Ravi Nair Physiotherapy College, Sawangi (Meghe), Wardha, India, with the approval of Datta Meghe Institute of Medical Sciences, Institutional Ethics Committee, Deemed to be University.

**MATERIAL REQUIRED:**
1) Microsoft Kinect azure
2) Projector
3) Consent form

**Study setting:** Ravi Nair Physiotherapy College
**Study type:** observational type
**Sampling technique:** simple random
**Sample size:** 132 participants
**Study duration:** 6 months
**Study design:** This study will be carried out in the HumEn research lab of Ravi Nair Physiotherapy College, Sawangi (Meghe), Wardha, after approval from Institutional Ethics Committee of Datta Meghe Institute Of Medical Sciences, Deemed to be University.

Before inclusion, all the participants will be informed regarding the aim and procedure of research. Figure 3. Show’s the flow chart of the study.

**Figure :3**

**Outcome Measure:**
1. Spatial parameter of gait

**Participant selection:**

**Exclusion criteria:**
1) individual with abnormal gait.
2) Lower limb fracture.
3) Traumatic injuries of lower limb.
4) Neurological problem.

**Inclusion criteria:**
1) Normal individual without gait impairment.
2) Subjects willing to participate voluntarily.
3) Both male and female patients.

**Procedure:**
We’ll catch recording of 132 subjects (male as well as female) to participate. This study hold single period, concurrent validity evaluation comparing spatial gait parameters derived from the Kinect framework. Ask subject to walk down a line, at normal pace, in front of the Kinect sensor. Subject walk along a line , starting from the beginning point and slow down before reaching to the Kinect. The distances are compatible with the guidelines for achieving the highest data quality. This distance allows to record atleast 1 full gait cycle (i.e. complete stride) per walking trial for each limb that does not include the initial step and final step of the pathway.

Besides, age, gender, occupation, weight and height of the individual’s is recorded as a supplementary details for better data collection.

**Expected Result:**
The study’s expected outcome will concentrate on evaluation of spatial parameter of gait in healthy individual. After completion of study result will
calculated by systemic data analysis by randomized control trial.

**Discussion**

Study protocol aim is to evaluate gait parameter in normal individuals using Microsoft azure. Its expected result concentrate on evaluation of spatial gait parameter using kinect azure. This study help to find the efficiency of kinect azure used in evaluating gait parameter in healthy indivuals.

**ETHICS AND DISSEMINATION:**

The approval of the Committee on Institutional Ethics must be obtained prior to the start of the study. Patients must be treated with respect first. Upon meeting the requirements of inclusion and exclusion criteria, the patients are taken for review.

**Source of Funding:** There will be no direct support for this research from public and private organization. The department of physiotherapy, at Datta Meghe institute of Medical Science, Deemed to be university will provide material needed for research.

Estimation of Interleukin-4 (IL-4) and Interleukin-6 (IL-6) Levels in Sera From Patients with Type 2 Diabetes Mellitus

Mazin Maky Thamer¹, Chee Fah Wong², Zafir Hassan Ghali³

¹Department of Biology, Faculty of Science and Mathematics, Universiti Pendidikan Sultan Idris, 35900 Tanjong Malim, Perak, Malaysia, ²Asst. Professor, Department of Biology, Faculty of Science and Mathematics, Universiti Pendidikan Sultan Idris, 35900 Tanjong Malim, Perak, Malaysia, ³Professor, Department of Biology, College of Education for pure science, University of Wasit. Iraq

Abstract

Type-2 diabetes mellitus is the most common chronic metabolic disorder characterized by elevation of blood glucose concentration (hyperglycemia) due to defect in carbohydrate, lipid and protein metabolism. Cytokines have an important role in impairing insulin signaling and selective destruction of insulin-producing beta cells. Thus, the second type of diabetes can be characterized as an immune-mediated disease. This study aimed to evaluate the serum levels of Interleukin-4 (IL-4) and Interleukin-6 (IL-6) of patients with type 2 diabetes mellitus among cases from Wasit province-Iraq. A total of 90 randomly selected subjects from Wasit province – Iraq: (60) patients with T2DM, and (30) apparently healthy subjects with normal fasting blood sugar as a control group. Enzyme-linked immunosorbent assay (ELISA) was used to measure the levels of interleukin-4 IL-4 and interleukin -6 in sera from patients with type-2 diabetes mellitus. The results of this study showed that IL-4 concentrations had a non-significant difference when compared patients with type-2 diabetes mellitus with the control group (154 ± 7.00 versus (vs) 151.49 ± 21, P-value (P) = > 0.05). While patients with T2DM revealed elevated serum levels of IL-6 compared to control group (B 637.1 ± 355.9 versus 266.3 ± 128.8, P = < 0.001).

Keywords: IL-6, interleukin-6; IL-4, interleukin-4; T2DM, type 2 diabetes mellitus, ELISA, the enzyme-linked immunosorbent assay.

Introduction

Recently, diabetes is classified as an epidemic disease due to its worldwide spread in varying proportions. Diabetes mellitus (DM) is defined as a heterogeneous metabolic disorder caused by hyperglycemia derived from either insulin action deficiency or impaired insulin secretion or both, which alters carbohydrate, protein, and fat metabolism. To date, the mortality rate of diabetes has increased to 1.5 million people making diabetes the 1st leading cause of death in the world. At a local setting, the prevalence of the disease in Iraq in 2012 was 10.9% depicting a serious rise in the number of T2DM patients.

One of the most common diseases in the world is type-2 diabetes mellitus. The increased acute immune response and pro-inflammatory cytokines were detected in diabetics in 1997. Since then, emerging evidence has shown that T2DM is a chronic inflammatory disease in which various stimuli, such as genetic or fatal metabolic pre-programming, over-nutrition or increased age, can increase levels of cytokines expressed. In which, the pattern of cytokine expression is changed, therefore, pro-inflammatory cytokines cause damage to pancreatic islet cells resulting in pro-inflammatory and protective cytokines imbalance.

Current studies are suggesting the possibility of inflammation being an important contributor to diabetes. This is due to the fact that inflammation can provoke changes in diabetes predominantly at the cellular
level, altering the functionality of tissues and cells demonstrating reactions of the inflammation including regulators, mediators, fibrinogen hs-CRP high sensitivity C reactive protein.

One family member of the cytokines is Interleukin 4 (IL-4) which is a typical cytokine of T helper type-2 (Th2) cells, could inhibit effect on the inflammation, decrease the production of pro-inflammatory cytokines and reduce the destructive enzymes through monocytes, and also plays a crucial role in the pathophysiology of T2DM. In addition to Interleukin-4 (IL-4), Interleukin-6 (IL-6) is a proinflammatory mediator cytokine biosynthesized by T-lymphocytes, macrophages, adipocytes and other sources such as endothelial cells, fibroblasts, and skeletal muscles.

On the other hand, IL-6 is responsible for many tasks such as controlling the activation and differentiation of T-lymphocyte responses and proinflammatory responses and also plays a role in the pathogenesis of autoimmune and inflammatory diseases, in the regulation of body weight, and in lipid metabolism.

This study aims to investigate the possible relationship between some cytokines (interleukin-4 and interleukin-6) and type 2 diabetes.

Material and Methods

Subjects

Patients group consist of 60 subjects with T2DM from Wasit province/Iraq (30 males and 30 females). Their ages ranged between 45–75 years. Control group comprised of 30 individuals (15 males and 15 females), apparently healthy subjects with normal fasting blood sugar and the controls were selected from Al- Karama Teaching Hospital (the local community of Wasit province – Iraq). Written consent was obtained by Al-Karama Teaching Hospital.

The criteria of the American Diabetes Association have been adopted in the diagnosis of T2DM in patients. This study excluded subjects with autoimmune diseases, cardiovascular diseases, acute and chronic inflammation.

Blood sampling

Venous blood (10 ml) has been collected in the infected tubes of patients and controls under sterile conditions between 08:30–10:30 am. Then the serum has been quickly frozen at (−20°C) and stored until further processed (Estimating the concentration of interleukins (IL-4 and IL-6) from patients with T2DM).

Estimation of IL-4 and IL-6 levels

Interleukin-4 and Interleukin-6 concentrations in sera were measured by ELISA using Human-IL-4-Mini ABTS-ELISA Development-Kit (Pepro-Tech, France) and Human IL-6 Mini ABTS-ELISA Development Kit (Pepro-Tech, France) as per the manufacturer’s instructions.

Statistical Analysis

Data were expressed as mean ± standard deviation (SD) or median (interquartile range). Differences between groups were tested with the Student’s t-test. The values of P < 0.05 were considered significant.

Results

The results of this determination as shown in Table 1, revealed that serum IL-4 concentrations displayed a non-significant difference in T2DM patients when compared with the control group (Diabetic patients 154.48 ± 7.00 compared with control 151.49 ± 6.21, P-value = 0.052). While, the serum concentrations of IL-6 revealed a significant difference in T2DM patients in comparison to controls (Diabetic patients 637.1 ± 355.9 compared with control 266.3 ± 128.8, P-value = 0.00013).

Discussion

Type 2 diabetes is a metabolic disease caused by insulin resistance and characterized by abnormal metabolism of glucose, proteins, and lipids. In fact, Type 2 diabetes is described as an inflammatory disease, with cytokines playing an important role in its diseases. Inflammatory processes influence the development of insulin resistance and reduced insulin secretion by pancreatic beta cells. Cytokines act as signaling molecules for immune cells, especially in autoimmune diseases, so cytokines play their role in developing and activating these cells.

Table 1 revealed a non-significant difference of IL-4 levels when compared patients with T2DM to control. These results are in agreement with a study conducted by Nuhair and others (2018) on the residents of Nassryain population in Thi-Qar/ Iraq. Festa and others 2002, also mentioned the decreased production of IL-4 in human T-cells in diabetic patients. Moreover, the levels of IL-4 in the blood of diabetic patients demonstrated decreased values, this finding are disagreed with our results related to IL-4.

The differentiation activity of IL-4 plays an important role in the production of immunoglobulin, also IL-4 is described as a growth factor for β-cells. IL-4 developed by CD+4T-lymphocytes type Th2, after activation by antigen binding to the T-cell receptor, and also by activated mast cells and basophils. IL-4 down-regulates the production of IFN-γ by Th1 CD4 + T-lymphocytes on the β-cells, IL-4 has a growth factor role mediated through the development of soluble CD23. On monocytes, because of its pleiotropic activity, IL-4 induces an increased number of major histocompatibility complex (MHC) class II antigens.

The results of this study revealed elevated serum levels of IL-6 in patients with T2DM. These results are in agreement with Nuhair et al (2018), who mentioned that there was a significant increase in the levels of IL-6 among diabetic patients as compared with controls in a study conducted on the Nassryain population in Thi-Qar/ Iraq. Vidhate et al (2013) also mentioned that there was a significant increase in the levels of IL-6 among diabetic patients as compared with controls in a study conducted on Indian Population from Navi Mumbai. In addition, several studies have found an increase in serum IL-6 concentrations, however some studies reported no difference, or even decreased IL-6 levels.

IL-6 might play a significant role in IDDM etiopathogenesis. In general, high levels of IL-6 are usually observed in the blood of diabetics, which is known to play an important role in the development of certain vascular diseases and atherosclerosis in addition to its main role in increasing inflammation.

Chronic low-grade inflammation in obese people plays a significant role in the subsequent development of insulin resistance. This results in a triple increase in systemic cytokine levels including IL-6, and thus becomes a risk factor for T2DM. Some studies point to the important role that IL-6 plays in fat metabolism in general. In humans, the action of IL-6 is associated with increased plasma free-fatty acids (FFAs). Due to high concentrations of IL-6 and C-reactive-protein, which is a surrogate marker for IL-6 activity, these associations seem significant. In obesity, increased concentrations of IL-6 are observed. Further, an increase in the release of IL-6 by visceral adipose tissue was observed three to four times more than subcutaneous fat taken from obese and non-diabetic patients. Therefore the main sources of elevated plasma concentration IL-6 up to 2-3g/mL-1 in obese patients and T2DM are adipocytes and macrophages present in adipose tissue.

The primary cell kinds engaged in regulating peripheral insulin sensitivity and homeostasis of glucose, hepatocytes, skeletal muscle cells, and adipocytes, react differently to IL-6. Strong experimental proof supports IL-6’s capacity to decrease insulin sensitivity in hepatocytes by interfering with insulin signaling, while findings on adipocytes and skeletal muscle cells...
are not always coherent. Compared to other kinds of cells, the greater responsiveness of hepatocytes may be associated with the existence of membrane-bound IL-6R. It should be observed that these experiments are carried out primarily in vitro on cell lines and for a brief period, using supraphysiological of IL-6 levels much greater than those engaged in low-grade chronic inflammation.

In addition, the experimental circumstances may not strongly match acute pathophysiological circumstances in which IL-6 operates in synergy with other cytokines and during inflammatory responses mediates crosstalk between distinct kinds of cells and tissues. Moreover, the level of IL-6R and sgp130 is not assessed in targeted pathological models in these early studies, nor is IL-6 trans-signaling taken into consideration, which is particularly critical in the investigation of cells that lack membrane-bound IL-6R.

Further, Serum IL-6 levels have also been found to be associated with insulin resistance and diabetes. In nondiabetic older populations, and healthy, middle-aged, white populations. Schultz and others showed that higher IL-6 serum concentrations associated with enhanced opposition to insulin. Liu and others in 2007 showed that serum IL-6 levels were also found to be higher in people with impaired glucose tolerance, T2DM, or cardiovascular syndrome relative to those with ordinary glucose tolerance or those who did not fulfill metabolic syndrome standards. Recently, a big prospective study of postmenopausal females who participated in the WHI (Women’s Health Initiative) in the United States has revealed that high concentrations of IL-6 are also correlated with an increased risk of clinical diabetes. Thus, it is necessary to clarify the immune and physiological roles of this interleukin, and as far as we know there are very few studies that explain the reason for the high levels of interleukin-6 in patients with type 2 diabetes.

Regarding to IL-4 concentrations, males and females of diabetic patients displayed no significant differences when compared with controls (155.16 ± 8.15 versus 151.89 ± 6.75, P-value = 0.733; 153.79 ± 5.680 versus 151.10 ± 5.84, P-value = 0.463) as in Table 4.2. It is traditionally accepted that IL-4 has anti-inflammatory functions but may have multiple actions. IL-4 did not differ significantly between ChP and T2DM. Lower levels of IL-4 were observed in ChP + T2DM which is similar to another study, although IL-4 and TNF-α in their investigation correlated positively with each other in T2DM. Hence, a conclusive anti-inflammatory role for IL-4 is not forthcoming. To the best of our knowledge, the lack previous studies in people with T2DM on the basis of gender related to IL-4 and IL-6 levels or prediabetes does not permit direct comparisons with similar samples.

Concentrations of IL-6 in T2DM males showed significant difference comparing to controls (808.3 ± 296.0 versus 241.8 ± 9, (P-value = 0.00022). No significant difference was showed in relation to female diabetic patients IL-6 levels in comparison to controls (466.0 ± 331.0 versus 290.9 ± 181.6, P-value = 0.065) as in Table 2.

Serum IL-6 levels have also been established to be associated with insulin resistance and diabetes. In nondiabetic older populations and healthy, middle-aged, white populations. In females, it is possible that elevated IL-6 levels may largely reflect adipocyte activation. For instance, IL-6 and downstream CRP production may be associated with the corelease of other pathogenic substances arising from otherwise stimulated adipocytes. Other potential mediators of insulin resistance deriving from adipose stores include tumor necrosis factor-a, leptin, free fatty acids, and resistin. Nonetheless, under the assumption that elevated levels of IL-6 and CRP purely reflect altered adipocyte function, the ready availability of reliable and sensitive markers of this process may represent a novel approach for early identification of both obese and nonobese individuals at increased risk for the clinical development of this disease.

Conclusions

In this study, we have determined the concentrations of two interleukins (Interleukin-4 (IL-4) and Interleukin-6 (IL-6)) in sera from patients with type-2 diabetes mellitus using enzyme-linked immunosorbent assay (ELISA). From this study, we concluded that elevated levels of IL-6 may be related with type 2 diabetes mellitus whereas the levels of IL-4 may not be
This case-control study is investigating the association between type-2 diabetes mellitus and two important interleukins; Interleukin-4 and Interleukin-6. Determination of these interleukins in sera of type-2 diabetes mellitus patients is considered a vital assay to assess this association. Elevated levels of interleukins might play a significant role in type-2 diabetes mellitus etiopathogenesis. High levels of IL-6 may be associated with insulin resistance and diabetes. For a deeper view of the relationship between interleukins and type 2 diabetes mellitus, we propose large scale studies involving different regions of Iraq.

Glial Fibrillary Acidic Protein (GFAP) and Cleaved Tau Protein (CTP) Biomarkers as a Forensic Tool for Detection and Assessment of Traumatic Brain Injury

Mohamed Kamel Mohamed, Mervat Hamdy Ab Elsalam, Eman Ab Elfattah Mohammed Elzohairy, Dina Sabry Ab Elfattah, Ehab Ab Elhalim Ab Elsalam

Abstract

Traumatic brain injury (TBI) is defined as a traumatically-induced structural brain injury or physiological disruption of brain function caused by an external force. Traumatic brain injury is a neuropsychiatric disorder that breaks down the remaining barriers between neurology and psychiatry. Several biomarkers have been developed to directly determine the pathology of the nerve cells in the central nervous system (CNS) when it is injured. This review recent research on brain injury biomarkers could be used for rapid and accurate diagnostics of TBI in easily accessible fluid.

Objectives: The purpose of this study was to assess utility of GFAP-BDP for the diagnosis of intracranial injury in patients with a positive clinical screen for head injury across the spectrum of TBI typically presenting to ED in Kasr- Alainy hospital.

Subjects & Methods: This prospective cohort study was based on the data collected from 90 cases presented to Kasr Al-Aini Hospitals Emergency Department, Cairo University, with history of traumatic brain injury through the period from April 2017 to Mars 2019. According to age, they were classified into 3 age groups; age group A (18-35 years), age group B (36-50 years) and age group C (> 50 years). Data were analyzed with respect to socio-demographic data, type of head injury, clinical presentations, radiological investigation, and management of TBI in relation to serum specific biomarkers level (GFAP, C-tau).

Results: The most common age group was age group B (18-35 years) (70%). Males were more common than females (71.1% and 28.9% respectively). The most common cause of trauma was fall from height (33.3%). Serum GFAP level and C-tau levels in studied groups show high significant correlation between them (p value <0.001).

Conclusion and Recommendations: The combination of the two biomarkers or more may be more useful than either biomarker in isolation for predicting intracranial lesions on CT scanning therefore decreases unwanted CT head scanning and radiological bad effect especially in young ages.

Keywords: Traumatic brain injury, Serum, GFAP, C-tau and CT scanning

Introduction

TBI is a common problem, called a silent epidemic because of a general unawareness of the condition. TBI is difficult to diagnose with imaging techniques, and there is no definite laboratory test to support the diagnosis. An undiagnosed case of TBI can result in premature
return to play with severe consequences or in a chronic neurodegenerative condition later in life.¹

Traumatic brain injury (TBI) is defined as a traumatically-induced structural brain injury or physiological disruption of brain function caused by an external force.²

An ideal laboratory test, detecting a brain injury–specific biomarker in one of the body fluids, would confirm or rule out the TBI, predict the outcome, and indicate when recovery is complete. This review recent research on brain injury biomarkers could be used for rapid and accurate diagnostics of TBI in easily accessible fluid.³

Head CT scan is the diagnostic modality of choice to evaluate patients for traumatic intracranial injuries. Although effective for detecting traumatic injuries that require observation or neurosurgical evacuation due to the widespread use of head CT scanning has been questioned due to potential adverse effects of radiation exposure, unnecessary emergency department resource use, and cost.⁴

Several biomarkers have been developed to directly determine the pathology of the nerve cells in the central nervous system (CNS) when it is injured.⁵ The blood–brain barrier (BBB), which normally is almost impermeable, can lose its integrity upon brain injury and allow the permeation of molecules into the blood.⁶

A number of patients who suffer from mild head injury later on develop significant disabilities. Biomarkers help identify and quantify the extent of injury and help predict the possible functional outcome of the patients.⁷

Materials and Method

Study population:

Data collected from 90 cases presented to Kasr Al-Ainy emergency department -according to specific criteria-during the period of the study. Egyptian origin and residence, more than 18 years, both sexes with history of traumatic brain injury were included in the study. While patients who had any pre-morbid non traumatic neurologic conditions or history of previous brain trauma were excluded from the study.

- Selected patients presenting within 24 hours of injury were subjected to draw (5cm) blood samples and dated to compare with time of injury. Serum samples were extracted and preserved at -20°C till chemical analysis.

- Selected patients were classified to groups according to age:
  1. Group (A) 18-35 years.
  2. Group (B) 36-50 years.
  3. Group (C) >50 years

- Another classification according to Glasco Coma Scale into:
  2. Moderate TBI (GCS 9-12). The study cannot depend on CT head as it is not informative.

- All patients had at least one CT head scan at admission time.

- Time of traumatic brain injury time obtained from patients themselves, patient relatives, ambulance crew, and others (referral letter, police report).

- The study will measure the level of GFAP and Cleaved Tau Protein (CTP) by ELISA a proprietary mouse monoclonal antibody for solid phase immobilization, and a proprietary polyclonal rabbit antibody for detection.

Data Collection

The current study sample collection process is designed to be taken in first 24 hours after trauma causing brain trauma. Negative CT head patients presented to emergency department with history of TBI must be observed at least 24 hours and another CT head may be further more indicated. Study of brain specific biomarkers will help doctors to decrease unnecessary CT head, decrease period of hospital stay and give them protection form medical liability if deterioration or death after uncalculated discharge has been occurred.

It also, divides 24 hours after trauma (total time of sample collection) to three subgroups to give more prediction accuracy to diagnose and evaluate TBI using brain specific biochemical markers level in relation to
delay time from trauma to sample collection.

The data will be formulated according to the data revealed from:

§ Patients primary survey (clinical examination and radiological CT scan)

§ Laboratory investigations (serum GFAP and C-tau levels). All cases presented with history of TBI within 24h of the injury.

I. Demographic data:
• Age: classified according to group A, B, and C.
• Sex: Males & Females.

II. Clinical picture:
• GCS score: 13-15 points, 9-12 points.
• Pupil light reflex: Normal, Sluggish.
• Vomiting: Yes, No.
• Severity of injury: Mild, Moderate.

III. Radiological investigations:
• CT head scan findings: Positive, Negative.
• MRI brain: Not indicated, Indicated.

IV. Lab investigations:
• C-tau level: <100, 100-149, 150-199, 200-300, >300.

V. Management: Conservative, surgical.

Ethical considerations

The study approval was taken by the ethical review committee of medical research, Faculty of Medicine, Cairo University, Egypt and informed consent forms were obtained from all participants. The study information including the purpose and details were explained to participants of both groups.

Results

Table 1 showed that 11.1% (10 patients) of cases had GFAP level below 200 and 45.6% (41 patients) of cases had level between 200-499, 27.8% (25 patients) of cases had level between 500-999, 14.4% (13 patients) of cases had level between 1000-2000 and finally 1.1% of cases had level more than 2000. The results showed that 5.6% (5 patients) of cases had C-tau level below 100 and 45.6% (41 patients) of cases had level between 100-149 then 18.9% (17 patients) of cases had level between 150-199 then 20.0% (18 patients) of cases had level between 200-300 finally 10.0% (9 patients) of cases had level more than 300

**Discussion**

Regarding GFAP level in studied cases, the study showed that 11.1% (10 patients) of cases had GFAP level below 200 and 45.6 % (41 patients) of cases had level between 200-499 then 27.8 % (25 patients) of cases had level between 500-999 then 14.4 % (13 patients) of cases had level between 1000-1999 finally 1.1 % (1 patients) of cases had level more than 2000. Most of studied cases had a level 200-499.

This is in agreement with 8 who reported that GFAP levels were significantly higher in those with evidence of traumatic pathoanatomic CT features when compared subjects with a negative head CT scan. (CT negative, mean GFAP 0.26±0.41 ng/mL; CT positive, mean GFAP 2.88±3.74 ng/mL; p<0.01)
Regarding C-tau level in studied cases, the study showed that 5.6% (5 patients) of cases had C-tau level below 100 and 45.6% (41 patients) of cases had level between 100-149 then 18.9% (17 patients) of cases had level between 150-199 then 20.0% (18 patients) of cases had level between 200-300 finally 10.0% (9 patients) of cases had level more than 3000. Most of studied cases had a level 100-149.

9 reported that the combination of the two biomarkers or more may be more useful than either biomarker in isolation for predicting intracranial lesions on CT scanning.

Regarding pupil light reflex, GCS, management, duration of hospital stay with GFAP level among studied cases, there was statistical difference between mean GFAP biomarker level which was highly significant (p value 0.001 0.001, 0.005, 0.023).

The current study is in agreement with 10 who studied multivariable prognostic analysis in traumatic brain injury as expected, both the GCS motor score and pupil response are powerful independent predictors of outcome. GCS also can predict the line of treatment and estimated period of hospital stay.

11 who studied Glial fibrillary acidic protein as a biomarker in severe traumatic brain injury patients the study showed similar results that by pupil light reflex examination of TBI presented cases, reflex was normal in 80% of patients. The prediction value of pupil light reflex test was higher than other clinical variables such as age, occupation, and vomiting in diagnosis and evaluation of traumatic brain injuries.

The study concluded that, patients with lower GCS had significantly higher level of serum C-tau protein and were associated with poor outcome. Correlating the serum C-tau levels and the GCS points at which it is significant may guide us further in qualitatively analysing the significant serum tau levels and throw some light on its role in projecting TBI prognosis.

9 who studied acute biomarkers of traumatic brain injury, the mean C-tau biomarker levels differ between moderate to severe TBI (GCS 3–12) and mild TBI (GCS 13–15) and also differ between complicated mild TBI (GCS 13–15 with abnormal cranial CT) and uncomplicated mild TBI.

Regarding CT head and severity of injury with GFAP level among studied cases, there was statistical difference between mean GFAP level which was significant p value (<0.001, 0.001) Table (51).

Our results are in accordance with 8 who proved that, the ability of the GFAP level to discriminate between patients with mild and moderate-to-severe injuries, as measured by the AUC, was 0.87 (95% CI, 0.81–0.93). The discriminatory ability of GFAP in assessing mild-moderate versus severe injury was 0.84 (95% CI, 0.77–0.91).

This is results are in accordance to 12 who suggested that, in patients with traumatic intracranial lesions on CT head scan, GFAP levels were significantly elevated (median, 0.588ng/mL), compared with those without lesions (median 0.033ng/mL).

In the present study, mean serum C-tau level in CT positive group was significantly higher compared to CT negative group. These results signify that this increase in serum C-tau level may be used to discriminate between patients with intracranial lesions and those without intracranial lesions, irrespective of the severity of injury.

13 mentioned that the increased serum C-tau level in severe head injured patients was associated with compromised blood–brain barrier (severe TBI). In contrast to 14 the study reported that CSF C-tau levels and found its levels were elevated 1,000-fold in TBI patients (1,519.6 ± 3,019 ng/ml) as compared to controls (0.031 ± 0.11ng/ml). Thus, C-tau may prove to be a promising molecule in severe TBI, provided more number of studies with highly sensitive detection methods in serum and CSF are undertaken.

Regarding to Pearson correlation between GFAP level and C-tau level studied groups there was high significant (p value <0.001) and low positive correlation (R=0.402).The second novel finding of this study is that the consideration of both biomarkers together improves the sensitivity and specificity for TBI diagnosis compared with each considered alone. Both serum GFAP and C-tau levels are powerful independent predictors of TBI outcome.
The current study showed that there is a positive correlation between high serum GFAP and C-tau protein levels and early diagnosis of TBI taking all other variables in consideration. In order to determine whether there was also a positive correlation between serum C-tau protein levels and patient outcome, the present study compared the serum C-tau protein levels in patient presented with history of TBI using clinical and radiological variables to add more prediction accuracy to studied brain specific biochemical markers. The study focused on the serum GFAP and C-tau protein levels during first 24 hours after TBI, showed the most significant differences among the three groups and thus was the most representative.

Conclusion and Recommendations

Serum GFAP level had greater value than serum C-tau in detection of intracranial lesion. There was a statistically significant but weak correlation between serum levels of C-tau and GFAP. Serum GFAP and C-tau levels in CT positive group were significantly higher compared to CT negative group. GCS had a strong significant relation with CT head findings and GFAP level. TBI biomarkers (GFAP and C-tau) have shortage in expression kinetics making them difficult (moving targets) to develop as reliable diagnostics. Blood samples used for TBI biomarkers measurement should be taken at multiple consecutive times after head trauma.

Cognitive Impairment and Its Impact on Quality of Life in Rural Indian Female after Stroke: A Cross Sectional Study Protocol

Nikita S. Deshmukh¹, Ashish Bele²

¹Final Year Student, Ravi Nair Physiotherapy College, Datta Meghe Institute of Medical Sciences, Wardha, Maharashtra, India, ²HOD, Department of electrotherapy and Associate Professor, Department of Community Health Sciences, Ravi Nair Physiotherapy College, Datta Meghe Institute of Medical Sciences, Wardha, Maharashtra, India

Abstract

Introduction: Stroke represented growing social, health care and economic problems. In 2005 vascular cognitive impairment a condition that can be found in 20-30% of stroke patient¹. Now in 2018-19 over 50 percent of stroke survivors have reported cognitive impairment 6 months after stroke and are associated with poorer quality of life which increase disability. Cognitive functions is identified as a top priority for stroke research. Cognitive impairment affects inadequate ability to focus on the job, recall, understand, prepare, use knowledge, initiate and stop the operation and solve problem. a stroke impaired cognitive function including focus, memory, vocabulary, executive function, perception and orientation of space. Because of abnormality in functional independence and other abnormalities in higher function, cognitive impairment may lead to affect independence. it increases the death ratio, abnormality. Stroke impacts wellbeing dramatically on health system resulting in high costs, and is also considered a global public health problem due to severe disabilities, functional deficiencies and reduced quality of life.

Method: The corrective study is assessing the cognitive impairment and the quality of life. The cognitive impairment will be measured with the use of the MoCA and QoL will be measured by stroke specific quality of life questionnaire. Female stroke patient with age in between 45-65 year who was diagnosed by the physician is included in the study.

Discussion: Stroke is a prevalent condition which affects most of the Indian population. Most studies are done on stroke including male and females both. Many studies have concentrated on cognitive disability after stroke and quality of life in males but no research is available in rural Indian females. The need for the research is therefore to establish the prevalence of cognitive disability in females and their effect on quality of life after stroke.

Key Words: Rural Indian females, Stroke, Cognitive impairment, Quality of life, MoCA, and SS-QoL scale.

Introduction

Stroke is a leading cause of death and disability in India¹. It represented growing social, health care and economic problems. In 2005 vascular cognitive impairment a condition that can be found in 20-30% of stroke patient². Now in 2018-19 over 50 percent of stroke survivors have reported cognitive impairment 6 months after stroke and are associated with poorer
quality of life which increase disability

The cognitive impairment after stroke is disturbed in any cognitive domain after stroke, executive function, memory, language, visuo-spatial function, visual-construction ability or global cognitive function. Hence, cognitive function is identified as a top priority for stroke research. Cognitive impairment affects inadequate ability to focus on the job, recall, understand, prepare, use knowledge, initiate and stop the operation and solve problem. A stroke impaired cognitive function including focus, memory, vocabulary, executive function, perception and orientation of space. The word cognitive impairment post-stroke is used to describe both mild cognitive impairment and dementia that either occurs 3-6 months after stroke incident. In addition, An approximate 16.9 million stroke cases occurred globally in 2010.

We do not know how many patients with strokes display deterioration or worsening of their cognitive impairment over a period of several years, and we do not have clear prognostic clues to classify those more likely to deteriorate. The estimates modified stroke prevalence range 84-262/100000 in rural areas, and 334-424/100000 in urban areas.

The definition of post-stroke cognitive impairment usually refers to disorders that arise after neuro-radiological examination after symptomatic stroke with associated ischemic finding. The post-stroke depression was found to be cognitive impairment related. It is believed to be linked mortality, reducing functional outcome and quality of life, and may be correlated with multiple factors and psychological mechanisms. Cognitive deficits are a negative prognostic factor that affects behavior and personality. The method such as Montreal Cognitive Assessment is commonly used clinically for examining cognitive disorder. Because of abnormality in functional independence and other abnormalities in higher function, cognitive impairment may lead to affect independence. It increases the death ratio, abnormality.

The physical, social and psychological effects of this disease are severe – approximately 90% of survivors have some kind of impairment. Quality of life in relation to health refers to all types of quality of life affected by diseases. Stroke impacts wellbeing dramatically on health system resulting in high costs, and is also considered a global public health problem due to severe disabilities, functional deficiencies and reduced quality of life.

**Need of The Study/ Rationale**

Stroke is a prevalent condition which affects most of the Indian population. Most studies are done on stroke including male and females both. Many studies have concentrated on cognitive disability after stroke and quality of life in males but no research is available in rural Indian females. The need for the research is therefore to establish the prevalence of cognitive disability in females and their effect on quality of life after stroke.

**Aim and Objective**

**Aim:** To assess the effect of Cognitive Impairment on quality of life in Rural Indian women after stroke.

**Objective:**

1. To find out the Cognitive Impairment in females after Stroke.
2. To find out the impact of cognitive impairment on the Quality Of Life of rural females after stroke.

**Material and Methodology**

Ethical approval will be obtained from the Institutional ethical committee. 40 participants will be selected randomly specially females and assessed for cognitive impairment and quality of life after obtaining consent form.

**Material:**

1. Couch
2. Chair with hand support
3. Immobilizer belt
4. Table
5. Pen

**Method:**

The research project will be conducted in Ravi Nair College of physiotherapy with rural population. It is cross-sectional observational study. All female patients...
who were diagnosed as having stroke and who fulfilled
the inclusion and exclusion criteria included in the study.

The corrective study is assessing the cognitive
impairment and the quality of life. The cognitive
impairment will be measured with the use of the MoCA
and QoL will be measured by stroke specific quality of
life questionnaire.

Mixed etiologies subject is excluded from the study.

**Instrumentation:**

MoCA , and SS-QoL scale is use as instrument.
The study selected because:

2. It is simple and convenient
3. Does not involve expensive technology or not to costly
4. It is time efficient to perform
5. Easy to understand
6. Reliability of MoCA is 0.75-0.96 , and SS-QoL is 0.65-0.99

**STUDY DESIGN:** Observational study.

**STUDY SETTING:** Ravi Nair College of Physiotherapy, Sawangi(M), Wardha

**PARTICIPANTS:**

**Inclusion and Exclusion Criteria:**

Inclusion criteria:

1. Female stroke patient
2. Age in between 45-65 year who was diagnosed by the physician is included in the study.

Exclusion criteria:

5) The patient having mix – etiologies
6) Elderly female above 67 year
7) Any other psychological disorder is excluded from the study.

**VARIABLES:**

1. MoCA Scale
2. SS-QoL Questionnaire.

**Data Sources/ Measurement:**

Ethical clearance will be obtained from institutional ethical committee (IEC). Participant will be selected by simple random technique. Inclusion and exclusion criteria will be implemented assessment during the hospital stay or within 3 month of stroke. To assess the different aspect of cognitive functions each participant tested approximately 1 and ½ hours session.

MoCA is commonly used method for cognitive evaluation. Eventually the MoCA returns a judgment-based score. The first only requires verbal input and involves orientation, memory and attention assessment. The second portion assesses the naming skills to obey verbal and written orders, writes a sentence randomly and copies a complex polygon.Since the MoCA includes divisions there is no limit of sub-domains. Total total score is 30 and total administration time is around 10-15 min.A cutoff <24 is used to define cognitive impairment.

With the SS-QoL we assessed Life Value

We applied the stroke Specific quality of life scale this method to measure the Quality of Life. The SS-QoL is a particular instrument used to measure health-related quality of life among individuals suffering stroke.It holds 49 objects in 12 domains. Higher values suggest a better quality of life linked to health.

**Data Analysis:**

Data analyzes are carried out using concise and infererensive statistics, using unpaired chesquare research students. The program used in the study will be the SPSS 24.0 version, the praphade prism 7.0 version and the degree of significance < 0.005 (p>0.005 m) is considered.

**STUDY SIZE:** 40

**STATISTICAL METHOD:** Simple Random Sampling

**Result**

Upon completion of the study results, statistical analysis will be estimated.
The result could show the impact on cognitive impairment and quality of life of post stroke patients in rural Indian females. or

The result could not show the impact on cognitive impairment and quality of life of post stroke patients in rural Indian females.

**Discussion**

Stroke is a prevalent condition which affects most of the Indian population. Most studies are done on stroke including male and females both. Many studies have concentrated on cognitive disability after stroke and quality of life in males but no research is available in rural Indian females. The need for the research is therefore to establish the prevalence of cognitive disability in females and their effect on quality of life after stroke.

**Limitations:**

It might be difficult to get convince patient for being a part of this study.

**Implication:**

Outcome of the study shall help the geriatric population to get aware about their condition and health the researcher to plan the treatment protocol.

**Generalizability:**

study not yet done.

**Ethics and Dissemination:**

The approval of the Committee on Institutional Ethics must be obtained prior to the start of the study. Patients must be treated with respect first. Upon meeting the requirements of inclusion and exclusion criteria, the patients are taken for review

**Source of Funding:** There will be no direct support for this research from public and private organization. The department of physiotherapy, at Datta Meghe institute of Medical Science, Deemed to be university will provide material needed for research.

**Conflict of Interest:** Nil

The Accuracy of Intrinsic Compression Ultrasound Elastography (E-Thyroid) in Differentiating Benign From Malignant Thyroid Nodule

Najlaa Hanoun

1F.I.B.M.S Radiology, D.M.R.D, Radiologist & Senior Lecturer In AL Yarmouk Teaching Hospital – AL Mustansiriyah Medical College

Abstract

Background: Ultrasound elastography (USE) is an ultrasound-based technique that addresses the biomedical properties of the nodules. Based on the stiffness of the tissue this technique differentiates between the benign nodules from the malignant ones where the hard and soft tissue is determined by the high or the low elasticity values respectively. The present study aimed to evaluate the efficacy of the E-thyroid in the differentiation of malignant and benign thyroid nodules and also a cut off ECI value using fine-needle aspiration as the diagnostic standard of reference

Methods: The current prospective study was done on 80 patients in the radiology department in Al Yarmouk teaching hospital in Baghdad city from April 2018 to April 2019. All the patients referred from the outpatient clinic. All the patients were examined sonographically starting with B mode ultrasound then elastoscan examination was done.

Result: The study result showed that among the 80 patients 65 had a benign nodule and only 15 were diagnosed with a malignant thyroid nodule. The ECI value and the histopathological result showed a significant agreement in the result and a cut off ECI value of 4 were shown to be effective to diagnose the presence of malignant thyroid nodule.

Conclusion: Overall, the present study showed that USE can be effectively used to differentiate between the malignant and benign thyroid nodules and being a safe method this can be used widely. However, the result of this study needs further validation with a larger study population.

Keywords: Ultrasound Elastography, (E-Thyroid), Benign Thyroid Nodule, Malignant Thyroid Nodule, Elasticity, ECI value, Cut-off

Introduction

Thyroid nodules are common findings and can be found in almost 50% of the unselected population on ultrasound imaging. Although in most of the cases these nodules are benign, however, approximately 4% to 6.5% of all the thyroid nodules are malignant (1).

Corresponding Author:
Dr. Najlaa Hanoun,
F.I.B.M.S Radiology, D.M.R.D, Radiologist & Senior Lecturer In AL Yarmouk Teaching Hospital – AL Mustansiriyah Medical College – contact Mail : Najlaahanoon@gmail.com Phone: 00964-7719330585

Ultrasonography being a noninvasive technique provides significant information regarding the pathological features of the nodules. Studies have shown that certain features as observed in the US findings such as microcalcification, solid composition of the nodules,
wider shape and irregular margins certainly indicate the presence of malignancy (3). In contrast, smooth margins with round shape, presence of peripheral vascularity, and cystic composition are the main features of benign nodules (4).

However, it was also reported that only US finding cannot be regarded as the sole technique for differentiation between malignant and benign nodules. To overcome the disadvantages of the US findings FNA technique was used to rule out the presence of cancer in thyroid nodules. Although FNA is a safe procedure the pain and the discomfort faced by the patient made this technique self-limiting (5).

In this context, the need for a technique was warranted that can overcome the disadvantages of ultrasonography and on the other hand, can effectively differentiate between the malignant from the benign nodules. Ultrasound elastography (USE) has recently been introduced in the examination of thyroid nodules. It is an ultrasound-based technique that addresses the biomedical properties of the nodules. Based on the stiffness of the tissue this technique differentiates between the benign nodules from the malignant ones where the hard and soft tissue is determined by the high or the low elasticity values respectively (6).

This method takes advantage of the changing elasticity of the soft tissues resulting from physiological or pathological conditions. E-thyroid uses the pulsations generated from the adjacent common carotid artery and thus it eliminates the need for manual compression of the transducer. This technique offers greater consistency in the ElastoScan image. However, different studies have reported the different diagnostic capacity of this technique. This difference in the result was mainly due to inter as well as intraobserver agreements, biased selection of images and subjective scoring. An elasticity contrast index (ECI value) is provided by this technique which is calculated by comparing the elasticity value of the nodule with normal tissue present within the ROI.

Previously this technique was used in the differentiation of malignant and benign breast masses and liver fibrosis staging (7),(8). Very recently this technique was started using in the differentiation of benign and malignant thyroid nodules. However, very few studies were conducted in this filed. In the present study, we aim to evaluate the value of E-thyroid in the differentiation of malignant and benign thyroid nodules & determining the cut-off value of ECI by using fine-needle aspiration as the diagnostic standard of reference.

Method and Materials

Selection of study population

This prospective diagnostic study was conducted in the radiology department of Al Yarmouk teaching hospital in Baghdad city from April 2018 to April 2019. Before the beginning of the experiment, the ethical clearance for the study was taken from the ethics committee of the al-mustansirhya college of medicine

All the patients who have visited the outpatient departments with the complication of single or multiple thyroid nodules were included in this study. A total of 80 patients who visited this hospital in the study period were included in the study. All the patients were examined sonographically starting with B-mode ultrasound then elastographic examination was done. Before enrollment, informed consent was obtained from each participant.

The exclusion criteria for the study were as follows:

(1) TR-1 nodule (0 points), benign

(2) Cystic component >20% of the nodule volume.

(3) Large nodules occupying >75% of thyroid lobe volume because insufficient surrounding normal thyroid tissue to be used as reference

(4) Nodules with the calcified shell.

Procedure:

Ultrasound & Elastoscan examination was performed using RS80A of Samsung equipped with E-thyroid software, using a 5 to 12 MHz linear transducer. At first, patients were instructed to lay in the supine position and then they were first examined by B-mode in at least 2 plain (axial & sagittal) to illustrate the different characteristics of thyroid nodule(s) such as maximum nodule dimensions, echogenicity, alignment, and calcification the nodules. Then the nodules were scored according to above TI-RAD system from (TR2 to TR5) while asking patient to hold breath for awhile a last scan data acquired from the nodule after delineation.
of its boundaries by operator, a multiple ECI value (Elasticity contrast index) were obtained and computed interactively and displayed on monitor, the largest value is assigned for that nodule for analysis of diagnostic accuracy.

After that, the position of each selected nodule(s) concerning the CCA is divided to either close or intrinsic to assess the possibility of the change of ECI value in relation to nodule position from the source of compression. A higher ECI value suggested a stiffer nodule with increased possibility of malignant tissue.

FNA examination under U/S guidance was used as the diagnostic standard of reference.

Statistical analysis:

The statistical analysis was then conducted on the results obtained. The data obtained by the histological analysis and the US data were compared and a p-value < 0.05 was regarded as statistically significant.

Result and Interpretation

The present study included a total of 80 patients among which 64 patients (80%) were female and 16 (20%) were male indicating a female predominance. Among these patients, only 7.5% were below 29 years of age group. The maximum of the female patients was in the 40 years to 49 years age group (31.3%). On the other hand maximum, male patients were in the 50 years to 59 years of age (10%). Overall, the highest number of patients was in the 40-49 years age group (37.5%) and the maximum of the patients were female. The statistical analysis showed a significant association between the age and gender of the patient with the prevalence of the thyroid nodule formation (Table 1).

No statistically significant association was reported for tumor position with the benign and malignant nature of the nodules (Table 2). (Table 3) depicts the correlation of histopathological results with the ECI value. This result indicates a highly significant association between the ECI value with the Histological findings. In the study, 81.4% of the nodules were found to be benign by histopathological examination compared with the ECI value which showed 90% as the benign nodules. On the other hand, 18.8% nodules were found to be malignant by histopathological finding and 10% of the nodules were found to be malignant by ECI value. The ECI value of 4 was set as the cut off for malignant nodule identification.

Discussion

Ultrasound elastography (USE) is an emerging non-invasive diagnostic tool that measures the differences of stiffness between malignant and benign lesions. The malignant tissue is stiffer compared with the normal tissue making the nodules less elastic compared to the benign nodules. Presently clinical knowledge on the calcified nodules suggests not to use the USE technique on calcified nodules because of the higher number of false-positive results. Previous studies have pointed out that this calcification results in increased stiffness even in benign nodules also resulting in false-positive results.
In the present study, a total of 80 patients were included and Ultrasound elastography was performed on these patients. A female predominance was observed in the study. The result indicated that the presence of a thyroid nodule has a significant correlation with the age and the gender of the patient.

Previous studies have pointed out that carotid artery pulsation can be used as the compression source and can significantly reduce the inter and intraobserver variability. This removes the hindrance of the carotid artery pulsations. Based on the objective scoring obtained by using a unique algorithm and an elasticity contrast found within the nodule, users can obtain reliable data on the degree of the elasticity (9),(10).

Based on these findings in the present study also the distance from the carotid artery was investigated. Most of the benign nodules were intrinsic in position to the carotid artery while in the malignant group total of 9 nodules were intrinsic to the carotid artery. However, no statistical significance was reported for this result. In another study conducted by Lim and Kim, it was reported that the finding by the USE is significantly associated with the distance from the carotid artery. The nodule that is closer to the carotid artery has an ECI value lower than the nodules present far from the artery. They have also instructed to remeasure the extreme lower ECI value before considering it as a benign nodule if the distance of the nodule is closer to artery 2.

In another study by Kim et al., a group of 165 patients was examined using the Accuvix XG machine supported with an E-Thyroid™ software. In this study, 154 nodules were found to benign and 42 were found to be malignant. All the malignant nodules were papillary thyroid carcinoma. The finding of this study showed 81.0% sensitivity, 63.6% specificity, 37.8% positive and 92.5% negative predictive value. An ECI value of 3.11 was used as a cut-off for diagnosing the malignant lesions by this technique (11). In the present study also a significant association was reported between the histopathological finding and ECI value. The present study showed that an ECI value of 4 can be used effectively to diagnose the malignant thyroid nodules.

Overall, the present study showed that USE can be effectively used to differentiate between the malignant and benign thyroid nodules and being a safe method this can be used widely. However, it should also be kept in mind that while investigating the nodules the distance from the carotid artery should also be considered as one of the limiting factors.

The present study also suffers from several limitations. Firstly, only one radiologist has evaluated the B-mode US images. Although the radiologist was quite experienced the interpretation might get biased because of this. Secondly, the cut-off value used in this study was inferred from small sample size and hence it might not prove to be the same in a large study population.

**Conclusion**

Overall, the present study showed that USE can be effectively used to differentiate between the malignant and benign thyroid nodules and being a safe method this can be used widely. However, the result of this study needs further validation with a larger study population.

Abstract

The purpose of this study was to find a method of determining laser models and intra vaginal progesterone sponge in Bali Cattle. An assessment was carried out at Sapi Loka Grati, Pasuruan, Indonesia. The parameters observed included the symptoms of estrus, response of estrus, and the level of pregnancy. Twenty Balinese cows were divided at random in two groups. P1 treated with laser puncture at a certain point and P2 treated with 1.5 g of progesterone + 10 mg of estradiol benzoate intra vaginal sponge. The diagnosis of subsequent pregnancies was done by ultrasonographic examination on day 40th after artificial insemination (AI). The laser used in this study was a soft laser with power supply specifications as follows: 50 Hz, 220 Volts, 50 Watts, ranging from 0.2 Joules to 0.5 Joules. These lasers include semiconductor lasers and laser probes. Three acupuncture points were used (GV 4, BL-22, and GV-2). Furthermore, the intra vaginal progesterone sponge used was made from silicone plastic similar to the drugs containing medroxyprogesterone acetate. Data testing was done by using the T-test. Results demonstrated that the P1 responses of estrus appeared on day 3rd, while P2 on day 9th. There was no significant difference (p >0.05) in the accumulation of estrus and pregnancy. In conclusion, estrus synchronization and pregnancy rate could be efficiently achieved in Bali cattle using either laser puncture or intra vaginal progesterone sponge. However, laser puncture treatment induced more spread estrus with higher pregnancy rate.

Keywords: Bali cattle, estrus synchronization, intra vaginal progesterone, laser puncture, pregnancy.

Introduction

Bali cattle is one of the beef-producing livestock in Indonesia, but domestic Balinese beef production has not been able to cover the needs because of their population and low productivity levels. Various methods have been taken so that livestock productivity is maximized, including through improved management and quality of feed or by utilizing technology. The low population of Bali cattle is partly due the low level of reproduction¹. For better reductivity, estrus induction is one of important ways to be performed. Estrus induction is usually performed with hormonal method, such as application of PGF2α, but the disadvantage is relatively expensive².

Laser puncture technology has been proven to induce estrus with variable success in goats³,⁴, sheep⁴, and cows⁵. Irradiation of acupoints by means of low-level laser provides a relatively safe, noninvasive and efficient way of stimulation of acupoints⁶. Response and signs of estrus could apparently be improved after conducting a laser puncture procedure, so that could increase a pregnancy rate⁷,⁸. The application of laser puncture to Bali cows resulted in a response to estrus 90%, and from insemination, a pregnancy rate of 80% was obtained. The occurrence of conception in marriage indicates that estrus that occurs with laser puncture stimulation is followed by ovulation⁹. In this study, laser

Corresponding author:
Herry Agoes Hermadi
Email: herrypro59@yahoo.com
puncture has been reported to comprise a success rate of estrus and pregnancy with progesterone intra vaginal sponge in Bali cattle.

**Materials and Methods**

A total of 20 non-pregnancy Bali cows aged 2-3 years old, from cattle at Grati, Pasuruan, Indonesia were used in this study. Their body was scored at least 2 from 5 grades. All of the cows have been confirmed to have a normal estrus cycle that randomly divided into three groups. P1 was given a laser puncture and P2 was given progesterone (1.5 g) and estradiol benzoate (10 g) intra vaginal sponge.

![Figure 1. Acupuncture points related to reproduction](image)

P1 was treated using low-level laser puncture. The laser used in this study was a soft laser include semiconductor laser using power supply with specifications: 50 Hz; electricity of 220 Volts, 50 Watts output power, and laser probes. The laser puncture stimulation was applied on three reproductive acupoints (Figure 1): (a) GV 4, in the depression along the dorsal midline at the intervertebral space between L2 and L3 (for remove Qi/blood stagnation); (b) BL-22, at the first lumbar intervertebral space (L1-L2); and (c) GV-2, on the midline, in a depression at the first coccygeal vertebral space (C1-C2)\(^9\). The laser was applied to each acupoint 0.2 to 0.5 Joules performed sequentially for 3 min/day for 3 days. Observation the sign of estrus was carried out on day 3 and 4.

P2 was treated using intra vaginal sponge with plastic design (Pro Sponge progesterone) soft release containing progesterone for estrus induction in cattle. It was a large sponge capsule prototype and has a T-shaped plastic on top of it with nylon thread as a puller during extraction (length of ±15 cm and a width of 8 cm) on the caudal part. PGF2α recommended for use after 7 days stored and removed from the vagina on day 7 to ensure synchronized estrus\(^10\). The occurrence of estrus was observed and the animals which exhibited estrus were inseminated artificially with fresh sperm and the presence of pregnancy was noted. Examination to determine pregnancy was evaluated 40 days after artificial insemination (AI) using ultrasonographic examination. The data presented as means standard error of the mean and were compared using the Student’s T-Test. They were considered to be significantly different if \(p < 0.05\).

**Results**

**Sign of Estrus**

Physically, the occurrence of estrus was almost similar to the sign of estrus caused by natural mating, characterized by swelling of the vulva and reddish with transparent mucus accompanied by the appearance of the Bartholin gland. However, the color of vulva is redder with more transparent mucus than normal estrus that makes easier to detect.

**Estrus responses**

There was no significant difference \((p > 0.05)\) among treatment groups in the sign of estrus after treatment (Table I). All of the cows (100%) of the laser puncture and 90% of sponge intra vaginal progesterone had exhibited estrus. The interval of estrus was 3-6 days for laser puncture-treated cows and 9-10 days for progesterone intra vaginal sponge-treated cows, respectively.

Research result showed that from 10 cows treated by laser puncture which had estrus, there were 5 cows (50%) estrus on day 3; 3 cows (30%) estrus on day 4 and 2 others (20%) estrus on day 6. Whereas, from 9 cows treated by progesterone intra vaginal sponge which had estrus, there were 7 cows estrus on day 9, while 2 cows estrus on day 10. Laser puncture technology required interval 3 to 6 days after laser treatment and the most was 3 days. It means that laser puncture technology for estrus synchronization provides faster response compare to progesterone intra vaginal sponge.
The synchrony response of the cows in the present study was similar to that reported by others. Adikara (1995) obtained estrus success rate of 95% for treatment without seeing the estrus phase and 100% for treatment in the luteal phase. After the last 24 hours of shooting laser puncture, symptoms of estrus and hormonal examination showed an increase in reproductive hormones\textsuperscript{11}. Herdis (2011) demonstrated the estrus response to laser puncture treatment reached 100% when induced to luteal phase ewes, and 95% when induced to unknown estrous cycle with the means of estrus duration of 27 hours\textsuperscript{4}.

**Pregnancy Rate**

The results of the study did not show any significant differences with T-test ($p > 0.05$) in pregnancy rate (Table 1). By 40 days after artificial insemination, 100% and 90% of laser puncture-treated cows and progesterone intra vaginal sponge-treated cows were pregnant. These results indicate the pregnancy rate of estrus cows was very high, referring to the minimum standard of artificial insemination success according to the Directorate General of Animal Husbandry for an area in cattle is 55\%\textsuperscript{12,13}. Ultrasonographic examination appearing hyperechogenic embryo and hypoechochogenic uterine horn (Figure 2).

Discussion

The mechanism of stimulation of acupuncture points to the target organ is closely related to the acupuncture point as an active electric cell and acupuncture meridian. According to Adikara (2001), the framework of acupuncture points and acupuncture meridians is in accordance with the TAO philosophy which reveals the balance between living things and their environment. The theory that supports this is the existence of relationships between cells through cell bridges (intercellular bridges) that can be passed by material/protein with a certain molecular weight. Because the relationship is initiated by active cells, if there is a stimulus will cause a reaction of the emergence of cell activity in the form: changes in polarization, electrical charge, the occurrence of influx ions that stimulate rRNA and activation of mRNA to perform protein synthesis. The stimulus will be specifically communicated by other similar cells (active nature) so that it is an activity between the extra and intra-cells to the organ. Related organs will be stimulated to carry out a dynamic and physiological function with optimal capacity. The transfer of stimuli and matter through these specific cellular pathways is a dynamic energy change that leads to balance for the creature’s body\textsuperscript{14}.

The accuracy of the occurrence of estrus and pregnancy cannot be separated from the expertise of each researcher. Laser energy that falls on living tissue will give a biological reaction that depends on the type of tissue, the condition of the tissue and the amount of laser energy, it can provide destructive, inhibitory or stimulating effects\textsuperscript{15}. Meanwhile, the energy generated by He-Ne soft laser or low-level laser is a biostimulator effect that aims to stimulate estrus in livestock so that their reproductive functions can take place properly and normally. By using estrus synchronization (either laser puncture or sponge intravaginal progesterone) the cows will be bred within a short period of time, and the subsequent lambing will also take place over a short time period. This will allow producers to plan for labor input and feed resources\textsuperscript{16}. Another benefit of estrus synchronization is that it will allow producers to utilize other advanced breeding techniques such as artificial insemination. In cattle, estrus synchronization and artificial insemination (AI) can be used to maximize the reproductive potential of cows by incorporating superior genetics into their operations\textsuperscript{17,18}.

Conclusion

Based on the results, Bali cows can be synchronized using either of the two methods described, with no significant differences in the success rate of estrus and pregnancy rate. However, cows synchronized with laser puncture had a shorter interval to estrus than cows synchronized with sponge intravaginal progesterone.

ACO-based Type 2 Diabetes Detection using Artificial Neural Networks

Aliakbar Tajari Siahmarzkooh
Assistant Professor, Department of Computer Science, Faculty of Sciences, Golestan University, Gorgan, Iran

Abstract

**Background:** Type 2 diabetes is one of the most common diseases among people. Early diagnosis and treatment can reduce mortality and morbidity. So far, various solutions have been proposed to predict this type of disease.

**Materials and Method:** In this paper, a method for diagnosing diabetes was proposed using the Ant Colony Optimization (ACO) algorithm. To this end, data set properties are first reduced using artificial neural network features and then prepared for classification purpose. Finally, some components of accuracy assessment on the proposed system were calculated.

**Results:** The simulation results show that by adjusting the parameters of ANN and ACO, about 3.2% better prediction accuracy is obtained than other researches.

**Conclusion:** The results of experiments represent that the proposed method is proper for health management in diabetes.

**Keywords:** Diabetes detection, Artificial Neural Network (ANN), Ant Colony Optimization (ACO).

Introduction

Diabetes is a chronic disease that is diagnosed with high blood glucose levels. About half of diabetics have hereditary characteristics, which is one of the most important features of diabetes. Poor pancreatic insufficiency and insufficient use of insulin are the causes of diabetes. There are two major types of diabetes. Type 1 diabetes (T1DM) is when pancreatic secretions damage \( \beta \) cells and prevent a timely drop in blood glucose levels. Insulin resistance and inefficient insulin secretion are the causes of type 2 diabetes.

We need information technology-based methods to study high-risk groups at risk for diabetes. In this regard, meta-heuristic algorithms are a good tool that is used as a computational process to discover patterns in large data sets and includes several solutions such as evolutionary clustering, machine learning and neural networks.

Meta heuristic algorithms have been successfully used to solve various problems in various fields of basic sciences, engineering and even humanities. Weather forecasting, stock market analysis, system suggesting better customer management in banks and shopping malls, disease forecasting and medical data analysis are examples of applications of this category of algorithm. In more detail, extracting logical patterns from patients’ information in hospitals is essential for support as well as analysis, which requires the use of intelligent methods and data mining tools.

In recent years, various data mining methods have been used to predict diseases. Algorithms as well as various toolboxes have been developed and studied by researchers. Here are some examples of work done.

Patil proposed a hybrid predictive model that used the K-means clustering algorithm to validate the data class tag and the C4.5 decision tree algorithm to create the final model.\(^1\) The results of his proposed method have an accuracy of 92.38% in classification. Aliza compared the predictive accuracy of the multilayer perceptron (MLP) model in the neural network with the decision tree algorithms ID3 and J48.\(^2\) The comparisons showed the
superiority of the pruned J48 tree with 89.3% accuracy compared to the others with 81.9% accuracy. Codina proposed artificial flexibility on multilayer perceptron (AMMLP) as the final model for predicting diabetes with an accuracy of 89.93%. All of the studies used the Pima Indians Diabetes Database for experiments. Also, the toolbox used by most researchers to perform analyzes was WEKA software.

Research shows that in order to obtain results with higher accuracy, data preprocessing operations must be performed before applying the proposed solution to clear the data and make it more meaningful and logical. Vijoyan examined the benefits of using different data processing methods to predict diabetes. The preprocessing methods studied were principal component analysis (PCA) and discretization. Research has shown that preprocessing improves the accuracy of simple Bayesian classification and decision tree. This reduces the accuracy of the backup vector machine. He analyzed the high-risk indicators of type 2 diabetes using association rules and the evaluation of false positive rates. Zhou also suggested the area of the ROC curve, the values of sensitivity and specificity for validation and review of test results.

Sojania presented an Android-based application solution for raising awareness about diabetes in his article. The application uses the decision tree classifier to predict users’ blood sugar levels and provides information and suggestions about diabetes. The application uses data collected from a hospital in the Indian state of Chhattisgarh. Shi et al. have developed a model for assessing the risk of developing diabetes using a mobile device to prevent people from developing diabetes.

Some articles focus on improving the K-means clustering algorithm. For example, Wang proposed an improved k-means clustering algorithm by removing noise data. Sun proposed a solution to improve the selection of primary k-means clustering centers based on the Forubenius norm distance. Shoni Wang proposed an improved k-means clustering algorithm with variance in which the primary clustering centers were selected using the Hoffmann tree structure. Most articles improve the initial values of cluster centers.

People at risk for developing diabetes need to develop a set of rating standards for prediction. In this regard, Chandrakar and Saini presented the risk score of Indian overweight diabetes as a tool to show diabetes to solve the problem of diagnosis or late diagnosis of diabetes. Hamm and Lou proposed k-means clustering in pairs and limited to a certain size to represent the population at high risk of diabetes. This provided a tool for classifying the risk of the disease.

In summary, some of the research done to predict diabetes. However, the accuracy of the prediction and the validity of the data were not sufficient for real applications. In addition, most of the models presented by researchers work well only on specific datasets that do not have acceptable results on different datasets. Therefore, we need to create a new forecasting model with higher accuracy and compatibility with other data sets. In this paper, in addition to the Pima Indians dataset, two other datasets are used to test the proposed model.

Materials and Methods

In recent years, the use of data mining algorithms to predict diseases has increased. Some researchers have shown that it is possible to obtain predictive models from initial patient data. In particular, most of the published articles in the field of diabetes prediction have been aimed at improving the accuracy of the model. In this regard, some researchers have obtained good results using the WEKA toolbox on the Pima Indian dataset.

This section includes a review of the data set used for the experiment, the ant colony algorithm for data preprocessing, and an artificial neural network for data classification. All simulation and experimental processes have been performed using MATLAB 2018 software.

The Pima Indian Diabetes Database contains information on 768 patients living near Arizona. Tests performed with positive and negative results show whether the patient has diabetes or not. For all samples, 8 numerical properties are considered. This data includes data on a person’s health as well as the results of tests performed. The features in the dataset are as follows:

- **Number of pregnancies (preg)**
- **Plasma glucose concentration in 2 hours in a glucose tolerance test (plas)**
One of the most effective tasks in creating a model is data preprocessing, which plays an important role in the modeling process by increasing the quality of data in large quantities. At this stage, by using some appropriate methods, data set optimization is done. First, numerical properties that have a certain interval are transferred to the interval of zero and one and normalization is performed on them. In the second stage of preprocessing, outlier data is identified using ant colony optimization and the mean value is recorded instead. At this point, some unknown values recorded in the data set are also recorded with the mean value. Then in the next step, the degree of dependence of the properties on the class property is calculated and based on that, the less effective properties are excluded from the feature set. In this way, the complexity of the data is reduced.

• **Ant Colony Optimization Algorithm**

The ant colony optimization algorithm is a probabilistic technique for solving computational problems which can be reduced to find good paths through graphs. Artificial ants stand for multi-agent methods inspired by the behavior of real ones. The pheromone-based communication of ants is often the predominant paradigm used. Combinations of artificial ants and local search algorithms have become a proper method for numerous optimization tasks involving some sort of graph such as vehicle routing and internet routing.

In the real world, ants of some species wander randomly and upon finding food return to their colony while laying down pheromone trails. If other ants find such a path, they are likely not to keep travelling randomly, but instead to follow the trail, returning and reinforcing it if they eventually find food.\textsuperscript{15}

In this algorithms, an artificial ant is a simple computational agent that searches for good solutions to a given optimization problem. To apply this optimization algorithm, the optimization problem needs to be converted into the problem of finding the shortest path on a weighted graph. Initially, each ant stochastically constructs a solution, i.e. the order in which the edges in the graph should be followed. Secondly, the paths found by the different ants are compared. The last step consists of updating the pheromone levels on each edge.

• **Artificial Neural Network**

An Artificial Neural Network (ANN) is based on a collection of connected nodes called artificial neurons, which loosely model the neurons in a biological brain. All connection like the synapses in a biological brain can transmit a signal to other neurons. Artificial neurons that receive signals then process them and can signal neurons connected to them. The signal at a connection is a real number and the output of each neuron is computed by some nonlinear functions of the sum of its inputs.\textsuperscript{16} These connections are called edges. Neurons and edges usually have a weight that adjusts as learning proceeds. The weight increases or decreases the strength of the signal at connections. Neurons may have threshold points such that a signal is sent only if the aggregate signal crosses that threshold. Generally, neurons are aggregated into layers. Different layers may perform different transmissions on their inputs. Signals travel from the first layer to the last layer, likely after traversing the layers multiple times.

**Figure 1. Pseudo-code for ACO.**\textsuperscript{15}

Results

To obtain the most accurate answer, 10-fold cross
validation and percentage split validation methods with different percentages were used. In the first validation method, the data set is divided into 10 subsets and in 10 consecutive periods, 9 subsets are used as training sets and another set is used for testing. In the second validation method, the data is used as a training set and the rest as a test set. Also found parameters are true positive rates (TPR), false positive (FPR), true negative (TNR), false negative (FNR), accuracy and f-measure.

In addition to the mentioned parameters, the ROC diagram related to the simulation is also calculated. This graph shows the ratio of positive rate to true positive false that the higher the level below the chart, the more accurate the model is.

The simulation results are shown on the dataset using each of the methods listed in Table 1. As we see, the application of the 10-fold method results in an accuracy of 99.24% and the use of the percentage split method results in an accuracy of 98.73%. If the accuracy of the model is considered as the main criterion of the accuracy of the proposed model, then the 10-fold validation method is superior to another. However, a closer look at the table shows that the amount of FPR in the second method is lower than in the first method, which means that in this method a person without diabetes is less likely to be labeled diabetic and in certain circumstances can it is a better option than the first method. Also, the true negative rate in the second method is superior to the first method (higher value), and this is useful when we want to identify people who do not have diabetes more accurately, in which case the percentage split validation method is better than the other. In other cases, the first method is superior.

Examining the table, it can be seen that in all accuracy parameters, the k-fold method is superior to the percentage split method; both in the parameters that have a positive aspect (such as true positive and false positive) or in negative parameters (true negative and false negative). The accuracy and f-measure values in

Figure 2. Flowchart for ANN
the first method are better than the second method.

**Conclusion**

As To prove that the proposed model improves the accuracy of the prediction, we compare the results with the experiments of other researchers in this field. Table 2 summarizes this comparison.

The accuracy obtained from the proposed method is 98.73% in the lowest case and 99.24% in the best case. As can be seen in Table 2, indicates the comparison of the accuracy of the proposed method with some recent approaches. Therefore, the proposed method is more appropriate than the other proposed methods.

The aim of this article was to create a suitable predictive model for diagnosing high-risk diabetes. In this paper, a new model for forecasting is proposed which includes two stages: data preprocessing phase and categorization phase. In the preprocessing phase, the ant data are identified using the ant colony algorithm and replaced with the mean value. The second phase is based on a neural network algorithm that uses which data is categorized. The results obtained from the simulation were compared with the results of other research works in this field and it was found that the accuracy of the proposed model is higher than other researches.

A Study for Assessment of Perception and Attitude of Medical Students about Medical Ethics, Consumer Protection Act (CPA) and its Influence on Violence against Doctors

Ankita Kakkar¹, Sushil Kumar², Archana Verma³, Alok Kumar⁴, Raj Kumar⁵

¹Associate Professor, Department of Forensic Medicine & Toxicology, School of Medical Sciences & Research, Sharda University, GautamBudh Nagar, Uttar Pradesh, ²Professor, Department of Forensic Medicine & Toxicology, Rama Medical College, Hospital & Research Centre, Mandhana, Kanpur, Uttar Pradesh, ³Professor, Department of Neurology, Uttar Pradesh University of Medical Sciences Saifai -206130, Etawah, Uttar Pradesh, India, ⁴Professor and Head (Forensic Medicine & Toxicology) & Dean, Faculty of Medicine, Uttar Pradesh University of Medical Sciences Saifai, Etawah, Uttar Pradesh, India, ⁵Vice Chancellor, Uttar Pradesh University of Medical Sciences, Saifai, Etawah. (U.P.), India.

Abstract

Medical Profession was included under The Consumer Protection Act (CPA) in 1986 to provide a forum to safeguard the rights of the customers and establish guidelines for the speedy redressal of their grievances against unethical medical practices. This by far has been the most crucial legislations introduced in the framework of health professionals which over the years seems to have propelled them to practice in a guarded manner. In recent times this also seems to be flanked by a spurt in Violence against the Doctors enormously. It is thereby imperative for all medical professionals to not only have a comprehensive knowledge of ethics and laws related to health care and medicolegal issues but also its implications in their profession. In this very light the current study was conducted as an attempt to assess the perception of undergraduate medical students towards medical ethics, CPA and its influence on Violence against Doctors.

Key words: violence, influence, unethical, redressal, CPA.

Introduction

In the past few decades, bit by bit the trust which cultivated the doctor-patient relationship has started getting eroded and attained the shape of a crisis in the present century, where society does not hold this noble profession in high esteem.

In 1986, a comprehensive legislation Consumer Protection Act (CPA) was implemented in India to promote and safeguard the concerns of consumers. The CPA provides a forum to safeguard the rights of the customers and establishes guidelines for the speedy redressal of their grievances against unethical medical practices.

The health care providers were brought in the domain of a ‘service’ as defined in CPA by the Supreme Court decision in a case of Indian Medical Association (IMA) vs VP Shantha.¹

The CPA provides a forum to safeguard the rights of the customers and establishes guidelines for the speedy redressal of their grievances against unethical medical practices. Since ancient time; the relationship between doctor and patient was based on mutual trust and confidence. They were treated like God and their People revered and respected them. Today, the fast pace of commercialization and globalization affect all spheres of life including medical profession.

With inclusion of medical profession under CPA, a surge in litigations arising out of breach in medical/dental profession is seen.

Not only that it also forms a background for violence against doctors, which is quite prevalent in Asian countries like India, Pakistan, Bangladesh, Israel, and China. Further, the prevalence rates have been higher in comparison to Western countries. The IMA suggests that up to 75% of doctors have faced some kind of violence at work, which is similar to the rates from other countries in the continent. This may be in the form of threatening calls, verbal abuse, intimidation, damage to the property, physical assaults causing injuries (simple or grievous), murder, and arson.

Medical professionals who faced violence have been known to develop psychological issues such as depression, insomnia, posttraumatic stress, fear, and anxiety, leading to absenteeism. Many have lost their clinics, injured themselves, lost lives, and also tarnished their reputation as a professional due to these incidents.

It is the need of the hour for us to address the issue of surging Violence against Doctors and recognize the causes where it stems from. In this background this study has been observed to discern the influence of CPA on increasing Violence against medical professionals.

**Material & Method**

A cross-sectional survey was conducted in the medical educational institute.

**Study Population**

189 MBBS students studying in 2nd & 3rd Professional at Rama Medical University Kanpur (U.P.) India; were included in present study.

**Ethical Clearance and official permission**

Before starting, ethical approval was obtained from the Institutional ethical committee and official permission was taken from the concerned authorities.

**Pre-testing of Questionnaire**

Prior to the data collection the questions were pre-tested among a group of professionals in order to ensure the level of validity and degree of repeatability.

**Questionnaire Design**

A self-administered, structured questionnaire written in English validated through a pretested survey including 16 items was used to assess the perception of undergraduate medical students towards medical ethics, CPA and its influence on Violence against Doctors. The questions were aimed to ascertain perspectives of participants towards medical ethics, CPA and its influence on Violence against Doctors.

The purpose and details of the study was explained to all the study participants. They were exposed to closed ended pre-tested and pre-validated questionnaire regarding awareness of Consumer Protection Act after obtaining their informed verbal consent. A self administered questionnaire having 16 questions related to various aspects of CPA and violence against doctor, was provided to the participants. Confidentiality was maintained.

The study participants were given the questionnaire (with complete explanation on how to fill in the questionnaire) on the day of visit by a single investigator. The participants were asked to respond to each item according to the response format provided in 30 minutes time. The questionnaire was later checked by the investigator. Data obtained was analyzed using SPSS version 20.

**Observation & Results**

A total of 189 students (81 Male and 108 Females) were considered for present study. Among 189 respondents, 82 were 2nd Professional and 107 were from 3rd Professional students. Most students were well aware of CPA. Out of 189 participants, 85% were well aware of Consumer Protection Act.

Discussion
Among 189 participants; 161 (85 %) attributed fear of CPA and litigations against the doctors as a cause of upsurge in violence against the health care professionals. With the advent of Consumer Protection Act, 1986 creating consumer disputes redressal agencies (C.D.R.As) there were drastic changes. This was immediately resented by the medical community who raised their shields and challenged the applicability of the Act to them. There is a considerable scope for studies to explore the role of unsatisfied doctors vis-à-vis their
services now being under the ambit of CPA.

As part of the medical curriculum, all doctors are taught clinical behavior but not all are taught empathy. Whereas in clinical practice, effective patient–doctor communication involving receiving an explanation for the occurrence of the symptom/sign, likely duration of treatment, the lack of unmet expectations, and empathy are associated with overall patient satisfaction with the services. In our study more than 80% students admitted lack of training and communication skills as a causative factor.

Such violence may end up with a variety of psychological and psychiatric conditions like insomnia, depression, Post-traumatic Stress Disorder (PTSD), agoraphobia, fear and anxiety, often leading to acute absenteeism from work and loss of productivity in the long-term.

Many a time, the patient does not comprehend the gravity of the situation and expects a better chance of complete recovery due to improper explanation by the treating doctor. In a country like India, due to the scarcity of doctors and health-care facilities, these issues are seldom given importance, which makes this one of the important causes of rising violence against health-care practitioners in the country. Statistics from a recent Indian study of 151 doctors, evaluating workplace violence, suggested that only six of them had received some formal training in effective communication and five of these doctors belonged to psychiatry department where it is a part of the curriculum. This suggests that there is an urgent need for improving the communication between the patient and doctor by imparting training to the current generation of doctors.

In India, a single doctor caters a population of 1,445 which is much lower than the WHO’s standard of one doctor for 1,000 people. This leads to a heavy workload with meager facilities. The study shows that 92% students accounted compelling workload as one of the contributory factors towards rise in violence.

71% students feel the need for more stringent laws to prevent violence against the doctors. Having a Central law for prevention of violence against healthcare persons and institutions would also help but a change in the IPC to make such violence a cognizable offence with stringent punishment is the need of the hour.

Limitations:

Being a cross-sectional study with relatively small sample size it is difficult to generalize these findings for the entire nation. Further, it was a questionnaire study, knowledge and awareness of participants may or may not be predicted, reflecting the intrinsic limitations of such studies. Further studies should be conducted with applicability of some better tools.

Preventive measures and Recommendation:

1. Well trained security staff must respond immediately in case violence occurs and assist if needed.
2. All medical centers must have an advance and robust public address system with distinct alert siren to cope up with such unfortunate incidences.
3. All the available staff should proceed to support the professionals under threat with a calm attitude and avoid any argument which may further worsen the situation.
4. Few unconcerned senior staff members, may try to talk with the patient’s relatives and try de-escalating the situation.
5. The practice of this drill should be done regularly in every health care establishment.

In addition, all hospitals should have a good network of closed circuit televisons and have a zero tolerance to workplace violence. Such steps have been taken already in developed countries.

Conclusion

Public awareness regarding medical negligence and patients right is growing worldwide including India. CPA is a reality which doctors needs to be trained exclusively.

Violence should be condemned in any form. However, against health care worker (HCWs) it is indefensible and should be dealt with stern efforts. Doctors and patients need to develop a better understanding between each other. Both have an important role to play in avoiding unnecessary violence. HCWs, while focusing on treatment, should not forget to communicate with the patients about the progress of therapy. A new chapter introduced in the medical curriculum focusing on the medical ethics, medicolegal knowledge and other nuances.
Patients, on the other should realize that medicine is not magic and a doctor is not God. It is to be remembered that the fight is against diseases and not against doctors.

These measures would definitely address the problem of violence against healthcare service professionals and damage to the property of clinical establishments across the country. Stronger political commitment to safeguard medical professionals by framing strict central laws and implementing them at the ground level would go a long way in resolving the long overlooked issues of violence against doctors.

To Study the Intervention of Bell’s Palsy by Video Self Modelling through Kinect Azure: A Research Protocol

Madhura R. Darware¹, Divya Jethwani²

¹Final Year Student, Ravi Nair Physiotherapy College, Datta Meghe Institute of Medical Sciences, Wardha, Maharashtra, India, ²Associate Professor, Department of Neuro-Physiotherapy, Ravi Nair Physiotherapy College, Sawangi(M), Wardha

Abstract

Background: Bell’s palsy is the common acute mono-neuropathy, and is commonly associated with facial paralysis or weakness of facial nerve. It is unilateral facial nerve paresis or paralysis. The cause of Bell’s palsy is suspected to be herpes simplex virus infection of nerve. The nerve get swollen because of this viral infection and is compressed in its canal as it passes through the temporal bone. Grading systems for the assessment of movements and asymmetry of face in Facial palsy are divided into computer-based and traditional grading systems. The program that uses Kinect Azure provides assessment method for evaluation of asymmetry of face at rest and the rating of facial palsy during voluntary activity of various areas over face. This study aims to investigate the intervention of facial palsy by video self modelling with the use of Kinect Azure.

Methods: 20 participants will be selected. Each group will include 10 subjects. Group A will receive conventional treatment, electrical muscle stimulator (EMS), and visual feedback.

Group B (Experimental group) will receive conventional treatment, electrical muscle stimulator and video self modelling. Each participant would be presented with their own videotape of video self-modeling, which included the best attempts at their evenest acts (smiles). Following 2 weeks of tape viewing the actions will be assessed. The outcome of the treatment will be assessed by Kinect Azure.

Discussion: Traditional methods for documentation of treatment effect have been through scales and questionnaires which at times are little complex and also difficult for patients to interpret. Hence this experimental and comparative study aims at focusing on the effective use of Kinect to document outcome for bell’s palsy.

Key words: Bell’s palsy, physical therapy, Kinect.

Introduction

Bell’s palsy is the common acute mono-neuropathy, and is commonly associated with facial paralysis or weakness of facial nerve. It is unilateral facial nerve paresis or paralysis. This disorder causes complete or partial inability of the paralysed side of face to voluntarily move facial muscles. The paresis or paralysis of face in Bell’s palsy result in inability to close the eyelid and temporary oral incompetence resulting in possible injury to the eye. Annual incidence of palsy is 15 to 30 per 100,000 people, with equal numbers of women and male affected. Any side of the face has no predilection. The palsy of Bell was identified in patients of all ages, with peak incidence in the 40s. It occurs more frequently in diabetes patients and pregnant females.

The cause of Bell’s palsy is suspected to be herpes simplex virus infection of nerve. The nerve get swollen because of this viral infection and is compressed in its canal as it passes through the temporal bone. Symptoms typically begin in the first week, and then gradually resolve over 3 to 3 months. It is in patients with diabetes, and while it can affect people of any age, incidence peaks in 40s. Paresis is the most disturbing symptom of Bell’s palsy; up to three quarters of affected people assume they have had a stroke or an intracranial tumour. The palsy frequently starts unexpectedly and...
progresses quickly, with maximum facial weakness occurring within two days. Hyperacusis, reduced tear production, and altered taste may be associated with symptoms. Patients may also report otalgia or aural fullness, and facial or retroauricular pain, usually mild and preceding palsy. Severe pain indicates herpes zoster virus, and can lead to a vesicular eruption and progression to Ramsay Hunt syndrome. Features can lead to a mild polynuropathy. A gradual progressive paralysis with other cranial nerve defects or headache increase the neoplasm possibility (4).

Video self-modelling is used with movements of face affected by facial nerve palsy (Lower Motor Neuron type). Although self-modeling patients view video clips of themselves engaging only in the correct, adaptive behavior and so the treatment relies on the patient being able to generate the desired form of behavior at least once. The action, or movement pattern, is recorded, edited into a short set of images by only choosing the best presentation and then given to the patient to watch again before replaying. Analyzing one’s best attempts at a desired reaction has been used to promote motor learning in a variety of therapeutic settings, and it improves the degree of success that integrates previously unachievable abilities. vBecause an successful smile provides the audience with a powerful emotional input, this study was designed to examine the use of video self-modeling as a method of adapting the smiles after facial nerve palsy.(5)

Evaluation of paralysis of face and quantitative grading of asymmetry is important to measure the severity of the disorder as well as to monitor its progression or improvement. As such, a precise quantitative grading system is needed which is easily understand, cheap and has minimum variability. As there is clearly a need for a clinically feasible tool that can assess the severity of the disease and the resultant loss of function from Facial palsy and can also calculate the efficacy of medical care or surgery. Such a tool should be qualitative, standardized, depending little or no on the observer, and cost-efficient.

Grading systems can be divided into conventional and computer based grading systems for determining facial gestures and facial asymmetry in facial palsy.(6) Modern approaches include the House-Brackmann grading system (HBGS)-The House and Brackmann grading system is recommended as a common standard for determining the degree of facial paralysis and is a clear and accurate method for evaluating facial function..(7) Functional disability index – It is a disease-specific, self-reporting functional status instrument that provides an essential component for the evaluation of citizens with facial neuromuscular disorders.(8) Many programs include Burres-Fisch, Nottingham, Sunnybrook, and many others. Computer-based FP grading systems including video recording and image processing are also proposed. (6)

Kinect Azure provides assessment method for evaluation of asymmetry of face at rest and the rating of facial palsy during voluntary activity of various areas over face. This study aims to investigate the intervention of facial palsy by video self modelling with the use of Kinect Azure.

Aim:

This study aims to analyze the intervention of Bell’s palsy by visual self-modeling using Kinect Azure.

Methodology

Study setting:

The trial will be carried out in HumEn research lab and Neuro Physiotherapy Department of Ravi Nair Physiotherapy College, DMIMS, Sawangi(Meghe), Wardha, Maharashtra, India ,after approval from Institutional Ethics Committee of Datta Meghe Institute Of Medical Sciences,Deemed to be University.

Study Design and Sample Size:

The design of the study is a single blinded randomized controlled trial of a Kinect Azure for individual diagnosed with bell’s palsy and it is an experimental and comparative study.

By using purposive sampling we will select 20 subjects(n=20) and will include 10 subjects in each groups(Group A and B). All topics will be clarified in detail about the research and a written informed consent will be taken. Group A will receive conventional treatment, electrical muscle stimulator(EMS),and visual feedback.Group B(Experimental group) will receive conventional treatment, electrical muscle stimulator and video self modelling. All topics will be clarified in detail about the research and a written informed consent will be taken. The schedule of enrollment, interventions, and assessments of the study is illustrated in Figure 1.

Participants

The Inclusion Criteria for the participants are as under:

1. Those who are willing to participate.
2. Patient affected by acute onset paralysis without detectable cause
3. Those with Idiopathic facial paralysis
4. Rehabilitation treatment carried out at our own hospital
5. Those who have unilateral facial paralysis-LMN type
6. Those who are between 20 to 42 years of age.
7. Those who scored above grade 3 on House brachman scale
8. Those have Normal superficial and deep sensation

The Exclusion Criteria for the participants are as under:
1. Those who are not willing to participate
2. Those with any type of facial fracture
3. Those with Known traumatic, inflammatory, Neoplastic pathology of facial nerve
4. Those with Bilateral facial paralysis
5. Those with UMN type facial palsy
6. Those who have Disease of central or peripheral nervous system
7. Those who scored below grade 3 on House brachman scale.
8. Those with Recent head injury
9. Those who have Psychiatric disease

PARTICIPANT TIMELINE:

The study duration is of 6 months and intervention duration is 2 weeks.

Assessment will be done on 1st day of visit following 2 weeks of tape viewing the actions will be reassessed.

RECRUITMENT: The neurologists and health care practitioners working under DMIMSU are invited to refer the prospective patients to our inpatient department (IPD). Regular visit to Neuromedicine, Neurosurgery wards will be done and contact will be maintain with doctors, record maintaining office for cases that will enrolled in hospital so that can be taken for study. The patients who are already undergoing treatment in our IPD and diagnosed with facial palsy will be assessed for the eligibility in the study as per the inclusion and exclusion criteria. Informed patient consent will be taken before allocation and after elaborating the purpose, nature, procedure, benefits and effects of the intervention.

Implementation:

Selection of the participants will be supervised by the research coordinator and principal investigators.

Blinding:

Tester(s) will be blinded to assign the subjects to the group. To ensure blinding, subjects will be mandated not to reveal any details of their treatment to the tester.

Study procedure:

The participants will be categorized into 2 groups:

Group A: (Conventional physiotherapy): The participants in this group will undergo 1 hour of conventional physiotherapy program daily, 5 days per week for 2 weeks. It will be performed by a physiotherapist in IPD. It will comprise of electrical muscle stimulator, visual feedback, facial exercises.

Group B: (Video self modelling combined with conventional physiotherapy): The participants in this group will undergo 30 minutes of conventional physiotherapy and 30 min of video self modelling based physiotherapy daily for 5 days per week for 2 weeks provided by physiotherapist in IPD. Each participant would be presented with their own videotape of video self-modeling, which included the best attempts at their evenest acts (smiles). In the following way we will make a videotape. A mobile video camera will be at a constant distance from the subject matter and set to run at session start. Subjects would be asked to complete a series of 5 smiles that included both their normal “everyday” (nonlinear) smile and their best (linear) “adapted” smile. The entire tape will be reviewed after a session, and 2 or 3 of the best smiles will be recorded using video editing software. Following 2 weeks of tape viewing the actions will be assessed.

The outcome of the treatment will be assessed by Kinect Azure from first day and after 2 weeks of intervention.

OUTCOMES

Primary outcome measures:

1) House-Brackmann Scale- For assessment of degree of facial paralysis.

2) Facial Disability Index used as an initial assessment tool and as a monitoring instrument to view
the outcome of intervention.

**Secondary outcome measure:**

Kinect Azure

**DATA COLLECTION AND MANAGEMENT**

**Data collection**

The assessment data will be collected from a pre-established spreadsheet with the baseline characteristics variable. Testing data will be put into a secure REDCap database. The nonelectronic data, such as hard copies of assessment forms, signed consent forms, etc., will be stored securely in the study setting. The employment of regular feedback concerning adherence and reminder phone calls (for attending the treatment) will be done.

**Data management:**

Data collection and documentation will be done under the guidance of the principal investigators. The study documentation will be evaluated thoroughly for accuracy. The Excel spreadsheet will be released at the end of the study to an allocation blinded statistician for conducting the necessary analysis, following which unblinding of the groups will be done. Checklists are used to prevent missing data due to the improper staff procedure.

**Statistical Analysis Plan**

Therapy induced changes in the primary outcome measures will be analysed via mixed-effects linear models across ‘time’ (pre-intervention vs post-intervention) and ‘group’ (Experimental vs control). The comparison will be done between the two groups using t-tests for the demographic measures and initial scores on outcome measures. For the interpretation of the results, we will set significant differences. Significance will be set at P less than 0.05. The results will be accounted for as per the CONSORT guidelines.

**BIAS**

Our study will have a low degree of selection bias (Oculus Quest). Measures will be taken to prevent attrition bias by giving reminder calls before each intervention and by giving transportation aids to those who require it. Thus, we anticipate a low percentage of dropouts.

**Discussion**

Our study aims to estimate efficacy of video self-modelling compared to conventional physiotherapy in individuals with Bell’s palsy. Physical therapy has played a significant part in Bell’s palsy management. Rehabilitation appeared effective in recovering facial symmetry, reducing paresis severity by 0.6 grades on the HB scale, and controlling synkinesia. Physiotherapy rehabilitation of an adapted (more symmetrical) smile was investigated by Dr Susan E in FNP subjects 1 year after the start, using video self-modeling (video replay of only the best adapted smiles) and implementing intentions (preplanning adapted smiles for specific situations and concluding that reaction time (RT) for the initiation of adapted smiles was 224 ms faster, adapted smiles were completed 544 ms faster, adapted smiles had higher overall quality, movement control and symmetry ratings, and Facial Disability Index scores also improved. His study supports these techniques of rehabilitation to maximize the quality of the smiles following facial nerve palsy. Kinect platform can be used to develop low cost approaches to measure the movement aspects objectively.

Research and development prospects and future therapeutic applications work with the Kinect are comprehensive. This will help to make diagnostic and prognostic evaluations.

**Ethical Approval and Dissemination**

Ethical approval will be taken from institutional ethical committee. The DMIMS which will fund research and the subjects which will participate in the study will be able to access the research’s main findings. For the enrolled subjects, data will be held safely for a minimum of five years. Once data collection is complete, a completion report will be produced for statistical analysis and sent for publication after review by institutional research cell.

**Patient Consent**

Principal Investigators will obtain the informed consent from the patient and one of the relatives on a printed form with signatures and give the proof of confidentiality.

**Confidentiality**

The study program will be explained to the participant and one of his/her relative, and the principal investigator will take personal information. The consent...
form will include the confidentiality statement and signatures of the principal investigator, patient and 2 witnesses. If required to disclose some information for the study, consent will be taken from the patient with complete assurance of his confidentiality.

**Author’s contribution**

DJ suggested the design of the study. MD and DJ led to the creation and design of the study. MD wrote the manuscript of this article. MD and DJ read and approved the final manuscript for publication.

**Declaration of interests:** The authors declare no conflicting interest.

**Funding:** No direct support will be taken for funding this research from any public and private organizations. The Department of Physiotherapy under Datta Meghe Institute Of Medical Sciences, Deemed to be University, will provide the necessary material for the research.

**Reference:**

Impact of Bedaquiline on Multidrug-Resistant Tuberculosis Treatment to Mother and Baby: An Incidental Case

Tutik Kusmiati¹, Faradila Nur Aini²

¹Medical Staff, Infection Division, Departement of Pulmonology and Respiratory Medicine, Faculty of Medicine, Universitas Airlangga – Dr. Soetomo General Academic Hospital, Surabaya, Indonesia, ² Resident, Departement of Pulmonology and Respiratory Medicine, Faculty of Medicine, Universitas Airlangga – Dr. Soetomo General Academic Hospital, Surabaya, Indonesia

Abstract

Background: Bedaquiline is a new drug which is recommended by World Health Organization (WHO) for individual regimen drug resistant-tuberculosis (DR-TB). The presence of regimen DR-TB in the blood is long enough with T¹/² 5-6 months, that is why bedaquiline is given on six months. Bedaquiline is not recommended for pregnant women because there is no data related to safety. The author will report an incidental pregnant female on bedaquiline treatment.

Case presentation: A 24-year-old woman with multidrug resistant tuberculosis (MDR TB) on individual regimen bedaquiline had incidental pregnancy at the 6th month treatment. In the beginning, the patient used bedaquiline because of the intolerance of second-line injectable drug. Bedaquiline regiment was used for 24th week. Pregnancy occured at the 6th month treatment. The patient continued the pregnancy and the MDR TB treatment was continued without bedaquiline. Nausea and vomiting were getting worse. Preterm labour occured in 33/34 weeks by cesarean section. The baby had severe asphyxia, used continuous positive airway pressure (CPAP), treated in NICU, had low weight but there was no disability. After several days of treatment, the condition of baby was improving and was able to outpatient.

Conclusion: The preterm labour, low birth weight, and neonatal emergency occured in a pregnant woman with MDR TB on individual regimen bedaquiline. Mother and baby can survive. More case and research data are needed on the safety of bedaquiline during pregnancy.

Keywords: bedaquiline, multidrug resistant tuberculosis, pregnancy, mother, baby

Introduction

Treatment of multidrug resistant tuberculosis (MDR TB) is increasingly complicated when the patient is pregnant. Pregnancy can occur when a patient has been diagnosed with MDR TB and is undergoing treatment or the pregnant woman diagnosed with MDR TB. There are still some controversial opinions regarding the management of MDR TB with pregnancy (¹). Some clinicians recommend terminating pregnancies and continuing MDR treatment. Other clinicians delay administration of the drug temporarily, especially in the early trimester. This doubt occurs because there is no data on the safety of MDR TB drugs in pregnant women and fetuses.

Case Presentation

A 24-year-old woman with MDR TB on individual regimen bedaquiline had incidental pregnancy at
the 6th month treatment. In the beginning, Acid-Fast Bacillus (AFB) sputum was positive, GeneXpert was *Mycobacterium tuberculosis* detected very low, Rifampicin Resistance detected, drug susceptibility testing (DST) was resistant of Rifampicin, Isoniazid, Ethambutol, Streptomycin, and sensitive of Kanamycin, Ofloxacin, Amikacin. The patient had moderate depressive episodes without psychotic symptoms because she had received TB treatment for the third time and treatment of MDR TB which took longer. Electrocardiography was within normal limit and there was no elongation of corrected QT interval (477 ms QTc). There was mild hearing loss on the right ear based. The laboratory data was normal. The patient had a strong motivation for treatment and recovery.

**Before Pregnant:** The patient used individual regimen bedaquiline because of intolerance of second-line injection drugs. Bedaquiline regimen was used for 24th week. The regimen was Pyrazinamida 1000 mg / Levofloxacin 750 mg / Ethionamide 500 mg / Cycloserine 500mg / Para-amino salicylic acid 8 mg / B6 100 mg with Bedaquiline 400 mg every day in the initial 2 weeks, and then continued with bedaquiline 200 mg three times a week. The patient had nausea and vomiting but medication was taken regularly.

**Pregnant:** Pregnancy occurred at the 6th month treatment. The patient continued the pregnancy and MDR treatment was continued without bedaquiline. The regimen was Pyrazinamida 1000 mg / Levofloxacin 750 mg / Ethionamide 500 mg / Cycloserine 500 mg / Para-amino salicylic acid 8 mg / B6 100 mg. Nausea and vomiting were getting worse and she had lost 5 kg of weight the first month of pregnancy. The patient had routine control of the pregnancy. There were no serious complaints during Antenatal Care.

**Labour:** Preterm labour occurred in 33/34 weeks gestation. Pregnancy had been maintained by tocolytic but it was unsuccessful. The bullae in both lung fields patient should the patients had sectio caesaria surgery and cannot vaginam labour (figure 1). There was no complication such as bleeding on the mother during operation process. The baby was female with clear coloured membranes but the baby had severe asphyxia (Apgar Score 3) in the first minute and was getting increase at the next evaluation. The baby used continuous positive airway pressure (CPAP) and treated in Neonatal Intensive Care Unit (NICU) for several days. Her weight was 1,950 gram so classified as low birth weight (LBW) but there was no disability. Babygram was within normal limit (figure 2). After several days of treatment, the baby was getting improved and transferred to the baby care room, which was then allowed to outpatient.

![Figure 1. Chest X-ray revealed the fibrotic process and multiple bullae in right and left apex hemithorax.](image1)

![Figure 2. Babygram.](image2)
Discussions

Pregnant women with untreated TB have morbidity, the risk of vertical transmission, and mortality rate of 40% (2). There is an increased risk of pregnancy complications such as spontaneous abortion, oligohydramnios, preterm labour, Intra Uterine Growth Restriction (IUGR), Intrauterine fetal Death (IUFD), and an increased risk of neonatal death. Therefore, pregnant women with TB need to be treated effectively before giving birth, including women with MDR TB. However, the clinician is often doubtful about the treatment because there is no data on safety.

Bedaquiline is bactericidal which is given an additional drug for MDR TB patients. Although bedaquiline is not teratogenic, there is no data on the safety of pregnant women. In this patient, pregnancy occurs at 6th month bedaquiline treatment. Bedaquiline has already stopped but the half-life (T1/2) is still around 4-5 months (0, 4). However, Bedaquiline is still in the blood and passes through the placenta to the fetus. This can impact the pregnancy in the first and second trimester.

Although bedaquiline was declared not teratogenic and mutagenic in the in vivo and in vitro studies, there was no study in pregnant women (1, 5, 6). In this patient, Partus Premature Imminent (PPI) occurs at 33/34 weeks of gestation by cesarean section. The baby had severe asphyxia with Apgar Score 3, but with good treatment, the Apgar score was increased in the next evaluation. The baby used CPAP and treated in NICU. Baby had low weight but there was no disability. After several days of treatment, the baby condition was improving and was able to outpatient.

Transmission of TB from mother to baby can occur during the fetus or after childbirth. TB in the fetus can occur when there is spread through the placenta during pregnancy. But this congenital tuberculosis is rare. In this situation, Mycobacterium tuberculosis has been identified in the amnion, decidua, and chorionic villi (7, 8). But this rarely happens if the mother has undergone effective treatment in pregnancy. In this patient, there is no specific process in umbilical histology examination. This is in accordance with the theory because mothers have received TB treatment well.

Conclusion

The preterm labour, low birth weight, and neonatal emergency occur in a pregnant woman with MDR TB on individual regiment bedaquiline. Mother and baby can survive. However, further monitoring is needed regarding the possibility of transmission of TB after birth. More case and research data are also needed on the safety of bedaquiline during pregnancy.

Ethics Statement

All procedures performed in studies / case report were in accordance with the ethical standards of the Ethics Committee in Dr. Soetomo General Academic Hospital, Surabaya, Indonesia. The authors explains the aimed, benefits, and rights of the participant during the process of collecting data to the patient’s guardian, if the participant agrees we ask the participant to fill out an informed consent sheet.

Conflict of Interest: The authors report no conflict of interest in this publish.

Acknowledgement : We would like to express our sincere thanks to the Indonesia Tuberculosis International Meeting (INATIME) event which facilitated us to present this research on 5-7 April 2019 at Surabaya, Indonesia.

Funding: None

Abstract

Migraine headache is a very common neurobiological disorder that is caused by increased excitability of the CNS. It has been increased the diagnosis of migraine headache which is based on the headache's characteristics and associated symptoms. It disturbs patients' quality of life and weakens their work, social activities, and life quality. Recently WHO organization classified migraine headache as 19th among all the disabling diseases. Data on sex related differences in migraine headache more marked overlapping with migraine features in females' subject. We have conducted survey on gender difference and prevalence of migraine having the sample size of 500 patients from Iraq.

We Selected Of 228 patients from 7-47 years who diagnosed with migraine headache according to Bagdad General hospital record from December 2018 to September 2019. After consent form signed, subjects were requested to fill questionnaire included demographic, clinical characteristics, history of sickness, duration of it, time happened in the months, general health, and other questions

The primary outcome was women are more prone to migraine attacks than men. 2-4 hours of pain was the most common period of headache along with triggering factor of stress and poor sleep. Migraine headache is a chronic daily sickness which is severe, and major health problem and disorder that effect on life quality.

in summary, we would confirm that there is presence of distinct gender related differences in migraine headaches add to some novel information that increase of level of migraine associated with family history.

Key Words: Migraine, Headache, gender- difference, disorders.

Introduction

Migraine headache are now acknowledged as one of the most prevalent cause of public ill health that would be affecting people health in all countries. This awareness comes, in the principal, from the multiple repetitions of the several of Global Burden of Disease (GBD) study since the year 2000 to 2018(1). one of GBD studies conducted in 2012 found tension and migraine types headache would be 2nd and 3rd the most prevalent disorders in the world (only dental caries was more common)(2).

Recently, global burden of disease increased and well cognizant during these years. Particularly by the population-based studies conducted in countries all over the world by what has been known as Lifting The Burden (LTB) (3, 4). Moreover, although LTB’s investigated all the use similar, identical methodology established for the purpose headache happening (5).

it has been defended several types of migraine, two principal types are: migraine with aura which is recognize and known as classic migraine and migraine without aura that are common migraine in many countries. The most common sort of migraine symptoms involved transient visual, sensory turbulences, motor interruption or language instabilities that are remain for 15 m or more than an hour and this mostly happened before onset of headache. while migraine Without aura

Wael Waleed Mustafa
E-mail: wael.walid@ruc.edu.iq
signs continuous from 4 to 72 hours and it symptoms are included sensitivity to light, nausea and vomiting, ailments in sound, touch, odor\(^6\).

Migraine is categorized as one-sided headache. The pain is location mostly behind eye, neck, face and shoulder\(^7\). Migraine confrontations usually are divided into five phases including by warning phase that are definite by physical and mental changes which trimmings after 1 to 24 h. second phase known as Aura phase which may include changes in visual (flashing lights sensitivity. its finales after 5 m to an hour. third phase would be Headache. it includes head pain usually experiences unilateral pain and some patients specific have bilateral pain. This particular phase symptoms may be involved nausea and vomiting, photophobia or phonophobia that take at least 4 hours or 3 days. forth phase known as resolution phase which is described as sufferer pain ended slowly. Sleeping is sufficient to cure this attack. Last phase would be postdromes or recovery phase. In this phase the discomfort and pain experiences are similar to symptoms happened in the first phase\(^8, 9\). Migraine can usually occur from environmental and genetic factors. Food is the most triggering factor other than fluctuation hormonal levels. It is most commonly occurs between the age of 20 to 50 years. It affects more boys than girls before puberty but often 2 -3 times more in elderly women than men. After menopause, there is a considerable reduction in migraine\(^10\). Many causes can lead to migraine such as environmental and genetic factors. Many studies support that Food is the greatest causing factor other than fluctuation hormonal levels\(^11\).

In the current study we aimed to describe the 1-year prevalence of these headache disorders in Iraq adult population, and present analyses of associations with demographic variables and disorders and history.

**Material and Methods**

In the medial of Iraq particularly in Baghdad city and from Number 2018 to Number 2019. After consent form has been singed responses to a feedback questionnaire were obtained from 330 individuals (238 females & 92 Males) from patients who attended headache and neurology disorders center, the individuals were selected on random basis.

Questionnaire based on 15 closed ended questions were asked form the general public covering awareness & history of migraine. several other questions included in the questionnaire such as gender, age group, duration of sickness, occurrence, symptoms, emotional and some of physical factors, inheritance factor and duration of treatment pattern.

**Results**

Results of the current study showed in table 1 that number of female prevalence in our area are more than male where noticed 138 patients (60%) while 92 males registered (40%). in the same table we noticed that women are taking their medicine faster than male. significant different has noticed among females who taken their medicines no more that 2 hours. even with other time point studied in the current study women were taking their medicines. describing pain feeling illustrated that 41% of female pronounce their pain by ache and pressure while 31% explained their pain by throbbing or pounding comparing to male where 29% of them experience their pain as throbbing or pounding. one of survey questions was that is migraine headaches bad to degree of awaken patients in the night. 42% of female answer were never while 63% of them were occasionally awake in the night. on the other hand, males respond showed that 41% were never awake in the night while 39% of them were occasionally awake from pain. knowing patient history would give a clue for prevalence such sickness among genders. having family member having this sort of sickness also included to have answer illustrated in table 1 where 59% of females answer were no and 41% yes. Table 1 also demonstrated that patients take part of this study respond to question asked about if headache cause health disorder that more males and females do not have any effect while 14% of females and males had health disorders.

Table2: Times of migraine experienced per month frequent of migraine headache per month would be explain who experienced more impact outcome from this sickness. Our results from table 2 showed that males and females having twice headaches per month is the most common answers 38% followed by once per month in females 18%. 14% of females and 13% of males had migraine headaches 3 times. 12% of females had migraine headaches 4 times per month while 8% of males showed same rate of headaches incidence.

In the present study authors pay intentions to general health of participants. Table 3 showed that period of having migraine headaches for more that 2 hours were higher among females 25% comparing to 17% among males. 18% of males and females had pain for 3-4 hours. 23% of males and females had pain for 5-12 hours of migraine headaches. 18% of females and 10% of males having pain for several days.

Considering general health, thus one of survey questions was that if patients had a head or neck injury.
77% of females and 80% of males did not have any injury while 23% of females and 20% of males had injury in neck and head. Having hormone or vitamins level checked answer was high no answer among females 87% comparing to 65% among males. 13% only of females had positive answer while 32% of males answered with yes. The survey included also question about general health in the last month 49% of females answered with good and 64% of males have same answered. 17% of females and 10% of male answered with excellent. Question about if migraine headaches effect on life quality, the answers were 57% of females it is effect at moderated level while 44% of males were answered at same level. Moderated effect was the higher percentage of impacts followed by 20% of females who answered with extremely effected which less than males at 21%.

Discussion

Migraine headaches are commonly occurring between the age of 20 to 50 years and this is similar to what has been found in the current study (12). More females that males who suffer from migraine headaches registered in the current study and this come along with previous studies which approved that migraine headaches are affected more on boys than girls before youth but it would increase among women for 2 -3 times more in elderly more than men. It has been reported that around one in each five women practices migraine headache. (13, 14). one study concluded that women are more express migraine attacks than men(13) . The frequencies of migraine headache results showed that significant increase in women in duration of more than 2 hours and several days and there are not different in the different duration included in the current study between males and females. Epidemiological studies in Korea on migraine headache demonstrated that women having long time expressing of headache than men and women also have an around three times greater risk of having migraine (15). Symptoms and description of sort of pain results headaches showed that more women explained their pain by Throbbing or pounding. As well as more women clarified their headache by Ache, pressure, Like a tight band and Dull comparing to males who less complain about headache and they always descripted as head pain. Our finding are in agreement with previous reported females to males description of pain where these studies illustrated that women predominant in groups of individuals that are affected by migraine (16)
up by night because the headache comparing to males. This may be related to male’s work and sustainability to pain. No significant different among females and males who having family history of migraine headache. Previous study showed that there are correlation to migraine headache and family history where they found 4 out of every 10 case of migraine showed headache relative but this study do not showed the different among males and females in this percentile(17). More females do not have health problem than males. Nevertheless, headache frequency and intensity found to be more related with health problems and gender has been approved in previous studies conducted in united states and Germany(18) in the current study, it has been proven that significant increase expressed 2 and 3 times of migraine headaches per month among women comparing to men. Sex specific may different according to hormone different. It has been reported that high level of estrogen and estrogen drawing through the menstrual period would be proposed as an elucidation for increase expression times per month among women (19).

Another question included in the questioner about who long the pain will be stay after taken pain medication, more women than men answered with continuing fell with pain after more than 2 and 3 hours after take medicine and even more women who feel with pain even after several days from taken medicine. This change in responded may be according to differences in the brain structural and neural circuity between women and men(20). Small proportion of patients who suffer from migraine visit doctors and use prescribed medication for migraine(14). No different has been showed among men and women who having injury in neck and head less women than men who do not checked their hormones and vitamins among our participant and this is because regular physical health checked and lab analysis is not common in Iraq, most patients going to doctor when they fell serious pain.

In summery migraine effect more in females comparing to males. Furthermore, we noticed through our analysis that more sex differences associated with some of characteristics and health disorders and family history. Our finding would propose the females are more prominent to headache and we recommended more study in this sickness and more awareness campaigns among Iraq population.

Abstract
Tuberculosis is chronic multisystemic disease caused mostly by Mycobacterium tuberculosis. The disease has its mention in the Vedas and Chakra and Sushruta described the features in the early 600 B.C. TB has a known site predilection for lungs, although, extra pulmonary cases have also been reported. The oral tuberculous lesions are a rare occurrence with atypical signs and symptoms, thus deferring an accurate diagnosis and treatment. A plethora of standard and contemporary diagnostic adjuncts facilitate the rapid and precise diagnosis. Anti-tubercular regimen forms the mainstay of treatment, although several recent drugs are also in clinical trial phase.

This article aims to highlight the etio-pathogenesis, clinical and oral features of tuberculosis, diagnostic tools, and management protocol for tuberculosis. There is also a brief mention on the various policies considered by World health Organization (WHO) to combat this dreaded disorder.

Key Words: diagnostic tools, oral tuberculosis, pulmonary tuberculosis, treatment protocol, tuberculosis.

Introduction
Tuberculosis (TB), a chronic, multisystemic infectious disease is characterized by granuloma formation.1 Tuberculosis (TB) is considered as a global public health hazard, outnumbering AIDS as the major infectious mortality cause. Early 80’s witnessed the decreased TB incidence due to BCG vaccination, anti-TB therapy and improved health care facilities. Resurgence of TB post 1985 occurred due to increased global population, HIV epidemics, deprived sanitary and health care conditions, TB endemic countries immigrants, and multi drug-resistance to anti TB.2,3 Currently, there is a decline in the incidence of TB cases, although, HIV infections and drug resistant strains pose a threat to the absolute abolition of TB.4

Robert Koch (1882) discovered the etiologic agent for TB.5 National Tuberculosis Association (American Lung Association) was established in 1904.6 Albert Calmette and Camille Guerin (1908) made the historic invention of TB vaccine BCG (Bacillus Calmette Guerin). The vaccine was first used on the human population in 1921. The vaccine is now counted in WHO’s list of most essential medication for basic health system.7

Epidemiology of Tuberculosis
According to the WHO TB Report (2018), TB has affected approximately 10.0 million (range, 9.0–11.1 million) individuals.8 The global tuberculosis burden reveals a marked variation among the numerous nations,
ranging from less than five to more than 500 new cases/100,000 population/year (130 being the average global burden). In 2018, TB associated mortality accounted for 1.2 million (range, 1.1–1.3 million) deaths among HIV-negative individuals (a 27% reduction from 1.7 million in 2000), and 2,51,000 deaths (range 2,23,000–2,81,000) among HIV-positive cases (a 60% reduction from 620,000 in 2000) respectively.9 Both sexes in all age groups are affected by TB, Men (aged ≥15 years) followed by women and children (aged <15 years) attributed for 57%, 32%, and 11% of all TB cases respectively. Among all TB cases, 8.6% patients had associated HIV infection (PLHIV).

Most TB cases in 2018 belonged to South-East Asia (44%), Africa (24%) and the Western Pacific (18%), with smaller percentages in the Eastern Mediterranean (8%), the Americas (3%) and Europe (3%). Eight countries accounted for two thirds of the global total: India (27%), China (9%), Indonesia (8%), the Philippines (6%), Pakistan (6%), Nigeria (4%), Bangladesh (4%) and South Africa (3%).10

India accounted for 35% of global TB deaths among HIV-negative people, and for 30% of the combined total number of TB deaths in HIV-negative and HIV-positive people. In India, notifications increased from 1.2 million in 2013 to 2 million in 2018 (+60%), including a 12% increase of 2,07,000 between 2017 and 2018. (https://www.who.int/tb/publications/global_report/en/)

Uttar Pradesh, with 17% of population of the country, is the largest contributor to the TB cases with 20% of the total notifications, accounting to about 4.2 Lakh cases (187 cases/lakh population). (https://tbcindia.gov.in/WriteReadData/India%20TB%20Report%202019.pdf)

Etiopathogenesis

The primary causative agent for tuberculosis is Mycobacterium tuberculosis.11 Mostly, transmission occurs via the respiratory route due to inhalation of Mycobacterium tuberculosis infected air droplets.12 Intake of unpasteurized cow’s milk (infected by Mycobacterium bovis) or infection by other atypical mycobacteria may also transmit the disease.13

Inhalation of contaminated air droplets causes seeding of M. tuberculosis bacilli in the lung alveoli. In immunocompetent individuals, the body defense mechanism (alveolar macrophages) clear this infection. However, in immunocompromised patients, M. tuberculosis multiplies inside the macrophages, and gets disseminated to regional lymph nodes, with further infection spread to the lungs, vertebrae, peritoneum, meninges, liver, spleen, and genitourinary tract. Cell-mediated immunity develops at this time and diagnostic tests of tuberculosis become positive. Tuberculosis pathogenesis usually ceases at this stage. The individual is symptom free and is said to have tuberculosis infection.14

In few cases, tuberculosis infection shows further progression to tuberculosis disease. If a healthy adult acquires M. tuberculosis infection, there is 5% to 10% likelihood that TB disease may develop during their life. There is 40% to 50% probability that TB disease may develop within 6 to 9 months in infected but untreated infants and toddlers.15 Several conditions may predispose to immune suppression (HIV infection, diabetes mellitus, malnutrition), causing progression from infective phase to disease in adults and children.16

TB pathogenesis is depicted in Fig.1.
TYPES OF TUBERCULOSIS- PULMONARY AND EXTRA PULMONARY TUBERCULOSIS

TB can be classified as either pulmonary or extra-pulmonary, based on the primary organ system implicated. Pulmonary TB is the most frequently encountered form. Tuberculosis may affect several extrapulmonary sites such as Lymph nodes, peritoneal cavity, genitourinary, nervous system, musculoskeletal system, and hepatosplenic systems.  

Approximately about 25% of TB lesions are seen in extra pulmonary sites, and head and neck tuberculosis occur in 10- 15% cases. However, primary oral lesions account to less than 1% of primary head and neck lesions. Oral tuberculous lesions may occur either primary or secondary to pulmonary tuberculosis with secondary lesions being more common. Primary oral tuberculous lesions have an age and site predilection (seen in younger age group, and gingiva being the commonest site), with accompanying regional lymphadenopathy. Tongue is the primary involved site in secondary TB, although palate, lips, buccal mucosa, gingiva and frenum may also be affected.

Oral tuberculous lesions usually have diverse manifestations, causing diagnostic dilemmas particularly when oral lesions herald the systemic features. Hence, TB should be considered in the differential diagnosis of suspicious oral pathologies.

Orofacial TB may involve any structure in and around the oral cavity. Andrade et al. suggested a classification of orofacial TB based on the site involved.

| IV    | Tuberculous lymphadenitis of the orofacial region  
No manifestations of Type I, II or III |
| V     | TB lesions in and around the oral cavity. |

Oro-facial TB manifests in various forms: Tuberculous ulcer, Desquamative gingivitis and gingival enlargement, lymph node TB, tuberculosis of tooth socket, tuberculous osteomyelitis, tuberculous sialadenitis, tuberculosis of maxillary sinus, tuberculous involvement of the Temporomandibular jaw and tuberculosis of skin.

1. **Tuberculous Ulcer**

Tuberculous ulcer is the most common oral lesion, appearing as an opalescent vesicle/nodule in its prodromal phase, which eventually rupture forming an ulcer. Tuberculous ulcer typically manifest as an irregular ulcer with undermined edges, mild indurated base covered with a yellowish granular slough.

Primary tubercular ulcers are rare, seen primarily in children and young individuals, appearing as shallow/deep, non-tender ulcers with tender lymph nodes. However, secondary lesions are seen in elderly as painful
ulcers with undermined margins, indurated base, covered with yellowish slough, and non-tender lymph nodes.23

The most common site for tuberculous ulcers is the tongue (lateral border ≤ tip ≤ anterior dorsum ≤ ventral surface), where it occur as persistent non-healing ulcer.24 Tuberculosis of the tongue may also manifest as an enlarged tongue (Macroglossia).19 Traumatic ulcers, aphthous ulcers, syphilitic ulcers and malignant ulcers should be considered in the differential diagnosis of TB ulcers.13

2. Tuberculous Gingivitis

Gingival tuberculosis may present as solitary proliferating granulation tissues or as mucosal ulcerations/erosions with rare concurrent marginal periodontitis.25,26 Desquamative gingivitis may occur in chronic infections, with tuberculosis being the most common chronic infection. Hasan et al. reported an interesting case of oral TB presenting as desquamative gingivitis.19 There are documented cases of gingival tuberculosis appearing as diffuse gingival enlargement.27,28

Gingival tuberculosis is rare and should be considered in the differential diagnosis of a persistent, recalcitrant, non-healing lesion.29,30

3. Tuberculoma

Tuberculous bacteria may reach the periapical tissues of the jawbone via-

A) Salivary acid-fast bacilli may invade the pulp of a deeply decayed tooth causing a periapical tuberculous periapical infection.

B) Blood stream TB dissemination

C) Deep periodontal pocket.31

The lesions are painless, rapidly spreading with significant bone involvement.19

4. Tuberculous involvement of extraction sockets of teeth

Deferred healing causes replacement of the extraction socket with pinkish-redish “tuberculous granulation tissue”.32 TB in such cases may result from the treating dentist who was later diagnosed with active pulmonary TB.33

5. TB lymphadenitis

Lymph node tuberculosis (LNT) is the most frequently occurring form of extra pulmonary TB in low TB prevalence regions. In TB endemic countries, LNT is outnumbered only by TB pleuritis. Mycobacterial cervical lymphadenitis is the most common form of LNT.34 TB lymphadenitis is atypical in its affinity to sex and age, primarily affecting younger age group
females, whereas pulmonary tuberculosis affects older male individuals.35

LNT presents as gradually progressing painless swelling of one/more lymph nodes. Initially, presents as firm, distinct, and mobile LN, later, appearing as matted with inflamed overlying skin. The full-blown cases manifest as softened lymph nodes with abscess and sinus.1

Jones and Campbell classification36 for LNT -

- Stage 1 - Reactive lymphadenitis - distinct, enlarged, mobile and firm nodes with nonspecific reactive hyperplasia
- Stage 2 - Peri adenitis - Rubberly lymph nodes fixed to underlying tissues
- Stage 3 - Cold abscess formation with softened central region
- Stage 4 - collar-stud abscess
- Stage 5 - Sinus tract formation.

The varied treatment protocol of tuberculous and nontuberculous mycobacterium cervical lymphadenitis warrants the differentiation between the two entities.37

6. TB SALIVARY GLANDS

Salivary gland TB is rare even in TB rampant nations like India. (2.5-10%).38 Primary and systemic TB has a site predilection for Parotid and Submandibular glands, respectively.39,40

According to Van Stubenrauch theory, the infection spreads from the oropharynx along the parotid gland duct (Stenson’s duct). According to Bockhorn and Berman postulates, dissemination of infection is through the blood stream and lymphatics, respectively.41

Tuberculous parotitis is frequently due to Mycobacterium bovis infection and rarely by Atypical mycobacterium.42 Parotid TB manifests in the following forms-

1. Acute inflammatory reaction of the gland mimicking sialadenitis, where the gland parenchyma forms multiple small abscess, later resulting in diffuse gland enlargement.43

2. Well circumscribed mass presenting as a progressively enlarging, asymptomatic mass, mimicking parotid neoplasm.44

3. Rarely as fistulous tract / abscess in the periauricular region.45

7. TUBERCULOUS OSTEOMELITIS

Local and systemic factors (viral infections, blood dyscrasias, chemotherapy and radiotherapy) predisposing to immune suppression usually aid in development of acute and secondary chronic osteomyelitis of the jawbones.46

Tuberculous jawbone osteomyelitis accounts only to less than 2% of skeletal tuberculosis.47 Maxillary jawbone TB osteomyelitis is rare mainly due to rich vascularity and strut maxillary bone structure.48

TB jawbone osteomyelitis typically present as apical osteitis and periodontitis with horizontal bone loss or as an extensive destructive osteolytic lesion, and differentiation with a dental abscess is difficult.49

8. TUBERCULOSIS OF TEMPOROMANDIBULAR JAW

TMJ tuberculosis usually occur secondary to a fistulous communication from the middle ear,50 and only six cases have been described as primary TB of the TMJ.51 A recalcitrant, painful preauricular swelling associated with trismus is the most frequently occurring manifestation.52 TB of the TMJ must be considered in the differential diagnosis of acute TMJ swelling and bone destruction, especially in TB endemic regions or those at risk of HIV.53

Initially, nocturnal muscle spasm occurs causing soft and elastic joint destruction, eventually causing localized atrophy of the periarticular muscles.54 Fibrosis or bony ankylosis, causing erosion of the condyle and glenoid fossa occurs in the advanced cases.

9. LUPUS VULGARIS

Oral lupus vulgaris is an exceptionally rare, however, it is the most common type of cutaneous TB in people with moderate immunity and high tuberculin sensitivity.57 In India, the common affected sites are buttocks, thighs, and legs, with rare facial involvement.
Lip mucosa, palate and the gingiva are the common oral sites affected. Disseminated pre-existing skin lupus outbreak, bacterial seeding from contaminated sputum, and hematogenous spread from the primary site may be the proposed pathogenic mechanisms. Laskaris described 4 cases of lupus vulgaris of the oral cavity.

Lupus vulgaris characteristically presents with a reddish-brown, nodular/plaque-like lesion, and shows an “apple-jelly” color on diascopy test.

10. TB NOSE AND PARANASAL SINUSES

Nasal and paranasal sinuses TB occurs infrequently due to the defensive mechanisms of the nasal mucosal ciliary action (nasal vibrissae) and the nasal secretions bactericidal properties. Maxillary and ethmoid sinuses are most frequently involved.

Maxillary sinus TB generally occur secondary to pulmonary tuberculosis. Nasal blockage/discharge/bleeding (epistaxis) with crusting are the common presenting manifestations. Sinonasal TB occur in 3 major forms: (i) mucosal involvement with polyp formation (ii) bony involvement with midfacial defects and fistular tracts (iii) hyperplastic form with granuloma impersonating a malignant lesion.

DIAGNOSTIC AIDS FOR OROFACIAL TUBERCULOSIS

TB diagnosis is usually made by detailed medical history, Physical examination and diagnostic aids like microscopic sputum smear examination, chest radiography and culture methods.

Fig. 3 depicts the various diagnostic aids in orofacial tuberculosis.
Fig. 3 Diagnostic Aids of Orofacial TB

**Prevention of Tuberculosis**

Center for disease control and prevention (CDC) has issued certain precautionary measures for healthcare professionals. Elective procedures should be deferred for active/suspected TB cases, and until all the TB investigations are negative. However, mandatory emergency treatment may be performed with certain precautionary measures:

- **a)** Appointment at the end of the day
- **b)** Should be the last treated patient
- **c)** Universal precautions for infection control-
  - Sterilization and disinfection of the operation theatres and instruments.
  - **Use of Rubber dams to prevent aerosol contact (except in patients with evident coughing)**
  - **Proper hand hygiene care**
  - **personal protective equipment (eye shields, HEPA or NIOSH N 95 face masks, head caps, gloves, and surgical gowns)**
  - **Evade direct contact with blood, body fluids and mucous membranes.**

**BCG VACCINATION**

Mycobacterium bovis Bacillus Calmette Guerin (BCG) vaccine is the most common preventive method.
to control global tuberculosis. BCG prevents severe disease and reduces death rates from miliary TB among children and meningeal TB in newborns, with variable suboptimal protection against pulmonary tuberculosis in children or adults. The Modified-Vaccinia-Ankara (MVA) 85A vaccine is an attempt to develop superior novel vaccine. However, clinical trials and studies have shown that it does not provide enough protection against TB.

### TREATMENT PROTOCOL

Anti-tubercular therapy (ATT) regimen varies based on the stage of infection and the individual’s risk likelihood. ATT regimen usually entails a drug combination, or a mixture of several drugs in a phasic manner (initial 2-month intensive phase followed by a 4- to 6-month continuation phase).

Directly observed therapy short-term (DOTS) efficiently monitors treatment adherence and completion. With the emergence of MDR-TB, DOTS-plus is a more arduous treatment strategy.

### Table 2 Management of orofacial tuberculosis

<td>Binds to 30s ribosomal units and inhibit translation</td>
<td>Ototoxicity, Nephrotoxicity, Neuromuscular blockade</td>
</tr>
</tbody>
</table>
4. Fluoroquinolones:  
Ciprofloxacin  
Oﬂoxacin  
Gatifloxacin  
Levoﬂoxacin  
Moxiﬂoxacin  

- Inhibits topo-isomerase II (DNA Gyrase), thereby releasing DNA with staggered double stranded breaks  
- Nausea, Abdominal rashes, Restlessness, Confusion

**COMBINATION DRUGS:**  
Rifamate  
Rifater  

- Competitive para-amino benzoic acid antagonist  
  - Isoniazid+Rifampin  
  - Isoniazid+Rifampin+pyrazinamide  
- GIT disturbances

Persistence and resistance are the primary factors preventing complete TB eradication. The bacilli evoke a chronic inflammatory reaction, causing the bacillary sequestration and preventing drug exposure. This requires extended ATT therapy to eliminate the bacterium, avoiding recurrence.74

Drug resistance occurs due to gene mutations, causing a heritable loss of drug susceptibility. Two types of drug resistance are observed in the context of TB.

MDR-TB- Mycobacterium tuberculosis (M. tuberculosis) is resistant to the most efficient first-line ATT.

XDR-TB has additional multi-drug resistance to the most active second-line agents, and fluoroquinolones.75

Researches are being conducted to develop novel anti-TB drugs that are economic, have better efficacy, a shorter treatment course, and should be able to treat latent TB, MDR-TB, and XDR-TB.76

| Milestone for 2025 | 75% reduction in tuberculosis deaths |
|                   | 50% reduction in tuberculosis incidence rates (less than 55 TB cases/100,000 population). TB affected families not to face calamitous charges. |

| Targets for 2035 | 90% reduction in tuberculosis deaths |
|                 | 90% reduction in tuberculosis incidence rates (less than 10 TB cases/1,00,000 population) TB affected families not to face calamitous charges. |

Conclusion

Tuberculosis is a common multisystemic disease, primarily affecting the pulmonary system. Oral TB lesions have bizarre clinical presentation, and the dentists need to be well acquainted with the varied oral features to arrive at an early and accurate diagnosis and treatment. Drug resistance to the various anti-tubercular drugs has posed a serious concern, and several novel ATT are currently in clinical trial phases to combat this complication. WHO has also adopted Global strategy and targets for tuberculosis prevention, care, and control.

Role of Vitamin D For Oral Health and Overall Health

K.Sheela1, Dhanasekhar Kesavelu1

1Senior lecturer Department of Prosthodontics, Dr.M.G.R.Educational & Research Institute, Thai moogambigai Dental College & Hospital, Chennai, 1Consultant Paediatrician & Paediatric Gastroenterologist, Apollo Childrens Hospital, Chennai

Abstract

Vitamin D, sometimes called the “sunshine vitamin” is produced in our skin in response to sunlight. It’s a fat-soluble vitamin in a family of compounds that includes vitamins D-1, D-2, and D-3. Our body produces vitamin D naturally when it’s directly exposed to sunlight. Vitamin D has several important functions. Perhaps the most vital are regulating the absorption of calcium and phosphorus, and facilitating normal immune system function. Getting a sufficient amount of vitamin D is important for normal growth and development of bones and teeth, as well as improved resistance against certain diseases. Nowadays, Vitamin D deficiency patients are identified in various medical fields and it is necessary to understand the symptoms, pathophysiology and therapeutic measures to overcome the deficiency of this vitamin in various age groups from pediatric to geriatric.

Key words: Cholecalciferol, Deficiency, Geriatric, Pediatric

Introduction

Vitamin D which was once known as “Fat soluble vitamin” now has been reincarnated with a dual role as “hormone” as well. Low vitamin D levels can drastically impact a person’s physical and mental well-being. Recently, following the discovery of vitamin D receptors throughout the body, its role in the prevention and treatment of chronic diseases has become an important area of research and interest. Vitamin D deficiency has been associated with various health problems such as cognitive decline, depression, osteoporosis, cardiovascular disease, hypertension, diabetes, and cancer. The process of aging predisposes the risk for vitamin D deficiency. Vitamin D plays a role in maintaining the homeostasis of various biological systems including the neuromuscular, skeletal, cutaneous, cardiovascular, and immune systems. Vitamin D also has properties such as tumor suppressing, anti-inflammatory, and antibacterial properties. It also plays an important role in Dentistry, in the development of teeth, promotion of the immune response to oral microbial infections, and promotion of healing post oral surgery. This article deals with the etiology, pathophysiology of vitamin D deficiency and its role in oral health from pediatric to geriatric.

Discussion

Vitamin D in its inactive form (vitamin D₃ or Cholecalciferol) is a steroid hormone that is synthesized in the skin with adequate exposure to the sun (ultraviolet light-bandwidth or frequency needs mentioning) and/or acquired through diet1-5. Foods naturally containing vitamin D are rare, and it can be found in high quantities in oily fish (such as salmon, mackerel, and herring) and commercial oils from fish (e.g., cod liver oil)⁶. Some of the major causes of VDD (Vitamin D Deficiency) is the lack of exposure to sunlight with adequate ultraviolet B rays (exogenous factor). VDD can also arise from a nutritional deficit due to inadequate intake of vitamin D, or hereditary disorders due to intestinal malabsorption and metabolic disorders. Drug related VDD is also possible due to iatrogenic causes such as increased clearance with anti-convulsant drugs phenytoin, carbamazepine, oxcarbazepine.

Vitamin D comprises of two components namely Vitamin D2 and D3. Vitamin D2 is produced via ultraviolet irradiation of ergosterol from yeast, while Vitamin D3 is obtained from ultraviolet irradiation of 7-dehydrocholesterol from lanolin, exhibiting the biological activity of cholecalciferol (vitamin D3), and it is synthesized in the human skin. According to the Endocrine Society Clinical Practice Guidelines, Vitamin D deficiency is defined as levels of 25(OH)D below 50 nmol/L and insufficiency as 25(OH)D levels of 52.5–72.5 nmol/L. The biomarker used for analysis of vitamin D status is by measurement of serum 25-hydroxyvitamin D (25[OH]D).

The cellular actions of Vitamin D are mediated through the Vitamin D receptor (VDR), which is a receptor molecule that binds to the active form of Vitamin D through the Vitamin D receptor (VDR), which is a ligand (RANKL). Mature osteoclasts remove calcium and phosphorus from the bone, maintaining the serum levels of calcium and phosphorus by hydroxylase (24-OHase), upholding its excretion in the bile. 1,25(OH)2D is recognized in the osteoblasts, 25-hydroxyvitamin D-25-hydroxylase (VD-25-hydroxylase) to vitamin D–binding protein (VDBP), which transports it to the liver. There, Vitamin D is converted by vitamin D-25-hydroxylase (VD-25-hydroxylase) to 25- hydroxyvitamin D (25(OH)D) (used as standard marker to the fetus vitamin D follow the maternal concentration and can be used as a standard marker to the fetus vitamin D deficiency will need to be considered with special focus on vulnerable population such as children, pregnancy, immuno-compromised individuals. With respect to oral disease, caries and periodontal disease are associated with VDD and its pathophysologic processes. Teeth are mineralized organs, surrounded by alveolar bone, and formed by three distinctive hard tissues: enamel, dentin, and cementum. The tooth mineralization process occurs parallel to skeletal mineralization, yet if mineral metabolism is disturbed then failures will occur similarly to those that occur in bone tissue. Vitamin D has impact on oral health based on bone metabolism. VDD compromises odontogenesis, resulting in a hypo mineralized dentition susceptible to fracture and caries lesions. Vitamin D plays a key role in bone and tooth mineralization, and when levels are unregulated it can lead to the “rachitic tooth”, which is a defective and hypo mineralized organ highly susceptible to fracture and decay.

Deciduous dentition can be influenced by maternal 25(OH)D levels, despite the influence of inherited defects of the fetus. Fetal serum-circulating levels of vitamin D follow the maternal concentration and can be used as a standard marker to the fetus. Therefore, if maternal 25(OH)D levels become unbalanced, this may have direct effect on the baby’s health particularly on tooth development. Nowadays, it is known that maternal VDD at 12–16, 20–32 and 36–40 weeks results in defects at the incisal third, middle third and cervical third of crowns respectively.

Vitamin D deficiency can impair the immune response to oral microbial infections, increasing the risk of oral infections and periodontitis. According to WHO, Dental caries is the fourth-most expensive chronic disease to treat. It has a complex and multifactorial etiology. Factors, such as cariogenic diet with a high carbohydrate content, cariogenic bacteria, and poor oral hygiene are risk factors for caries and periodontal infection. Certain evidence also highlights the association of low levels of vitamin D and the high prevalence of caries in both children and adults, although the mechanism remains unclear.

Hujoel et al concluded from studies that optimal vitamin D concentration (≥75 nmol/L) is associated with lower odds for dental caries in children. A randomized controlled trial concluded that the vitamin D supplementation reduced the risk of caries in about 47%, but with low certainty. Schroth et al showed that caries-free children were twice as likely to have optimal vitamin D concentrations (≥75 nmol/L) and those with severe early childhood caries were at nearly three times the odds of having deficient levels (<35nmol/L).
The impact of nutrition on periodontal health, particularly Vitamin D deficiency, has been investigated and a recent European study stated that an inadequate vitamin D status impacts periodontal health and oral functions. Vitamin D concentrations were associated with higher periodontal destruction, severe periodontitis stages and higher tooth loss. A more recent study from 2019 showed vitamin D supplementation was linked to a decrease of salivary cytokines before nonsurgical periodontal treatment. The association between periodontitis and maternal VDD reveal that pregnant women with moderate to severe periodontitis are diagnosed with lower serum levels of vitamin D. Non-surgical periodontal treatment during pregnancy was proved to be successful in reducing adverse pregnancy outcomes along with vitamin D supplementation showed mild clinical improvements in birthweight as shown by Khan et al.

Movement of tooth depends on the application of predetermined forces that cause mechanical stimuli with two simultaneous processes such as bone resorption on the pressure site, through osteoclastic activity; and bone formation on the tension site, by osteoblastic action. These processes may result in rapid tooth movement. Albeit animal observational in nature, there is an increasing evidence from a study by Kale et al showing that local application of vitamin D results in a faster tooth movement.

VDD is common in patients with oral neoplastic lesions. In a case-control study, direct association between VDD and increased risk of squamous cell carcinoma of the esophagus, oral, and pharyngeal cancers, which were more prevalent in heavy smokers and severe alcoholism. Anand et al demonstrated that vitamin D receptor expression was increased in premalignant lesions and oral cancer, and vitamin D supplementation significantly diminished therapy-related toxicities in late-stage oral cancers, with less morbidity and better quality of life.

Vitamin D is well known to be essential for the geriatric population. Osteomalacia in adults, like childhood rickets, develops in vitamin D deficiency, commonly presenting with severe aches in bones and muscles, marked proximal muscle weakness making standing up and walking difficult and painful and a marked ‘waddling’ gait. This condition is common in older people, vitamin D repletion is associated with increased risk, and severity of osteoporosis. Better vitamin D availability may contribute to reducing chronic inflammatory problems such as periodontitis and atheromatous disease, and may reduce acute vascular events due to arterial plaque disruption where inflammation is a major factor in progression of atheromatous disease.

Low baseline vitamin D status predicts reduced healing in the year after surgery for periodontitis, a common problem in older people, and giving vitamin D to subjects with severe periodontal problems improved post-operative bone defect resolution, supporting suggestions that hypovitaminosis D may worsen periodontitis. In Dental implants, osseointegration depends on bone metabolism, there is a possibility that low levels of vitamin D in the blood can negatively affect healing processes and new bone formation on the implant surface. The relationship between serum levels of vitamin D and osseointegration of dental implants is controversial and has been evaluated in a few case reports and animal studies. Most studies suggest that adequate serum levels of vitamin D can enhance the healing of peri-implant bone tissue. Patients with vitamin D deficiency (serum levels of vitamin D <10 ng/mL) showed an early implant failure rate of 11.1% Vs. failure rate of 2.9% in patients with normal levels of the vitamin (>30 ng/mL).

Owing to the impact of vitamin D deficiency-related complications and failures in dentistry, it is necessary that the clinician uses vitamin D supplements when deficiency is observed. Typically, 5,000 IU/day is recommended by the AACE (American Association of Clinical Endocrinologists) but a 8 to 12-week supplementation period is needed to reach adequate levels. This timeframe makes implant dentistry quite inconvenient, owing to the often-encountered need to restore teeth at earlier time points, along with the necessity to satisfy patient expectations within reasonable time frames. Over the years, it has become increasingly clear that vitamin D absorption is further optimized with several co-factors. These include vitamin K, magnesium,
calcium, manganese, and boron, among others. These co-factors, when present, help absorb vitamin D toward optimal levels in shorter healing periods.

Interestingly, the striking overlap between risk factors for severe COVID-19 and vitamin D deficiency, including obesity, older age, has led some researchers to hypothesize that vitamin D supplementation could hold promise as a preventive or therapeutic agent for COVID-19. However, a study conducted by Meltzer et al. in September 2020 concluded that persons who are likely to have deficient vitamin D levels at the time of COVID-19 testing were at substantially higher risk of testing positive than those with sufficient levels, and patients under treatment for vitamin D deficiency were not found to have increased risk for COVID-19. Further research is underway to confirm the efficiency of vitamin D supplementation and its role in prevention of COVID-19 infection, which is a very challenging area of research for the researchers in this current pandemic.

**Conclusion**

It’s imperative to understand the importance of vitamin D deficiency, its role in metabolism, growth, in maintaining the milieu interior in a wide range of population from pediatric to geriatric age groups, where particularly vulnerable age groups are now identified. Its role in regulating the immunopathology inflammatory response in various systems of the body also shows its antioxidant property. It is necessary to adhere to the daily recommendation of vitamin D according to the age of the individual for the maintaining of bone health.

This review article aims to sensitize the clinician about the metabolism, the pathway and the current evidence on vitamin D and the panorama of diseases and disorders that it may bring about and its role in oral health with particular emphasis on dental health. Role of vitamin D has gained momentum and it has now become the norm for it to be supplemented and deficiency treated to achieve optimal outcomes both in well-being and interventions.

Abstract

Introduction: Traumatic dental injuries are common among children owing to their developing
neuromusculoskeletal responses. This study aims at assessment of knowledge, attitude and practice towards
management of trauma to anterior teeth among faculty members and students of Medical College.

Materials and Method: A cross sectional survey with pretested questionnaire was used to assess the
demographics of the participants along with their knowledge regarding dental trauma, their attitude and
practices to handle them. Total of 200 participants comprising, 150 students and 50 faculty members of
the dental institute were part of this study. Descriptive statistics was used to represent each category. Also,
inferential statistical methods were used to assess any significant differences between the groups when
significance level is kept at 5%.

Results: The findings showed that almost 40% of the participants had experienced dental trauma before,
the most common trauma that they encountered was tooth fracture. Faculty members had better knowledge
score compared to students those who have had previous knowledge before regarding this issue also had
better knowledge than their counterpart.

Conclusion: The present study showed that the participants have sufficient knowledge about dental trauma,
and they showed a positive attitude towards it. However, some were still reluctant to perform dental first aid
when required due to the lack of training availability and education. Dental first aid needs to be a part of the
curriculum. Training programs are even more helpful, as it will help to build the confidence of the operator.
This will create awareness among the public about the importance of managing dental trauma of the anterior
teeth.

Key words: Emergency management; Tooth injuries; Tooth fracture; Tooth avulsion; First aid.

Introduction

Traumatic dental injuries are very common; epidemiological studies revealed that one out of two
children sustains a dental injury, most often between
Dental injuries can be due to a fall, injury from a variety of sports, road accidents, or even being struck by an object. Among them, fall is the most common cause of dental injuries. Crown fractures and luxation are the most commonly occurring dental injuries. Anterior teeth are most commonly involved in both the primary and permanent dentition in the majority of trauma cases. The maxillary central and lateral incisors were the most common teeth injured. The prognosis of traumatized teeth depends on the prompt and appropriate treatment, which often depends on the knowledge of the people managing the victim, which often are school teachers and parents. The International Association of Dental Traumatology (IADT) have come up with dental trauma guidelines that are intended to provide information for health care providers caring for patients with dental injuries. Although the actions taken at the site of accident holds crucial position in the outcome. Therefore, dentists should give appropriate advice in addition to increasing public awareness through electronic communications. Hence, the goal of these guidelines is to provide information for the immediate and urgent care of traumatic dental injuries.

The aim of current study was to assess the knowledge, attitude and practices towards management of anterior teeth trauma among students and faculty of medical institute in Karnataka with the objective to assess if any discrepancy between the students and faculty knowledge, attitude and practices.

Materials and Methods

A total of 200 respondents were selected for the study purpose using purposive sampling technique. Prior to the commencement of study, ethical clearance was obtained from institutional ethical committee. The participants were briefed about the study procedure and written consent was obtained to be a part of the study. A questionnaire was used comprising of 8, 4 and 4 questions for knowledge, attitude and practices. This questionnaire was tested for validity and reliability, which was found satisfactory.

For data presentation purpose, collected data was entered into Microsoft Excel 2016 and subjected to descriptive analysis. Furthermore, data was subjected to SPSS software to calculate correlation if any between the students and faculty.

Results

Table 1 shows that 79 participants have experienced or witnessed dental trauma before, while 121 have not. Out of these two groups, the ones who have had previous experience with dental trauma before shows better mean score of knowledge than the other with p-value of (P=0.009). This has been represented in a bar graph shown in Figure 1.

Figure 1: Background data of study participants (N = 200)

Figure 2: Response by study participants on “need for knowledge on Dental First Aid”
Figure 3: Response by study participants on “Need to include Dental First Aid in Curriculum

Figure 4: Response by study participants on “their reluctance to perform dental first Aid.”
Figure 5: Self-rating of knowledge on Dental First Aid among study participants (Percentage)

Figure 6: Reasons for lack of knowledge on dental first aid among study participants
(Those rating average and below, N = 189)
Figure 2 and Figure 3 show positive responses from faculties and students for the need of knowledge on dental first aid and the need to include dental first aid in curriculum.

Figure 4 shows the majority of the faculties and students are not reluctant to perform dental first aid with recorded percentage of 74% from faculties and 55.3% from students. The remaining 26% of faculties and 44.7% of the students are reluctant to do so.

Figure 5 shows a pie chart of participants self-rated their knowledge on dental first aid. The highest percentage of self-rating by the participants is ‘Average’ (44%) followed by ‘Below average’ (28.5%), ‘Poor’ (21.5%), ‘Good’ (5.5%) and ‘Excellent’ (0.5%).

Figure 6 shows a pie chart of reasons for lack of knowledge on dental first aid among study participants. The highest percentage of reason reported by participants is ‘Lack of professional training’ (63.49%) followed by ‘Lack of dental incidence’ (13.75%), ‘Lack of interest’ (12.6%), ‘Busy curriculum’ (8.9%) and ‘Don’t know’ (1.05%).

Discussion

Dental trauma is defined as traumatic injuries to the oral tissues such as the tooth, gums, alveolar bone and others. This type of trauma usually occurs during sports or rigorous activities, and they commonly affect the younger age groups such as children. The cause of dental trauma is unpredictable and can occur anytime, anywhere and to anyone and the most common tooth involved in dental trauma is the upper anterior, which can lead to negative effects to a person such loss of confidence and difficulty in eating. It is important for the public to know more about the management of the traumatic events and preventive measures that can be taken, so that the incidence of dental trauma can be reduced. Hence, this study was carried out to assess the level of knowledge, attitude and practice of faculty members and students of Melaka Manipal Medical College towards management of trauma to the anterior teeth.

Out of all 200 participants, almost 40% of them reportedly had witnessed or experienced dental trauma and the most common type of trauma experienced was tooth fracture. Those who had experienced dental trauma also had better knowledge score compared to those who have not experienced or witnessed any kind of dental trauma (P=0.09). Collectively, more than 80% of study participants did not have any previous knowledge on dental first aid. The results are similar to the study done by Mohandas et al, where 90% of the physical education teachers had received first aid training but among that 90%, only 4% had come across management of dental trauma as part of their first aid training. Even though only a few of the participants had previous knowledge about dental trauma, they showed better knowledge score with (P=0.025) compared to their counterpart.

While assessing practices among study participants, option ‘pick up the tooth, place in milk and go to dentist’ was chosen by as much as 18% of the study participants since, milk is proven to maintain the viable integrity and proliferative capability of periodontal ligaments cells. The next question regarding this case was about ways to arrest bleeding and almost 80% of study participants opted the option ‘ask child to bite on cotton pad’. The third question shows the highest percentage of the most proper answer whereby around 90% of study participants shows the urgency to bring the injured boy to the dentist immediately within 1 hour to manage the trauma, and for the last question, the study participants were asked about the consequence of not managing the dental injury properly and 50% answered ‘disrupts the eruption of permanent tooth’. 76% of study participants answered that they would immediately go to the dentist, and this shows their urgency on managing this matter similarly as in the first case. Even though fracture of enamel of a permanent tooth does not need any emergency care, dental attention should still be given to prevent any pulpal infections. In regards to the retention of dental knowledge, it is seen that the knowledge level of study participants is satisfactory. Almost 50% knows that it is possible to reattach a fractured tooth and 65.5% knows that is also possible to re-implant an avulsed or fallen tooth. 81.5% of study participants answered correctly regarding the way to handle an avulsed tooth and that is by holding the crown portion of the tooth, unlike previous study conducted. This is because to ensure a successful replantation of the tooth, damage to the pulpal tissue needs to be avoided, as they will help in the regeneration process later.

Most of the study participants felt that they should learn more about dental first aid and it should be part
of the curriculum. We found that 60% of the study participants were not reluctant to perform dental first aid if they encounter such situations and the remaining 40% are reluctant to do it with the most cited reason of fear of causing further harm or injury to the patients.\textsuperscript{11} Majority of the faculty members and students self-rated their knowledge on dental first aid as average and lack of professional training was the common reason reported by the faculty members and students on why they rated themselves, which was somehow in tandem with the previous findings.\textsuperscript{12,13,14}

**Conclusion**

The present study highlights some key factors related to lack in consistent knowledge and practices towards management of anterior tooth trauma. In spite of which, the participants of current study i.e. both faculty and students carry pretty good amount of not only knowledge and attitude but also, practices. The reason stated are different with common being the non-standardized and uniform knowledge not being imparted in all dental colleges in India. Although, a further more multicentric surveys involving more number of participants from various other medical and dental college and universities might give better clarity on the roadblocks.

1School of Midwifery, Faculty of Medicine, Universitas Airlangga, Surabaya, Indonesia, 2Department of Physiology, Faculty of Medicine, Universitas Brawijaya, Malang, Indonesia, 3Department of Public Health, Faculty of Medicine, Universitas Brawijaya, Malang Indonesia

Abstract

Cigarette smoke is one of the exogenous free radicals that can enter the blood circulation so that it can disrupt all body cells and tissues, including the reproductive organs. The anthocyanin in purple sweet potato is one of the bioactive that can counter free radicals. This study was conducted to prove the effect of anthocyanin in purple sweet potato from Gunung Kawi cultivar on follicle-stimulating hormone (FSH), and folliculogenesis levels on Wistar rats (Rattus norvegicus) exposed to cigarette smoke. This study was an experimental study with Randomized Post Test Only Control Group Design, using 30 female Wistar rats aged 1-2 months weighing 150-200g. The rats were divided into three groups of where they were exposed to cigarette smoke and administered with anthocyanin (each group with the doses of 20, 40 and 80 mg/kgbw/day). One positive control group was exposed to cigarette smoke without being administered with anthocyanin for 56 days, and one more group served as a negative control. The FSH levels in the serum were measured by employing the ELISA method, and the folliculogenesis (follicle amount and number of ovary follicular granulosa cells) was measured from histopathological slides with Haematoxylin-Eosin staining. The results indicated that anthocyanin in purple sweet potato significantly increased the FSH levels, the follicle amount and the number of primary follicular granulosa cell, secondary, and Graafian on female Wistar rat ovaries exposed to cigarette smoke with a p-value of less than 0.05. To ensure the anthocyanin dose that had maximum effect, more research is required with more dose variations and chronic toxicity tests for the safety of the anthocyanin in purple sweet potato of Gunung Kawi cultivar.

Keywords: anthocyanin, purple sweet potato, Gunung Kawi cultivar, FSH, ovary, folliculogenesis

Introduction

Cigarette smoke is one of the exogenous free radicals that can enter the bloodstream so that it can disrupt all body cells and tissues. The body physiologically produces antioxidants to counter the reactivity of free radicals. This antioxidant captures the free radicals and prevents its reactivity amplification by cutting the free radical’s chain oxidation reactions with cellular components, causing this antioxidant to earn its name as the free radical scavenger. If the number of free radicals exceeds the amount of antioxidant in the body, free radicals will increase the ROS in the blood. If this condition continues without any resistance from the body, oxidative stress will take place.

Oxidative stress can cause synthesis and secretion disturbances on hypothalamic GnRH. This failure will cause the pituitary gland to fail the synthesis and secretion of follicle stimulating hormone (FSH) and luteinizing hormone (LH). In addition, oxidative stress caused by cigarette smoke can affect folliculogenesis by inhibiting the follicle growth, increasing apoptosis, decreasing ovary volume and follicle count, and causing damage to the ovary, including granulosa cell degeneration. The cigarette smoke component that causes oxidative stress can cause DNA impairment to the follicles in the ovary, which is the source of estrogen hormone. Ganoon (2012) also suggests that nicotine suppresses follicle growth in the ovary, which results in the decreased levels of estrogen hormone.
One of the bioactive that can be used as antioxidants to counteract free radicals is anthocyanin. Anthocyanin is a potential antioxidant because of its capability to rapidly reduce oxygen species and turn it into a more stable aryloxyl radicals. This notion is supported by the research suggesting that anthocyanin can have higher antioxidant activity than vitamin E, vitamin C and beta-carotene. Zhao (2013) also reveals that the antioxidant effects of anthocyanin extract of sweet potato purple are higher than vitamin C.

Based on the background mentioned above, this study aims to prove the effect of anthocyanin in purple sweet potato (Ipomoea batatas L.) of Gunung Kawi cultivar on FSH serum and folliculogenesis levels on Wistar rats (Rattus norvegicus) exposed to cigarette smoke.

Materials and Methods

Experiment Animals

This study utilized healthy female Wistar rats and it was acclimatized. The samples of thirty rats aged 1-2 months, weighing 150-200g were divided into five groups, each has six rats, including one negative control group (without cigarette smoke exposure with anthocyanin), one positive control group (exposed to cigarette smoke without anthocyanin) and three treatment groups. The three treatment groups were the groups administered with anthocyanin at the doses of 20 mg/kg BW, 40 mg/kg BW, and 80mg/kg BW per day given through feeding tubes for eight weeks. All animals from the five groups were fed ad libitum.

Before starting the cigarette smoke exposure and anthocyanin administration, vaginal swabs were performed to see the estrus cycle. The cigarette smoke exposure started when the rats were in the proestrus phase. After eight weeks of exposure, vaginal swabs were performed on day 56 to determine the proestrus phase. The dissected rats were in the proestrus phase. The experimental animals were anesthetized through intramuscular injection (IM) in the thigh using 1% ketamine at a dose of 0.2ml.

Cigarette smoke exposure

Cigarette smoke exposure was administered as much as two sticks/day, i.e. one stick in the morning and one stick in the evening for eight weeks after they were found in the proestrus phase. The Cigarette smoke exposure box was made of fiberglass sized 26x12x12. It was only filled with three rats because there were only three rooms available in the smoking pump. The brand of cigarettes used was Gudang Garam Merah clove cigarettes (kretek cigarettes). After every exposure, the box was always cleaned from the remaining cigarette smoke from the previous treatment.

Anthocyanin Administration

Anthocyanin was administered by calculating the prescribed doses, which were 20mg/kgbw (Anthocyanin 1), 40 mg/kgbw (Anthocyanin 2), and 80mg/kgbw (Anthocyanin 3) daily. All doses were diluted using 1 ml of aquadest and were administered for one week. The anthocyanin solution was administered by using a 1ml syringe and then put into the rats’ stomach using feeding needles.

Sample Collection

After eight weeks of administration, the female Wistar rats were treated with vaginal swabs to determine the proestrus phase after dissection. Furthermore, the blood was taken intracardially through the right heart ventricle as much as 3 ml through injection syringe. Then, the blood was put in test tubes without administered with anticoagulant which was then covered with rubber plugs. Next, the left ovary organ was taken, then put into 10% formalin buffer solution.

FSH Level Examination by using ELISA method

The blood serum samples were placed into 50 µl microplates. Then, 100µl Enzyme Conjugate was added for each microplate, then shaken for 2-5 minutes. The microplates were then incubated at 37ºC for two hours. After incubation, the solution in the microplates was cleaned up. Then, the microplates were washed by using 300µl washing solution and then shaken for 3 minutes. The washing was repeated for five times. When finished, the plates were turned over, pressed firmly with absorbent paper, and dried using a tissue. Then, 100µl TBM substrate solution was added to each microplate in order. On the next step, the tubes were incubated for 20 minutes at a closed room temperature by using window film and then wrapped with aluminum foil.
foil. Next, the reaction was stopped by adding 50µl stop solution into each microplate gently. Then, they were shaken for 5 seconds. The FSH level examination was conducted by inserting the microplates into the ELISA Spectrophotometer. The results were read at a wavelength of 450nm.

**Making of HE Ovary Preparation**

The ovary tissue was dissected to a thickness of 2-3 millimeters and then put into a 10% fixative formalin buffer. The tissue was then cut into 3-5 µm thickness for histopathological examination using Hematoxylin-Eosin (HE) staining.

**Examination of Ovary Follicle Number**

The number of ovary follicles was calculated from the ovary histopathological slides by using the Olympus XC 10 Dotslide Microscope for the overall cross-section and further identified with 400 magnification to calculate the primary, secondary and Graafian follicle.

**Examination of Ovary Follicular Granulosa Cells**

The calculation of the number of primary, secondary and Graafian follicular granulosa cells was carried out after obtaining the overall number of follicles. Then, the slides were explored to determine the examination visual fields of the primary follicular granulosa cells (4 visual fields), secondary follicular granulosa cells (5 visual fields), and Graafian follicular granulosa cells (5 visual fields) by using Olympus XC 10 Dotslide Microscope with 1,000 times magnification.

**Statistic Analysis**

The research results are expressed as average ± standard deviation (SD) of the mean. The data on FSH levels, the number of primary, secondary, and Graafian follicles, and the number of primary and secondary follicular granulosa cells were tested using One Way ANOVA difference test. Then the assessment proceeded with post-hoc LSD (Least Square Differences) test, while the number of Graafian follicular granulosa cells were calculated using Kruskal-Wallis test and further proceeded with the Mann Whitney-U test using SPSS version 20.0 (SPSS Inc., IBM). The coincidence interval was set at 95% and declared significant if the p-value was less than 0.05.

**Results**

The Effect of cigarette smoke exposure on FSH levels and folliculogenesis in female white rats (*Rattus Norvegicus*)

The difference test results in cigarette smoke exposure towards the FSH levels and folliculogenesis were carried out by comparing the negative control group with the positive control group.

Discussion

Cigarette smoke is an exogenous free radical that can accumulate in female reproductive organs\(^{13}\). The effects of free radicals on the reproductive organs include disorders of reproductive hormones, ovary maturation, ovulation, follicle development, fertilization and implantation.

In this study, it was found that cigarette smoke exposure on female Wistar rats significantly decreased the FSH levels and folliculogenesis in comparison to the control group (p-value <0.05). This indicates that cigarette smoke contains free radicals which can cause an increase in oxidative stress, either directly or indirectly\(^{14}\). Because of the increased oxidative stress, lipid peroxide occurs which can cause damage to the arcuate nucleus and ventromedial nucleus in the hypothalamus, resulting in disruption of hypothalamic GnRH synthesis and secretion. This failure will cause pituitary failure to synthesize and secrete FSH and LH. The excessive amount of cigarette smoke entering the body through inhalation will cause oxidative stress in the brain, resulting in brain cell degeneration which will cause damage to the hypothalamus. If this stage occurs, the levels of GnRH (gonadotropin releasing hormone) will decrease and will have an impact on the decreasing levels of FSH (follicle stimulating hormone) and LH (luteinizing hormone). This level decrease of FSH and LH hormones will interfere with the development of granulosa cells and the number of ovary follicles. This will disrupt ovary function and can result in infertility\(^{4,14}\).

The administration of anthocyanin from the purple sweet potato of Gunung Kawi cultivar with several dose levels in this study has indicated that there was an increase in FSH levels compared to the positive control group. At 80mg/kgbw anthocyanin dose, the highest FSH level was obtained compared to the other doses. From the study results, it was found that the fastest dose of anthocyanin in purple sweet potato from Gunung Kawi to increase FSH serum levels, follicle counts and the number of primary, secondary and Graafian follicular granulosa cells in female Wistar rats exposed to cigarette smoke was 80mg/kgbw (A3 treatment) in comparison to the anthocyanin doses of 20 mg/kgbw and 40 mg/kgbw. This proves the theory stating that anthocyanin can act as antioxidants. Anthocyanin is neuroprotective because it can capture ROS and prevent the occurrence of lipid peroxidation processes in the brain. The absence of oxidative stress in the brain will have an impact on increasing sex hormones (FSH and LH)\(^{15}\). Anthocyanin functions as an antioxidant by reducing free radicals, donating electrons to free radicals\(^{16,17}\). In addition, the anthocyanin from purple sweet potato can increase the Total Antioxidation Capacity (T-AOC), i.e. the enzymatic antioxidants in the body (SOD and GSH-PX) and reduce MDA levels so that the oxidative stress does not occur in body organs, including the ovary. This condition will affect the process of follicle and granulosa cell development\(^{12}\).

This study concludes that the anthocyanin in purple sweet potato of Gunung Kawi cultivar can increase FSH levels and folliculogenesis in female white rats exposed to cigarette smoke. However, this study cannot be generalized to humans because there has not been a chronic toxicity test and the dose of anthocyanin from purple sweet potato has not been found to be truly optimal for all organs instead of only the reproductive organs.

Conclusion

The results indicated that anthocyanin in purple sweet potato significantly increased the FSH levels, the follicle amount and the number of primary follicular granulosa cell, secondary, and Graafian on female Wistar rat ovaries exposed to cigarette smoke.

Abstract

Introduction: Cervical adenocarcinoma is the second most common type of cervical cancer. The marker to predict the risk of this cancer is still need to be improved. This study aimed to evaluate the correlation between expression of E6 HPV with p53 and p16INK4A in cervical adenocarcinoma and cervical normal.

Methods: This study was a cross sectional study conducted at the Department of Anatomic Pathology, Dr. Soetomo General Academic Hospital Surabaya Indonesia using 49 paraffin blocks during period January-December 2017. The E6 HPV, p53, and p16INK4A expression were detected by immunohistochemistry staining.

Results: There were significant differences between the expression of E6 HPV and p16INK4A in cervical adenocarcinoma and cervical normal, but the expression of p53 was no significant difference with p=0.060 (P>0.05). There was a positive correlation between the expression of E6 HPV with p53 and p16INK4A expression (p<0.05) in cervical adenocarcinoma and cervical normal, and in cervical adenocarcinoma group, there was a significant correlation between the expression of E6 HPV with p53 (p=0.004) and p16INK4A (p=0.028), but no correlation was found between p53 with p16INK4A expression (p=0.092).

Conclusion: It suggests that p16INK4A might serve as marker for predicting the risk of developing cervical cancer from the epithelium of cervical normal.

Introduction

Worldwide, cervical cancer is the third most common cancer ranking after breast and colorectal, with an estimated 530,000 new cases and 275,000 deaths in 2008. It is the fourth most common cause of cancer death ranking below breast, lung, and colorectal cancer. This is estimated that incidence and mortality rate of 15 and 8 per 100,000 respectively¹. Indonesia has a population of 132,521,684 women and is at great risk for cervical cancer. In 2018, cervical cancer is the second most common cancer after breast cancer, with 32,469 new cases and 18,279 death². The most common type of cervical cancer is squamous cell carcinoma, which affects ectocervical part, and the second most common type, is cervical adenocarcinoma, which affects the endocervical part, with an incidence of about 15% and the incidence tends to increase³.

The cause of cervical cancer is infection of Human Papillomavirus (HPV). The HPV virus infects the cervix through sexual contact, causing cervical squamous cell carcinoma and cervical adenocarcinoma⁴. The HPV 16 and 18 cause the 70% of cervical cancer in the world⁵, while HPV 6 and 11 cause the 90% of anogenital wart cases⁶. The HPV viral oncogenes, E6 and E7, have shown to be the main contributors to the development of HPV-induced cancers. These oncogenes have the ability to bind host cell regulatory proteins, especially tumor suppressor gene products. The HPV E6 protein
complexes with cellular proteins E6-AP and p53 and facilitates p53 degradation via the ubiquitin-dependent proteolytic system. E6 proteins of both high risk and low risk HPV types bind to p53 in vitro, but only E6 proteins of oncogenic HPV types can target p53 for degradation, thus inhibits the stabilization and activation of p53\textsuperscript{11}. The HPV oncoprotein E7 is known to bind and inactivate hypophosphorylated retinoblastoma protein (pRB), which eventually leads to upregulation of p16INK4A. P16INK4A is a tumor suppressor protein that inhibits cyclin dependent kinases (CDK)-4 or -6 binding to cyclin D which regulates the G1 cell cycle checkpoints\textsuperscript{12}.

Both p53 and p16INK4A in normal cell is almost undetectable by IHC staining. The expression of wild-type p53 (WT) has a very short half-life\textsuperscript{13}, therefore it is undetectable by immunohistochemistry (IHC) staining. In HPV infection cases, E6 protein of HPV will degrade p53 protein. p16INK4A protein in normal cells is expressed in very low level and almost undetectable by IHC. Because of the transforming activity of E7 oncogene, p16INK4A is strongly expressed in tumor cells affected by HPV and may be easily detected by IHC\textsuperscript{14}. However, the correlation between E6, p53, and p16 do not clear yet. Hence, the objective of this study was to evaluate the correlation between the expression of oncoprotein of E6 HPV with the expression of p53 and p16INK4A in cervical adenocarcinoma and cervical normal.

**Material and Method**

This study was a cross sectional study conducted at the Department of Anatomic Pathology, Dr. Soetomo General Academic Hospital, Surabaya, Indonesia during period January-December 2017. The study was approved by Ethics Committee of the Faculty of Medicine, Universitas Airlangga. The specimens of this study were 10 formalin fix paraffin embedded (FFPE) specimens of cervical normal from uterine prolapse cases and 39 FFPE of cervical adenocarcinoma cases. The diagnosis of cervical adenocarcinoma was made by a pathologist. The selection of FFPE samples using purposive random sampling, with inclusion criteria were specimens diagnosed as cervical adenocarcinoma histopathologically and tumor tissue in FFPE still has enough for IHC staining. The Pathologists sort and adjust between representative slides of cervical adenocarcinoma tissue and paraffin blocks.

E6 HPV was detected by immunohistochemistry (IHC) staining using the HPV16 E6/18 E6 Antibody (C1P5): SC-460 (Santa Cruz Biotechnology). Positive interpretation of the IHC staining was based on nuclear or combined nuclear and cytoplasmic staining. Only cytoplasmic staining was considered as negative\textsuperscript{15}. Scoring of the E6 HPV 16/18 was performed using an arbitrary semi quantitative scale. There was no staining that represented negative staining (score 0), 5-25% staining represented mild positive staining (score 1), 25-50% staining represented moderate positive staining (score 2), and >50% represented extensive positive staining (score 3)\textsuperscript{16}.

The expression of p53 was detected by IHC staining using monoclonal antibody p53 clone Y5 (Biocare). p53 is regarded as having score 0 if 0-5% of the cells were positive, score 1 if 5-25% of the cells were positive, score 2 if 26-50% were positive, score 3 if 51-75% were positive, and score 4 if >75% of the cells were positive\textsuperscript{17}.

p16INK4A expression was detected by IHC staining using the Anti-CDKN2A/p16INK4a Antibody (clone 1E12E10) IHC-plus™ LS-B5261 (LS Bio). Scoring of p16INK4A was negative (score 0) if <1% of the cells were positive, sporadic (score 1) if 1-5% of the cells were positive, focal (score 2) if 5-25% of the cells were positive, and diffuse (score 3) if >25% of the cells were positive\textsuperscript{18}.

Statistical analysis to evaluate the differences between the expression of E6 HPV, p53 and p16INK4A at cervical normal tissue and adenocarcinoma tissue was performed using The Kruskal-wallis (p<0.005) test and its correlation was analyzed by Spearman correlation test (p<0.005).

**Result**

This study used cervix specimen of women aged 30-81 years with mean ± SD of 51.78 ± 9.395. Cervical normal tissue was found in 10 specimens (20.4%) and cervical adenocarcinoma tissue were in 39 specimens (79.6%) (Table 1).

The results showed positivity and negativity for IHC staining of E6 HPV, p53, and p16INK4A expression in cervical normal and adenocarcinoma (Figure 1).

Figure 1. The immunohistochemistry staining of the E6 HPV, p53, and p16INK4A expression in cervical normal and adenocarcinoma. The expression of the E6 HPV negative staining in cervical normal (A) and positive staining in cervical adenocarcinoma 400 x (B). The expression of p53 negative staining in cervical normal (C) and positive staining in cervical adenocarcinoma 400x (D). The expression of p16INK4A negative staining in cervical normal (E) and positive staining in cervical adenocarcinoma 400x (F).
The E6 HPV expression in all of the cervical normal were negative, whereas in cervical adenocarcinoma the expression was positive with scores 0, 1, 2, and 3. We found significant difference between the expression of E6 HPV in cervical normal and in cervical adenocarcinoma with p=0.001 (P<0.05) (Table 2). Profiles of p53 expression in cervical normal showed that 60% (6/10) had score 0 and 40% (4/10) had scores 1 and 2, whereas in cervical adenocarcinoma the scores varied between 0, 1, 2, 3, and 4, but there was no significant difference with p value=0.060 (P>0.05) (Table 2). Profile of p16INK4A expression in cervical normal showed that 90% (9/10) had score 0 and 10% (1/10) had score 1, whereas in all cervical adenocarcinoma tissues had scores of 1, 2, and 3, and most of the specimens had score 3. Statistical analysis showed that there was a significant difference between p16INK4A expression in adenocarcinoma and cervical normal with p<0.0001 (P<0.05) (Table 2).

There was a significant correlation between the expression of E6 HPV with the expression of p53 and p16INK4A (p<0.05) from all of data both cervical adenocarcinoma and normal. In cervical adenocarcinoma group, there was a significant correlation between the expression of E6 HPV with the expression of p53 and p16INK4A, but in cervical normal, the data could not be analyzed because it was constant (Table 3). The Spearman’s coefficient (rs) for expression of E6 HPV and p53 from cervical adenocarcinoma was 0.402 with p value 0.004 (p<0.05). We found significant positive correlation between the expression of E6 HPV with p53 (Table 3). The rs for expression of E6 HPV with p16INK4A was 0.313 with p value of 0.028 (p<0.05), indicating a positive significant correlation between the expression of E6 HPV with p16INK4A in cervical adenocarcinoma (Table 3). These results indicate that the increase in the expression of E6 HPV is along with increased expression of p16 protein. There was no correlation between p53 expression and p16INK4A with Spearman’s coefficient rs 0.244 with p value=0.092 (p>0.05 (Table 3).

### Discussion

Cervical adenocarcinoma is one of the most frequent epithelial malignancies of the cervix after a squamous cell carcinoma. Screening for this type of adenocarcinoma cancer is more difficult because it is located in the endocervical canal. Therefore, the patient is often diagnosed at an advanced stage.

This study used the cervical normal tissue as control group and cervical adenocarcinoma tissue. The expression of E6 HPV in the study was a parameter for detecting the infection of HPV 16/18. Positive IHC staining showed that it was infected by HPV 16 and or 18 on the tissue. The expression of p53 in this study was a parameter to determine p53 activity in cervical adenocarcinoma tissue and cervical normal as control. p16INK4A expression in this study was a parameter for detecting p16INK4A protein accumulation in the tissues.

This study showed that E6 HPV in cervical normal was negative, while in cervical adenocarcinoma, it was both negative and positive. These suggested that in
cervical normal tissue, there is no expression of E6 HPV 16/18 oncoprotein. This indicated that cervical normal tissue in this study was not infected with HPV 16 and or 18. This study also showed that there was a significant difference in the expression of E6 HPV between cervical normal and adenocarcinoma tissue. This indicates that in adenocarcinoma cervical tissue there is an infection of HPV 16 and or 18. This is in accordance with the results of previous research that the HPV virus infects the cervix in the ectocervical area, causing squamous cell carcinoma and cervical adenocarcinoma. The genotype of HPV 16 and 18 cause for 70% of cervical cancer in the world, while HPV 6 and 11 account for 90% of the causes of anogenital warts.

HPV E6 protein binds to p53 and stimulated p53 degradation through a binding mechanism called ubiquitin-dependent proteolytic pathway (E6AP) to produce ubiquitination p53. Positive results for p53 in IHC staining may indicate accumulation of mutant-type p53 or ubiquitinated form of p53 undergoing degradation, but it still needs further study. Overexpression of p53 suggested accumulation of p16INK4A because pRb normally inhibits p16INK4A transcription. Increasing expression of the viral oncogenes in dysplastic cervical cells might thus be reflected by increased expression of p16INK4A. This study showed that cervical normal tissues were IHC staining p16INK4A is physiologically expressed very low in some cells, especially cells undergoing squamous metaplasia process). In contrast, due to the activity of cell transformation due to the oncogenic E7 HPV High Risk (HR) protein, p16INK4A is expressed very strongly in cervical cells with dysplasia and may easily be detected by IHC. Therefore, p16INK4A may be considered as a surrogate marker for HPV HR oncogene expression. In the epithelium of cervical normal, it was negative for 90% (9/10) specimens and was positive for 10% (1/10) specimens in sporadic appearance. It is also reported that 10% of cervical normal specimens expressed p16INK4A. This study showed that there was a significant difference between p16INK4A protein expression in cervical adenocarcinoma and cervical normal. This finding suggested that it might serve as a marker for predicting the risk of developing cervical cancer in epithelium of cervical normal and the IHC of p16INK4A might be used as supplementary test for cervical specimens.

HPV is an etiological agent of cervical cancer and classified into high-risk and low-risk genotypes according to their association with cancer. The oncogenic proteins are E6 and E7, E6 high risk HPV promote the degradation of p53, while E6 low risk. Expression of the E6 protein from HPV high risk resulted in degradation of p53, whereas E6 from HPV low risk did not. The E7 HPV inactivates pRB. There was a correlation between the expression of p16INK4A and pRb in cervical neoplasia. pRB inhibits the transcription of the cyclin-dependent kinase inhibitor gene p16INK4A. Increasing expression of the viral oncogenes in dysplastic cervical cells might thus be reflected by increased expression of p16INK4A. This study showed positive correlation between the expression of E6 HPV 16/18 with the expression of p53 and p16INK4A in cervical adenocarcinoma. Another study also showed an association between p16INK4A and endocervical carcinomas. This indicate that p16INK4A is a specific marker for premalignant and malignant lesions of the squamous and endocervical mucosa and it may be used as an important tool for reducing incorrect diagnosis of adenocarcinoma. However, the expression of E6 HPV 16/18 and p16INK4A between cervical normal and cervical adenocarcinoma were significantly different, while the expression of p53 was not significantly different. It showed that cervical normal tissues were
not infected by HPV 16/18, so that it resulted in no expression of p16INK4A. Therefore, we suggest that pathology centers in Indonesia, where HPV examination cannot be performed, might perform IHC for p16INK4A as a substitute method of examination.

**Conclusion**

In conclusion, this study showed positive correlation between the expression of E6 HPV 16/18 with p53 and p16INK4A in cervical normal and cervical adenocarcinoma tissues. We also found significant different expression of E6 HPV 16/18 and p16INK4A between cervical normal and cervical adenocarcinoma tissues. It suggested that p16INK4A might serve as marker for predicting risk of developing cervical cancer in epithelium of cervical normal and the IHC of E6 HPV and p16INK4A may be used as supplementary test for cervical specimens.

Correlation of Physical Activity with Fear of Fall in Patients with Total Knee Replacement - A Research Protocol

Nupur Thombare¹ Shalaka Dhankar²

¹Final year BPT, Ravi Nair Physiotherapy College, DMIMS (DU) Sawangi (M), Wardha, Maharashtra,
²Assistant Professor, Department of Community Health Sciences, Ravi Nair Physiotherapy College, DMIMS (DU)
Wardha, Maharashtra

Abstract

Background: An elderly patient who has undergone total knee replacement may have fear of fall. Fear of fall after TKR and its impact on physical activity is sparsely researched. This study was aimed to find a correlation of physical activity with fear of fall in patients with Total Knee Replacement. Physical activity is assessed using the Physical activity scale for the elderly (PASE) Scale. The PASE Scale is understandable, reliable, and is a valid tool to assess physical activity in the elderly. Fall efficacy scale (FES) is a valid tool to assess fear of fall. Objectives: The objective of the current study is to assess physical activity and fear of fall and to find Correlation of physical activity with fear of fall in patients with TKR. Methods: This study will be carried out in Physiotherapy OPD, Ravi Nair Physiotherapy College and AVBRH Hospital Sawangi Meghe, Wardha. 100 Patients undergone TKR will be examined. Physical activity and fear of fall will be assessed using the PASE scale and Fall Efficacy Scale respectively. Results: Upon completion of the Study result will be estimated by statistical analysis. Conclusion: After going through various studies, maximum studies indicated that there is a decrease in physical activity in patients with TKR but very few studies indicated fear of fall in the patients. Therefore, the current study is being carried out which could help to reach the conclusion to find whether there is any correlation between physical activity and fear of fall in patients undergone TKR. Because rehabilitation after TKR is mainly concentrated on improving the physical function however if the patient has fear of fall this may interfere with the patient returning to his or her physical activity.

Keywords: TKR (Total Knee Replacement), Fear of fall, Physical activity, PASE Scale, FES, Elderly population

Introduction

The most common surgical procedure performed in patients with chronic knee arthritis is total knee replacement worldwide (¹). Deficits after Total Knee Replacement is seen for an extended period of 7 years or even more. This significantly affects the functional independence of the patients in terms of walking speed, postural stability, stair climbing this in turn reduces muscular strength, range of motion, and an altered pattern of motion that is visible postoperatively.

Balance is important to maintain postural stability while conducting functional activities and for avoiding fall. Stability (static and dynamic) is a complex process that involves the integration of sensory information about the body’s location and its ability to provide an effective motor response to the movement of the body. (²)

Various activities like active living regular exercises, ability to transportation are all included in a broad term as Physical Activity. (³⁵) These include household activities,
(3) Social participation, and recreational activities. After undergoing total knee replacement physical activity of the patient can be severely affected if the patient is not provided with appropriate rehabilitation. Furthermore, this may lead to reduced muscle strength and physical activity which will again affect the strength in the lower extremity. This vicious cycle will go on continuing to make the patient with total knee replacement physically inactive. This may result in loss of balance, reduced confidence, and make them dependent and may increase fear of fall.

Total knee replacement is mostly associated with osteoarthritis and physiological factors like weakness of muscle and impaired postural control may contribute towards fall in the elderly. The above-mentioned factors can further reduce the ability of the patient effectively resulting in low confidence and reduced quality of life.

(4) Balance is important for the maintenance of posture and for the avoidance of fall. Fall is described as an event that inadvertently leads a person to rest on the floor. Fear of falling is more complex, referring to people who trust in their own ability to perform a task safely without losing equilibrium. Some researchers have declared it as a loss of trust in patients’ ability to balance, other people have described the fear of falling in different ways to someone who involves avoiding daily activities and to another losing trust in balance and walking which may contribute to delayed recovery after total knee replacement. Few elderly people develop symptoms or Behaviour in response to a fall without any physical trauma. They can voice an increased or decreased fear of falling that can lead to emotional delivery, changes in psychology, or social changes. Fear of falling when Usually referred to as an adverse outcome of the fall, not much is known about it. It is possible to provide interventions to avoid fear and certain conditions caused due to it, if fear is the only factor that is responsible for physical inactivity.

(5) Counselling that should be provided to the patients after the surgery for total knee replacement by the health care workers in the developing world setting about physical activity is limited due to the insufficient data on the demands for physic activity and various activities that are being pursued, also the inherent socio-cultural differences, in a developing country physical activities following Total Knee Replacement that varies significantly from those performed by the patients who lives in a developed country. Specific life requirements can require a greater emphasis on daily activities, thus reducing time for discretional activities. Furthermore, rehabilitation can be affected because of not having enough access to physiotherapy and postoperative treatment until patients return home.

Knee osteoarthritis is an often-chronic condition that can cause joint pain, muscle weakness in lower limbs, and physical dysfunction in elder males and females. Apparently, The most successful operative treatment for chronic knee osteoarthritis is total knee replacement, since it relieves pain and improves mobility in around 80 percent of patients. Since replacement of knee decreases knee pain and enhances physical function patients will be able to increase their degree of physical activity but sometimes due to fear of falling the patient is not able to initiate the activity. Nevertheless, while total knee replacement patients show gains in their Physical activity twelve months after surgery, still they do not meet the required amount of physical activity. High rates of sport and intense work practices, on the other hand, have been identified as significant risk factors for early implant failure. Therefore, Physical activity assessment and fear of fall assessment using the valid, accurate, and reproducible tool are of particular concern for total knee replacement patients.

The Physical Activity Scale for Elderly (PASE) is a test that is created especially for adults aged sixty-five and over. This measures the strength, intensity, and duration of physical activity, which may be performed by self or interviewer. The benefits of the PASE scale is that it requires a limited time to finish, the time period for the retrieval is quick.

Moreover, persons who undergo total knee replacement are at risk for multiple problems, such as inflammation, periprosthetic fracture, symptomatic loss of implants. These complications significantly reduce the benefits of total knee replacement and often require revision surgery.

Total knee replacement(TKR) is intended to enhance function and decrease the pain that occurs because of osteoarthritis and should therefore enable these patients to increase their levels of physical activity after the
operation. But, there were contradictory reports on the rates of physical activity after total knee replacement.

Although some research indicated increased physical activity, others found little to no improvement in the average rate of physical activity after undergoing Total knee replacement but there is less evidence on the correlation of physical activity with fear of fall. Therefore, the current study focuses to correlate fear of fall and physical activity after total knee replacement.(10)

Patients with total knee replacement experience postoperative pain regularly. Post-operative exercise strategies are suggested but the effect of various physical activity is uncertain. Nevertheless, postoperative pain after total knee replacement frequently continues for several years. Postoperative pain interferes with healing, leading to delayed or poor recovery. Regulating physical activity is a kind of non-pharmacological treatment strategies for pain. Originally, the standard solution for treating acute skeletal and muscular pain was bed rest, but more recently, exercise was advised to enhance pain and quality of life as much as possible. Exercise did postoperative, which includes moving out of bed and walking as soon as possible after the procedure, is also recommended in the patients who have had surgery of Total knee replacement. Improved physical activity postoperatively is critical in functional recovery. Suitable physical activity pacing is then effective in minimizing the intensity of musculoskeletal pain. Physical activity pacing aims to remove the variability of ups and downs in the pattern of exercise, maintaining a consistent pace during the day, and preventing a blind increase in physical exercise. Poor physical activity gives rise to discomfort, psychological symptoms, and physical impairment in patients having a higher amount of pain. However, postoperative patients are also usually recommended only to increase physical activity as often as possible to enhance physical function postoperatively. The effect of variability in day-to-day physical activity has not been studied. Therefore, proper assessment of physical activity is needed. (11)

Falls impact about one-third of older adults residing in the city per year and have significant safety and social implications. Older people have the impact of Fear of falling (FOF) regardless of any experience of fall they have encountered previously. The health of the person is affected because of activity limitation which is due to fall and also fear of fall. There are lower rates of self-reported Physical activity likely because of lack of movement after injury or preventing action due to fear of falling. There can be a reduction in balance and strength due to a decrease in an activity which may make them dependent and long-term care. Fear of Fall is linked to increased falls, functional limitations, reduced quality of life and decreased Physical Activity levels. Although Fear of fall can result in additional care while performing any activity, likely avoiding accidents, the reduced activity can also contribute to deconditioning and decrease in muscle strength.(12)

**Rationale:**

Various studies have been carried out to find physical activity in Total Knee Replacement patients. But there is less evidence of fear of fall associated with Total Knee Replacement patients. Therefore, a need was felt to assess fear of fall in Total Knee Replacement patients along with the physical activity and to find out co-relation between physical activity and fear of fall in Total Knee replacement patients.

**Objectives:**

1. To assess physical activity in patients with Total Knee Replacement.
2. To Assess the fear of fall in patients with Total knee replacement
3. To find Correlation of physical activity with fear of falling in patients with Total knee Replacement.

**Methodology**

The study will be conducted in the OPD of Community Health Science in Ravi Nair Physiotherapy College, SawangiMeghe, Wardha. The Institutional ethics committee clearance will be obtained before the commencement of the study. Initially, the Patient will be thoroughly evaluated. After satisfying selection criteria the patient will be selected for the study. Informed consent will be obtained in order to participate in the study. The subjects undergone Total knee replacement (Bilateral /Unilateral) in Age group of 50-80 years will be included. Patients with Neurological disorder resulting in impaired balance and Patients with vestibular
disorders will be excluded. PASE Questionnaire will be used to assess physical activity in the elderly and the fall efficacy scale will be used to assess fear of falls in older population. Reading will be spread on a master sheet. Data will be analyzed statistically.

**Outcome measures:**

1. Fall Efficacy Scale to assess fear of fall.
2. PASE score to assess Physical activity.

**METHODS:**

**Study Design:** Observational Study

**Study Setting:** Physiotherapy OPD, Ravi Nair Physiotherapy College and AVBRH hospital Sawangi Meghe, Wardha

**PARTICIPANTS:**

**Inclusion criteria:**

1. Total knee replacement patient Bilateral / Unilateral
2. Age group 50-80 years
3. Both Genders

**Exclusion criteria:**

1. Patients with Neurological disorders resulting in impaired balance.
2. Patients with vestibular disorders.

**VARIABLES:**

1. Fear of fall
2. Physical activity

**DATA SOURCE/MEASUREMENT:**

For fear of fall- Falls efficacy scale score will be measured

For Physical activity- the score on the PASE scale will be measured

**Bias:**

Subjects not fulfilling the selection criteria will be excluded from the study to prevent bias.

**Study Size:** 100

**Statistical method:** Convenient Sampling Technique.

**Result:** Upon completion of the study results, statistical analysis will be estimated.

**Discussion**

The current study is carried out to find a correlation of fear of falls with Physical activity in Patient undergone total knee replacement various studies have shown that reduced physical activity and fear of falls is associated with Total Knee Replacement(2,5). Fear of fall may result in reduced physical activity and interchangeably if the physical activity is reduced after undergoing Total Knee Replacement may result in musculoskeletal changes causing decrease muscle strength and Range Of Motion affecting balance and inducing fear of falls. Thus, the current study aims to find out whether there is the correlation of fear of falls and physical activity in patients with Total Knee Replacement.

**Key Result:** Total knee replacement, Fear of fall in elderly, Physical activity in elderly, PASE Scale, Fall Efficacy Scale, FES, Elderly population, falls

**Limitation:** It might be difficult to convince the patient for being a part of this study.

**Generalisability:** Study not done yet.

Case Report

The Risks of Femoral Nailing in the Positioning of Hemilithotomy on Traction Table Getting A Contralateral Well-Legdrop-Foot

Jasraj Kaur Bhamra1, Manpreet Kaur Bhamra1, Waqar M. Naqvi2

1Intern, Department of Community Health, Physiotherapy, Ravi Nair Physiotherapy College, Datta Meghe Institute of Medical Sciences, Sawangi Meghe, Wardha, Maharashtra, India. 2Professor & HOD, Department of Community Health Physiotherapy, Ravi Nair Physiotherapy College, Datta Meghe Institute of Medical Sciences, Sawangi Meghe, Wardha, Maharashtra, India.

Abstract

Introduction: Postoperative contra lateral morbidity following fracture fixation surgery is rare due to hemilithotomy placement on traction table. Following a typical orthopedic femoral nailing, we should note a case of unexplained typical peroneal nerve palsy formed on the contra lateral side, manifesting with drop foot.

Case report: After prolonged femoral nailing, a 32-year-old male suffered an uncommon common peroneal nerve palsy that manifested itself toward lateral drop foot. This iatrogenic and intermittent disorder was delineated to be position-related neuropraxia after neurophysiological analysis and review of applicable literature.

Conclusion: Place modification at intervals or complete avoidance of excessive hyperflexion of the knee is advised to prevent typical peroneal nerve morbidity against the lateral.

Keywords: foot drop, fracture of shaft of femur, common peroneal nerve palsy

Introduction

This study describes an extremely severe peroneal nerve palsy that formed following a severe orthopedic femoral nailing on the contra lateral leg, manifesting with drop foot (FIGURE 1). Fortunately, after a 4-month, cautious treatment, this functional deficiency was intermittent and fully recovered. So surgeons must be mindful of this possible morbidity when conducting surgery.

Case Presentation:

A 32-year-old male (body mass index of 30.2 kg/m²) sustained a comminuted, spiral fracture over his right femur in a motor vehicle accident. He was alert and focused on physical examination in the emergency department, with a strong contra lateral leg. Initial neurovascular examination on both legs were normal. The fracture was then treated using an intramedullary nailing with a closed reduction and stabilization. The patient underwent these surgical procedures under general anesthesia, and the unoperated leg was placed in a supine hemilithotomy position by a boot. It took four hours to achieve a suitable fixation, leading to technical difficulties in closely aligning fragments as well as in locking distal static screws. Fixation acceptable when the patient recovered consciousness he began complaining of extreme numbness and unable to move the unoperated leg.
His left leg was without swelling and local heat. However, at 24 hours after surgery, he already had a left foot drop showing complete loss of ankle dorsiflexion as well as impaired sensation under the knee, especially at the foot dorsum. The motor activity of the leg involved did not change during the remaining stay, while his sensory test progressed to a classic typical peroneal palsy distribution. The patient was fitted with an ankle-foot orthosis and was given physiotherapy with symptoms consistent with a severe peroneal nerve palsy. The velocity of the motor nerve conduction (NCV) indicated decreased amplitude in the common left peroneal nerve and needle electromyography (EMG) showed no motor unit action potential (MUAP) in the anterior left tibialis muscle, which was consistent with typical left peroneal neuropathy. He had daily outpatient follow-ups at our rehabilitation clinic after discharge, and was taught home exercises and given electrical stimulation. Both the motor and sensory functions of his left leg showed incremental progress. Two months after the incident he was almost able to remove his orthoses, and in the 4-month follow-up was observed a complete recovery of the unoperated leg without permanent sequelae.

**Clinical findings:**

Neurological findings included: foot manifesting complete loss of ankle dorsiflexion as well as impaired sensation below the knee, particularly at the foot dorsum there decreased pin-prick sensation and dragging of the left foot during gait study, with impaired dorsiflexion on heel strike.

**Diagnostic assessment:**

The velocity of the motor nerve conduction (NCV) indicated decreased amplitude in the common left peroneal nerve and needle electromyography (EMG) showed no motor unit action potential (MUAP) in the anterior left tibialis muscle, which was consistent with typical left peroneal neuropathy. Laboratory testing was done. Studies on nerve conduction and electromyography have confirmed the diagnosis of a severe peroneal neuropathy. Studies of nerve conduction showed potential amplitudes of a conductive block across the fibular head and below-normal compound motor activity. Slowing of the conduction was not observed. It was common to have the sensory and motor nerve responses in both legs. Electromyography of the right anterior tibialis muscle showed improvements in active and chronic denervation.

**Therapeutic intervention:**

- Intervention type in physiotherapy exercise
- self care
- ankle foot orthosis
- electrical muscle stimulation
- home program

**plan of care decide as per month:**

1 MONTH

- Electrical muscle stimulator: 30 contractions
  - sets × 3 times set
- Isometric dorsiflexion: 15 sec hold, repetition
  - 10 times (FIGURE 2(a))
  - Isometric planterflexion: 15 sec hold, repetition
  - 10 times (FIGURE 2(b))
- Wedge board standing
- Providing ankle foot orthosis: An orthotic ankle-foot is given that treats the steppageate by preventing drop in the foot during movement.

2 MONTH:

- Isometric dorsiflexion (active assisted movement) 15-20 sec hold, repetition - 15 times [FIGURE 2(a)]
- Isometric planterflexion: 15-20 sec hold, repetition 15 times [FIGURE 2(b)]
- Electrical muscle stimulator: 30 contractions × 3 times set
- Wedge board standing: 10 mins
- Toe to heel plantar flexion 10 sec hold for 10 min

3 MONTH:

- Electrical muscle stimulator: 30 contractions × 2 times
- Marble picked up exercise × 10 times
- Toe curl exercise × 7 to 8 times

4 MONTH:

- Electrical muscle stimulator × 30 contractions
- All foot movement will be actively performed
- Isometric dorsiflexion/plantarflexion
- Home program exercise

Discussion

The common peroneal nerve is often involved in trauma in lower extremities, and typically occurs as a foot drop while damaged due to the paresis of its distributed ankle dorsiflexor, anterior tibialis, toe dorsiflexors, extensor digitorum brevis and extensor hallucis longus muscles. Postoperative drop foot on the contra lateral, uninjured leg is uncommon in literature and occurs only in case reports. Several causes contribute to common peroneal nerve neuropathy, including external compression (Plaster cast, brace or immobilization), direct trauma, traction injury, and entrapment in the fibular tunnel. The reinforcement of the flexed knee and calf significantly raises intramuscular pressure (direct compression theory) and reduces blood pressure in the ankle (vascular insufficiency theory). Another cause of common peroneal neuropathy is prolonged unhealthy position which induces a syndrome of nerve trapping presenting as a drop in the foot.

Conclusion

We note an rare case of contra-lateral, common peroneal nerve palsy that formed following femoral nailing. Physiotherapy plays a major role in the treatment of foot drop patients. The primary goal of care is to increase the range of motions. Only modalities of manual therapy and electrotherapy performed satisfactorily on patient.

Abstract

Competition in the business world nowadays caused many pressures on workers and resulting in work stress. During 2001, the problem of stress had cost the organization up to $ 300 billion in terms of reimbursing maintenance costs, workers’ compensation, absenteeism and labor turnover. In Indonesia, especially Jakarta, around 1.33 million residents experience stress. This figure reaches 14% of the total population with severe stress levels of 7-10% and acute stress of 1-3%. It was also reported that Health care costs were almost 50% higher for treating workers who experienced high levels of stress in their work. Previous studies had found out that work stress was caused by several factors including work environment and workload. The purpose of this study was to analyze the correlation between workload and work environment with work stress on the Maintenance and Repair Division workers of PT. PAL Indonesia (Persero). This research design was a cross-sectional study. The population in this study were all technician workers on the Maintenance and Repair Division of PT. PAL Indonesia (Persero) as many as 51 workers. The sample was calculated using a simple random sampling technique so that a sample of 49 workers was obtained in the Production Department, Maintenance and Repair Division of PT. PAL Indonesia (Persero) as many as 51 workers. The sample was calculated using a simple random sampling technique so that a sample of 49 workers was obtained in the Production Department, Maintenance and Repair Division of PT. PAL Indonesia (Persero). The study was conducted in June 2019. Variables in this study were work climate, noise, lighting, physical workload, mental workload, and work stress. The data were analyzed by using the chi-square test and spearman test because there are differences in the scale of the data on the variables. The results are: work climate is not related to work stress (sig 0.715 > α), noise is not related to work stress (sig 0.380 > α), lighting is not related to work stress (0.322 > α), physical workload is related to work stress (sig 0.004 < α), mental workload has no relationship with work stress (sig 0.377 > α). The conclusion of this study is that only physical workload has a correlation with work stress.

Keywords: Workload, Work Environment, Work Stress

Introduction

Along with the development of the business world in the current development era, competition in the business world both at home and abroad is getting tougher and more complex. This forces companies to look for new innovations in order to increase production efficiency and productivity of their workers. To realize this, the company is challenged to be able to move all organizational factors to work optimally. One factor that plays a very important role in an organization is the human or worker factor. Workers have full control on every activity of the company in order to achieve its objectives.

Corresponding Author:
Putri Ayuni Alayyannur
Email: putri.a.a@fkm.unair.ac.id (+6281331068808)
Therefore, workers are required to perform well in the interests of the company. The high demands of companies on workers will cause pressure in workers and can cause work stress. Work stress is a feeling of stress experienced by employees in carrying out work. In addition, stress is a response in adjusting that is influenced by differences in each individual and his psychological processes, as a result of environmental actions, situations or events that produce too much psychological and physical demands of a person\(^{(1)}\).

Symptoms of work stress according to Beehr & Newman are divided into three, namely 1) Psychological symptoms, which are characterized by anxiety, tension, confusion, irritability, mental fatigue, depression, ineffective communication, boredom. 2) Physiological symptoms, physiological changes are characterized by symptoms such as feeling tired / tired, exhausted, dizzy, digestive disorders, respiratory problems, high blood pressure, sleep disorders, physical fatigue, skin disorders, increased heart rate. 3) Symptoms of behavior such as absenteeism, decreased performance and productivity, decreased quality of interpersonal relationships with family and friends, anxiety.

In addition to the work environment, factors that also influence the occurrence of work stress are workloads. Human work consists of two characteristics that is, mental and physical in nature, then each has a level of loading which is different. Too much loading rate high energy consumption allows overload for physical workload and “overstress” for mental work, conversely intensity too low loading is possible boredom in physical work and burnout or “understress” on mental work. So, effort is needed for intensity levels optimum loading between the two limits the extreme was and of course different between each individual\(^{(7)}\). Workload is something that arises from the interaction between the demands of tasks and the work environment used as a workplace. Workload is divided into 2 namely physical workload and mental workload\(^{(8)}\). High work demands in the company will cause a large workload given to workers. Winarsunu states that there is a correlation between workload with three strains, namely psychological, physical, and behavioral strains\(^{(9)}\). On this basis, the purpose of this research is to find out the relationship between work environment and workload with work stress.

**Material and Method**

The approach used in this study was a quantitative research approach. Based on aspects of data collection, this study is a type of observational research because the researchers only observe objects without giving any treatment or intervention act. The design of this study was a cross-sectional study because the data collection was carried out in only one time period, that is when the research was conducted in the field.

Data collection in this study was using the questionnaire method and laboratorium measurement. The data collected were then analyzed on the correlation between two variables. Data presentation techniques used in this study include: editing, scoring, and tabulating. The data obtained will then be processed using data processing software. The results of the processed data were then analyzed descriptively and presented in the form of a frequency distribution table and percentage analysis, as well as an analysis of the correlation significance test between the two variables. The data were analyzed by using the chi-square test and spearman test because there were differences in the scale of the data on the variables. The significance level could be seen from the significance value. If it was less than 0.05, it showed that there was a correlation between the analyzed variables. Most of the styles are intuitive. However, we invite you to read carefully the brief description below.

This study was conducted in the Maintenance and Repair Division of PT. PAL Indonesia (Persero), Surabaya on June 2019. The population used in this study was 51 technician workers of the Maintenance and Repair Division of PT. PAL Indonesia (Persero), Surabaya. The sample was calculated using a simple random sampling technique so that a sample of 49 workers was obtained in the Production Department, Maintenance and Repair Division of PT. PAL Indonesia (Persero). The research variables analyzed in this study consisted of the dependent and independent variables. The independent variable in this study was the work environment (consisting of work climate, noise and lighting) and workload (consisting of physical workload and mental workload). Meanwhile, the dependent variables in this study was work stress.
Findings

The Frequency Distribution of Work Environment

In this study, work environment variables on the Maintenance and Repair Division of PT. PAL Indonesia (Persero), Surabaya consisted of work climate, noise and lighting at work. Those three variables were divided into two categories based on the conditions felt by the workers, either the workers feel disturbed or not disturbed. Based on Table 1, the majority of workers (89.8%) did not feel disturbed by the work climate. The remaining 10.2% or 5 workers feel disturbed by the work climate in their workplace. Furthermore, as many as 36 people or 73.5% of workers did not feel disturbed by noise that occurs in the workplace. The rest (26.5%) were disturbed by the noise. For lighting variables, the majority of workers (77.6%) did not feel disturbed by the lighting in their workplace. While the remaining 22.4% were disturbed.

The Frequency Distribution of Workload

The workload in this study was divided into two, namely physical workload and mental workload. Each variable was being grouped into three categories: low, medium and high. Based on Table 2, it can be seen that the majority of technical workers was having a ‘moderate’ physical workload (44.9%). Furthermore, as many as 19 workers (38.8%) had ‘low’ physical workloads and the remaining 16.3% had ‘high’ physical workloads.

The Frequency Distribution of Work Stress

Work stress in this study was divided into 3 categories, namely low, moderate, and high. Based on Table 3, it is shown that the majority of technician workers on the Maintenance and Repair Division of PT. PAL Indonesia (Persero), Surabaya were having a work stress in the ‘moderate’ category (53,1%) or as many as 26 persons. The rest, 17 persons (34,7%) were having work stress in the ‘low’ category and 6 persons (12,2%) were having work stress in the ‘high’ category.

The Relationship between Work Environment and Work Stress

Work environment variables in this study on the Maintenance and Repair Division of PT. PAL Indonesia (Persero), Surabaya consisted of work climate, noise and lighting at work. Based on Table 4, it is shown that each of the variables from work environment had no significant correlation with work stress as the significance value was > 0.05. So, it was concluded that there was no significant correlation be-tween work environment and work stress on the technician workers of the Maintenance and Repair Division of PT. PAL Indonesia (Persero), Surabaya. The OSH policy and the provision of PPE were correlated with individual commitment. Those two variables had a relationship in the ‘moderate’ category and a positive relationship with individual commitment. It was shown from the p-value in the OSH policy and the provision of PPE that was less than 0.05.

The Relationship between Workload and Work Stress

Workload variables in this study on the Maintenance and Repair Division of PT. PAL Indonesia (Persero), Surabaya consisted of physical workload and mental workload. Based on Table 5, it is shown that physical workload had a significant correlation with work stress (significance value 0.004 < α). Further, mental workload had no significant correlation with work stress (significance value > 0.05). So, it was concluded that only physical workload had a significant correlation with work stress, as for mental workload had no significant correlation with work stress.

Discussion

Literature Review will show that the results of the research carried out in accordance with some of the results of other studies. The correlation result showed that there was no significant correlation between work environment and work stress. This is not in line with the research results of Angwen, which stated that there is a positive relationship between the physical work environment and work stress on PT. Citrabuana Electric Stage\(^6\). Therefore, it can be said if the physical work environment is comfortable then work stress too will be temporarily low if the physical work environment is uncomfortable, then his work stress will also be high. As for stress is an output of the interaction between individuals and the work environment, in which it can be a threat and stressors for both psychologically and physiologically of an individual\(^10\). This is in line with the research result which stated that both the physical work environment and non-physical work environment affects work stress on employees at PT PLN (Persero) Distribution of East Java Malang Service Area\(^5\). Physical work environment is all things that are around where someone works, which directly or indirectly can affect in carrying out his work, while non-physical work environment is all things that happen in the company related to work relations, both relationships with superiors and relationships with colleagues, as well as relationships with subordinates\(^11\). Companies are required to be able to make a good work environment. Because, in running the employee’s work will interact directly with a work environment that is in each part of the company. So, the work environment will be very influential on the stress that will be received by employees or can also be interpreted that work environment is one of the ways that can be done to be able to control or minimize the stress received by employees. If interaction with the environment can going well will reduce the rate stress, besides that a good work environment will reduce fatigue and burnout at work\(^5\). Another study stated that the importance of the work environment for performance because of a good and positive work environment as well empower can increase employee work productivity\(^12\). Further discussion of the variables in the work environment on work stress, the correlation result showed that there is no significant correlation between work climate and work stress. In the previous studies on the relationship between work climate and work stress, there was various results. Recent research results found that work climate has an influence on work stress. Furthermore, it is found that organizational climate had a negative effect on employee work stress. This indicates that the healthier the climate of an organization, the lower level of employee work stress. Conversely, the unhealthier a climate in the organization, the higher the level of employee work stress\(^13\). Another research result stated the opposite and along with this research’s result found that climate the organization has no effect on work stress\(^14\). The results of the study explain that awareness or dysfunctional feelings of employees as a result of conditions that are felt at work and an employee’s psychological and physiological reactions to uncomfortable or undesirable conditions are not affected by quality the internal environment of the organization which is relatively ongoing, experienced by members organization, influence their behavior and can be described in terms of a set characteristics or nature of an organization such as structure, responsibilities, standards, appreciation, support and commitment. Hereafter, the correlation result showed that there is no significant correlation between noise and work stress. The previous studies showed various results on the relationship between noise and work stress. Shept in stated that there was a positive correlation between noise and work stress of the electrical industry employees\(^9\). In line, Dawson also stated that there was a positive relation between the perception of noise in the work environment with work stress on bank employees\(^15\). A noisy environment is a disturbance that can affect comfort and health, especially those originating from operational activities of machine tools. Noise is a stressor that can cause physical, psychological, and human behavior changes\(^16\). In contrast, Febriana stated that there was no significant role between perception of noise on work stress on PT. Hasnur Riung Sinergi’s employees\(^9\). Further, the correlation result showed that there is no significant correlation between noise and work stress. In contrast, another research resulted in the influence of lighting workspace against work stress on research subject caused additional light intensity done helps reduce decrease in physical factors and factors psychological factors that affect work stress\(^17\). Employees who work on the premises those with good lighting will work better because they can work more optimally compared to lower lighting. Besides, that good
lighting also affects employee psychology where they will feel cared for and will create a positive perception in the mind the employee. Good physical and positive perception is what will cause employees to work with productive and achieve high performance\(^{(11)}\).

Further discussion of the variables correlated with work stress were physical work-load and mental workload. Every job, of course will put a burden on the workforce or humans both physically and burden mentally, from an ergonomic standpoint, every workload received by someone must be appropriate or balanced well against physical ability, cognitive abilities and human limitations who receive the burden. Physical workload is the workload received from jobs that require physical energy such as lifting, pushing, transporting, while for mental workload is the difference between demands between workloads of a task with the maximum capacity of someone in motivated condition\(^{(18)}\). The result of this study showed that there was a correlation between physical workload and work stress. This is in line with the research result which stated that there is a positive relationship between workload and work stress on PT Citrabuana Electric Stage employees\(^{(6)}\). Thus, it can be said that if the workload is high then the work stress will also be high. Conversely if the workload is low, the work stress will also be low. Furthermore, the result of this study showed that there was no significant correlation between mental workload and work stress. In contrast, there is a relationship between mental workload and work stress on labor CSSD In-stallation of Surabaya Hajj General Hospital. The relationship between mental work-load and stress have a strong relationship in the same direction which mean a higher mental workload experienced by workers, the higher the work stress level experienced by the workforce at CSSD Installation\(^{(19)}\). In line, there was also a relationship be-tween mental workload and work stress on educational workers such as teachers and lecturers in Batam\(^{(7)}\). Mental workload which is greater than the body’s ability can cause an uncomort feelings (early phase), tiredness (overstress), injury, accident, pain, illness and decreased productivity (final phase). Inconversely, if the workload is smaller than the body’s ability, it can cause understress, boredom, saturation, lethar-gy, less productivity and illness\(^{(20)}\).

**Conclusion**

Based on the results of this study, it can be concluded that the majority of technician workers on the Maintenance and Repair Division of PT. PAL Indonesia (Persero), Surabaya did not feel disturbed by the work environment in the workplace. The research results showed that most of the workers experienced the moderate level of both physical and mental workload. They also experienced a moderate level of work stress.

From the study results, we can conclude that there is no significant relationship between work environment and work stress. Further, there is no significant relationship between mental workload and work stress. The significant relationship is only found between physical workload and work stress.

The Role of Ultrasonography in The Diagnosis of Oral and Maxillofacial Disease

Ni Putu Mira Sumarta¹, David Buntoro Kamdjaja², Roberto Manahan Yantie Simandjuntak³
¹Researchers staff in Department of Oral and Maxillofacial Surgery, Faculty of Dental Medicine, Universitas Airlangga, Surabaya-Indonesia

Abstract

Objective: Ultrasonography, as a diagnostic tool, constitutes a non-invasive, cost-effective, readily-available and repeatable imaging technique. Ultrasonography has been used as a means of diagnosing various medical conditions for many years. However, in the field of maxillofacial surgery it represents a relatively new aid in the diagnosis of various diseases affecting the oral and maxillofacial regions. These include: infection, soft-tissue related diseases and vascular anomalies which can be detected using Doppler ultrasonography. This article presents four cases, in which ultrasonography was employed to confirm diagnoses and act as a guide to treatment.

Methods: Four cases of soft tissue swelling and enlargement were diagnosed with the aid of ultrasonography, namely: a submasseteric abscess, a nasolabial cyst, a dermoid cyst and a left buccal space abscess caused by a foreign body (i.e. a fish bone).

Result: In the case of a submasseteric abscess, ultrasonography was used in confirming the diagnosis and therapy, while determining the maximal point of the abscess. In the cases of both cysts, ultrasonography highlighted well-defined cystic lesions with internal echo showing fluid accumulation, while in the buccal space abscess, an ultrasonogram confirmed the exact location of the fish bone.

Conclusion: Ultrasonography is a quick, widely-available, relatively inexpensive, painless procedure which can be repeated as often as necessary without risk to the patient. Thus, ultrasonography is a valuable diagnostic aid to the oral and maxillofacial surgeon in achieving early and accurate diagnosis.

Keywords: Abscess, Cyst, Maxillofacial abnormalities, Ultrasonography.

Introduction

Ultrasonography (USG), as a diagnostic tool, is a non-invasive, cost-effective, readily-available and repeatable imaging technique. Although used as a diagnostic tool in the treatment of various medical conditions since 1940, in the field of maxillofacial surgery it represents a relatively new diagnostic aid.¹,² Medical ultrasound devices use ultrasound waves of 2-20 MHz. USG technique is based on the variable acoustic impedance produced at tissue interphases as sound waves reflected at various organ surfaces to produce images.³ The reflected sound beam produces diagnostic anatomic information relating to the size, shape and internal structure of normal tissues and also pathologic processes. The time interval between the ultrasound wave’s being emitted from the transducer and the registering of the reflected wave produces a measurement of the distance between the skin and the organ and also the location of the pathology. The resulting information from the reflected waves is digitalized and thousands of such measurements generate an ultrasound cross-sectional image which is then recorded on the monitor in order to enable its interpretation. Ultrasonography images comprise: hypoechoic (low reflection of sound waves) that appear black, isoechoic (intermediate reflection of sound waves) that appear heterogeneously grey, and hyperechoic (high reflection of sound waves) that appear white. Bone tissue, empty space and water are generally hypoechoic, while bone margin is hyperechoic and muscular tissue is isoechoic.⁴

USG is used as an aid in the diagnosis of various diseases in the oral and maxillofacial regions such as infection, soft-tissue related diseases such as those afflicting the salivary gland, lymphnode reactions, cysts and neoplasm. Vascular anomalies can also be detected using Doppler ultrasonography.¹,³,⁵ Recently, USG became more popular in dentomaxillofacial region because of increasing radiation dose concerns and
economic limitations.  

The purpose of this clinical study is to present four cases of soft tissue swelling where USG was used as an aid in confirming diagnosis and supporting surgical treatment.

**Material and Methods**

Clinical study was conducted through retrospective medical record study of four cases of soft tissue swelling and enlargement in patients of the Oral and Maxillofacial Department, Universitas Airlangga Dental Hospital where diagnosis was confirmed using USG (GE), as well as an aid in surgical therapy.

**Case 1**

A 24-year old female presented swelling of the left cheek and inability to open her mouth after having her lower left first molar extracted ten days prior to admission. Clinical examination findings included: patient looking unwell, presence of a diffuse, hard and painful swelling in the left masseter region and limited ability to open the mouth (i.e., less than 1 cm wide). No fluctuation was encountered, while intraoral examination confirmed no signs of post-extraction infection of the socket. Clinical diagnosis of a submasseteric space abscess was conducted and surgical drainage was planned. A USG examination completed for confirmation revealed a hypoechoic lesion in the submasseteric region with fluid echo intensity at a maximal point of 1.57 cm. The presence of a submasseteric abscess was confirmed by means of USG examination (figure 1).

![Figure 1. Ultrasonogram showed hypoechoic lesion (x sign) in submasseteric space abscess.](image-url)
An intraoral incision with Swann Morton surgical blade no.11 was performed to evacuate pus from the submasseteric space abscess, 1 cc pus mixed with blood being drained. On evaluation, pain was found to have diminished, mouth opening had widened and the swelling had gradually subsided.

Case 2

A 59-year-old male attended with painless enlargement of the left nasal base which had been developing during the ten years prior to admission. Clinical examination revealed soft tissue enlargement with defined borders in the left nasolabial region resulting in a narrowing of the left nasolabial sulcus when compared to the right side, measuring ± 2 cm in diameter with a soft consistency and painless on palpation. Intraoral examination revealed a flattened left upper anterior vestibulum due to enlargement with defined borders, measuring ± 2 cm in diameter, with a soft consistency and painless on palpation. Periapical radiograph examination was within normal limits (Figure 2A). Diagnosis of a nasolabial cyst was made and confirmed by means of USG which showed a thin walled cystic lesion with defined border and internal echo, measuring 2.49 x 1.87 x 2.39 cm in the left nasolabial fold (Figure 2B).

Extirpation of the cyst was performed through an intra oral approach, healing was effective and no recurrence was found upon evaluation.

Figure 2. Periapical radiograph showed normal appearance in nasolabial cyst (2A). Ultrasonogram showed cystic lesion in the left nasolabial fold (2B).

Case 3

A 25-year-old female had complained for the previous 12 years of a recurrent neck swelling that forced her tongue upwards and backwards, thereby impairing both her breathing and ability to swallow. She also complained of pain and fever, but was generally in good condition. The submental swelling was erythematous, well-defined, measured 4 cm in diameter and extended sublingually, pushing the tongue upwards and backwards. The consistency was firm and tender on palpation. Submandibular node enlargement was evident.

Clinical diagnosis of the infected dermoid cyst was conducted and, after aspiration made from the submental region for decompression revealed an extremely viscous, yellowish fluid, the patient was sent for USG examination. The USG revealed a well-defined heterogeneous echoic lesion, measuring 3.34 cm
in diameter, with mixed content and debris. There was also post-aspiration defect with adjacent fluid collection and no intralesion vascularization was found. The submandibular glands were enlarged and diagnosis of an infected dermoid cyst was confirmed (figure 3).

The treatment consisted of extirpation of the cyst through an extra oral approach under general anesthesia, healing was effective and no recurrence was found upon evaluation.

Figure 3. Ultrasonogram of Dermoid cyst showed a well defined heterogenous echoic lesion measuring 3.34 cm in diameter, with mixed content and debris. There was also post aspiration defect with adjacent fluid collection, and no intralesion vascularization found.

Case 4

A 68 year old male presented with swelling on his left buccal region that had been present with intermittent pain for one week prior to admission. The patient had suffered a fish bone puncture to the left buccal region upon eating three months previously. Clinical examination confirmed well-defined erythematous swelling in the left buccal region measuring 2 cm in diameter, with firm consistency and little pain on palpation. Well-defined intraoral swelling in left buccal mucosa measuring 2 cm in diameter, with a soft consistency and tender on palpation. An initial, provisional diagnosis was one of a left buccal space abscess caused by a foreign body (fish bone). This was subsequently confirmed by USG which revealed a foreign body (fish bone) in the left buccal region measuring 7 mm and 8.4 mm in depth from the skin surface. There was also adjacent fluid collection around the fish bone, edematous surrounding tissue and increased vascularization (figure 4).

Surgical drainage and exploration of the fish bone using an intraoral approach was performed. Upon
exploration, a 7 mm long fish bone was found and evacuated. The healing process was successful and no recurrence found.

![Ultrasonogram showing foreign body](image)

**Figure 4.** Ultrasonogram showed foreign body measuring 7 mm and 8.4 mm in depth from skin surface in the left buccal region (yellow arrow). There was also adjacent fluid collection around the fish bone, oedematous surrounding tissue, and increased vascularization in buccal space abscess caused by foreign body.

**Result**

All cases presented showed that USG 100% accuracy in diagnosis of soft tissue enlargement in oral and maxillofacial region, as well as guiding surgical drainage and approach.

**Discussion**

USG has been traditionally employed in the assessment of soft tissues in the abdomen and pelvis. Its role in oral and maxillofacial surgery is less widely recognized. Recently, a considerable body of literature and research reports about the reliable use of USG in diagnostic processes relating to oral and maxillofacial lesions. Research into the accuracy, sensitivity, specificity and predictive value of ultrasound as a means of diagnosis of cervico-facial soft tissue swelling conducted by Akinbami, et al. (2006) confirmed the reliability of ultrasonography in the diagnosis of pleomorphic adenoma as being 80% and 100% for adenocarcinoma and hemangioma. It was also 100% in the majority of cyst and salivary gland swellings. Ultrasonography was also 100% specific in the diagnosis of monomorphic adenoma and hemangioma. Research conducted by Chandak et al., (2011) to evaluate USG in the diagnosis of head and neck swelling, showed that this form of diagnosis provided a sensitivity and accuracy rate of 98.5% compared to that of clinical diagnosis at 85.7%.

All of the four cases reported in this paper showed congruence between clinical, ultrasonographic and histopathological diagnosis. This is consistent with the findings in the research reports referred to above.
In aiding therapy such as abscess drainage, ultrasonography can delineate the location and extent of abscess formation. USG is capable of measuring the distance from skin to oral mucosa, denoted a third dimension of the swelling and quantification of pus through its anechoic pattern and inflammatory zone. Ultrasonography can also be used intraoperatively to aid in the aspiration, incision and drainage of pus. As in the case of submaseteric abscesses and buccal space abscesses discussed in this report, the distance of the maximal point of the abscess, the location and distant of fish bone from the skin can be detected using ultrasonography.

**Conclusion**

Ultrasonography is a quick, widely available, relatively inexpensive, painless procedure which can be repeated as often as necessary without risk to the patient. Thus, ultrasonography is a valuable diagnostic aid to the oral and maxillofacial surgeons for early and accurate diagnosis, as well as in surgical treatment of oral and maxillofacial soft tissue enlargement.

Association of Gamma-GT Serum and Nerve Conduction Velocity of Nervus Peroneus Motor Vehicles on Diabetic Polyneuropathy Patients

Januar1, Mudjiani Basuki2

1Researcher of Department of Neurology, Faculty of Medicine, Universitas Airlangga, Dr. Soetomo Teaching Hospital, Surabaya 60285, Indonesia, 2Lecturer and Researcher of Department of Neurology, Faculty of Medicine, Universitas Airlangga, Dr. Soetomo Teaching Hospital, Surabaya 60285, Indonesia

Abstract

Background and Objectives: Diabetic Polyneuropathy is one of the common complications of diabetes mellitus (DM) and can lead to foot ulcers or amputation. The pathophysiology of Diabetic Polyneuropathy includes several factors such as metabolic, vascular, autoimmune, oxidative stress and neurohormonal growth-factor deficiency. The recent studies have suggested the use of serum gammaglutamyl transferase (GGT) as an early marker of oxidative stress. Therefore, we investigated whether serum GGT may be useful in predicting Diabetic Polyneuropathy.

Methods: The study was conducted in patients with diabetic polyneuropathy who meet the criteria for inclusion and exclusion in neurological outpatient clinic and EMG room departments of Neurology Dr.Soetomo General Hospital Surabaya consecutively started in June 2014 to April 2015.

Result: We obtained 20 study subjects (8 subjects with increased serum levels of gamma GT and 12 subjects with normal serum levels of gamma GT). There was statistically no significant between serum levels of gamma GT with motoric nerve conduction velocity (NCV) of peroneal nerve (p = 0.582 ; Odds ratio 0.600).

Conclusion: There was no relationship between elevated levels of serum gamma GT with decreased motor nerve conductivity velocity peroneal nerve in patients with diabetic polyneuropathy.

Keywords: Polyneuropathy, Gamma GT, Motoric, Nerve Conduction Velocity

Introduction

Neuropathy is a classic complication of diabetes. Distal polyneuropathy is the most frequently progressive diabetic neuropathy that progressively manifests slowly, symmetrically with glove and stocking patterns1. Neuropathy is most common in diabetics patients age over 50 years, rarely happen in age under the 30s and very rarely in children2.

Neuropathy is a major complication of diabetes that conduces in high morbidity rates. There is a strong association between hyperglycemia and progression of neuropathy reported in many studies. Oxidative stress plays an important role in the etiology and pathogenesis of diabetes. There is a change in the production of reactive oxygen species (ROS) in mitochondria and antioxidant defense systems of mitochondria3. Hyperglycemia, auto-oxidation of glycated proteins, increased production of reactive oxygen species (ROS), decreased antioxidant
defense, increased lipid peroxidation and membrane degeneration are the main causes of apoptosis or necrosis, which is common in diabetes 4.

The process of oxidative stress causes damage to cells and occurs in several types of cells in the nerves, including neurons (in axons and nerve terminals), glial cells, vascular endothelial cells. There are many changes that trigger the activation and recruitment of macrophages, which causes an inflammatory mechanism of stress and cell death. Until there is a difference from cellular stress happened that causes cell dysfunction or death and shows clinical manifestations as a neuropathy 5.

Early detection of diabetic neuropathy is very important in diabetes patients because prevention could reduce morbidity and mortality, but there is no gold standard to diagnose polyneuropathy. The San Antonio consensus recommends that a diagnosis of polyneuropathy should be measured in at least one of the five categories that measured by symptom scores, physical examination scores, quantitative sensory testing (QST), cardiovascular autonomic function (cAFT) and electrodiagnostic 6. Therefore, this study aims to determine the correlation of serum Gamma-GT levels and the nerve conduction velocity of Motor Peroneus Nerve in Diabetic Polyneuropathy Patients.

**Methods**

This study is cross-sectional to determine the association between serum Gamma-GT levels and motor peroneus nerve conduction velocity in type 2 of diabetes mellitus (DM) patients with polyneuropathy. This research was conducted between June 2014 to April 2015 in Nerves Unit of Dr. Soetomo General Hospital, Surabaya. The sample of the study was diabetic polyneuropathy patient who had outpatient treatment. The inclusion criteria were; patients suffering from diabetic neuropathy based on the Toronto criteria, <65 years old, were willing to participated in the study. As for the exclusion criteria were patients who have liver disorders, kidney disorders, heart problems, history of alcohol consumption, and obesity. The sampling technique of this study using consecutive sampling 7.

This research procedure begins when all the subjects included in the inclusion criteria and the responsible family of the patient are informed of the purpose, usefulness, and the risk of the study. At the end of the explanation, the subject or family was asked to read and ask questions about things that have not been understood. If they have understood and agreed, they were required to sign an approval letter 8. Subjects who have signed the letter of consent recorded their identity and characteristics in the form. The data collection of research subjects was conducted by author and residents in training, with the following steps: a careful history, physical examination and neurologic, sample selection for appropriate cases of inclusion and exclusion criteria, recording of eligible samples and all clinical data required 9.

All the data collected was processed statistically using SPSS 22.0 (SPSS. Inc. Chicago IL). Univariate data analysis was used to describe each variable, either independent or dependent variable from case group and control group with frequency distribution table. The bivariate analysis was used to determine whether there a relationship between two variables, or can also be used to determine whether there a difference between independent variables with dependent variables by using chi-square test 10.

For interpretation of results, this study uses the degree of significance (α) of 5%, with a note if p <0.05 then Ho is rejected, if p> 0.05 then Ho accepted 11. While to know the amount of risk factor, then used Odd ratio analysis (OR) with interpretation as follows; if OR = 1 means that the variable suspected as a risk factor has no effect on the occurrence of an effect, if OR> 1 and the range of confidence interval do not include number 1, then the exposure is a risk factor of effect, if OR <1 and the range of confidence interval do not include number 1, then the exposure under study can reduce the occurrence of effects (preventing factors) 12.

**Result**

In this research, there were 20 subjects of DM polyneuropathy patient that consisting of 11 subjects with normal Gamma GT levels, the rest was not normal and from 20 subjects it was obtained an increase of NCV (nerve conduction velocity) by 8 subjects while the rest decreased. The mean age was 51.85 years with standard deviation ± 4.793 using the Kolmogorov-Smirnov test 0.548 (p> 0.05) indicating that the normal distribution
(Table 1).

In the subject group of DM polyneuropathy with decreased KHS has obtained 3 subjects (60%) who suffered DM >10 years and 5 subjects (33.3%) who suffer from DM <10 years, while patients with normal NCV got 2 subjects (40% ) who suffered DM 10 years and 10 subjects (66.7%) who suffered from DM <10 years old. The percentage difference in lengths suffering from DM was not statistically significant (p = 0.292) (Table.2). The subjects of polyneuropathy DM with NCV decreased by 5 people (55.6%) with serum triglyceride (TG) level and 3 (27.3%) patients whose serum TG levels increased while the patients with normal NCV were 4 (44.4 %) with normal serum TG levels and 8 people (72.7%) whose serum TG levels increased. The percentage difference in serum TG levels was not statistically significant (p = 0.199) (Table 2).

Serum Gamma-GT levels with NCV decreased by 5 subjects (45.5%) that considered as normal and 3 subjects (33.3%) with elevated levels. While, serum
Gamma-GT level with normal NCV was 6 subjects (54.4%) as normal and 6 subjects (66.7%) with increasing rate. The association of serum Gamma-GT levels with nerve conduction velocity in diabetic polyneuropathy patients was not statistically significant with p = 0.582. The value of Odds ratios obtained was 0.600, with a confidence interval range of 0.097 - 3.720 (CI 95%) (Table 3).

**Discussion**

Based on the theory, on normal subjects, age and sex might be affected NCV. Older subjects had longer latency, smaller amplitude, and slower NCV than the younger subjects. While in female is have a higher amplitude, and difference in latency in each extremity than male. In one study 15% of people with type 2 diabetes had symptoms of neuropathy and almost 50% obtained NVC deceleration. Another case-control study with electrocardiographic-Nerve Conduction Velocity (EMG-NCV) test obtained significant differences in age and sex in diabetic neuropathy patients compared to normal control. However, this study found no significant association between age, and sex of NCV in diabetic polyneuropathy patients. This result was possible because of the research method used differently from previous studies.

The duration of DM patients also has an effect on the nerve conduction velocity, as in previous studies on the presence of complications of DM microvascular along with the length of DM associated with low nerve conductivity. Triglyceride levels also indirectly affect the nerve conduction velocity, hyperlipidemia is important in the development of diabetic polyneuropathy because elevated serum TG levels correlate with decreased myelin fiber density, independent of other variables such as age, DM length, DM control, and other variables.

In this study, there was no significant correlation between duration of type 2 diabetes and triglyceride levels with peroneus nerve conductive motor velocity in diabetic polyneuropathy patients. This was because there were differences in study design where this study using cross-sectional study that only shows the condition of the patient during the examination, while the process of poly polyneuropathy was a chronic process.

Theoretically, there is a close relationship between serum gamma-GT concentration and diabetic polyneuropathy in type 2 DM patients. This correlation also inversely proportional to nerve conductivity velocity. It was mentioned that the higher serum gamma-GT the lower the speed of nerve conduction. In a study that comparing the group of type 2 DM with the normal group showed a significant increases in serum gamma-GT (P <0.001) in all DM type 2 groups, whereas serum gamma-GT levels in diabetic polyneuropathy patients, were significantly increased compared to type 2 DM.
patients with velocity normal nerve conduction (65.7 Vs 40.6 IU/L, P = 0.002). The results of this study did not statistically found a significant relationship between serum Gamma-GT levels and nerve conduction velocity of motor peroneus. This may be due to different types of studies with previous studies, patients with controlled blood sugar, and may require a larger sample 17.

**Conclusion**

Based on the result of the research, it can be concluded that there was no correlation between serum gamma-GT level and nerve conduction velocity of motor peroneus in diabetic polyneuropathy patients.

**Ethical Clearance:** The research process involves participants in the survey using a questionnaire that was accordant with the ethical research principle based on the regulation of research ethic committee. The present study was carried out in accordance with the research principles. This study implemented the basic principle ethics of respect, beneficence, nonmaleficence, and justice.

Abstract

Background: Viral, dietary and genetic factors are implicated in the etiology of nasopharyngeal cancer, a rare type of head and neck cancers. Unlike other viruses, HHV-8 encodes several human cytokines homologues and regulatory genes that play important roles in the viral pathogenesis.

Objective: To analyze the rates of HHV-8 infection in tissues obtained from a group of patients with nasopharyngeal carcinoma and inflammatory nasal polyps (INP).

Patients and Method: One hundred-thirty formalin-fixed, paraffin-embedded nasopharyngeal carcinoma and nasal inflammatory polyps tissues enrolled in this study; 65 nasopharyngeal tissue biopsies from nasopharyngeal carcinoma; 35 tissue biopsies from nasal inflammatory polyps and 30 nasopharyngeal tissues with unremarkable pathological changes, as apparently healthy tissue control. Detection of HHV-8 was done by chromogenic in situ hybridization (CISH) technique detection system.

Results: In nasopharyngeal carcinoma tissues, the HHV-8-DNA positive CISH reactions were detected in 23.1% while in nasal inflammatory polyps tissues HHV-8-positive CISH reactions were found in 8.6% of the examined tissues. The correlation between HHV-8 and NPC & INP was highly significant (P= 0.001).

Conclusion: Significant HHV-8 detection in nasopharyngeal carcinoma & inflammatory nasal polyp tissues could point for their possible role in either pathogenesis or carcinogenesis of both these lesions.

Keywords: HHV-8; Nasopharyngeal carcinoma; Inflammatory nasal polyps; CISH.

Introduction

Nasopharyngeal carcinoma (NPC) is a common aggressive and highly malignant tumor, arising from nasopharyngeal mucosa, and locally extending to the base of the skull, palate, nasal cavity or oropharynx. High incidence of cervical lymph nodes as well as distant metastases was reported (1). NPC are more vastly common seen in certain regions of East Asia and Africa than other regions. Viral, dietary as well as genetic factors were implicated in its etiology (2).

Epithelial head and neck malignancies demonstrate a relationship to oncogenic viruses including Human Papilloma virus, Epstein-Barr virus or Merkel cell polyoma virus, where oropharynx and respiratory tract were noticed as a common sites for the persistence and transmission of these oncogenic viruses (3,4).

e-mail: shakir_immuno@yahoo.com
Kaposi’s sarcoma, a low-grade angioproliferative malignant neoplasm, is associated with human herpes virus – 8 infection, also known as the KS-associated herpes virus (KSHV)(5).

HHV-8 virions have morphological and structural features typical of other herpes viruses, including 3 proteins encoded by ORF 25, 26, and 62, however, a fourth protein, (encoded by ORF 65) lacks significant similarity to other herpetic viral counterparts(6). HHV-8 genome possesses approximately highly conserved 26 core genes, responsible for viral regulation, replication, and maturation (7). HHV-8 has at least 12 other human host gene homologs, not shared by other human herpes viruses, implicated in oncogenesis(8). In addition, a variety of gene products are encoded in HHV-8 for transformation, proliferation, cell signaling, antiapoptosis and angiogenesis, and immune modulation and immune evasion which may be involved in oncogenesis promotion and viral persistence(9).

Up to our best knowledge, the present study, represents the first in Iraq to analyze the rate of HHV-8 infection and to highlight a possible associative role of this virus in tissues obtained from a group of Iraqi patients with nasopharyngeal carcinoma (NPC) and inflammatory nasal polyps (INP).

**Material and Method:**

The detection of HHV-8 was performed on 4μm paraffin embedded tissue sections by chromogenic in situ hybridization (CISH) kit (purchased from ZytoVision GmbH. Fischkai, Bremerhaven. Germany), using digoxigenin-labeled oligo-nucleotides probe that targets HHV-8 DNA.

A probe complementary to a sequence of Human Herpes Virus -8 gene DNA was : Amount; 8.9 OD, 271 μg, 39.5 nmol; Length : 20-mer; GC content : 50 % Concentration (volume 1ml): 39.5 pmol/μl; Molecular weight : 6849 g/mol; Modification : 5’ Digoxigenin; Scale : 0.2 μmol; DMT : HPLC - Sequences of HHV8 Probe: (5’-ATG CAG CTA CAA CTT CGG AG-3’)A G C T; 6 5 5 4, respectively.

This study utilized SPSS program (version-21) for the statistical analysis, where Chi-Square test (χ2), Odd ratio and Spearman’s rho have been used to evaluate the differences between variables.

**Results**

I. Distribution of patients with nasopharyngeal lesions according to their Age: The nasopharyngeal cancer patients in this study were related to the age range from 18 -77 years and the mean age of those patients was (42.85 ± 14.89) years. Whereas the mean age of patients with inflammatory nasal polyps was (28.22 ± 17.76) years and their age ranged from 7 – 67 years and the mean age of apparently healthy individuals was (43.25 ± 6.99) years and their age ranged from 32- 64 years and as shown in table (1).

II. Histological grading of Nasopharyngeal carcinoma (NPC): The grading of carcinoma group in the present study revealed that well differentiated (keratinizing) carcinomas constituting 10(15.4%) tissues of NPC group, while 2(3.1%) tissues of NPC have moderately differentiated grade. The poorly differentiated non- keratinizing grade was observed in 4(6.2%) tissues while undifferentiated carcinomas grade was observed in 49(75.4%) (Table 2). The statistical analysis of grading distribution of NPC revealed highly significant differences at (P<0.01).

None of control tissues group presented positive signals for HHV-8-CISH test. However, in comparison to the percentage of HHV-8-DNA in healthy control group as well as in the group of INP, the differences between the percentages of HHV-8-DNA in tissues of patients with nasopharyngeal cancers and each of these groups are statistically very highly significant (P value = < 0.0001) and as revealed in (Table 3).

III. Human Herpes Virus -8-CISH expression in patients with nasopharyngeal & inflammatory nasal polyps:

Positive HHV-8 DNA-CISH signal scoring: Fifteen out of sixty five (23.1%) nasopharyngeal tissue biopsies with NPC showed positive CISH reactions for HHV-8-DNA (Figure 1). The Inflammatory nasal polyp (INP) tumors group revealed 8.6% positive signals which represented 3 out of 35 tissues in this group.

II. Signal intensity of HHV-8 - CISH testing: The signal intensities of HHV-8-CISH signal detection in NPC tissues group illustrated the strong signal intensity in (15.4%) whereas (6.2%) and (1.5%) have weak, and moderate intensity, respectively. In Inflammatory nasal polyp lesions, (5.7%) have moderate intensity; while...
(2.9%) have weak intensity. Statistically highly significant differences were recorded between studied groups at (P<0.01) as detailed in (Table 4).

Figure (1): Microscopic appearance of HHV-8–CISH signals in nasopharyngeal carcinoma. Two patterns of blue–violet signals are observed at the site of complementary sequence in the cell nuclei of HHV-8-DNAA: A: Carcinoma with negative reaction (10X). B: Carcinoma with low score and moderate intensity reactions (10X).
IV. Correlations among the HHV-8 and the patient characteristics of nasopharyngeal carcinoma & Inflammatory nasal poly:

A strong positive relationship (with highly significant correlation) was found between HHV-8 and grade in NPC & INP ($r = 0.419, P = 0.006$). In addition, a strong positive relationship (with highly significant correlation) was found between HHV-8 and site of NPC & INP ($r = 0.483; p= 0.003$). However, there were no significant correlations among HHV-8 and age as well as gender (Table 5).

**Table 5. Spearman’s rho statistical testing of age, grade, HHV-8-CISH to evaluate the studied markers in in patients with NPC & INP.**

**Discussion**

In this study, the nasopharyngeal cancer patients have age range from 18 to 77 years and their mean age was $(42.85 \pm 14.89)$ years while the mean age of patients with inflammatory nasal polyps was $(28.22 \pm 17.76)$ years and their age ranged from 7 – 67 years (Table 1). The patients’ age in the present results coincides with the results of many other studies: Oga et al.\(^{(10)}\) and Parmar et al.,\(^{(11)}\) who found the mean age of Nigerian patients with head and neck cancers, including nasopharyngeal cancers, was 43.3 years. Several other studies are also in agreement with the current results, where nasopharyngeal cancers increased with the advancing age with a peak age of 41-60 years and decreased above 60 years\(^{(12,13)}\).

Also the current results could reflect that age is an important risk factor in nasopharyngeal tumorigenesis, where could be related by many risk factors that enhance appearance of malignant nasopharyngeal tumor in young age group in relation to the proceeding of age such as genetic predisposition, smoking and changes in life style (a highly caloric diet-rich in fat, refined carbohydrate, alcohol uptake)\(^{(14,15)}\).

Fifteen out of sixty five (23.1%) nasopharyngeal tissue biopsies with NPC showed positive CISH reactions for HHV-8-DNA (Figure 1). The Inflammatory nasal polyp (INP) tumors group revealed 8.6% positive signals which represented 3 out of 35 tissues in this group. None of control tissues group presented positive signals for HHV-8-CISH test.

Ablashi et al.\(^{(16)}\) found that out of 42 NPC patients, only two of these patients demonstrated antibodies to HHV-8. However, the complete lack of HHV-8 by PCR evaluation in\(^{(17)}\) study led them to hypothesize that HHV-8 is an unlikely etiologic candidate. HHV-8 infection was more prevalent in countries where classic and endemic KS occurred\(^{(18)}\).

HHV-8 encodes a viral homolog of interleukin 6, that induces increased motility, cell-cell and cell-substrate dyshesion and epithelial-to-mesenchymal transformation in breast cancer cells\(^{(19-21)}\).

The relationship between HHV-8 and NPC is based on the concept of identification of HHV-8 genome sequences in NPC tissues and immortalization of primary mammary epithelial cells by HHV-8. Although
the presence of HHV-8 is not enough for the tumorigenic transformation, yet it is expected to become an early events along cumulative changes over the years that become the starting step, similar to what happened in Kaposi’s carcinogenesis (22-25).

Abstract

Increased levels of pollutants in the room, apart from the penetration of outdoor pollutants, can also come from indoor pollutant sources such as cigarette smoke, smoke from using firewood, and the use of mosquito coils. Pneumonia is the ultimate overlooked child killer (major “forgotten killer of children”). In Klaten District, pneumonia cases in the last 3 years have increased, 1,068, 1,244, and 1,705. This study was to determine the relationship between the incidence of pneumonia and exposure to smoke at home in children under 5 years of age in Klaten Regency, Central Java Province. This type of research is observational analytic with case-control studies. The total sample of 278 (139 cases and 139 controls) children under 5 years of age resided in Klaten Regency and were recorded as pneumonia cases in the public health care register in 2012 that met the inclusion and exclusion criteria. The research instrument consisted of a structured questionnaire. The results of data analysis showed that the relationship with the incidence of pneumonia in children under five was the variable exposure to cigarette smoke (OR=2,053; \( p=0.017 \) and 95% CI=1,137-3,705) and exposure to kitchen smoke (OR=2,664; \( p=0.003 \) and 95% CI=1,4002-5,0680). Factors associated with the incidence of pneumonia in children under 5 years of age in Klaten Regency, Central Java Province are exposure to cigarette smoke and exposure to kitchen smoke.

Keywords: Risk factors, pneumonia, toddler

Introduction

The goal of health development that has been listed in the National Health System is an effort to implement health by the Indonesian nation to obtain the ability to live a healthy life for every community to achieve an optimal health degree, which is said to indicate that the increase in the degree of public health is influenced by several factors, namely the environment, health services, actions and congenital (congenital)¹.

Environmental conditions can affect public health conditions. Many aspects of human well-being are influenced by the environment, and many diseases can be initiated, supported, sustained, or stimulated by environmental factors. This means that the interaction between humans and their environment is an important component of health because humans need the carrying capacity of environmental elements for their survival, for example, air, water, food, clothing, and all human needs must be taken from their environment. Human health can only be affected by environmental conditions if the human is exposed to environmental factors at a level that cannot be tolerated²,³.

The house plays a very important role in human life, where the values of a family take place, it becomes a human space to express how to live, communicate, interact with the people closest to them. The housing and settlement problems in Indonesia are rooted in the shift
in population concentration from rural to urban areas. The growth of the urban population in Indonesia is quite high, around 4% per year, higher than the national growth, and tends to continue to increase\(^4\,^5\).

Indoor air pollution can be very dangerous because the source is in direct proximity to humans. In developing countries, an important problem of indoor air pollution is pollution in the house due to cooking or burning wood for heating without adequate chimneys. Other pollutants that hurt health are O\(_3\), ionizing radiation, and cigarette smoke. WHO estimates that every year there are about three million cases due to indoor air pollution and 0.2 million due to outdoor pollution\(^6\).

Based on research from the American College of Allergies, about 50% of diseases are caused by indoor air pollution. The United States Environmental Protection Agency (US EPA) states that indoor air pollution is two to ten times more dangerous than outdoor air. Scientific America reports that a baby crawling on the floor inhales carpet dust, mold, mildew, mites, etc. the equivalent of smoking four cigarettes a day. More than 90% of people spend their time indoors so indoor air pollution has more dangerous health impacts than outdoor air pollution\(^7\).

Increased levels of pollutants in the room, apart from the penetration of outdoor pollutants, can also come from indoor pollutant sources such as cigarette smoke, smoke from using firewood, and the use of mosquito coils. Pneumonia is one of the causes of high morbidity and mortality in children under five years of age (toddlers) in developing countries. Nineteen percent of deaths of children under five are caused by pneumonia. Three-quarters of pneumonia cases in the world are found in 15 countries and Indonesia is in the sixth rank\(^5\,^8\).

According to WHO and UNICEF, pneumonia is the major “forgotten killer of children”. Pneumonia is a higher cause of death when compared to the total deaths due to AIDS, malaria, and measles. Every year, more than 2 million children die from pneumonia, meaning 1 in 5 children under five dies in the world. Pneumonia is the most common cause of death, especially in countries with high mortality rates. Almost all deaths from pneumonia (99.9%), occur in developing and less developed countries (least developed)\(^9\,^10\).

Indonesia is one of the 15 countries and occupies the 6th place with 6 million cases. The Household Health Survey (SKRT) from the Ministry of Health in 1992, 1995, and 2001 showed that pneumonia had a major contribution to infant and child mortality. Whereas in the basic health research (Riskesdas) in 2007, pneumonia was in 2nd place as the cause of death for infants and toddlers after diarrhea and was in 3rd place as the cause of death in neonates\(^11\).

**Material and Method**

This type of research is an observational analytic study with case-control study design. The population in this study were all children under 5 years of age suffering from pneumonia in 3 sub-districts in rural areas and 2 sub-districts in urban areas and visited each Public health center.

The research locations were in 5 sub-districts, namely Pedan (Pedan Public health center), Tulung (Tulung and Majegan Public health center), gantiwarno (Switchwarno Public health center), Klaten Selatan (Klaten Selatan Public health center), and Kalikotes (Kalikotes Public health center). The population in this study were 139 cases and 139 controls. Data analysis of the research results was carried out in 3 stages, a namely univariate analysis which aims to describe the phenomena found, both in the form of risk factors and effects or results, bivariate analysis to determine the relationship of research variables to the incidence of pneumonia used the Mc Nemar test and multivariate analysis was carried out. with the conditional logistic regression multiple tests to find evidence that the independent variables are related to the dependent variable which is measured together.

Discussion

Cigarette Smoke Exposure

Cigarette smoke is categorized as the most dominant cause of indoor air pollution. In a closed room, smoke collects with a concentration that varies according to the number of smokers in the room, the type of cigarette, the number of cigarettes smoked, and the characteristics of the room such as size, ventilation, temperature, and humidity. Smoking is not only dangerous for the health of the smoker but also dangerous for those around him who are accidentally exposed to the smoke (passive smoking), especially children who still have low immunity. Besides being carcinogenic, cigarette smoke can also cause airway irritation by sulfur dioxide, ammonia, and formaldehyde\(^{12,13}\).

Based on research in Klaten Regency, the results of the bivariate analysis showed that there was a significant biological and statistical relationship between cigarette smoke exposure and the incidence of pneumonia with \( p = 0.0046 \) at \( \alpha = 5\% \) (0.05); \( OR = 2 \); and \( 95\% \) CI = 1.267-4.325, so that continued with multivariate analysis obtained \( p\)-value = 0.017; \( OR = 2.053 \); and \( 95\% \) CI = 1.137-3.705, which means that there is a significant relationship between exposure to cigarette smoke and the incidence of pneumonia. The magnitude of the risk can be seen from the \( OR = 2.053 \) value, which means that children exposed to cigarette smoke will have an increased risk of developing pneumonia by 2.053 times greater than children who are not exposed to cigarette smoke.

Mosquito Coils Exposure

Most of the Indonesian people still use mosquito coils to repel mosquitoes because the price of mosquito coils is relatively cheaper. Mosquito repellent is very dangerous for our body, especially mosquito coils. Mosquito repellent includes drugs that contain toxic chemicals and are very harmful to the body when the
smoke is inhaled. Mosquito repellent is dangerous for humans because of the active ingredients belonging to the organophosphate group such as Dichlorovynil dimethyl phosphate (DDVP), Proxopur (Carbamate), and Diethyltoluamide, which are a type of insecticide that kill insects that are carcinogenic14,15.

The toxic content of mosquito repellents depends on the concentration of the poison and the amount of use and the effect on the body depends on the type, amount, age of use, and the ingredients of the mixture. Children are vulnerable to mosquito repellents because their organs are not yet perfect and their immune systems are not yet good. The active ingredients of the mosquito repellent will enter the body through the breath and the skin and then circulate in the blood and then spread to the body’s cells such as respiration, brain (through the central nervous system), and others. The greatest effect will be experienced by sensitive organs. Because, mosquito repellent is more about inhaled, so what is usually affected is breathing. Meanwhile, the side effects on the skin depend on the sensitivity of the skin. Disturbances in human organs will occur if the use of insect repellent is not controlled or the dosage is excessive. People who have allergies will react more quickly. The most common allergies usually affect the airways, causing a cough16,17.

The human airway is equipped with an epithelium or airway lining which has cilia like vibrating hairs that function to expel something. Cilia will react to secretions (mucus fluid) and foreign objects in the airway that will be expelled upward, however, the chemicals in mosquito repellents consist of active, irritating substances so that the epithelial cells and cilia are more easily damaged. If the epithelium and cilia are damaged, foreign objects cannot be removed. Besides, the cells under the epithelium will also be affected as a result, mucus will be released. Furthermore, the airway becomes contracted because the nerves are disturbed, resulting in coughing and difficulty breathing16,18.

Based on research in Klaten Regency, the results of the bivariate analysis showed that there was no significant biological or statistical relationship between exposure to mosquito coil smoke and the incidence of pneumonia with p = 0.0925 at α = 5% (0.05); OR = 1.6; and 95% CI = 0.931-2.836 because the p-value <0.25, then continued with multivariate analysis, the results obtained were p = 0.266 OR = 1.37 and 95% CI = 0.786-2.394 which means that there is no significant relationship between exposures. mosquito coils with incidence of pneumonia. The magnitude of the risk can be seen from the OR = 1.37, which means that children exposed to mosquito coil smoke will increase the risk of developing pneumonia by 1.37 times greater than children who are not exposed to mosquito coil smoke.

**Kitchen Smoke Exposure**

Based on research in Klaten Regency, the results of the bivariate analysis showed that there was a significant biological and statistical relationship between exposure to kitchen smoke and the incidence of pneumonia with a value of p = 0.0006 at α = 5% (0.05); OR = 2.9; and 95% CI = 1,523-5,980, so that continued with multivariate analysis obtained p-value = 0.003, OR = 2,664 and 95% CI = 1,400-5,068, which means that there is a significant relationship between exposure to kitchen smoke and the incidence of pneumonia. The magnitude of the risk can be seen from the OR = 2,664, which means that children who are exposed to kitchen smoke will have an increased risk of developing pneumonia by 2.664 times greater than children who are not exposed to kitchen smoke. This study was different from Salam (2006), which showed that there was no significant relationship between exposure to kitchen smoke and the incidence of pneumonia with p = 0.157; OR = 3.328, and 95% CI = 0.630-17.596.

Air pollution from burning traditional kitchen biomass (wood, charcoal, straw, former harvest) is a public health risk. Smoke pollutants produced from combustion are very dangerous to health and will cause various kinds of diseases, especially if the ventilation does not meet health requirements. Diseases that can be caused include ARI, asthma, lung cancer, cataracts, and tuberculosis. The smoke and soot when inhaled enter the respiratory tract to the lining of the lungs (mesothelium) so that the respiratory system will shrink (spasm), as a result, the elasticity of the lungs will decrease and the vascular pressure will increase. Biomass stoves produce pollutants, including carbon monoxide. Carbon monoxide is poison gas. The concentration of CO in the kitchen using biomass can reach 100 ppm per hour, far above the threshold set by the World Health Organization...
Conclusion

Based on the results and discussion of research, the relationship between the incidence of pneumonia and exposure to smoke in the home in children under 5 years of age in Klaten Regency can be concluded as follows: The research variable that was not statistically significant for the incidence of pneumonia in Klaten was exposure to mosquito coil smoke.

Factors Affecting Romantic Relationship Satisfaction of University Students

Kyu Eun Lee¹, Hae Kyung Chang²

¹Professor, Department of Nursing, Catholic Kwandong University, Republic of Korea,
²Professor, Department of Nursing, Hanseo University, Republic of Korea

Abstract

Background/Objectives: The purpose of this study was to identify the factors affecting romantic relationship satisfaction of university students.

Methods/Statistical analysis: This study was conducted with 187 students from four universities in cities and provinces nationwide. Data were collected from September to October 2019 using a self-administered questionnaire. Collected data were analyzed through the stepwise regression analysis using the SPSS statistics program.

Findings: The final regression model showed that self-esteem, anxiety attachment, and avoidance attachment were significant predictors related to romantic relationship satisfaction in university students and explained 34.7% of the variance in romantic relationship satisfaction.

Improvements/Applications: The university student period is a time to form an adult attachment, thereby preparing for a happy marriage in the future by increasing the romantic relationship satisfaction. Therefore, it is necessary to develop and apply the educational programs that can increase self-esteem and positive heterosexual relationship for university students.

Keywords: University students, sexual attachment, sexual attitude, self-esteem, romantic relationship satisfaction

Introduction

The time in university is a transitional stage from adolescence to adulthood, and it can be seen in the three main area of identity exploration: love, work, and worldviews which is the late period of adolescence and early period adulthood. In Korea, many young people begin to date only after entering university. A satisfactory experience through the romantic relationship with a partner enhances an individual’s psychological health and level of happiness, allows them to feel positive emotions, and influences the development of positive self-concept. Romantic relationship satisfaction refers to the subjective evaluation, attitude, and positive feelings about relationships, and attachment is one of key factors related to relationship satisfaction.

Adult attachment is the result of a process in which the attachment target shifts from the primary caregiver to friends and lovers as an individual enters into adulthood. For university students in the emerging adulthood, who are in the process of forming adult attachment, the experience of healthy romantic relationship is important in itself. In particular, individuals with stable attachment in relationships with partners have displayed positive characteristics such as confidence, happiness, and constructive approaches toward relationship conflicts, while individuals with high levels of attachment anxiety and avoidance showed negative characteristics such as discomfort, jealousy, etc., in their relationships. Therefore, in order for unmarried men and women to
maintain a satisfactory relationship with the opposite sex, the sexual aspect must be considered, and for this, an individual’s attitude toward sex is important.

Sexual attitude is one’s own cognitive perspective on an individual’s sexual aspect, is formed through sexual behaviors, and enables individuals to determine current and future sexual behavior based on it\[9\]. Positive sexual attitudes not only affect personality maturity, but also premarital and post marital sex life  

Self-esteem, meanwhile, is a key factor in determining an individual’s behavior and adaptation, and it is essential for the healthy sexual function in romantic relationships\[11\]. Specifically, Lee’s study\[12\], which finds that teenagers with low self-esteem are more exposed to unwanted sex, suggests that self-esteem is related to satisfaction in relationships. Prior studies in Korea frequently show that sexual attitude affects satisfaction in relationships, but the direction of the influence is different. Although the results are inconsistent, it is clear that sexual attitude is correlated with relationship satisfaction\[13\]. In addition, there are studies on adult attachment and satisfaction with romantic relationship, but there is a only of handful of research on the mechanism. Moreover, there is no research on an integrated approach to the factors affecting the satisfaction of relationships among university students. Therefore, this study aims to provide the necessary basic data to establish healthy romantic relationships and appropriate sexual attitudes of university students by identifying the determinants in relationship satisfaction of university students using variables of various aspects.

**Method**

**Subjects**

The subjects of this study were students of universities located in four cities and provinces in Korea and were convenient-sampled to male and female university students with dating experience. Using G*Power 3.12, the sample size of the study was set to be 160, where the median size effect is 0.15, a significance level is 0.05, and the number of predictor variables is 8, to secure 95% of the statistical power for regression analysis. Therefore, in this study, a total of 187 questionnaires were included in the final analysis after distributing the questionnaire to 192 people considering the dropout rate of 20%.

**Tools**

**Adult attachment**

The Experience in Close Relationship (ECRS), developed by Brennan et al.\[14\], was used. Adult attachment measurement tools consist of two areas: 18 questions for avoidance attachment and 18 questions for anxiety attachment. The higher the score on a 5-point scale of 36 questions, the higher the avoidance attachment and anxiety attachment. In this study, Cronbach’s $\alpha$ were found to be 0.74 (avoidance attachment), 0.87 (anxiety attachment), and 0.83 overall.

**Sexual attitude**

The sexual attitude measurement tool developed by Woo\[10\] was used. The tool was comprised of 35 questions with a 5-point scale. A higher score means a more open sex attitude, and a lower score means a more conservative sex attitude. Cronbach’s $\alpha$ in this study was found to be 0.74.

**Self-esteem**

The self-esteem measurement tool developed by Rosenberg\[15\] was used. The self-esteem measurement tool consists of 10 questions with a 5-point scale. A higher score means a higher degree of self-esteem. Cronbach’s $\alpha$ in this study was found to be 0.82.

**Romantic relationship satisfaction**

The romantic relationship satisfaction measurement tool developed by Lee\[16\] was used. The tool consists of 41 questions with a 5-point scale. A higher score means higher romantic relationship satisfaction. Cronbach’s $\alpha$ in this study was found to be 0.92.

**Data collection**

For the data collection, universities located in four different regions across the country from September 9 to October 31, 2019 were randomly selected. Through a research assistant at each local university, the purpose and method of the study were explained to the study subjects, and written consents from the subjects who exhibited voluntary participation were received. The research assistants explained that the collected data would not be disclosed or used for any purpose other than research, that the subject’s personal information would
be kept confidential and guarantee anonymity, and that the subject could stop participating in the research at any time if desired. The data were collected using structured questionnaires and it took 10~15 minutes to complete the questionnaire.

**Ethical considerations**

This study was conducted after receiving research approval from the Institutional Review Board (IRB) of University C to project the subjects in prior to conducting the study (IRB No: CKU-19-01-0207)

**Data analysis method**

The collected data were processed by computer statistics using SPSS/WIN 22.0 program. Descriptive statistics for the general characteristics and variables of the subjects were obtained. The difference in Romantic relationship satisfaction level was determined according to general characteristics t-test, ANOVA, and post-test Scheffé test. The correlation between the Romantic relationship satisfaction and the variables was analyzed by Pearson’s correlation coefficient. In addition, in order to identify factors affecting the Romantic relationship satisfaction, it was analyzed by stepwise multiple regression after multicollinearity diagnosis.

**Result**

**General characteristics of subjects**

Mean age of the subjects was 21.03(±2.06) years old and 20 to 29 years old group was the most among these with 134 persons (71.7%). The distributions of the gender were 95 male (50.8%), 92 female (49.2%). There were 1st 55(29.4%), 2nd 41(21.9%), 3rd 39(20.9%) and 4th 52(27.8%) in the Grade. Residence was living alone 82(43.9%), dormitory 72(38.5%) (Table 1).

Difference in degree of romantic relationship satisfaction according to general characteristics

The degree of romantic relationship satisfaction was non-significantly different according to general characteristics (Table 1).

Correlation between romantic relationship satisfaction and variables

The degree of romantic relationship satisfaction of the subjects was positively correlated with self-esteem ($r=0.53$, $p<0.001$) and negatively correlated with avoidance attachment ($r=-0.40$, $p<0.001$), anxiety attachment ($r=-0.42$, $p=0.008$), and sex attitude ($r=-0.19$, $p=0.008$). In other words, a higher degree of self-esteem, lower avoidance and anxiety attachment, and more conservative sexual attitudes all led to higher satisfaction in romantic relationships (Table 3)

Influencing factors on romantic relationship satisfaction

As a result of verifying the multicollinearity before performing regression analysis, the variance expansion index (VIF) among the variables is 1.140 to 1.561, which is less than 10, which can be considered free of autocorrelation. In addition, the Durbin-Watson statistic that confirms the independence among the error terms was found to be 1.594, which satisfies the assumption of independence. A total of four independent variables were used to identify the determinants of romantic relationship satisfaction: adult attachment (avoidance attachment and anxiety attachment), sexual attitude, and self-esteem. The stepwise regression analysis
The results are as follows: self-esteem ($\beta=0.330$, $p<0.001$), anxiety attachment ($\beta=-0.237$, $p<0.001$), and avoidance attachment ($\beta=-0.209$, $p=0.002$). The exploratory power of the three variables 34.7%, and the most influential variable was self-esteem (Table 4).

Discussion

In this study, the romantic relationship satisfaction level of the university students was 2.59 points on a scale within a range from 1 to 5. This score was lower than the average of 3.47 points of the local university students, which was measured with the identical measurement tool[17].

As a result of examining the correlation between university students’ romantic relationship satisfaction and their variables, it was found that adult attachment had a negative correlation with romantic relationship satisfaction. This result is consistent with Choi and Kim[17] and Yildiz, Cokamay, and Artar[18]. In general, the two dimensions of adult attachment, avoidance attachment and anxiety attachment, are viewed as unstable attachment, and there tend to be more relationship problems as the degree of adult attachment grows stronger[19]. Anxiety attachment in this study had a stronger negative correlation with romantic relationship satisfaction than did avoidance attachment, which is similar to the results in the previous literature[17].

People with high anxiety attachment tend to focus on their stress, reflect on negative thoughts, and emotion-centered coping strategies. On the other hand, those with a high level of avoidance attachment use strategies that cognitively and behaviorally distance themselves from the cause of stress[20].

The university students’ sexual attitude and romantic relationship satisfaction were found to have a negative correlation, which was consistent with the prior result of Hendrick, Hendrick, and Reich[21] that more conservative sexual attitude leads to higher romantic relationship satisfaction. Conversely, a study of unmarried men and women with sexual experience reports a significant positive correlation between sexual consciousness and romantic relationship satisfaction[13], showing no consistency in the correlation between sexual attitude and romantic relationship satisfaction. In the future, if one establishes a strategy to maintain a satisfactory relationship by identifying the attitude of individuals, he or she will be able to increase satisfaction on the relationship.

Furthermore, romantic relationship satisfaction is higher in the group with high self-esteem[22], which is consistent with the results of this study. Through these results, one will be able to enhance romantic relationship satisfaction by turning negative sexual attitude into positive sexual attitude when establishing a strategy to maintain a satisfactory romantic relationship.

After analyzing the effects on romantic relationship satisfaction in the study, self-esteem, ($\beta=0.330$, $p<0.001$), anxiety attachment ($\beta=-0.237$, $p<0.001$), and ($\beta=-0.209$, $p=0.002$) explain 34.7% of romantic relationship satisfaction. Among them, self-esteem was the most influential variable on relationship satisfaction. It can be interpreted that those who love themselves and feel valued maintain satisfactory relationships with their partners[23]. There are several factors in the characteristics which people with low self-esteem exhibit in relationships. First, they need more acceptance and incorrectly perceive others’ attitude. These people believe that they need to live up to the specific standards they have set for themselves or need to have valuable traits to be loved and accepted by important people, so they underestimate the positive attitudes their partners have toward themselves or evaluate less of their partners’ attitude[11]. If the partner’s continued acceptance is suspected, he or she could distance himself or herself from the partner, devalue romantic relationships,
be unnecessarily disappointed in them, and end the relationship in dissatisfaction [24].

Anxiety and avoidance attachment, which are forms of unstable attachment among adult attachments, were the second and third factors that explained the relationship satisfaction of the university students. Hazan and Shaver[7] argue that adult attachment is the one of the most well-known variables in predicting relationship satisfaction and is related with romantic relationships in adulthood. Their findings demonstrate that positive emotions as happiness and trust are usually reported in relationships in the case of stable attachment, whereas instable attachment types such as avoidance or anxiety feel a lot of negative emotions such as discomfort or jealousy in relationships.

The overall results suggest that it is necessary for university students, in order to improve the romantic relationship satisfaction, to have a positive and active life attitude toward their own lives so that they can stablish positive sexual attitudes and enhance their self-esteem.

Conclusions

In this study, self-esteem, anxiety attachment, and avoidance attachment were significant predictors that influence university students’ romantic relationship satisfaction and the three variables’ explanatory power was 34.7%. Based on these results, it is necessary for university students to develop a sense of self-respect and experience the process of exchanging positive feelings with their partners in order to improve their satisfaction with romantic relationships.

This study is meaningful in that it takes account sexual attachment variables, a new concept in nursing, into account to provide nursing intervention to enhance healthy relationship satisfaction of university students.

Video Self Modelling - An Intervention to Study Bell’s Palsy through Kinect Azure: A Research Protocol

Madhura R. Darware1, Divya Jethwani2

1Final year Student, 2Associate Professor, Department of Neuro-Physiotherapy, Ravi Nair Physiotherapy College, Sawangi(M), Wardha

Abstract

Background: Bell’s palsy is the common acute mono-neuropathy, and is commonly associated with facial paralysis or weakness of facial nerve. It is unilateral facial nerve paresis or paralysis. The cause of Bell’s palsy is suspected to be herpes simplex virus infection of nerve. The nerve get swollen because of this viral infection and is compressed in its canal as it passes through the temporal bone. Grading systems for the assessment of movements and asymmetry of face in Facial palsy are divided into computer-based and traditional grading systems. The program that uses Kinect Azure provides assessment method for evaluation of asymmetry of face at rest and the rating of facial palsy during voluntary activity of various areas over face. This study aims to investigate the intervention of facial palsy by video self modelling with the use of Kinect Azure.

Methods: 20 participants will be selected. Each group will include 10 subjects. Group A will receive conventional treatment, electrical muscle stimulator(EMS), and visual feedback.

Group B (Experimental group) will receive conventional treatment, electrical muscle stimulator and video self modelling. Each participant would be presented with their own videotape of video self-modelling, which included the best attempts at their evenest acts (smiles). Following 2 weeks of tape viewing the actions will be assessed. The outcome of the treatment will be assessed by Kinect Azure.

Discussion: Traditional methods for documentation of treatment effect have been through scales and questionnaires which at times are little complex and also difficult for patients to interpret. Hence this experimental and comparative study aims at focusing on the effective use of Kinect to document outcome for bell’s palsy.

Key words: Bell’s palsy, physical therapy, Kinect.

Introduction

Bell’s palsy is the common acute mono-neuropathy, and is commonly associated with facial paralysis or weakness of facial nerve. It is unilateral facial nerve paresis or paralysis. This disorder causes complete or partial inability of the paralysed side of face to voluntarily move facial muscles. The paresis or paralysis of face in Bell’s palsy result in inability to close the eyelid and temporary oral incompetence resulting in possible injury to the eye. (4) Annual incidence of palsy is 15 to 30 per 100,000 people, with equal numbers of women and male affected. Any side of the face has no predilection. The palsy of Bell was identified in patients of all ages, with peak incidence in the 40s. It occurs more frequently in diabetes patients and pregnant females. (2)

The cause of Bell’s palsy is suspected to be herpes simplex virus infection of nerve. The nerve get swollen because of this viral infection and is compressed in its canal as it passes through the temporal bone. (3) Symptoms typically begin in the first week, and then gradually resolve over 3 to 3 months. It is in patients with diabetes, and while it can affect people of any age, incidence peaks in 40s. (5) Paresis is the most disturbing symptom of Bell’s palsy; up to three quarters of affected
people assume they have had a stroke or an intracranial tumour. The palsy frequently starts unexpectedly and progresses quickly, with maximum facial weakness occurring within two days. Hyperacusis, reduced tear production, and altered taste may be associated with symptoms. Patients may also report otalgia or aural fullness, and facial or retroauricular pain, usually mild and preceding palsy. Severe pain indicates herpes zoster virus, and can lead to a vesicular eruption and progression to Ramsay Hunt syndrome. Features can lead to a mild polynoepathy. A gradual progressive paralysis with other cranial nerve defects or headache increase the neoplasm possibility (4).

Video self-modelling is used with movements of face affected by facial nerve palsy (Lower Motor Neuron type). Although self-modeling patients view video clips of themselves engaging only in the correct, adaptive behavior and so the treatment relies on the patient being able to generate the desired form of behavior at least once. The action, or movement pattern, is recorded, edited into a short set of images by only choosing the best presentation and then given to the patient to watch again before replaying. Analyzing one’s best attempts at a desired reaction has been used to promote motor learning in a variety of therapeutic settings, and it improves the degree of success that integrates previously unachievable abilities. vBecause an successful smile provides the audience with a powerful emotional input, this study was designed to examine the use of video self-modelling as a method of adapting the smiles after facial nerve palsy. (5)

Evaluation of paralysis of face and quantitative grading of asymmetry is important to measure the severity of the disorder as well as to monitor its progression or improvement. As such, a precise quantitative grading system is needed which is easily understand, cheap and has minimum variability. As there is clearly a need for a clinically feasible tool that can assess the severity of the disease and the resultant loss of function from Facial palsy and can also calculate the efficacy of medical care or surgery. Such a tool should be qualitative, standardized, depending little or no on the observer, and cost-efficient.

Grading systems can be divided into conventional and computer based grading systems for determining facial gestures and facial asymmetry in facial palsy (6). Modern approaches include the House-Brackmann grading system (HBGS)-The House and Brackmann grading system is recommended as a common standard for determining the degree of facial paralysis and is a clear and accurate method for evaluating facial function. (7) Functional disability index – It is a disease-specific, self-reporting functional status instrument that provides an essential component for the evaluation of citizens with facial neuromuscular disorders. (8) Many programs include Burres-Fisch, Nottingham, Sunnybrook, and many others. Computer-based FP grading systems including video recording and image processing are also proposed. (6)

Kinect Azure provides assessment method for evaluation of asymmetry of face at rest and the rating of facial palsy during voluntary activity of various areas over face. This study aims to investigate the intervention of facial palsy by video self modelling with the use of Kinect Azure.

**Aim**

This study aims to analyze the intervention of Bell’s palsy by visual self-modelling using Kinect Azure.

**Methodology**

**Study setting:**

The trial will be carried out in HumEn research lab and Neuro Physiotherapy Department of Ravi Nair Physiotherapy College, DMIMS, Sawangi(Meghe), Wardha, Maharashtra, India, after approval from Institutional Ethics Committee of Datta Meghe Institute Of Medical Sciences, Deemed to be University.

**Study Design and Sample Size:**

The design of the study is a single blinded randomized controlled trial of a Kinect Azure for individual diagnosed with bell’s palsy and it is an experimental and comparative study.

By using purposive sampling we will select 20 subjects(n=20) and will include 10 subjects in each groups (Group A and B). All topics will be clarified in detail about the research and a written informed consent will be taken. Group A will receive conventional
treatment, electrical muscle stimulator (EMS), and visual feedback. Group B (Experimental group) will receive conventional treatment, electrical muscle stimulator, and video self modelling. All topics will be clarified in detail about the research, and a written informed consent will be taken. The schedule of enrollment, interventions, and assessments of the study is illustrated in Figure 1.

**Figure 1 Schedule of enrolment, interventions and assessments.**

Participants

The Inclusion Criteria for the participants are as under:

1. Those who are willing to participate.
2. Patient affected by acute onset paralysis without detectable cause
3. Those with Idiopathic facial paralysis
4. Rehabilitation treatment carried out at our own hospital
5. Those who have unilateral facial paralysis-LMN type
6. Those who are between 20 to 42 years of age.
7. Those who scored above grade 3 on House brachman scale
8. Those have Normal superficial and deep sensation

The Exclusion Criteria for the participants are as under:
1. Those who are not willing to participate
2. Those with any type of facial fracture
3. Those with Known traumatic, inflammatory, Neoplastic pathology of facial nerve
4. Those with Bilateral facial paralysis
5. Those with UMN type facial palsy
6. Those who have Disease of central or peripheral nervous system
7. Those who scored below grade 3 on House brachman scale.
8. Those with Recent head injury
9. Those who have Psychiatric disease

PARTICIPANT TIMELINE:

The study duration is of 6 months and intervention duration is 2 weeks.

Assessment will be done on 1st day of visit following 2 weeks of tape viewing the actions will be reassessed.

RECRUITMENT: The neurologists and health care practitioners working under DMIMSU are invited to refer the prospective patients to our inpatient department (IPD). Regular visit to Neuromedicine, Neurosurgery wards will be done and contact will be maintain with doctors, record maintaining office for cases that will enrolled in hospital so that can be taken for study. The patients who are already undergoing treatment in our IPD and diagnosed with facial palsy will be assessed for the eligibility in the study as per the inclusion and exclusion criteria. Informed patient consent will be taken before allocation and after elaborating the purpose, nature, procedure, benefits and effects of the intervention.

Implementation:

Selection of the participants will be supervised by the research coordinator and principal investigators.

Blinding:

Tester(s) will be blinded to assign the subjects to the group. To ensure blinding, subjects will be mandated not to reveal any details of their treatment to the tester.

Study procedure:

The participants will be categorized into 2 groups:

**Group A:** (Conventional physiotherapy)
The participants in this group will undergo 1 hour of conventional physiotherapy program daily, 5 days per week for 2 weeks. It will be performed by a physiotherapist in IPD. It will comprise of electrical muscle stimulator, visual feedback, facial exercises.

**Group B:** (Video self modelling combined with conventional physiotherapy) The participants in this group will undergo 30 minutes of conventional physiotherapy and 30 min of video self modelling based physiotherapy daily for 5 days per week for 2 weeks provided by physiotherapist in IPD. Each participant would be presented with their own videotape of video self-modeling, which included the best attempts at their evenest acts (smiles). In the following way we will make a videotape. A mobile video camera will be at a constant distance from the subject matter and set to run at session start. Subjects would be asked to complete a series of 5 smiles that included both their normal “everyday” (nonlinear) smile and their best (linear) “adapted” smile. The entire tape will be reviewed after a session, and 2 or 3 of the best smiles will be recorded using video editing software. Following 2 weeks of tape viewing the actions will be assessed.
The outcome of the treatment will be assessed by Kinect Azure from first day and after 2 weeks of intervention.

Outcomes

Primary outcome measures:

1) House-Brackmann Scale- For assessment of degree of facial paralysis.

2) Facial Disability Index used as an initial assessment tool and as an monitoring instrument to view the outcome of intervention.

Secondary outcome measure:

Kinect Azure

DATA COLLECTION AND MANAGEMENT

Data collection

The assessment data will be collected from a pre-established spreadsheet with the baseline characteristics variable. Testing data will be put into a secure REDCap database. The nonelectronic data, such as hard copies of assessment forms, signed consent forms, etc. will be stored securely in the study setting. The employment of regular feedback concerning adherence and reminder phone calls (for attending the treatment) will be done.

Data management:

Data collection and documentation will be done under the guidance of the principal investigators. The study documentation will be evaluated thoroughly for accuracy. The Excel spreadsheet will be released at the end of the study to an allocation blinded statistician for conducting the necessary analysis, following which unblinding of the groups will be done. Checklists are used to prevent missing data due to the improper staff procedure.

Statistical Analysis Plan

Therapy induced changes in the primary outcome measures will be analysed via mixed-effects linear models across ‘time’ (pre-intervention vs post-intervention) and ‘group’ (Experimental vs control). The comparison will be done between the two groups using t-tests for the demographic measures and initial scores on outcome measures. For the interpretation of the results, we will significant differences. Significance will be set at P less than 0.05. The results will be accounted for as per the CONSORT guidelines.

BIAS

Our study will have a low degree of selection bias (Oculus Quest). Measures will be taken to prevent attrition bias by giving reminder calls before each intervention and by giving transportation aids to those who require it. Thus we anticipate a low percentage of dropouts.

Discussion

Our study aims to estimate efficacy of video self-modelling compared to conventional physiotherapy in individuals with Bell’s palsy. Physical therapy has played a significant part in Bell’s palsy management. Rehabilitation appeared effective in recovering facial symmetry, reducing paresis severity by 0.6 grades on the HB scale, and controlling synkinesis. Physiotherapy rehabilitation of an adapted (more symmetrical) smile was investigated by Dr Susan E in FNP subjects 1 year after the start, using video self-modeling (video replay of only the best adapted smiles) and implementing intentions (preplanning adapted smiles for specific situations and concluding that reaction time (RT) for the initiation of adapted smiles was 224 ms faster, adapted smiles were completed 544 ms faster, adapted smiles had higher overall quality, movement control and symmetry ratings, and Facial Disability Index scores also improved. His study supports these techniques of rehabilitation to maximize the quality of the smiles following facial nerve palsy. Kinect platform can be used to develop low cost approaches to measure the movement aspects objectively.

Research and development prospects and future therapeutic applications work with the Kinect are comprehensive. This will help to make diagnostic and prognostic evaluations.

Ethical Approval And Dissemination

Ethical approval will be taken from institutional ethical committee. The DMIMS which will fund research and the subjects which will participate in the study will be able to access the research’s main findings. For the
enrolled subjects, data held safely for a minimum of five years. Once data collection is complete, a completion report will be produced for statistical analysis and sent for publication after review by institutional research cell.

**Patient Consent**

Principal Investigators will obtain the informed consent from the patient and one of the relatives on a printed form with signatures and give the proof of confidentiality.

**Confidentiality**

The study program will be explained to the participant and one of his/her relative, and the principal investigator will take personal information. The consent form will include the confidentiality statement and signatures of the principal investigator, patient and 2 witnesses. If required to disclose some information for the study, consent will be taken from the patient with complete assurance of his confidentiality.

**Author’s contribution**

DJ suggested the design of the study. MD and DJ led to the creation and design of the study. MD wrote the manuscript of this article. MD and DJ read and approved the final manuscript for publication.

**Declaration of interests**

The authors declare no conflicting interest.

**Funding**

No direct support will be taken for funding this research from any public and private organizations. The Department of Physiotherapy under Datta Meghe Institute Of Medical Sciences, Deemed to be University, will provide the necessary material for the research.

The Association between Teeth Loss and Oral Health Problems

Aesa Alzaroug Jaber1, Alshame M.J. Alshame2, Khaled Owidat Abdalla3, Prabhu Manickam Natarajan4
1Assistant Professor in Oral surgery, University of Science and Technology of Fujairah, UAE., 2Assistant Professor Department of Oral surgery, Sebha University, Libya, 3Assistant Professor, Departments of Orthodontic, Sebha University, Libya, 4Associate Professor in Periodontics, University of Science and Technology of Fujairah. UAE.

Abstract

Background: The teeth play various functional roles, from the most basic functions to more subtle functions. One of the most tragic events that can happen to the teeth are loss it, as a result trauma or dental diseases. Tooth loss has esthetic, functional, positional and psychological impacts on the life of individuals.

Objectives: To investigate the association between tooth loss and oral health problems among partially and completely edentulous patients. Method: (Questionnaire and Clinical Examination). Self-administered questionnaire was distributed to the patients to collect information relating to demography and cause of tooth loss, in addition to mastication and speech state after tooth loss. Four clinical conditions including supra-eruption, drifting teeth, temporomandibular disorders and bone resorption were used to recognize the effects of missing teeth. Patients seeking dental treatment at General Hospital, Morzuk, Libya were recruited for the study. Criteria included age of 16 years and above with one or more missing teeth except for third molars. Results: altogether 58 participants, 31 (53.4 %) were males while 27 (46.6%) were females. The participants were aged 16–>45 years, among them, 44 patients (75.9%) are partially edentulous, and 14 patients (24.1%) were completely edentulous. The patients with complete teeth loss and the patients with missing both the anterior and posterior teeth are most groups suffer problems among patients who involved in the study. patients who loss posterior teeth are the lowest group had, suffer of health problems due to loss of teeth among all of them.

The general relationship between tooth loss and the oral health problems was positive and strong. Conclusions: there are statistically significant relationship between tooth loss and oral health problems, where the strong value of this relationship (0.614) and significance within less than (0.05).

Key words: Tooth loss, consequences of tooth loss, causes of tooth loss.

Introduction

The teeth play various functional and aesthetic roles as essential daily activities from the most basic functions like eating and speaking to subtler functions related to good appearance1. Teeth are anchored in the jaws by the periodontal ligament. This ligament connects the cervix (neck) of the tooth, at the junction between the crown and root, to the gingiva. Below that, the ligament connects the outer layer of the tooth root (cementum), to the adjacent bone (jawbone). The jawbone of the maxilla and mandible that support the teeth is the alveolar bone2.

One of the more dramatic discoveries in the medical sciences in the twentieth century has been the realization that tooth loss is not an inevitable consequence of aging, but the result of trauma or dental diseases3. Tooth loss continues to be a major problem in clinical dentistry and has received significant attention in everyday dental practice4.

In most developing countries, the main reason for people to seek for dental care is pain that has become intolerable after a long period of “wait-and-see”5-6. Because of the delay in seeking treatment, the patients present with destroyed teeth that is impossible to treat
by the conventional restorative procedures. Likewise, insufficient finances limit restorative and rehabilitative dental treatment as well as shortage of professionals and dental materials. Therefore, we can assume that, many patients have a large number of missing teeth. The absence of one or more natural teeth often results in disability. This can trigger several positional and functional changes such as impairment in speech, mastication ability and integrity of dental arch.

Studies have shown that, tooth loss can have a substantial effect on the emotions as well as oral health and function. In the past, many patients felt that tooth loss was inevitable and were, to a certain extent, prepared for that eventuality.

Today, patients’ expectations have changed and many see tooth loss as a negative event. Patients may suffer real or perceived detrimental effects following the loss of one or more teeth.

**Problem Of Research**

Recent studies have confirmed the findings of many researchers that, both functional and psychological compromises as well as positional changes are following tooth loss if unrestored.

These positional changes may be of sufficient magnitude to complicate restorative treatment. Therefore, the desire of patients to have an excellent prosthesis for their missing teeth may pose dental technician with many challenges to achieve ideal function and best esthetics.

Many studies are available exhibiting the causes of tooth loss, but comparatively there are fewer studies documenting the effects or consequences of tooth loss, literature is scarce about the consequences of tooth loss in our country.

There is however, paucity of information on whether patients or people with missing teeth are aware of the side effects of tooth loss on them or on the remaining teeth.

**This study will help :**

- To understand the causes and consequences of tooth loss among our patients.
- Demonstration about the relationship between tooth loss and oral health problems.
- Encourage our patients for replacing their lost teeth.

**Objectives**

- To recognize the causes and effects of tooth loss.
- To investigate the association between loss teeth and oral health problem.
- To determine functional and positional changes that following tooth loss.
- To prioritize restoration and replacement of missing teeth to meet functional demands, and ensure quality dental services for all citizens.

**Materials and Method**

(Questionnaire and Clinical Examination)

Self-administered questionnaire was distributed to the patients to collect information relating to demography and cause of tooth loss, in addition to mastication and speech state after tooth loss.

Four clinical conditions including supra-eruption, drifting teeth, temporomandibular disorders and bone resorption were used to recognize the effects of missing teeth.

Patients seeking dental treatment at General Hospital, Morzuk, Libya were recruited for the study.

Criteria included age of 16 years and above with one or more missing teeth except for third molar.

**A. Study Design.**

A short-term study design

**B. Study Area.**

This study conducted in the prosthetic clinic at the General Hospital of Morzuk, Libya. The location of this hospital is in the city center beside the modern mosque along the main road.

**B. STUDY SAMPLE.**

The study was conducted among the partially and
completely edentulous patients who attended dental clinic at the hospital for refers or received various oral health services.

C. INCLUSION CRITERIA.

- The people who have missing teeth, either partially or completely edentulous.
- Age is 16 years old and above.

D. EXCLUSION CRITERIA

- Any subject who have loss of third molars alone (considered as complete dentition).
- The patients who have teeth extraction for orthodontic purposes (treatment objectives).

E. ETHICAL CONSIDERATIONS

Ethical clearance for this study was obtained from Dental Prosthetic Department of the Medical Technology College in Sabha University.

The study also was approved by the administration protocol of General Hospital of Morzuk, Libya. In addition, every 23 participant was informed of his or her right to refuse participation or to withdraw from the study at any moment.

TOOLS AND TECHNIQUE OF COLLECTION OF DATA.

1. QUESTIONNAIRE (OPEN-CLOSE):

- Self-administered open-close questionnaire used to collect information from the patients. The questionnaire contained 13 questions, one was dichotomous, and one question had space for the participant to write the answer.

The questions in the beginning enquired about the personal information such as age, gender, economic and education status. Thereafter, the subjects questioned about causes and duration of tooth loss, in addition to some effects that happened after tooth loss.

The subjects were of four age groups ascending from 16 to more than 45 years of age (16-25 years, 26-35 years, 36-45 years, and >45 years).

2. CLINICAL EXAMINATION:

- Clinical examination conducted by using examination tools: dental chair, mouth mirror, tweezers and periodontal probe.

The examination included clinical variables such as type of edentulousness (partial or complete), position and type of missing teeth. In addition to the consequences of tooth loss on patients’ wellbeing, such as temporomandibular disorder, drifting of remaining teeth, overeruption of unopposed teeth and bone loss (resorption).

To determine the position and type of missing teeth, we used graphical representation to represent the upper and lower teeth. In addition, we have also used it to determine whether the teeth have drifting (inclining) or overeruption.

Results:

Altogether 58 participants, 31 (53.4 %) were males while 27 (46.6%) were females. The participants were aged 16 – >45 years, among them, 44 patients (75.9%) are partially edentulous, and 14 patients (24.1%) were completely edentulous. Among the study group, the patients with complete tooth loss, patients with missing both anterior and posterior teeth were suffering with more problems. The least suffering was those who lost posterior teeth.

Many oral health problems had shown high average occurrence on T-Test and strong relationship on Pearson correlation. The general relationship between tooth loss and the oral health problems was positive and strong.

Conclusions

There is a statistically significant relationship between tooth loss and oral health problems, where the strong value of this relationship was (0.614), and the level of significance was less than (0.05).

F. STUDY DESIGN.

A short-term study design

B. STUDY AREA.

This study conducted in the prosthetic clinic at the
General Hospital of Morzuk, Libya. The location of this hospital is in the city center beside the modern mosque along the main road.

G. STUDY SAMPLE.

The study was conducted among the partially and completely edentulous patients who attended dental clinic at the hospital for refers or received various oral health services.

H. INCLUSION CRITERIA.

· The people who have missing teeth, either partially or completely edentulous.
· Age is 16 years old and above.

I. EXCLUSION CRITERIA

· Any subject who have loss of third molars alone (considered as complete dentition).
· The patients who have teeth extraction for orthodontic purposes (treatment objectives).

J. ETHICAL CONSIDERATIONS

Ethical clearance for this study was obtained from Dental Prosthetic Department of the Medical Technology College in Sabha University. The study also was approved by the administration protocol of General Hospital of Morzuk, Libya. In addition, every 23 participant was informed of his or her right to refuse participation or to withdraw from the study at any moment.

K. TOOLS AND TECHNIQUE OF COLLECTION OF DATA.

1. QUESTIONNAIRE (OPEN-CLOSE):

- Self-administered open-close questionnaire used to collect information from the patients. The questionnaire contained 13 questions, one was dichotomous, and one question had space for the participant to write the answer.

The questions in the beginning enquired about the personal information such as age, gender, economic and education status. Thereafter, the subjects questioned about causes and duration of tooth loss, in addition to some effects that happened after tooth loss.

The subjects were of four age groups ascending from 16 to more than 45 years of age (16-25 years, 26-35 years, 36-45 years, and >45 years).

2. CLINICAL EXAMINATION:

- Clinical examination conducted by using examination tools: dental chair, mouth mirror, tweezers and periodontal probe.

The examination included clinical variables such as type of edentulousness (partial or complete), position and type of missing teeth. In addition to the consequences of tooth loss on patients’ wellbeing, such as temporo-mandibular disorder, drifting of remaining teeth, overeruption of unopposed teeth and bone loss (resorption).

To determine the position and type of missing teeth, we used graphical representation to represent the upper and lower teeth. In addition, we have also used it to determine whether the teeth have drifting (inclining) or overeruption.

Data Analysis

All Data was analyzed by using Statistical package for Social Science SPSS (Version 18)

- Analysis included one sample T-Test and Pearson Correlation to find the correlation between the tooth loss and oral health problems. In the analysis, the tooth loss category was used as independent variable; it is divided into four groups:

  · Missing anterior teeth only.
  · Missing posterior teeth only.
  · Missing both anterior and posterior teeth.
  · Complete teeth loss.

The dependent variable was that problems who followed the tooth loss: positional changes (overeruption and drifting teeth), functional changes (low mastication, poor aesthetic and speech distortion), bone loss (resorption) and emotional effects of tooth loss.34 significance (0.000). Similarly, increase in tooth loss led
to increase in low mastication or low chewing ability.

As for the relationship between tooth loss and speech distortion was positive with medium-strength, the level of significance reached (0.002).

With increase of teeth loss, the distortion of speech also increased.

The relationship between tooth loss and aesthetic problems (poor appearance) was positive with slight-strength correlation (1.261), the level of significance less than (0.05).

With increase of teeth loss, the aesthetic problems also increases. The problem of drifting teeth showed a negative low correlation (reverse relationship) the level of significance was (0.037).

Increase in tooth loss led to a decrease in drifted teeth.

As for the problems of the negative emotional effects and bone loss (resorption) are showed positive correlation but low strength (weak), but indicative of the level of significance higher than (0.05), that correlation is not significance in both problems. While, the overeruption of unopposed teeth is showed a negative correlation (reverse relationship), but the significant is higher than (0.05). Therefore, the correlation is not significant.

The general relationship between tooth loss and the oral health problems (all previous problems), the correlation value was (0.614), and the level of significance was (0.000), which is less than (0.05). It is a positive and strong correlation, and with increasing teeth loss, there is also an increase in oral health problems.

**Result**

Fifty-eight patients consisting of 31 male (53.4 %) and 27 (46.6%) female participated in the study. The ages ranged from 16 to more than 45 years. The majority of participants were within the age group 26-35 years (29.3%). About half of the respondents (48.3%) had academic education or more.

About 18 (31%) of participants were their answers about first experience with tooth loss are (5-10 years ago).

Among the participants, 44 patients (75.9%) are partially edentulous, and 14 patients (24.1%) were completely edentulous. Of those with partially missing teeth some of them had, missing teeth in anterior only 16 (27.6%), and some had missing teeth only in the posterior region 14 (24.1%), while others had missing teeth in both anterior and posterior regions 14 (24.1%).

**Causes of tooth loss**

The most common cause of tooth loss in this study was dental caries 27 (46.6%), followed by Periodontal disease 20 (34.5%), trauma was responsible for 9 (15.5%) cases of tooth loss, and lastly, just two patients (3.4%) had congenitally missing teeth.

</table>

In addition, a lot of them are suffer the problem of bone loss, where an average of this problem is (1.929), the standard deviation (0.267), and the level of significance less than (0.05).

As for the aesthetic problems (poor appearance) and negative emotional effects (psychological effects) there are no statistically significant prove the occurrence of
this problems between these patients, because the level of significance of these problems was higher than (0.05).

Because the patients with complete teeth less do not have remaining teeth, considered their answers about the problems of drifting teeth and over-eruption are (NO).

**The Summary of T-Test Results**

The patients with complete teeth loss and the patients with missing both the anterior and posterior teeth are most groups that clearly suffer problems among patients who involved in the study.

While those who loss posterior teeth only are less group suffer health problems due to loss of teeth among all of them.

**The results of Pearson Correlation**

The following results shows the general relationship between tooth loss and problems of oral health on the one hand, and then shows the relationship between tooth loss and every problem separately.

The strongest relationship was between tooth loss and temporomandibular disorder (TMD) (0.813). It is a strong positive correlation, and the level of significance (0.000), which is less than (0.05). Whenever increasing the teeth loss, increasing problem of TMD.

Then followed that, the relationship between tooth loss and low chewing ability. It is also a positive and strong correlation (0.730) and was indicative of the level of significance (0.000). Whichever, with increase of teeth loss, the problem of low mastication increasing.

As for the relationship between tooth loss and speech distortion was positive medium-strength, the level of significance reached (0.002). Whichever, with increase of teeth loss, the distortion of speech well increasing.

The relationship between tooth loss and aesthetic problems (poor appearance) was positive slight-strength correlation (1.261), the level of significance less than (0.05). Whichever, with increase of teeth loss, the aesthetic problems will be increasing.

As for the problem of drifting teeth, showed a negative low correlation (reverse relationship) the level of significance was (-0.037). With increase of teeth loss, will decreasing the drifted teeth.

As for the problems of the negative emotional effects and bone loss (resorption) are showed positive correlation low strength (weak), but indicative of the level of significance higher than (0.05), that correlation is not significance in both problems.

While, the overeruption of unopposed teeth is showed a negative correlation (reverse relationship), but the significant is higher than (0.05). Therefore, the correlation is not significance.

The general relationship between tooth loss and the oral health problems (all previous problems), the correlation value was (0.614), and the level of significance was (0.000), which is less than (0.05). It is a positive and strong correlation, whichever, with increasing of teeth loss, the oral health problems will be increasing.

**Discussion**

Studies concerning the epidemiology in dentistry have showed that dental caries and periodontal diseases are the most prevalent pathologies that affect the oral cavity. Previous studies performed by American researchers had suggested that dental caries was the main reason for teeth extraction, and other studies accomplished in New Zealand, Sweden, and even in Brazil confirmed that caries may lead to tooth mortality.12-13.

The association between positional changes and tooth loss.

- Temporomandibular disorder (TMD)

The TMD has been very clear in patients with complete teeth loss, because without teeth, the occlusion plane changed in these patients, therefore disorders such as excessive closures and other problems are exposed.

While, the remaining teeth in patients with partial teeth loss maintained at the occlusion plane in the proper place.

Therefore, the TMD is commonly in complete edentulous patients than partial edentulous patients.

This study concluded that, the correlation is strong
between tooth loss and TMD, unlike that study conducted by Ciancaglini and his colleagues\textsuperscript{14} who have concluded that tooth loss is of little relevance in the etiology of temporomandibular disorders.

- Over-eruption

The overerupted teeth emerged in patients with missing both anterior and posterior teeth only, maybe because this problem needing too many gaps and teeth without opposite in the jaws. The relationship between tooth loss and this problem was negative, because with increase of teeth loss will not be teeth there to occur overeruption on it after that.

- Drifting teeth

The drifting teeth common between patients with loss anterior and posterior teeth clearly, which also for occurs is required many gaps and remaining teeth in the jaws, so the proportion of occurrence it slight. Like previous problem, the correlation between tooth loss and this problem was negative, because with increase of teeth loss will not be teeth there to occur overeruption on it after that.

THE ASSOCIATION BETWEEN FUNCTIONAL CHANGES AND TOOTH LOSS.

- Low chewing ability

The patients who suffered of low mastication on extensively were patients with complete teeth loss, as a known without teeth the chewing ability is absent.

The partial teeth loss patients who suffered of this problem were very simple; because good chewing ability is assured even with remain just (20 well-distributed teeth). Similarly, (Sarita et al., 2003)\textsuperscript{15} he has found these previous results.

- Poor appearance

The aesthetic problem due to tooth loss is clearly in patients who have lost their anterior teeth. These patients have complained about their appearance after the loss of these teeth, because the anterior teeth visible and complementary to the beauty of the face.

Because this problem is restricted by spatial conditions (place of the missing tooth), thus not experienced by all patients with tooth loss. Therefore. The correlation was positive but weak.

- Speech distortion

The patients with missing anterior teeth and with complete teeth loss are suffering from this problem significantly. Because the anterior teeth have an important role in the process of speech and produce pure sound.

Thus, the loss of the anterior or all teeth, the pronunciation and aesthetic would affected.

BONE LOSS (RESORPTION)

The majority of patients’ categories had loss (resorption) in their alveolar bone clearly. Because after tooth loss the bone begins to resorb immediately.

The bone loss among patients with missing posterior teeth were somewhat low. Because the bone in the posterior wider than anywhere, so it needs longer time to be absorbed.

On reverse a study by (Bhaskar)\textsuperscript{2} who concluded that, bone loss is more pronounced posteriorly than anteriorly.

THE NEGATIVE EMOTIONAL EFFECTS OF TOOTH LOSS

The negative emotional effects due to tooth loss are not frequently occurring among patients, because with passage of time getting used to it and accept the event, after it was initially difficult admission.

Moreover, a lot of them not care about teeth loss and did not lend attention to this issue originally. Therefore, the correlation was not significant.

THE ASSOCIATION BETWEEN TOOTH LOSS AND ORAL HEALTH PROBLEMS

Most of previous problems had shown high average occurrence on T-Test and strong relationship on Pearson correlation. Therefore, the general relationship between tooth loss and the oral health problems was positive and strong.
Conclusions

This study demonstrated that tooth loss causes several oral health problems. There is a statistically significant relationship between tooth loss and oral health problems, where the strong value of this relationship was (0.614), and the significance was less than (0.05).

Recommendations

Based on the findings of the study, the following recommendations are made:

· Dental personnel should make an effort to identify individuals with risk of tooth loss on oral health in order to prevent tooth loss.

· The patients with tooth loss should replace their missing teeth to restore function and protect the remaining teeth.

· Improvement of dental laboratories to provide quality replacement of missing teeth at affordable costs.

· Further long-term multicenter studies to evaluate the consequence of tooth loss and assist in giving a more accurate projection of the patients’ needs across the nation is mandatory.

Ethical Clearance: Ethical approval obtained from local Ethic Committee of Sebha University (South Libya).

Relationship between inflammatory Response and Pathology of *Listeria monocytogenes*

Ali Anok Njum¹, Jabbar Afate ALwan², Yasir Faisal Abbas³

¹Community Health Department, Samawa Technical Institute, Al-Furat Al-Awsat Technical University, Kufa, Iraq,
²Ass.Prof., Biotechnology College, Al Qadysia University, ³ Samawa Technical Institute, Al Furat Al Awsat Technical University

**Abstract**

*Listeria monocytogenes* is a feebly pathogenic, Gram-positive bacterium and ready to develop additionally at the temperature of 4°C. A man frequently gets influenced by expending tainted water and food. 150 aborted placentas were achieved from women and cultured directly, while other were fixed in formalin buffer to study the effect of CD 45 and CD74 in pathogenesis of *Listeria monocytogenes* associated with placentitis in aborted women. Results showed six placental samples from out 50 were positive for listeria culture, were exhibited high expression of CD 45 and CD74 aborted placenta infected with *Listeria monocytogenes* as a compared to uninfected placenta. This study concluded that a relationship between inflammatory response and pathology of *L. monocytogenes* in placental tissue that were collected from aborted women in Al-Muthana City.

**Keywords:** *Listeria monocytogenes*, aborted women, CD45, CD74.

**Introduction**

Listeriosis is a typical foodborne ailment created by *Listeria monocytogenes*. This bacterium is pervasive and found in all aspects of climate including soil, water and rotting vegetation. Huge aspect of the different instances of listeriosis are brought about by taking of the living being in nourishments [¹]. Sickness as a rule happens in very much characterized high danger gatherings, including pregnant ladies, children and immunocompromised grown-ups, however may incidentally happen in people who have no inclining fundamental condition [²].

As indicated by the reports of CDC, pregnant ladies are normally around multiple times more delicate to listeriosis than sound grown-ups [³]. *Listeria* is Gram-positive bacterium of the slash stick structure, motile and is to be found in water and earth. It is truly proficient for endurance since it develops at the temperature under 3°C and all to around 4°C, and beat likewise the unsafe impact of cooling drying and warming [⁴]. Because of that, it tends to be increased in food, which is kept in cooler. Creatures can be additionally transporters of listeria so by devouring of meat, meat items and milk of the tainted creatures, can be influenced likewise the person. Vegetables, aside from carrot and tomato, likewise can be defiled by this bacterium from earth of compost [⁵]. The acquired creature listeria by food can do the attack onto the gastrointestinal epithelial over the unblemished gastrointestinal parcel. Listeria after that being phagocytes by macrophage, monocytes, or granulocytes. The pathogenesis of this bacterium relies upon the property of *Listeria* for endurance and propagation in the host phagocytes. As an intercellular microorganism that balanced out in the lymph tissue goes into circulation system, hepatic tissue and different organs [⁶]. This study was aimed to isolation and detection *L. monocytogenes* from placental specimens that collected from aborted women and to find out the relationship between inflammatory response and pathology of *L. monocytogenes*.

**Materials and Methods**

**2.1. Patients and Sample Collection**

This study was conducted in Al-Smawa hospital of Al-Muthana City, during the period of January 2020 to April. One hundred and fifty aborted women were secondhand in this study. Placental specimens were achieved from aborted distributed into two slices, one slice cultured directly on 7% sheep blood agar (Difico, USA), Listeria selective medium and Eosin
Methylene Blue (EMB) agar (Himedia, India). The cultures were incubated at 37 C for 3 days, aerobically. Other slice of placenta tissue were stable in 10% buffered formalin, managed usually, and stained with Immunohistochemistry as” charity by Mao et al., [7].

2.2. Statistical methods

Percentages were used as a statistical method to express the results, and the probability (p. value) value was calculated for a significant level at (0.001).

Results

Six placental samples from out 50 were positive for listeria culture and yielded practically unadulterated development of β-haemolytic settlements on the blood agar following 24 hours of brooding. The states of microorganisms were showed up little, approximately 1-2 mm in breadth, round, smooth and whitish-dark. On the Listeria specific agar, the states had comparative attributes and were 3-4 mm in size. Development was not seen on EMB agar. Immunohistochemical (IHC) analysis of placental samples exhibited Positive placental staining for CD 45 and CD 74 (Table 1, 2 and Figure 1).

*Significant (p ≤ 0.01)
From results showed only six cases were positive for *L. monocytogenes*, the culture characteristic of *Listeria* same with that reported by [8]. Listeria causes necroperulant inflammation; sever placentitis, infiltration of inflammatory cells, hemorrhage and accumulation of amorphous material. Immunohistochemical assays showed high expression of inflammatory CD (CD45 and CD74) and. Chemokines participate in the progression of the inflammatory process by altering the original by changing the native T-helper 0 response to a T-helper 1, T-helper 2, or a mixed T-helper 1 and T-helper 2 response [9, 10]. In the present study, IFN-γ-specific staining the Listeria invigorates Lymphocyte interceded resistance, which, under the impact of cytokines, pulls in macrophages that produce provocative granulomata where microorganisms are obliterated.

Memory Lymphocytes give a gained protection from Listeria disease, and this may clarify why listeriosis is connected with harm, immunosuppressive treatment, Helps, pregnancy and the youngster. This can likewise represent the perception that neutropenia and issues of supplement or immunoglobulin blend are not related with extreme predominance of the infection [11, 12]. Aside from the resistant status of the host, different elements, which impact whether obstructive illness happens incorporate the destructiveness of the contaminating strain and the size of the inoculum [13, 14]. The infective portion is obscure trophoblast cells, was found fundamentally contrast between the tainted and uninfected proposed that the epithelial CD45 recoloring presumably reflects receptor-bound CD45, since this cytokine is delivered distinctly by Immune system microorganisms and NK cells. Besides, it was found in biopsy tests with positive MNCs, proposing a nearby capture of the cytokine in listeria contaminated cells *L. monocytogenes* disease is related with expanded CD74 creation in humoral resistance and enactment of antigen introducing cells [15]

**Conclusions**

This study concluded that a relationship between inflammatory response and pathology of *L. monocytogenes* in placental tissue that were collected from aborted women in Al-Muthana City.

Epidemiological Study of Burn Deaths at a Tertiary Care Centre in Mumbai

Babaso Kalel1, Pawan Sabale2, Shailesh Mohite3

1Ex. Junior Resident, 2Professor (additional), 3Professor and Head, Department of Forensic Medicine, Topiwala National Medical College, Mumbai

Abstract

Death due to burns is an important cause of unnatural death commonly encountered in Medico-legal Practice. This prospective study was conducted on 100 cases of burn deaths caused by flames, hot liquids and flash of electricity. This study was conducted to know the demographic profiles, common risk factors, causes and manners of death in fatal cases of burns. Most of the cases were in the age group of 21 to 50 years with a peak incidence in 21-30 years age group, with female predominance. In the study, maximum cases were due to kerosene stove blast leading to accidental burns, followed by pouring of kerosene as a source of burn.

Key words: Burn, autopsy, Kerosene Stove Blast, Accidental Burn

Introduction

Death due to burns is one of the most important public health problems faced by all nations today. Burns represent an extremely stressful experience for both the burn victims as well as their families. Death due to burning is an important cause of unnatural death commonly encountered in Medico-legal Practice.

In different communities the aetiological factor of burn injuries varies considerably, hence a careful analysis of the epidemiological factors in every community is needed before the planning and implementation of a sound prevention program. This study was conducted to know the demographic profiles, common risk factors, causes and manners of death in fatal cases of burns.

Materials and Methods

This prospective observational study was carried out on persons who died due to burns and were brought for medicolegal post mortem examination at mortuary of department of Forensic Medicine of a tertiary care centre in Mumbai, during the period of one year and three months i.e. from 1st September 2016 to 30 November 2017.

This prospective study was conducted on 100 cases of burn deaths caused by flames, hot liquids and flash of electricity, after approval from the ethics committee for academic research project.

Primary data, in each case, was collected from inquest report, accidental death report and indoor paper records. The percentage of burn injury was recorded by sketch diagram, photographs for easy understanding and interpretation. The percentage of burns was calculated on the basis of Wallace’s rule of nine for adults and Lund and Browder’s chart for children.

Results and Discussion

There were 992 medico-legal post-mortem examinations conducted at the Department of Forensic Medicine and Toxicology attached to a tertiary care...
centre in Mumbai during the study period. Out of which, 100 (10.28%) cases were of death due to burns. In the present study 100 (10.28 %) cases of death due to burns were included.

Most of the cases (72%) were in the age group of 21 to 50 years with the peak incidence in 21-30 years age group, with female predominance. This is similar to the observations of Chawla R et al\(^1\) and Dasari H et al\(^2\). It shows proneness of the young population to hazards of fire. This is the most active group of people where the females are more concerned with the kitchen hence more chances of sustaining accidental burns. Females outnumbered males in all age groups except in 0-10 and 71-80 age groups. House wives were involved in 45% cases followed by workers in 21% cases, others victims were students, vegetable venders, car washers, garment painting, and farmers. This is consistent with a study done by Deshpande et al.\(^3\) This may be due to the fact that in children and elderly both sexes are equally and occasionally exposed to fire.

Table 2 - Marital Status of deceased

<table>

<td>39</td>
<td>61</td>
</tr>
</tbody>
</table>
The data shows that maximum incidence of burn deaths occurred in married people i.e. 82 as compared to unmarried people which is only in 07 cases and 11 cases were below the legal age of marriage. Out of married 82 people, there were 52 females and 30 were males, it shows female predominance. In this study, 36 married females out of total 100 victims died within seven years of marriage. Out of these 36 married females only in one case there was allegation of demand for dowry.

This finding is consistent with Dasari H et al\(^2\) and Tasgaonkar et al\(^4\). This is an indicator of social problems among married people, especially females, who have all household responsibilities. Also younger and newly married females may become the victim of dowry demand and domestic violence.

Maximum 77 (77 %) incidences occurred inside the house i.e. in close place (kitchen, bedroom, living room), followed by whereas 18 (18 %) were reported outside the house i.e. in open space. 05 (05%) incidences were reported at the workplace. This is because the housewives working in the kitchen are more prone to hazards of fire. Most of the suicidal victims prefer closed spaces like a living room.

<table>
<thead>

<td>12</td>
<td>50</td>
</tr>
</tbody>
</table>

More deaths due to burns 40 (40%) occurred in those who sustained 41 to 60 % of burns, 26 (26%) deaths occurred who sustained 61 to 80 % of burns and 17 (17%) deaths occurred in 81 to 100 % burns. Fewer deaths caused due to burns occurred in 9cases who had sustained 0 to 20 % burns, 8 deaths occurred in those who sustained 21 to 40 % burns. Maximum 50 (50%) people survived for one to seven days after the incidence of burn followed by 23 (23%) who survived for eight to fourteen days and 12 (12%) people survived for less than twenty-four hours. These findings suggest that the more the percentage of burn, less is the survival period and vice versa.
Table 4 - Distribution of source of burn of deceased

</tr>
<tr>
<td>Cracker Blast</td>
<td>01</td>
</tr>
<tr>
<td><strong>Total</strong></td>
<td><strong>100</strong></td>
</tr>
</tbody>
</table>

Kerosene stove blast was leading source of accidental burns in 35 cases, followed by pouring of kerosene as a source of burn in 22 cases. This finding is consistent with Chawla et al.\textsuperscript{1}

Maximum deaths due to burns i.e. 91 (91%) occurred were dermo-epidermal type of burns followed by 08 deaths (08%) due to epidermal burns and 01 death (01%) due to deep burns. Out of 100 burn deaths, 97 victims were hospitalized and 3 were brought dead. The nature of burn injuries in all 100 victims was antemortem.

In all types of thermal burns, the upper half of the body was observed to be involved more than the lower half of the body. Similar findings were also observed in a study done by Deshpande et al\textsuperscript{3}, who observed that anterior and posterior trunk were most commonly affected followed by lower extremity. In a study done by Mustafa F\textsuperscript{5}, maximum involvement of upper limbs (66.8%) was observed followed by lower limbs (49.1%).
Table 5 - Distribution of immediate cause of death

<table>
<thead>
<tr>
<th>Cause of Death</th>
<th>No of cases</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pneumonia &amp; septicemia</td>
<td>37</td>
</tr>
<tr>
<td>Pneumonia</td>

</tr>
<tr>
<td>Neurogenic Shock</td>
<td>11</td>
</tr>
<tr>
<td>Hypovolemic shock</td>
<td>06</td>
</tr>
<tr>
<td>Others</td>
<td>07</td>
</tr>
<tr>
<td>Total</td>
<td>100</td>
</tr>
</tbody>
</table>

It is observed that in maximum 37 cases (37%) the immediate cause of death was pneumonia and septicemia. In 19 cases (19%) the cause of death was pneumonia, 20 cases (20%) it was septicemia, 6 cases died due to hypovolemic shock and 11 cases died due to neurogenic shock. Out of 11 cases, in 08 cases the cause of death was neurogenic shock due to electrocution and in three cases the cause of death was neurogenic shock due to 95 to 100 % burns. The other causes include acute renal failure, acute respiratory failure, shock and suffocation and head injury secondary to electrocution.

Chawla R et al\(^1\) observed 22 % cases died due to primary shock, 10 % died due to oligemic shock and 56% died due to Septicemic shock and 12 % died due to injuries. Death within the first 72 hours is due to loss of fluid leading to hypovolemic shock. As the survival period and hospital stay increases, chances of infection increases leading to septicemia.

On the contrary, Nath et al\(^6\) observed shock as the cause of majority deaths i.e. 65.74 %, followed by septicemia 28.7 % cases. In a study done by Tasgaonkar et al\(^4\), observed 3.38 % deaths due to Neurogenic shock, 36.38 % cases due to oligemic shock, 29.54 % cases due to Septicemic shock and 30.46 % cases due to acute tubular necrosis and complications of septicemia.

The manner of death in 78% cases was accidental, 18% cases had committed suicide and 04 % were homicidal in nature. This finding is consistent with Tasgaonkar et al\(^4\) and Buchade et al.\(^7\) This might be due to the fact that maximum victims in the present study were housewives who were more prone to accidental contact to fire while working in the kitchen, particularly in small and crowded houses. This is not consistent with a study of Nath et al\(^6\) which shows maximum burn deaths i.e. 177 (81.94 %) which were suicidal followed by 35 (16.20 %) homicidal and least cases 4 (1.85 %) were accidental.

**Conclusion**

Females aged between 21 - 40 years are more susceptible to burn injuries. Maximum numbers of victims were housewives and died due to accidental burns. However accidental burn deaths are preventable through a combination of prevention strategies and improvements in the care of people affected by burns. The cases of burns with alleged dowry demand are very low in this study. This may be due to mass and social media in creating awareness among the society regarding laws dealing with dowry death or non-reporting of the dowry issue at the time of post-mortem examination.

Kerosene stove blast was observed to be the most common source of accidental burns. These stoves
provide a very cheap alternative to electric or gas stoves, especially in low socio-economic groups. The accidents are usually due to the fact that the victims do not follow the instructions and do not observe the necessary precautions.

Assessment of Occupational Stress in Medical Doctors Working in Tertiary Care Hospital

Dipika Baria¹, Tejas J. Shah², Shruti Brahmbhatt³, Mahavir Rajput⁴

¹Assistant Professor, Physiology, ²Associate Professor, Biochemistry, ³Associate Professor, Pharmacology, ⁴Professor, Physiology, Smt. B. K. Shah Medical Institute and Research centre, Sumandeep Vidyapeeth, Vadodara, Gujarat (India)

Abstract

Background: Nowadays, stress has commonly been assessed especially in medical doctors. The reason for the same is that medical doctors have to play high competitive roles and in turn have so many responsibilities keeping in mind the holistic care to patients.

Aim/objective: To assess occupational stress in medical doctors working in tertiary care hospital of Bhavnagar, Gujarat.

Materials and Methods: This cross-sectional study was conducted during September 2017 to December 2017 after prior approval of institutional ethics committee. Total 75, both male and female medical doctors were enrolled as study participants after written informed consent and based on inclusion criteria. Along with case record performa, self-administered pre-tested questionnaires having stress scale namely Professional Stress Scale (PSS) and Perceived Stress Scale 10 items (PSS-10) were given to all participants as a study tool. The data of scores received on scales was and entered in Microsoft excel and the same was analyzed by using GraphPad Prism 5 software for various proportions, associations and frequencies. The associations were considered significant if the p value is less than 0.05.

Results: Out of 75, total 50 participants filled and submitted the questionnaires. The mean age of participants was 31.96 years. As per the stress scales used, moderate stress was observed among medical doctors irrespective of sex. The commonest symptom observed among stressed doctors was sleep disturbances (insomnia).

Conclusion: Moderate to mild stress was found among medical doctors. Stress in medical doctors is never underestimated irrespective of sex. Insomnia is the commonest symptom observed among stressed doctors.

Keywords: Occupational Stress, Medical Doctor, Insomnia

Introduction

Stress is a widely spread and considered very common phenomenon which affects not only the individuals but also organizations and societies. Due to globalization and increased complexities of work and demands, stress has now become a prominent and permeating problem to everyone. Cobb and French (1975) defined occupational stress as “any characteristics of job environment which poses a threat to the individual”. Copper and Marshall (1976) have expressed that “by occupational stress is meant negative environmental factors or stressors associated with a particular job”.¹ Stress can be generally defined as unwanted, improper or overemphasized response to a situation. Person’s anxiousness to a particular situation
can be positive but stress is always being considered as negative which in turn affects physical and mental well being of a person. Stress in medical practice has always been a topic of interest owing to its adverse outcomes. The reason for the same is that medical services involve not only treatment of patients but also a holistic care. Therefore, any negligence or mistakes in patient’s care could be very costly and irreversible. With such huge responsibilities, it is always expected from a medical doctor that he/she should be free from any kind of worries, tension or mental pressure rather he/she should have perfect state of mind. But in reality, medical doctors are likely to get stress due to complex work pattern and lot of expectations from society.\(^2\) Moreover, the modern medical work environment is very compound and to which different doctors respond to it differently. Some are finding it encouraging and fruitful, whereas others may feel anxious, stress and annoyed from the heavy workload. The medical work practices are constantly being evolved by incorporating newer skills and techniques in patient’s care due to advances in medical knowledge. This in turn leads to changes in doctor’s work pattern due to professional and career development competitions. The heavy workload and the health risks faced by the doctors put them under lot of stress. Doctors have higher rates of suicide, psychiatric illness and possibly alcohol and drug misuse than the general population.\(^3,4\) Stress has a direct impact in employee’s health and consequently impacts work performance. It also leads to psychosomatic disorders such as asthma, diabetes, backpain, hypertension, anxiety, depression and arthritis.\(^5\) One of the leading causes of disability by the year 2020 have been identified by WHO is stress related disorders.\(^6\) Studies which measured stressful life events found that approximately 90% of suicide attempters reported negative life events\(^7\) and about 35% experienced stressful life events in the previous 6 months.\(^8\) with the passage of time, greater emphasis is given to assess stress in medical doctors and to find out its sources. The major adverse outcome of having persistent work related stress in doctors is poor quality in patient care which in turn affects services to mankind.\(^9,10\) Therefore, this study was undertaken to assess stress among medical doctors working in tertiary care hospital in Bhavnagar, Gujarat.

### Materials and Methods

Study design of present research was cross-sectional. The data were collected from the medical doctors working in tertiary care hospital in Bhavnagar, Gujarat. The study was approved by ethics committee. Participants were chosen irrespective of their designation, gender and qualification. Present study was carried out from September 2017 to December 2017. A total 75 doctors were approached to participate in the present research study. They were selected by random sampling method from the employee list provided by Hospital HR department. Their enrollment was based fulfilling the inclusion criteria mentioned below:

1. He/she willing to participate in the study
2. He/she has more than 1 year of working experience in same profession
3. He/she is working in any of the shifts in Hospital
4. He/she has no any known disease

Informed written consent was obtained from all study participants before starting the data collection and they were assured for confidentiality of their information. In every step of this survey, anonymity of study participants was maintained. The study was entirely based on the self-administered and pre-validated questionnaire for the assessment of stress levels. The questionnaire had two parts: **Part 1** – Demographic details including work experience, working hours, work scheduling, breaks and number of dependents and **Part 2** – Included two stress scales, Professional Life Stress Scale\(^11\) and Perceived Stress Scale 10 Items.\(^12\) The Professional Life Stress Scale, scores can range from 0 to 60 and classified into 4 different classes depending on the obtained scores. Scores between 0 and 15 indicates no stress, 15 to 30 indicate moderate stress, 30 to 45 indicate stress needing remedial action and 45 to 60 indicates stress as a major problem needing intervention without delay. Perceived Stress Scale 10 item measures the degree to which the situations in one’s life are appraised as stressful. Scores can range from 0 to 40 with higher scores indicating greater association. The responses of questionnaire were entered in Microsoft Excel and analyzed using GraphPad Prism 5 software for various proportions, associations and frequencies. The associations were considered significant if the p value is less than 0.05.
Results/ Observations

In this study the response rate for the self administered questionnaire among medical doctors was 50 (66%) means 50 participants have submitted filled questionnaires out of total 75 enrolled.

Demographic details: Among the 50 respondents, 50% were male and 50% were female. Most of the doctors (both among male and females) were in the age group of 20-30 years, 14 (28%) and 16 (32%) respectively. The mean age of the respondents was 31.96 years (Table.2). The number of dependents varied between nil to 5 and the mean number of dependents was 1.36. On an average the doctors worked for 11.08 hours per day. Majority of the doctors were eligible to take two breaks of 15 minutes each for tea/coffee and one break of 30 minutes for lunch. Most of the doctors travelled 5 minutes to 30 minutes to reach their place of work. Majority, 38 (76%) of the respondents had a work experience of 10 years or lesser (Table.3).

Stress scores:

Scores of the Perceived Stress Scale:

00 – 10: 11 (22%)
11 – 20: 19 (38%)
21 – 30: 20 (40%)
31 – 40: 0 (0%)

Analyzing the perceived stress scale, most of the doctors (40%) scores ranged 21-30 followed by 11-20 and 00-10. The mean score was 16.66.

Scores of the Professional Life Stress Test:

00 – 15: 19 (38%)
16 – 30: 29 (58%)
31 – 45: 2 (4%)
According to the professional life stress test, 2 doctors (4%) were stressed, needing immediate remedial intervention. Out of this two, both were male doctors. 29 (58%) were moderately stressed and 19 (38%) had no stress. Among the 29 with moderate stress, 15 (51%) were males which underlines that stress is more among men when compared to women and this difference was not significant.

There was no significant association between any of the study variables like gender, total work experience, number of dependents, total work hours, break time and the stress levels according to both perceived stress scale and professional life stress test.

All the 50 doctors had at least one symptom of stress and the symptom of stress which troubled the most was considered and depicted in the table 4. Problems associated with sleep were the most common stress symptom among the participants with most of them having difficulty going to sleep. Digestion problems and poor appetite, tiredness and hopelessness, excessive sweating, inability to unwind and lack of self-confidence were the other symptoms of stress among the respondents.

Discussion

Professional stress leads to adverse effects which belong to both physical and emotional. It occurs when efforts and dedication at workplace did not match with ability, resources and financial expectations of the person who is employed. Special emphasis was given to professional stress as it has harmful effects on human health and can disturb social and personal association. It has been observed in India that doctors who are working in Government setup were provided least
facilities and resources. Moreover, they have issues with regards to salary as compared to workload. Hence, medical profession is considered as one of the heavily work occupied profession with minimal incentives for healthcare providers. Therefore, present efforts targeted doctors acquainted with Government hospital, Bhavnagar on the basis of the stress severities. Majority of the participants were belong to age less than 30 years which also suggested that they were eager to participate in the study and also knew that they might have some kind of stress. We enrolled both male and female doctors the ratio of which is 1:1. Our findings matched with the studies done by Passey et al\(^\text{15}\) and Azmi et al.\(^\text{10}\) In the demographic details, the male doctors have more numbers of dependents than females which may enhance the existing level of stress in them. Average working hours of doctors was 11.08 hours which is somewhat higher than the average population. Moreover, these hours are full of attention and determination in patients’ care. As per the stress scales results, this study showed moderate to mild stress among medical doctors. Our findings were also supported by the various studies,\(^\text{3, 10, 15, 16}\) PSS-10 scores for majority of doctors in this study was between 21-30 which must be monitored and if the scores show an increasing trend, then it suggests the need for intervention. The professional life stress test scores suggest that few employees are stressed and the need to adopt stress management techniques. Even this trend has to be monitored and intervention started when needed. More importantly, the company can adopt stress management trainings (SMT) even short duration SMT would be beneficial both for the doctors and the hospital. Among the various symptoms of stress, insomnia was the most common among doctors which suggest that if sleep disturbances are there it should be taken into consideration immediately.

**Limitations of the Study**

1. The study had a small sample size which did not give proper idea about actual stress levels among medical doctors.
2. The participants were reluctant to give proper response in terms of filling questionnaire and submit the same. Out of total 75 questionnaire distributed, only 60 filled questionnaires were received. Among them 10 questionnaires were incomplete, so they were rejected and rest 50 completely filled questionnaires were considered for the study.

**Conclusion**

Increased stress levels are a major problem affecting the doctors working in tertiary Government hospital. Moderate to mild stress was found in medical doctors. Sleep problem is the most common symptom during stress. Stress at workplace has a major adverse implication both at individual as well as the organizational.

Pre-Analytical Errors in Clinical Diagnostic Laboratory: A Crucial Step to Look for Accuracy and Reliability

Tejas J. Shah¹, Roshni Sadaria², Smita Vasava³

¹Associate Professor, Biochemistry, ²Associate Professor, Biochemistry, ³Assistant Professor, Biochemistry, Smt. B. K. Shah Medical Institute and Research centre, Sumandeep Vidyapeeth Deemed to be University, Vadodara, Gujarat (India)

Abstract

Clinical Diagnostic Laboratory (CDL) plays a very important role in diagnosis and treatment of diseases. Total testing process (TTP) of laboratory includes pre-analytical, analytical and post-analytical phases. To have an accurate and reliable results, detection and prevention of errors is must from all these phases. Chances of errors are more in pre-analytical phase as compared other two phases. Though standards have been made to control error occurrence in pre-analytical phase, errors still noticed in this phase. The reason is all the steps involved in this phase are dependent on humans and thus it is out of control of laboratory. Therefore it is necessary to generate proper guidelines or manual to minimize errors in pre-analytical phase. This is also an important step to achieve Total Quality Control (TQC). We have tried in this review to summarize important pre-analytical errors, their occurrence at various stages, prevalence and preventive aspects.

Keywords: Clinical Diagnostic Laboratory, total testing process, pre-analytical errors

Introduction¹⁻⁵

In current era, disease diagnosis is mostly dependent on accurate and reliable laboratory results. Thus, the role of laboratory became very crucial to ensure the best possible results outcome from its analysis process. Nowadays performance of laboratory drastically improved due to advancement in technology like automation, sample collection, its transport and reports delivery. But it is very difficult, not impossible, to achieve 100% accuracy and reliability in laboratory performance. As it is rightly said that errors are bound to occur in any endeavor, analytical process of lab also faces errors. These errors are classified as pre-analytical (test order to receipt of sample in lab), analytical (sample processing and analysis) and post-analytical (report generation to its dispatch). Out of these three, pre-analytical errors are the most commonly occurred errors in total testing process (TTP) of laboratory. Study showed 46 × 71% errors encountered during TTP were belonging to pre-analytical phase. Hence, this phase must be monitored carefully to avoid such errors. Pre-pre-analytic and actual pre-analytic are two areas of the pre-analytical phase. Selection of Tests to be done, identification of patient for sample collection, preparation and its handling are part of the pre-pre-analytical process. Storage of samples and its processing in lab i.e. pipetting and centrifugation are part of actual pre-analytical process. All the errors occurring before the sample is processed for analysis in laboratory are considered as pre-analytical errors. These include improper test request, fault in sample collection, transportation errors and errors in request forms filling. These all errors are under control of human as it is carried out manually, therefore laboratory have no any control over it. But still all the responsibility lies on the laboratory as finally report is dispatched by lab. Hence,
laboratory must ensure error-free pre-analytical phase which is a crucial step in quality control (QC) whereby lab maintains its quality.

**Pre-Analytical Errors**

Pre-analytical errors encompass all the administrative and functional errors that occur prior to laboratory analysis of samples. The International Federation of Clinical Chemistry and Laboratory Medicine (IFCC) have developed the range of pre-analytical phase quality markers to underscore pre-analytical errors. The pre-analytical phase error variables are shown in Table-1.

<table>
<thead>
<tr>
<th>Table-1: Variables of pre-analytical phase</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Patient Variables</strong>*</td>
</tr>
<tr>
<td><strong>Collection Variables</strong></td>
</tr>
<tr>
<td><strong>Handling Variables</strong></td>
</tr>
</tbody>
</table>

*Uncontrollable variables

List of commonly occurring pre-analytical errors is as below:

- Patient identification error
- Sample labeling error
- Erroneous blood collection or wrong mixture ratio
- Early clotting
- Collection in wrong vacutainer
- Hemolyzed sample / lipemic sample

- Increased RBCs and decreased plasma volume
- Effect of temperature/ sunlight
- Lack of timely transportation to lab
- Improper handling of specimen

Patient identification is most important first step in blood sample collection. Error in patient identification is very serious in terms of poor outcome of patient care which can be irreversible. Error in identification may be due to heavy workload experienced by staff in hospital.

Table-2 showed pre-analytical errors observed in previously conducted studies.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
As per the table-2, it can be concluded that

1. the most common pre-analytical errors observed are:
   - Hemolysed blood samples
   - Clotting blood samples/ tube factor
   - Inappropriate form/ request form filling

2. Pre-analytical errors are observed mostly in indoor patient departments (IPD)

**Prevention**

Pre-analytical errors mostly occurred with the blood specimen followed by urine and other body fluids. The sources of errors with their possible prevention is given in table-3.
<table>
<thead>
<tr>

</tr>
<tr>
<td>Handling of Blood Specimens in special conditions</td>
<td>Faulty handling</td>
<td>Special training to be given to phlebotomist</td>
</tr>
</tbody>
</table>
For urine specimen, guidelines given by Clinical and Laboratory Standard Institute (CLSI) should be followed.\textsuperscript{21} Cerebrospinal fluid (CSF) specimen also forms an important part of CDL. For the collection of CSF, sterile screw-cap tubes should be used. Preferably clinician or resident doctors should collect CSF. Blood contaminated CSF sample must be discarded. CSF sample should be immediately sent to lab after collection. After receiving in lab, it must be centrifuged first before analysis. For preservation, sample should be stored in small aliquot tube to be filled up to 75\% to avoid adsorption and evaporation.\textsuperscript{22, 23}

Conclusion

The most common errors of pre-analytical phase in clinical laboratory observed are Hemolysed blood samples, mistakes in the filling of tubes or inadequate anticoagulant-blood ratio or tube factor, followed by patient misidentification or improper request form filling. These errors can be prevented by following proper guidelines laid down by various bodies, getting trained in phlebotomy and referring blood collection and other manuals in lab. This forms a very crucial component of laboratory quality. Blood collection manual should address not only patient variables but also specimen variables. Training should be provided regarding pre-analytical manual to all the concerned personnel who are part of health care services. Awareness among clinician/physician regarding such errors and its prevention should be generated which ultimately help in reducing pre-analytical errors.

Search Strategy

We searched Google and PubMed with the terms: “pre-analytical errors”, pre-analytical phase”, and “biochemistry lab” in combination with “quality control”, “total testing process”, “clinical chemistry”, “laboratory”, “analytical phase”, “analysis”, “clinical biochemistry laboratory”. We gave preference to papers published within the past 20 years, but did not exclude some important less recent publications.

Ethical Approval

This study did not warrant institutional review board review as no human subjects were involved.

Primary Prevention of COVID 19

Preksha Luthra

1Intern, Jawaharlal Nehru Medical College, Datta Meghe Institute of Medical Sciences (DU), Wardha

Abstract

Coronavirus disease - 19 is caused by a newly discovered virus called coronavirus. Coronavirus is a spherical, enveloped particle with a single stranded RNA which causes acute mild respiratory illness. The transmission is via airborne droplets. It multiplies in the nasal mucosa causing cell damage and inflammation. COVID 19 has been increasing exponentially as it spreads very fast and in a country like India with a population of 135 crore it is difficult to curtail the spread of the virus. The steps taken to control this spread such as social distancing, nation-wide lockdown were important to restrict the geographical spread of coronavirus. The virus is transmitted by droplets which can travel in air when an infected person or carrier coughs or sneezes. Therefore, primary preventive measures like practicing hygiene with soap and water for at least 60 seconds or using alcohol-based hand rub, social distancing and lockdown were implemented. This article covers the method of hand washing, steps of hand washing and gives information about the do’s and don’ts of alcohol-based hand rubs. It also covers the importance of social distancing and lockdown with the social distancing methods adopted in India.

Key words: Coronavirus, hand washing, prevention, alcohol based sanitizers, masks, mode of transmission, social distancing, N95, respirators, droplet, lockdown, biomedical waste management, disposal, labelled containers.

Introduction

Coronavirus disease - 19 is caused by a newly discovered virus called coronavirus. Coronavirus is a spherical, enveloped particle with a single stranded RNA which causes acute mild respiratory illness. The transmission is via airborne droplets. It multiplies in the nasal mucosa causing cell damage and inflammation. This is manifested as sneezing, cough, cold, nasal obstruction and fever. (1)

The disease spreads by coming in contact with an infected person through droplets and since most people could be asymptomatic carriers the best way to prevent the spread is to be informed about the preventive measures for the society at large. There is no medication or vaccination available for this virus right now. All vaccinations are under trial and therefore won’t be available anytime soon. Primary prevention, that is, aiming to prevent the disease even before it occurs has now become the only means of curtailing the spread of coronavirus.

Method

Published articles, documents were reviewed and compiled together to constitute this article.

Hand Hygiene

Hand hygiene is now considered as one of the most important steps in infection control protocols. With an increasing number of healthcare-associated infections and multi drug resistant pathogens health care practitioners have realised that it is time to go back to the fundamentals of infection prevention by using uncomplicated and cost effective widespread measures like hand hygiene. This has occurred because of scientific evidence backing the fact that simple measures like adopting proper hand washing can on their own reduce the risk of cross transmission of infections in healthcare.

The hands of healthcare workers are colonized with multi drug resistant pathogens which can survive for as long as 150 hours. Around 1000000 skin cells are shed in a day that can contaminate the immediate surrounding of the patient.
Importance

Hand hygiene has become one of the most important and the least costly methods in reducing transmission of infection.

The objects we touch during the day such as door knobs, mobile phones, car keys etc act as fomites i.e. fomites are the inanimate objects that serve as mechanism of transfer of infection between hosts.

There are two types of flora on the hand; transient and resident flora.

Transient flora is present in the superficial cells and the resident flora is present in the deeper layers. These transient microorganisms can be removed easily by hand washing and are the main source of spread of infection in a healthcare facility.

MRSA or methicillin resistant staphylococcus aureus has become one of the most challenging problems faced in the ICU and studies have shown that increase in compliance for hand washing has shown a fall in MRSA rates.

The most important problem faced after knowing the importance of handwashing is knowing when to use a sanitizer and when to wash hands with soap and water.

(2)

Major determining factors should be cost, availability of product, requirements from the product and the presence or absence of visible contamination of hands.

Advantages of using plain soap:
1. Good for removal of soil and proteinaceous material from hands.

Disadvantages of using plain soap:
1. Not bactericidal
2. Can cause dermatitis

Advantages of using alcohol compounds:
1. Faster onset of action
2. Effective against bacteria, enveloped and non enveloped viruses.

Disadvantages of using alcohol compounds:
1. Cannot be used when hands are visibly soiled
2. Flammable
3. Volatile
4. The type of alcohol, concentration, duration of contact and method of application all play a key role in its action.

Wash hands with soap and water when
1. Visibly soiled with blood and other body fluids
2. After using the washroom
3. Prior to and after meals.
4. After blowing one’s nose, coughing or sneezing
5. After providing routine care for someone who needs assistance

Alcohol based hand rub should be used
1. When in direct contact with the patient
2. Before wearing gloves
3. Before inserting self-retaining catheters etc
4. Before and after examining patients

Method of hand washing
Figure 1: Steps of Handwashing (World Health Organisation, 2020)

Method of hand washing:

Before washing hands remove all accessories such as bangles, wrist watches, rings etc.

Following the given steps is important because when we wash hands in a hurry some areas of the palm are neglected such as thumbs, tips of fingers and interdigital clefts.

Wet hands under running water, lather with soap and follow the steps mentioned in the image above. Wash hands under running water. Air dry or use a single use disposable towel to dry the hands.
Even with the on-going attempts to spread awareness about the importance of hand hygiene there are some factors that influence the compliance of health workers to hand hygiene: clinical factors such as working in an ICU, understaffed hospitals, weekdays, camps where there’s no time for the health care professional to practice proper hand hygiene (4,5).

Other factors include lack of guidelines and protocols in institutions, lack of knowledge, when wearing personal protective equipment, forgetfulness, shortage of soap and water supply (6).

Methods to improve hand hygiene:

It takes 21 days to form a habit and that’s why the practice of hand hygiene shouldn’t just be taught in medical colleges, it should be practiced.

With the idea of increasing the clinical exposure of medical students in colleges such practices should be taught then.

Hospital administration should install sinks and maintain adequate supply of soap, sanitizers and disposable towels should be available in every ward, doctors must use hand sanitizer after visiting every patient in the ward, the nursing staff, cleaning staff should be taught the right method. (2)

The most important step in increasing compliance would be to adapt these activities at the peripheral health centres since they are the first and the most commonly visited place by a patient. The staff at a peripheral health centre should be taught the right method and should explain it to the patients as well. Hand hygiene demonstrations should be conducted for them.

Other steps like positive role modelling and the use of performance indicators also improve the adherence to hand hygiene (7).

It should be emphasized that wearing gloves does not eliminate the need for hand hygiene and that contamination may occur during glove removal. Hospitals should also have an infection control team and should strictly follow protocols made by them.

The problems of non-compliance in the Indian scenario are due to factors like overcrowding, limited number of doctors due to high cost of medical education, understaffing, poor infrastructure such as lack of sufficient hand facilities such as sinks, running water and sewage system, lack of awareness and education, ignorance and the fact that most people are losing faith in doctors it’s hard to adapt such practices in our society.

Figure 2 Areas often missed on improper hand washing
Handwashing or the use of alcohol based sanitizer has become a necessity now and is now practiced not only at hospital entrances but also at places of worship, airports, cabs etc. This clubbed with social distancing to reduce the spread of coronavirus.

**Masks**

Considering the route of spread of infection i.e. droplets, the use of masks to curtail the spread of infection becomes evident. The droplets can further form aerosols and travel longer distances and remain in the air for longer periods of time therefore the use of masks at all times is crucial.

There are various types of masks available for people to use but they should be used according to the following factors - profession, places visited, duration of contact with people and risk of development of complications in people who have comorbidities such as HIV/Diabetes, elderly and pregnant females.

Doctors and the entire hospital staff should wear N95 masks. The panic and the fear caused by the coronavirus outbreak has led to a high demand of these N95 masks and therefore guidelines for the use, reuse and extended use of N95 masks has been provided to the health care professionals.

**The Physics behind N95 masks:**

Once an airborne particle touches the fibre in the mask it stays stuck to it and isn’t airborne anymore. This mainly depends on the particle size.

Particles larger than 1 micrometer travel in a straight line due to inertia and because these masks have a lot of these sticky fibres, it’s bound to stick to one of those. This is called “capture by inertial impaction”.

Particles smaller than 0.1 micrometer collide with air molecules and move in a zigzag motion called the Brownian movement. This makes the particle stick to a fibre and is called “capture by diffusion”. Intermediate size particles are difficult to filter because they do not move like the other size particles and therefore can move around the fibre with the air. But N95 masks capture these particles using an electric field. This is called as “capture by electrostatic attraction”. And because it filters 95% of such particles, it is called an N95 mask.

Extended use of the mask means using the same mask for repeated exposure to several patients without removing the respirator in between patients.

Reuse is the use of the same N95 respirator for multiple patients but removing it after each encounter.

Perform hand hygiene before and after touching the respirator. A face shield could be worn over the mask for additional protection.

When to discard the respirators?

1. When used after an aerosol generating procedure.
2. Visibly soiled respirators should be discarded
3. After coming in close contact with an infected patient.

Controlling the spread of respiratory infection using a mask is a well established strategy.

The use of face masks can account for the different levels of prevention i.e primary as well as secondary.

Primary prevention aims at reducing the incidence of disease by elimination of risks for the protection of personal and community health.

Secondary prevention aims at reducing the prevalence by shortening the duration of the disease. This is done by early detection and interventions to minimise disability. This is practiced everywhere now by the means of thermal temperature checks. People with fever are subjected to further evaluation.

**Biomedical Waste Management of Covid-19**

The following measures are proposed for covid 19 waste management:

1. Dedicated sanitation workers deputed only to collect covid-19 waste
2. All the bags and containers from covid 19 areas should be labelled as “COVID-19 WASTE’
3. They should have foot operated lids.
4. The inner and outer surface of these containers must be disinfected daily with 1% sodium hypochlorite solution.
5. Double layers should be used to ensure no leaks.
6. Records of covid 19 waste should be maintained
Face shields, goggles, hazmat suit, nitrile waste and laboratory wastes such as transport media, plastic vials, vacuators, pipette tips should be disposed of in the RED bin.

Used masks such as N95 masks, head cover, shoe cover, disposable linen gown, leftover food, disposable plates, glasses, tissues, toiletries etc used by the patients should be disposed of in the YELLOW bin.

The risk of transmission of COVID 19 from sewage water of healthcare facilities is low but still requires adequate disinfection and waste water treatment.

Social distancing

Social distance turned out to be the most effective means in combating COVID 19 worldwide because it broke the chain of transmission by acting as a primordial level of prevention.

Primordial prevention is aimed at establishing and maintaining conditions that minimise hazards to health. This level of prevention acts even before the onset of the disease and this is particularly helpful for this pandemic because of the high number of asymptomatic people who are potential carriers and can spread the virus among others (8).

Primordial prevention is acting on the underlying socio-economic and environmental conditions leading to causation of disease. The most effective mode of intervention here is health education which is difficult in a country as diverse as India.

This is achieved by newspapers, local news channels, radio and the caller tune while dialing someone. These act as a constant reminder of maintaining the new normal as it is being called.

Here, the mode of transmission is droplet.

When the respiratory droplet particles are >5-10 micron in diameter they are referred to as respiratory droplets and when they are less than 5 micron they are called droplet nuclei.

According to the current information on Coronavirus, it is primarily transmitted between people through respiratory droplets and contact routes. The microorganisms that are less than 5 micron remain suspended in the air (9).

Factors that influence the airborne transmission:

1. Temperature
2. Humidity
3. Rainfall
4. Amount of sunlight
5. Wind
6. Human behaviour

Other factors include the socioeconomic and living conditions. The number of people residing in an area is important.

Indoor environments such as indoor ventilation, use of air conditioning also affects the spread of pathogens. Poor or inadequate ventilation has played an important role in the spread of many pathogens (10).

Since most of these factors are beyond our control, the only way to curtail the spread of such a pandemic that could be adapted was modifying the human behaviour that included social distancing, nation-wide lockdown, ban on large gatherings, schools and colleges, factories, malls, theatres and places of worship being shut and people were encouraged to stay indoors and practice work from home for as long as possible and to only go out for essential work.

This was important because it broke the chain of spread, decreased the number of people being exposed to the virus and also helped with contact tracing and thus reducing the burden on the health care professionals (11).

Social distancing norms suggest keeping a distance of about 6 feet or about 2 arms’ length from others. This is one of the easiest and most effective methods we have to avoid being exposed to the virus and slowing it’s spread locally and across the country and the world (3).

Just like hand hygiene, social distancing is an effective method based entirely on behavioural patterns of individuals and by not abiding to the norms of social distancing it could very easily overwhelm the healthcare system since the number of beds, the availability of ventilators, PPE kits, rapid tests for COVID19 and masks is limited.

Social distancing measures practiced in India currently:
1. Contact less delivery practices by food, grocery delivery services such as Swiggy

2. The number of people in a shop at a time is monitored.

3. Digital transactions are being preferred over cash.

4. Classes and meetings are being conducted over video calls.

5. Admissions are being done online.

6. Long queues outside of shops are avoided by keeping a safe distance between people. Shop owners have marked circles outside their shops as guides to maintain social distancing.

7. The number of people in a car is also according to the social distancing norms according to the various zones.

8. Restaurants have to maintain a distance of one meter between the tables and do regular temperature checks and follow proper hand hygiene.

9. Encouraging work from home as long as possible. (12)

10. Postponing all non-essential social and cultural gatherings. (3)

Nationwide lockdown

So the purpose of a nationwide lockdown was twofold: it slowed the transmission of the virus and second it also slowed the geographical spread of the virus which is extremely important in India. Both of these play a crucial role because slowing the transmission slows the short term spread of cases and by slowing the geographical spread and localizing the geographical spread there is flattening of curve in the long term. It is estimated that without the lockdown the cases would have been six times the current estimated infection.

Conclusion

COVID emerging as a pandemic has shed some light on a lot of aspects of the basics of health care such as hand washing. Adopting correct hand washing methods, teaching staff and students, knowing when to use soap and water and when a hand sanitizer should be used and focussing on the areas that are commonly missed while washing hands is important to know. Just knowing the right method won’t be enough, hospitals should also have the facilities and infrastructure to provide the same. These practices are cost efficient.

Some other lessons learnt from the pandemic

Social distancing and hand washing should become a part of normal life from now on whether there’s a virus or not and guidelines for people at risk people should be in place and practice.

Mental health is important.

We should pay more attention to our health.

Children and elderly who are more at risk to infections in general should not be neglected.

Hospitals should have infectious disease control teams with proper protocols in place.

Need to promote original R&D and strengthen our drug and vaccine development programme.

A Critical Appraisal of Inclusions of “Bioethics in Laboratory Medicine” into the Existing Postgraduate Curriculum of Pathology, Microbiology and Biochemistry

Anjankar Ashish P¹, Ninave Sudhir², Mishra Gaurav V³
¹Associate Professor, Department of Biochemistry, ²Professor & Head of the Department, Department of Forensic Medicine, ³Associate Professor, Department of Radiodiagnosis, Jawaharlal Nehru Medical College, Wardha, Maharashtra, India

Abstract

Introduction: Laboratory physicians confront with ethical issues in routine practice, but still ethics does not draw the importance it deserves. A critical appraisal of the existing postgraduate curriculum of Pathology, Microbiology and Biochemistry with reference to its Bioethical inclusions to their conformity with reference to Bioethical principles applicable to profession as included in UNESCO Declaration is needed.

Aim: To critically analyse the inclusions of “Bioethics in Laboratory Medicine” into the Existing Postgraduate Curriculum of Pathology, Microbiology and Biochemistry with reference to Bioethical principles incorporated in UNESCO Declaration

Material and Methods: It was a descriptive study for rapid review of literature for the purposes of identification and critical appraisal of bioethical considerations in Laboratory Medicine in existing Guidelines for Competency Based Postgraduate Training Programme for MD in Pathology, Microbiology, Biochemistry with reference to Bioethical principles included in UNESCO declaration specially those applicable to profession and not propagation or advocacy.

Observations and Results: Upon critical analysis and mapping of the competencies in the Guidelines for Competency Based Postgraduate Training Programme for MD in Pathology, Microbiology, Biochemistry with the principles in the UNESCO universal declaration, 16 competencies were identified as professional ethical inclusions. 19 Competencies suggested in regards to “Bioethics in Laboratory Medicine” for Guidelines for Competency Based Postgraduate Training Programme for MD In these subjects to make them commensurate with UNESCO universal declaration

Conclusion: This has brought out subsequent omissions which need to be managed in order to make competencies in Existing PG curriculum of Pathology, Microbiology and Biochemistry comparable with the UNESCO universal declaration and therefore, make it better and standardised on global and international level.

Keywords: Bioethics, Laboratory Medicine, Postgraduate Curriculum

Introduction

Medical practitioners are responsible towards their patients to exert their professional competence in a virtuous manner and to abide to the laws of the state & community. The general principle of healthcare ethics is that the patient’s welfare is paramount. This applies
to laboratory services as well. Similar to other fields of medicine, Laboratory Medicine is required to obey and practice high ethical specifications.

The qualified staff of a medical laboratory is restricted by the ethical principles of their corresponding profession. “Ethical medical practice is the expected conduct of laboratory physicians” and that striving to achieve high ethical standards is an essential aspect of medical excellence. Overarching goal for laboratory physicians is to maintain professional integrity.

Around 70% of medical diagnoses now rely on pathology laboratory analyses emphasizes the crucial role that laboratory physicians play in patient care. The clinician must be committed to same ethical fabric as the laboratory physician to assure that results of the investigations are enforced in the patient’s preferable interest. The clinician’s judgment about diagnosis, prognosis and treatment are routinely based on results and interpretations of laboratory investigations. Permanent damage to the patient may be caused by inaccurate tests and their faulty interpretations.

The term Bioethics was coined in 1926 by Fritz Jahr in article about a ‘bioethical imperative’ regarding the use of animals and plants in scientific research.

The United Nations Educational, Scientific and Cultural Organisation was established at Paris, France on 4th November, 1946. Hence, it was on the 19th of October, 2005 at the 33rd General Conference of UNESCO, which was held at Paris, that the Universal Declaration on Bioethics and Human Rights was adopted by one and all.

Taking stock of the overall global situation, the academic committee of the Medical Council of India formulated a detailed draft pertaining to competency based undergraduate medical education invoked a module titled ‘AETCOM Module’ (Attitude, Communication, and Ethics), which was notified in the year 2018 and is incorporated in the ‘Competency Based Undergraduate Medical Education Curriculum’. Such systematic guidelines regarding ethical considerations are missing in the existing postgraduate Medical curriculum of Pathology, Microbiology and Biochemistry.

Laboratory physicians confront with ethical issues in routine practice, but still ethics does not draw the importance it deserves. A report by the IFCC Task Force on Ethics indicates that formal and proper teaching of ethics is missing from many clinical chemistry and laboratory medicine training programs and that there is a perceived need for training programs for ethical considerations in laboratory Medicine.

It is in this context that a critical appraisal of Postgraduate curriculum of Pathology, Microbiology and Biochemistry with reference to its Bioethical inclusions vis-à-vis professional ethics inclusions needs to be looked into for the purposes of an judicious operational mix of the two, so that the learner is oriented on the said arena in an all-round manner so that optimal results thereto stand generated.

**Rationale Of The Study:**

In this context, the inclusions pertaining to ethical considerations in laboratory Medicine in postgraduate Medical curriculum of Pathology, Microbiology and Biochemistry in regard to their objective, scope, operation, outcome and relevance needs to be critically looked. A critical appraisal of the existing postgraduate curriculum of Pathology, Microbiology and Biochemistry with reference to its Bioethical inclusions to their conformity with reference to Bioethical principles applicable to profession as included in UNESCO Declaration is needed.

The appraisal of the Bioethics in Laboratory Medicine inclusion therein also become inevitably necessary to assess as to whether the said inclusions incorporate the tenets and principle of bioethics as have evolved over a period of time with reference to their applicability to professional ethics as applicable to modern medicine to be upheld in practicing of the same by the registered medical practitioners of the modern medicine.

**Research Question**

Are there any limitations and resultant scope for update for ethical considerations in the Laboratory Medicine in the existing postgraduate curriculum of Pathology, Microbiology and Biochemistry?
Aim

To critically analyse the inclusions of “Bioethics in Laboratory Medicine” into the Existing Postgraduate Curriculum of Pathology, Microbiology and Biochemistry with reference to Bioethical principles incorporated in UNESCO Declaration

Objectives:

1. To identify the bioethical inclusions in existing Guidelines for Competency Based Postgraduate Training Programme for MD in Pathology, Microbiology and Biochemistry

2. To critically analyze the bioethical inclusions in existing Guidelines in regard to their conformity with reference to Bioethical principles applicable to profession as included in UNESCO Declaration.

3. To suggest update and inclusions of “Bioethics in Laboratory Medicine” in these Guidelines so as to make them comparable with the Bioethical principles incorporated in UNESCO Declaration.

Material and Methods

Period of Study : Six Months

Design : Descriptive Study

Duration : October 19 to March 20

Procedure :

Rapid review of literature for the purposes of identification of bioethical considerations in Laboratory Medicine in existing Guidelines for Competency Based Postgraduate Training Programme for MD in Pathology, Microbiology and Biochemistry with reference to Bioethical principles included in UNESCO Declaration specially those applicable to profession and not propagation or advocacy.

Further, to critically appraise the conformity of the bioethical inclusions in Guidelines for Competency Based Postgraduate Training Programme for MD in Pathology, Microbiology and Biochemistry with reference to their conformity with the bioethical principles as applicable to the profession in the UNESCO declaration.

Data:

Identifying Bioethical inclusions in existing Guidelines for Competency Based Postgraduate Training Programme for MD in Pathology, Microbiology and Biochemistry, which is already applicable to various medical colleges under the ambit of Medical Council of India.

Critical appraisal of the said identified Bioethical inclusions with reference to their conformity with the bioethical principles as applicable to the profession included in UNESCO declaration.

Further, to work out the inclusion of non-included bioethical principles in the form of structured competencies as “Bioethics in Laboratory Medicine” and their incorporation in these Guidelines with reference to their learning levels including their mode of assessment.

Collection Tool

Critical appraisal of the guidelines for Competency Based Postgraduate Training Programme for MD in Pathology, Microbiology and Biochemistry, document against the Bioethical principles as applicable to profession in the UNESCO Universal Declaration.

Observations And Results

Amongst the UNESCO Universal Declaration, principles 3 to 20 were listed as professional bioethical inclusions which were directed towards the learner and his profession directly. The remaining principles were directed towards the states, international affairs and regulation i.e. advocacy. These were therefore excluded.

This study analyzed a total number of 16 competencies, enlisted in Guidelines for Competency Based Postgraduate Training Programme for MD in Pathology, Microbiology and Biochemistry with their respective learning domains, levels as per Miller’s pyramid, and assessed in as against the principles
included in the UNESCO Universal Declaration laid down by the UNESCO.

These 16 competencies enlisted in Guidelines for Competency Based Postgraduate Training Programme for MD in Pathology, Microbiology and Biochemistry reflected either single or multiple principles as per the UNESCO universal declaration of human rights and bioethics. Therefore these 16 competencies in Competency Based Postgraduate Training Programme were identified as professional ethical inclusions.

So, we had two sets – one set of competencies enlisted in Guidelines for Competency Based Postgraduate Training Programme for MD in Pathology, Microbiology and Biochemistry and another set of UNESCO universal declaration principles.

Of these 16 competencies enlisted in Guidelines for Competency Based Postgraduate Training Programme for MD in Pathology, Microbiology and Biochemistry, 4 competencies dealt with the cognitive domain and 12 competencies dealt with higher domains of learning – psychomotor and affective.

Article 3 – Human dignity and human rights was reflected in maximum number of competencies (n=12 competencies). This was followed by Article 4 – Benefit and harm (n= 8 competencies) and article 5 – autonomy and individual responsibility (n=8 competencies). Further, Article 14 – Social responsibility and health was noted to be reflected in 7 competencies (n=7 competencies) followed by article 10 – equality, justice and equity, article 11 – non-discrimination and non-stigmatization, article 12 – Respect for cultural diversity and pluralism, article 16 - Protecting future generations, article 18 – decision making and addressing bioethical issues were noted to be reflected in 3 competencies each (n=3 competencies). Article 8 – respect for human vulnerability and personal integrity, Article 13 – solidarity and cooperation, article 15 – Sharing of benefits issues were noted to be reflected in 2 competencies each (n=2 competencies). Article 6 – consent, article 7 – persons without the capacity to consent, and article 9 – privacy and confidentiality, article 20 – Risk assessment and management were noted to be reflected in 1 competency each. (n=1 competency).

However, article 17 – Protection of the environment, the biosphere and biodiversity article 19 – ethics committee had no reflection in the Guidelines for Competency Based Postgraduate Training Programme for MD in Pathology, Microbiology and Biochemistry.

**Discussion**

Upon critical analysis and mapping of the competencies in the Guidelines for Competency Based Postgraduate Training Programme for MD in Pathology, Microbiology, Biochemistry with the principles in the UNESCO universal declaration, 16 competencies were identified as professional ethical inclusions. There are 2 principles in the UNESCO universal declaration which have no representation in the Guidelines for Competency Based Postgraduate Training Programme for MD in Pathology, Microbiology, Biochemistry – articles 17 and 19. They are as under:-

Article 17 – Protection of the environment, the biosphere and biodiversity

Article 19 – Ethics committee

These principles should be adequately represented in Guidelines for Competency Based Postgraduate Training Programme for MD in Pathology, Microbiology, Biochemistry in order to make it commensurate it in conformity with the UNESCO universal declaration. These principles need to be articulated by working out their placement, learning level and modes of teaching and assessment.

The competencies framed for article 17 are two – first covering the cognitive domain with K and KH levels in the Miller’s pyramid and second covering the psychomotor and affective domains with S and SH levels in the Miller’s pyramid respectively. The competencies framed for article 19 are two – first covering the cognitive domain and second covering the psychomotor and affective domain with K, KH and S, SH levels in Miller’s pyramid respectively.

Addition of the suggested competencies would take into account the omissions realised in Guidelines for Competency Based Postgraduate Training Programme for MD in Pathology, Microbiology and Biochemistry when critically appraised as against the UNESCO universal declaration of human rights and bioethics so
as to make it commensurate with the latter in the best way possible.

Protocols and guidance materials on ethical issues related to laboratory medicine have developed by many countries and professional agencies. For instance, the International Organization for Standardization (ISO) has created ISO 15189:2012 “Medical laboratories – Requirements for quality and competence”. Numerous professional organizations have outlined codes of ethics for clinical laboratory professionals. Despite importance of ethics in laboratory Medicine, there is variability in education that is focused on ethics in the laboratory Medicine.

So, there is a perceived need for systematic training programs for ethical considerations in laboratory Medicine in the existing Postgraduate Curriculum of Pathology, Microbiology and Biochemistry. Inclusions of “Bioethics in Laboratory Medicine” in systematic manner into the Existing Postgraduate Curriculum of Pathology, Microbiology and Biochemistry with reference to Bioethical principles incorporated in UNESCO Declaration will raise awareness with regards to various ethical dilemmas during their day to day working in Medical Laboratory.

The competencies framed under “Bioethics in Laboratory Medicine” covering the cognitive domain with K and KH levels in the Miller’s pyramid and remaining competencies covering the psychomotor and affective domains with S and SH levels in the Miller’s pyramid respectively.

Modes of teaching these competencies are didactic lectures as well as large and small group discussions, focussed group discussions. Modes of assessment for the cognitive domains can be in the form of short answer questions, long answer questions as a part of the respective theory examination. Modes of assessment of the psychomotor and affective domains can be in the form of viva voce, oral examination and clinical case presentation.

Conclusion

The present study deals with the mapping and matching of the competencies included in Guidelines for Competency Based Postgraduate Training Programme for MD in Pathology, Microbiology and Biochemistry with the UNESCO universal declaration on human rights and bioethics. This has brought out subsequent omissions which need to be managed in order to make competencies in Existing PG curriculum of Pathology, Microbiology and Biochemistry comparable with the UNESCO universal declaration and therefore, make it better and standardised on global and international level. These recommendations as suggested competencies pertaining to exclusions in Existing PG curriculum and addition of “Bioethics in Laboratory Medicine” can fulfil the realised omissions in the existing PG curriculum of these subject’s competencies.

Limitations

A detailed study of actualized operation and outcome thereto are beyond the scope and ambit of the present study taking into account the actualization of the suggested competencies thereto.

Ethical Clearance:

Institutional Ethical Committee Clearance was obtained from Institutional Ethical Committee of university.

Personal Hygiene Practices and Morbidity Pattern among A Tribal Primary School Children Of Maharashtra

Ashish Wasudeo Khobragade1, Ninad Nagrale2, Mohd. Junaid1
1Associate Professor, Department of Community Medicine, Shri Shankaracharya Institute of Medical Sciences, Bhilai, 2Associate Professor, Department of Forensic Medicine & Toxicology, Datta Meghe Medical College, Nagpur

Abstract

Background: Scholastic performance of the child depends upon the overall health of the child. Methods: A cross sectional study was conducted among 162 tribal school children. Results: Prevalence of anaemia was 54.9%. Second most common morbidity was dental caries (31.48%) followed by underweight (27.77%) Head louse infestation was common among girl students. Conclusions: Most common morbidities present among primary school children of a tribal school were anaemia, dental caries, underweight and refractive errors. Girl students had better hygiene than boys.

Keywords: Personal hygiene, morbidity, tribal, primary school

Introduction

The first school health check up service was started in 1909 in Baroda city of Gujarat.1 School going children should be healthy physical as well as mentally. If the health is sound then only they can devote their full time to studies. Unhygienic conditions make them vulnerable to various diseases. Morbidities among the school going children lead to absenteeism from the school. Sometimes it leads to school dropout also.

Provision of better health and free elementary education are enshrined in the constitution of India as the rights of the children .Health Education has important role in the improvement of the hygiene among the school children. Health education should be part of the routine teaching hours in the school. Students have less morbidities, if they are better in their hygiene status. Various strategies are launched to improve the hygiene among the school children. School sanitation and hygiene education (SSHE) is included in Surva Siksha Abhiyan (SSA).2 School should promote water sanitation and hygiene (WASH) strategy to improve the hygiene among the students.3

Objectives:

1. To assess the personal hygiene practices of tribal school children
2. To study the morbidity pattern among school children in a tribal school

Methodology

Study setting:
The study was conducted in a tribal school in one district of Maharashtra.

Study Period: Study was conducted from November 2019 to January 2020

Study design: Cross sectional study (descriptive study)

Inclusion criteria: students studying in 1st to 4th standard of a tribal school
Sample Size: Total on roll students from 1st to 4th standard were 177. 162 students were present on the day of school health check up, so 162 school children were included in the study. 89 boys and 73 girls were included in the study.

Sampling method: Convenience sampling

The study was conducted as a part of school health check up programme in a tribal school of Maharashtra. Students from the 1st to 4th standard were included in the study. Detailed examination of the school children was done by the faculties and residents of the Community Medicine department. Questions were asked regarding their personal hygiene practices. After the interview health education session was conducted regarding personal hygiene.

Preformed, pretested, pre-structured questionnaires were asked regarding their personal hygiene. Questionnaires were designed in local language. Face to face interview was conducted. Questions were asked regarding their hairs and nails cleaning, brushing of teeth, use of clean uniform, washing of hand after defecation, daily bathing and use of footwear.

The study was approved by the institutional ethics committee. Permission was taken from the head of the school for conducting health check up. All the data was kept confidential.

Statistical analysis: Statistical analysis was done by using R software version 3.6.1.

![Figure 1: Standard and sex wise distribution of students](image)

Results: Hygiene among the girl student was better than boys. [Table 1] The most common morbid conditions among primary school children attending tribal school were anaemia (54.93%) followed by dental caries (31.48%), underweight (27.77%) and refractive errors (14.81).[Table 2]

Discussion

This study was conducted as a part of school health check up. 162 students consisting of 89 boys and 73 girls were included in the study. Students from 1st to 4th standard were included in the study. [Figure 1] On the day of health check up 15 students were absent. Morbid conditions affect the attendance of the students.

Assessment of the hygiene practices was done using questionnaire. 79 % of the student’s hair were clean and combed properly. 84% student’s nails were clean and trimmed. 80% students were with clean uniform. 20% of the students do not wash their hairs regularly with shampoo. Head lice infestation is common among the girl students. All the students brush their teeth regularly. Seven percentages of the students do not wear footwear regularly. Prevalence of worm infestation was 6.17%. Worm infestation may be one of the causes for high prevalence of anaemia. 81% student’s teeth were clean. Seven percentage students do not use brush and toothpaste/tooth powder to brush their teeth. Boys have better hygiene status than girls found in a study conducted in Lahore also 94% have satisfactory hygienic status.6 64% school children do not use soap to wash their hand in Angolela, Ethopia.5 Health education has positive impact on hygiene status of the students. Before imparting health education, hygiene status of the students was poor among the students in a school in Lucknow.6 Hence, health education has a very vital role in the schools.

Prevalence of anaemia among the student was 54.93%. Anaemia was the most common morbid condition present among the students. Second most common morbidity was dental caries. Some students do not brush their teeth regularly. Teeth were dirty in 19% students. Fluorine deficiency causes dental caries. 27.77% of the students were underweight according to their age. Refractive error was present among 14.81% students. Refractive error affects visibility and consequently leaning capabilities of the students. Hence correction of refractive error should be done on priority basis so that it will not affect scholastic performance of the student. Some teachers may be trained to check refractive errors of the students.

Louse infestation was present in 20.55% girl students. Some girl students do not wash their hairs regularly with shampoo. 20% girl’s hairs were neither clean nor properly combed.12% students were having skin problems. Prevalence of worm infestation was 6.17%. Prevalence of cough and cold was 11.73%. Girl students were better in hygiene practices than boys.

Most common morbidities are anaemia, worm infestation and dental caries found in a study conducted in urban slum area of Hyderabad among school children aged 4 to 15 years. They also noticed poor hygiene among school children.7 Girl’s student knowledge regarding personal hygiene is better than boys in a school situated in slum area of Kolkata. In the same study, prevalence of lice and worm infestation is 40% and 45% respectively.8 Girls are better performer in hygiene. Most common morbid conditions present in the students are dental caries (65%), upper respiratory tract infection.9 Dental caries (38.9%) and worm infestation are commonly present among the rural students of Odisha. Only 10% students have poor hygiene status.10 Skin and dental diseases are common among tribal children above five years of age in Mysore district of Karnataka.11 Malnutrition, dental caries, worm infestation, skin diseases are common among school children.12 84% boys and girl students are malnourished in a tribal school of Thane district of Maharashtra. In the same study other most common morbidities are anaemia and dental caries.13 26.5% school children are malnourished in a school of a south India. Dental caries is present in 47% of the students found in the same study.14 Personal hygiene was better among girl students and most common morbidities were anaemia and worm infestation.15 Dental caries is common among urban school children than tribal and rural. Prevalence of dental caries among tribal school children is 15%.16

Unhygienic practices are common among tribal school children. It is one of the reasons for high prevalence of morbidities among them. It may lead to school absenteeism and affect academic performance.

Conclusions

Anaemia, dental caries and malnutrition were the most common morbid conditions present among primary school children of a tribal school. Hygiene status of the girl students was better than boys.
Recommendations:

Regular school health check up camp should be conducted to detect morbid conditions so as to reduce school absenteeism and improve their scholastic performance.

Abstract

The COVID-19 (Corona Virus Disease-19) has become the most critical health problem worldwide. It was first started from Wuhan, China and now it has affected more than 230 countries and millions of people. The diabetic patients with uncontrolled glycemic state for long term can result in many microvascular and macrovascular complications. Hence they are most commonly affected individuals during COVID-19. In this review we have briefed about the impact of COVID-19 in diabetes, the different pathophysiology and management of diabetes in this phase.

Key Words: COVID-19, Diabetes

Background

The Corona Virus Disease-19 (COVID-19) has changed the scenario all over the world. It ranges from affecting the children to geriatrics with several effects on economy, psychology, education and obviously the health of people.

It has started since December 2019 from Wuhan, China and progressed further involving more than 200 countries including India. [1][2][3] The COVID-19 is a fatal pandemic spread throughout the world. The corona virus is positive single stranded RNA, which is named so because of its similarity to the shape and structure of a crown or solar corona as per appearance in electron microscope. [1][3]

The WHO (World Health Organization) proclaimed the COVID-19 flare-up as international emergency crisis on 30th January, 2020 and moved up to Pandemic on eleventh March, 2020.[3][4]

It has caused many deaths and severe illnesses in many patients who have poor immunity. The vulnerable population regarding morbidity and mortality includes patients with presence of comorbid conditions. Diabetes is well known to affect the majority of population worldwide leading to comorbid condition. [1][5][6][7]

So we have written a brief review on the effect of COVID-19 on Management of Type 2 Diabetes patients.

Ethical Approval

This study did not warrant institutional review board review as no human subjects were involved.

Symptoms and Characteristics Of COVID-19

The symptoms of Corona Virus Infectious Disease-19 include fever, sneezing, coughing, body ache and difficulty in breathing. The incubation period varies from 2 to 14 days and the symptomatic phase from 6 to 41 days. Some of the patients may develop respiratory distress due to viral pneumonia and ultimately respiratory
failure. The number of hospitalizations is much more than common virus infection leading to severe respiratory distress and deaths. However, not all the patients progress towards respiratory distress and death, many people remain asymptomatic or with mild symptoms in spite of being corona positive. This is more dangerous as we cannot know where to identify and how to prevent the further spread. 

The Diabetes and COVID-19

Various studies conducted in china have shown that majority of the patients who were admitted due to COVID-19 were having comorbid conditions compared to patients with no comorbidity. The rate of death was higher in patients with comorbid state due to development of pneumonia. The diabetic individuals are with poor immunity due to increased blood sugar level, which acts as a factor contributing to invite COVID-19 infection easily. Among diabetic patients, exaggerated cytokine response leads to pro inflammatory response resulting in expanded degree of Interlekin-6 (IL-6) and C-responsive protein (CRP). The corona virus infection provokes inflammation and prompts a cytokine storm. This inflammatory process weakens the immunity of diabetic people putting them in vulnerable population group for COVID-19 infection.

Angiotensin Converting Enzyme 2 (ACE 2) receptors are present in pancreas, cell membrane of lung, enterocytes and many other tissues. ACE2 is involved in prevention of inflammation and has anti oxidant property. This enzyme degrades the angiontension II and I to smaller peptides, and these peptides play role as anti inflammatory and anti oxidants.

ACE 2 receptors can increase the blood sugar level even in patients who are not diabetic but when infected with COVID-19. This hyperglycemia may be due to damage to beta cells in pancreas. It was observed that patients infected with SARS were hyperglycaemic for 3 years even after recovered which establishes the injury to pancreatic beta cells. The study reported in Wuhan shows that the diabetic patients admitted for COVID-19 were unable to control the hyperglycemia in spite of management according to guidelines American Association of Clinical Endocrinologists and American Diabetes Associations. These all points add on the vulnerability of diabetic patients to catch on the COVID-19 infections and worsening of the morbid state leading to mortality.

Management of Hyperglycaemia in Diabetes with Presence of COVID-19

The diabetic patients who have uncontrolled blood sugar level for long term can cause many complications. A study reported that diabetes was the most impacted condition due to COVID-19 followed by chronic obstructive pulmonary disease (COPD), hypertension, heart disease, asthma, cancer and depression. So the diabetes leads among all the diseases to be affected specifically in presence of corona virus.

The COVID-19 deregulates the glycemic control in diabetic patients worsening the comorbid state of patient. A study reported in Wuhan that more than 50% of the blood glucose measurements were abnormal in admitted diabetic patients for COVID-19. Hence, it suggests the meticulous management of diabetic patients as hyperglycemia plays important role in organ damage in diabetes.

The type 2 diabetic patients have been most commonly managed by Metformin, and if it cannot be controlled with Metformin alone then additionally Insulin administration is required. The diabetics are at higher risk of hospital admission after catching corona virus infection. Therefore they need to be managed by Insulin administration for hyperglycemia when not controlled with oral antidiabetics.

The Metformin is first line drug to be prescribed to type 2 Diabetic individuals. The Metformin can significantly decrease the risk of mortality in patients with chronic respiratory infection. A study reported there was significant decrease in death rate in diabetic patients with Metforin compared to diabetic without Metformin.

It activates the AMP-activated protein kinase (AMPK) in the liver, which causes functional changes to ACE 2 receptor. Thus, it may diminish the attachment of SARS-CoV-2. So Metformin seems to be helpful to diabetics during COVID-19.
The other antidiabetic drugs which are commonly used include GLP-1 analogue (Glucagon-Like-Peptide-1 analogue), SGLT-2 (Sodium Glucose Transporter-2) blockers and DPP4 (Dipeptidyl Peptidase 4) inhibitors. Besides the antidiabetic effect, they play role as anti-inflammatory, anti adipogenic and antagonism of Insulin Resistance. However, SGLT2 inhibitors and GLP1 analogue increase the expression of ACE2 receptors, so they can worsen the state of patient in presence of COVID-19. So it seems to withhold the SGLT 2 inhibitors in patients at this phase when COVID is widely spread. [14]

DPP4 inhibitors can increase the chances of upper respiratory infection but not the pneumonia. However, enough clinical evidences are needed to establish the role of DPP4 inhibitors in diabetic patients with COVID-19. The preclinical data has revealed that DPP4 inhibitors can reduce the severity of COVID-19 but again the sufficient clinical evidence is must to ascertain the relationship. [14][18]

A study reported that Thiazolidinediones put the diabetic patient at higher risk of pneumonia in comparison of patients on sulfonylureas. A study had reported that Pioglitazone increase the expression of ACE 2 receptors and so it may worsen the metabolic state in presence of COVID-19. [14][18]

**Conclusion**

The COVID-19 has become the serious health problem with world wide spread. The vulnerable population to be affected with it and leading to morbidity and mortality includes patients with poor immunity and comorbid conditions. The diabetic individuals are most commonly impacted with COVID-19 and so their strict control of hyperglycemia is mandatory to prevent the further worsening of state. Metformin has been the first choice of drugs to be prescribed in Type 2 diabetes. It has additional anti inflammatory property and it significantly reduces the morbidity as well as mortality in type 2 diabetic patients in comparison of other antidiabetic agents during this phase.

The Effect of Communication Ability of Care Workers in Charge of Visiting Care in Elderly at-Home Welfare Centers on Quality of Service: with Empathy as Mediator

Hee Kyung Kim
Professor, Department of Nursing, Kongju National University, Gongju, Republic of Korea

Abstract

**Background/Objectives:** The purpose of this study is to provide data for nursing intervention development that increases the quality of service of care workers by identifying the mediating effect of empathy in the effect of communication ability on quality of service.

**Methods/Statistical analysis:** Data were collected for 93 visiting care workers. Data were analyzed by descriptive statistics, Pearson’s correlational coefficients, multiple regression and Sobel’s test.

**Findings:** Subjects’ quality of service and communication ability (r=.62, p<.001), and empathy (r=.56, p<.001) showed high positive correlation. As a result of the mediating effect of empathy, communication ability had a significant effect on empathy in step 1 (β=.64), in step 2, communication ability affected the quality of service (β=.62), in step 3, communication ability had a positive effect on the quality of service (β=.45), and empathy also had a positive effect on quality of service (β=.28) and showed 42.2% explanatory power. It was found that empathy had a partial mediating effect.

**Improvements/Applications:** Care workers should make efforts to provide services by understanding and listening to and empathizing with the expressions of the elderly. The directors of the visiting care center should develop and train programs that can improve effective communication, empathy and quality of service.

**Keywords:** Care workers, Mediating effect, Communication Ability, Empathy, Quality of Service

Introduction

In Korea, with the start of Long-Term Care Insurance for the Elderly in 2008, the health and welfare of the elderly are improving as the elderly care policy is expanded and the working field is revitalized in taking care of the elderly through the expansion of care personnel such as care workers as well as medical personnel. In addition, the rapid increase of the elderly population along with the prolongation of life expectancy, coupled with the active social advancement of women, is raising the need for more elderly care workers.

Care workers for the elderly care for the elderly in elderly nursing hospitals or belong to a visiting care center and are active in the form of caring for the elderly in elderly families in the form of visiting care. In particular, care workers who are in charge of visiting care directly and proactively provide elderly care, so their role is considered to play a very important and decisive role in the elderly’s daily activities and health.

On the other hand, looking at the proportion of the population by age in 2017 and 2067, the proportion of the aged 65 or older will increase (13.8% → 46.5%), and
as it will reach 7.07 million in 2017, 10 million in 2025, and 19.01 million in 2050 [1], care for the elderly will become more and more important. Among the elderly in Korea, 89.5% of the total elderly responded that they have been continuously suffering from the disease for more than 3 months and have chronic diseases, and elderly people in general have more than two chronic diseases on average, and 83.5% of all elderly people have taken prescription drugs for more than 3 months. In addition, the physical and cognitive functions of the elderly are also limited as they age, and 71.4% of the subjects with reduced physical function are being cared for. In addition, because more than half of them rate their health as bad [2], it is thought that more care for the elderly, that is, nursing services, will be needed.

Quality of elderly care service refers to the excellence of services provided to pursue user satisfaction [3]. Quality of service is measured by considering reliability, responsiveness, assurance, empathy, and tangible dimensions. Therefore, the quality of service of care workers can be an index for evaluating the visiting care of the elderly, and the excellent quality of service of care workers will have a great effect in maintaining health while increasing the satisfaction of the elderly.

In order to improve the quality of service of care workers, it is necessary to identify the factors that affect it. Previous studies have shown that humans have the ability to live socially through communication. Humans with such communication ability can communicate their opinions efficiently and convincingly and maintain a smooth relationship with others, which is an important factor in determining the quality of human life [4]. Jung [5] reported that communication ability is a factor affecting the quality of care. For communication ability, the better you empathize, the better you can demonstrate social competence in various situations [6] and it can be said that the quality of service of care workers can be improved. In addition, empathy, which can understand and feel the inner experiences of others, such as emotions and psychological states, is closely related to communication ability [7] and it is said that by predicting the other’s behavior through the ability to accept and understand the other’s role, it can respond appropriately to social situations, thereby promoting interaction and communication ability [8].

Therefore, it was to provide basic data for the development of programs that can improve the quality of service of care workers by testing the mediating effect of empathy in the relationship between communication ability and quality of service.

Methods

1. Subjects

The subjects were 93 care workers belonging to an elderly at-home welfare center in D City, and care workers receiving refresher education in education centers in S and G City. They were adult who understand the purpose of the study and voluntarily expressed their willingness to participate and gave written consent, with working period of more than 6 months. Using the G-power 3.1.9.4 program, 88 people were calculated as a result of calculating the number of samples required to maintain 2 predictors, .15 effect size, .05 significance level, and .90 power, and in consideration of the 10% dropout rate, 96 people were surveyed, and the data of 93 people were finally analyzed.

2. Instruments

2.1. Communication ability

The comprehensive measure of interpersonal communication ability developed by Hue [9] modified and supplemented by Bae [10] was used. With a total of 14 questions, 2 items were coded in reverse. The questions were on a Likert 5-point scale, and higher the score, the higher the communication ability. At the time of development, the reliability Cronbach’s α was .72, and in this study, it was .83.

2.2. Empathy

The tool for empathy was a self-report test developed by Davis used by Lee [11]. This tool consists of a total of 26 questions, consisting of 14 questions of cognitive empathy and 12 questions of emotional empathy. The questions were on a Likert 5-point scale, and 8 inverse questions were coded in reverse. The higher the score, the higher the empathy. The reliability Cronbach’s α in the study by Lee [11] was .72 and in this study was .85.

2.3. Quality of service

The ‘SERVQUAL’ scale developed by Parasuraman,
Zeithmal, Berry\textsuperscript{[12]} used for care workers by Jung\textsuperscript{[5]} was used. It has a total of 20 questions on the Likert 5-point scale, and higher the score, the higher the quality of service. In the study of Jung\textsuperscript{[5]}, the reliability of the tool Cronbach’s $\alpha$ was .97 and in this study was .92.

3. Data collection

Data collection was from August to October 2020. Researchers and research assistants visited one elderly at-home welfare center located in the east area of D City, each one care worker maintenance training institution in G and S City, and after obtaining permission to the center director and the director, with the help of a research assistant who was educated on the research objectives and methods, he directly explained the research objectives to the care workers and received written consent. Data was collected through completing the questionnaires. The time required to complete the questionnaire was 10~15 minutes.

4. Ethical consideration

This study was approved by K University’s Institutional Review Board (KNU_IRB_2020-62).

5. Data Analysis

Using the SPSS/WIN 23.0 program, the descriptive statistics of the general characteristics and variable were calculated, the correlation between each variable was calculated using Pearson’s correlation coefficients, and the mediating effect of empathy in the relationship between communication ability and service quality utilized multiple regression. The significance test for mediating effect size was analyzed by Sobel’s test.

Result and Discussion

1. General characteristics of subjects

In the general characteristics of the subjects, the subjects of this study were care workers (100%) who are in charge of visiting care, ranging in age from 39 to 82 years old, with an average of 58.34±7.59 years old and 58.1% (54 persons) under 59 years old. Most (92, 98.9%) were women, and as for the educational background, 68.6% (64 people) had a high school diploma or higher, and the average working experience as a care worker was 40.48±34.85 months, ranging from 6 months to 12 years. It was found that more than half (64.5%, 60 people) had no other certifications than the care worker certification. 39 (41.9%) care workers had received maintenance training or job training once in the past year. For monthly income as care workers, about 0.51 million to 1 million won accounted for 47.3% (44 people).

2. Degree of communication ability, empathy and quality of service in subjects

The care workers’ communication ability scored 3.80 points out of 5 points, empathy scored 3.68 points out of 5 points, and quality of service scored 4.20 points out of 5 points [Table 1].

![Table 1. Degree of communication ability, Empathy and Quality of service in Subjects (N=93)](image)

3. Correlation between communication ability, empathy, and quality of service in subjects

Quality of service and communication ability ($r=.62, p<.001$), quality of service and empathy ($r=.56, p<.001$), and empathy and communication ability ($r=.64, p<.001$) all showed high positive correlation [Table 2].
Table 2. Correlation between Communication Ability, Empathy, and Quality of Service in Subjects

<td>.62 (&lt;.001)</td>
<td>.56 (&lt;.001)</td>
<td>1</td>
</tr>
</tbody>
</table>

4. Mediating effects of empathy in the relation between communication ability and quality of service in subjects

As a result of examining the autocorrelation of the dependent variable and the multicollinearity between the independent variable before testing the mediating effect, the Durbin-Watson index for autocorrelation was 1.59-1.77, which was close to 2, which was independent. The multicollinearity between the independent variables was less than 10 with the VIF (Variation Inflation Factor) index 1.00~1.71, and tolerance was 0.59~1.0, which is above the standard value of 0.1, and there was no multicollinearity, which meant the data was suitable for regression analysis.

As a result of applying the mediating effect, in step 1 regression analysis, communication ability, an independent variable, had a statistically significant effect on empathy, a mediating variable (β=.64), and the explanatory power for empathy was 40.8%. In the second-stage regression analysis, communication ability, an independent variable, had a significant effect on the quality of service, a dependent variable (β=.62), and the explanatory power for quality of service was 38.3%. In step 3, in order to test the effect of empathy, a mediating variable, on quality of service, which is a dependent variable, as a result of regression analysis with communication ability and empathy as predictive factors and quality of service as dependent variable, communication ability was found to have a positive effect on quality of service (β=.45), and empathy also had a positive effect on quality of service (β=.28), and it showed 42.2% of explanatory power.

As a result of comparing the β values, it was confirmed that empathy showed a partial mediating effect as much as 0.17 since the β=.62 value in step 2 was larger than the β=.45 value in step 3. As a result of confirming the significance of the mediating effect coefficient, it was statistically significant (Z=2.53, p=.011) [Table 3].

Discussion

The purpose was to analyze the relationship between communication ability, empathy and quality of service of care workers in charge of visiting care, and to understand the mediating effect of empathy in the effect of their relationship and communication ability on quality of service.

The communication ability of this study was 3.80 out of 5 points, higher than 3.48 points of hospital nurses\(^{[10]}\) and higher than 3.29 points of nursing hospital care workers and home visit care workers\(^{[5]}\). This is because the care workers in this study are care workers who are in charge of home visits, and because they provide elderly care services by themselves, it is difficult to perform their duties well without proactive and active communication, and it is thought that communication ability scored higher than that of health care workers working in other fields or in other occupations. The level of empathy was 3.68 points, similar to the empathy of nursing students 3.39\(^{[13]}\) and the emotional intelligence of care workers 3.53, and it can be said that care workers understand the psychology and attitude of others, feel compassion, care for them, and feel the pain of others’ difficulties as well as have an attitude to empathize.

The service quality of care workers was 4.20 out of 5, which was higher than that of 3.80 of Jung\(^{[5]}\). It is expected to provide training to continue to provide quality service.

The relationship between the subjects’ communication ability, empathy and quality of service showed a high positive correlation. This was consistent with the results\(^{[5]}\) showing positive correlations with communication ability, emotional intelligence, and quality of care services of 258 care workers. The higher the communication ability and empathy, the better the quality of service. It is desirable to provide a training program for care workers to effectively learn verbal and non-verbal communication skills and have the emotional ability to empathize.

Empathy showed partial mediating effect in the relationship between communication ability and quality of service of care workers. These results were similar to the results that sympathy had a mediating effect in the communication ability and interpersonal relationship of nursing students\(^{[13]}\) and that the communication ability and emotional intelligence of care workers had an effect on service quality\(^{[5]}\). In hospital nurses, communication ability was found to be a factor affecting nursing work performance, and hotel bakery employees’ emotional intelligence and empathy showed a high correlation with service quality, and it was similar to the report that empathy had a moderating function in the relationship between emotional intelligence and job satisfaction\(^{[14]}\).

By applying the result that empathy and emotional abilities affect service quality in hotel employees, like nursing care workers as a service occupation, and applying it to the service quality of care workers, practice should be pursued in order to improve communication skills and empathy of them.

Conclusion

Based on the results of this study, it is necessary to increase self-leadership in order to increase the job competency of care workers in charge of visiting care. To do so, self-control and self-motivating autonomy need to be increased, the role and abilities should be realized through thinking and action strategies to set goals and to take responsibility for the results. Ultimately, such efforts can increase the influence of care workers, and it is thought that they can improve their job competency and increase the satisfaction of the care target. Therefore, it is suggested that a leadership improvement program be developed and actively used as a refresher education for care workers.

Assessing the Training Needs Regarding ‘Breaking Bad News’ amongst Emergency Medical Services (EMS) Professionals in Pune India

Parag Rishipathak¹, Shrimathy Vijayaraghavan², Anand Hinduja³
¹Professor & Director, Symbiosis Centre for Health Skills, Symbiosis International (Deemed University), Pune, India, ²Medical Officer, Academics, Symbiosis Centre for Health Skills, Symbiosis International (Deemed University), Pune, India, ³Adjunct Faculty, Symbiosis Centre for Health Skills, Symbiosis International (Deemed University), Pune, India

Abstract

Introduction: ‘Breaking Bad News’ (BBN) in the scenario of poor prognosis or death is considered to be one of the most stressful aspects of the duties of a Healthcare professional. In the recent years, the subject of BBN has gained traction among healthcare professionals and psychologist leading to the creation of some comprehensive models to train professionals. Emergency Medical Professionals are among the likeliest to encounter BBN situations. Hence it is imperative that they be formally trained to deal with patients and their families effectively.

Objective: To assess the training needs regarding ‘Breaking Bad News’ (BBN); amongst Emergency Medical Services (EMS) Professionals.

Methodology: The study was conducted amongst 150 Emergency Medical Professionals in Pune, India. A previously tested and validated questionnaire developed by Rasmus et al in June 2020 was utilized for the study. Questionnaire was administered to the respondents through online mode after obtaining informed consent. Responding to all questions was mandatory. The respondents were given one day to fill the questionnaire. Any queries pertaining to questionnaire were clarified during data collection.

Discussion: The present study was done to assess the baseline awareness of EMS professionals about BBN and to devise a customized training program for them. Unfortunately, majority of the respondents were not even aware that BBN is a separate subject having specific procedures and protocols followed globally. The lack of training instils fear of facing such situations and adversely affects the mental health of EMS professionals. This can be corrected by utilizing tools like simulation and role play to provide adequate exposure to EMS professionals in a safe environment.

Conclusion: The findings of the study point towards an emergent need of formal practical training on this crucial yet ignored aspect of the health care professionals’ duties. Comparative Studies can be conducted in the future to assess the effectiveness of this training program.

Keywords: Breaking Bad News (BBN), Emergency Medical Services (EMS) professionals, Formal training, Training Needs

Introduction

‘Breaking Bad News’ (BBN) in the scenario of poor prognosis or death is considered to be one of the most stressful aspects of the duties of a Healthcare
professional. Unfortunately, the healthcare education curriculum does not provide for formal training regarding effective communication with the patient and/or caregivers.¹

A study in 2010 conducted amongst physician and nurses in Iran by Arbabi et al,² concluded that lack of adequate communication skills among healthcare professionals leads to inertia in disclosing bad news to the patients or their relatives. This was partly attributed to the fear of managing the adverse emotional reaction of the patients’ or caregivers after listening to bad news.

In the recent years, the subject of BBN has gained traction among healthcare professionals and psychologist leading to the creation of some comprehensive models to train professionals. A few of these models that has gained popularity include the ABCDE model developed by Rabow and Mephee. This acronym stands for Advance preparation, Building a therapeutic relationship or environment, communicating well, Dealing with patient and family reactions, and Encouraging and validating emotions.³

Another model called SPIKES has been recognized in standard guidelines in numerous countries.⁴⁵ The model consists of six steps including: Setting up the interview, assessing patient’s Perception, obtaining Patient’s information, Providing, Knowledge and information to the patient; addressing the patient’s Emotions with empathic responses and Strategy and Summary⁴.

Although these models offer a structured approach for healthcare professionals to adopt, their utilization has been abysmally low. One way to improve their utilization is to sensitize healthcare professionals on the significance of effective communication during an adverse outcome. Physician and caregiver surveys have highlighted the importance of upfront and honest communication while delivering bad news⁶⁷⁸.

Within the healthcare cadre, Emergency Medical Professionals are among the likeliest to encounter BBN situations. Hence, it is imperative that they be formally trained to deal with patients and their families effectively.⁹ The first step in this direction is to assess the training needs to help tailor practical training program based on recognized protocols.

**Objective:** To assess the training needs regarding ‘Breaking Bad News’ (BBN); amongst Emergency Medical Services (EMS) Professionals.

**Methodology**

The study was conducted amongst 150 Emergency Medical Professionals in Pune, India. A previously tested and validated questionnaire developed by Rasmus et al in June 2020 was utilized for the study.

The original questionnaire comprised of two sections wherein the first section recorded sociodemographic information. The second section consisted of 7 items pertaining to the exposure of the respondents in BBN.

Of the 7 items 3 were required to be answered in a binary Yes/No and the remaining 4 items were in the format of Multiple Choice Questions (MCQ).

Questionnaire was administered to the respondents through online mode after obtaining informed consent. Responding to all questions was mandatory. The respondents were given one day to fill the questionnaire. Any queries pertaining to questionnaire were clarified during data collection.

All 150 respondents reverted with the completely filled questionnaire. The data was tabulated and statistically analysed with the help SPSS version 23.

**Results**

On the basis of the demographic findings, it was seen that the average respondents were between the age group of 21-25 years with 84% female majority. Further, 42% were BHMS graduates and more than 93% of the respondents had a work experience of 1-5 years.
As seen in figure 1 and 2, 3% of the respondents had never participated in a situation in which they had to deliver poor prognosis or news regarding death of a patient. Within the rest nearly 50% of the respondents had to face BBN situations regularly.
Figure 3.
As seen in figure 3, majority of the respondents were not aware of any specific procedure/protocol required to be followed during a BBN situation.

Figure 4.
As seen in figure 4, only one fifth of the respondents had undergone formal training in BBN as part of their academic curriculum. As many as, 62% of the respondents cited that that they have not received any kind of formal/informal training on the subject.
As seen in figure 5, majority respondents felt that using easy and understandable language is the most important rule while delivering bad news.

As shown in figure 6, a whopping 77% respondents felt that dealing with the patients’ emotions was the most challenging and difficult aspect.
**Discussion**

The present study was done to assess the baseline awareness of EMS professionals about BBN and to devise a customized training program for them. Most of the respondents were in the age group of 21-25 with nearly 93% of them having a work experience of 1-5 Years. This category of EMS professionals is the most vulnerable to poor communication and inept handling of difficult patient situations. Being first responders, it is essential to train them in various soft skills including empathy and effective communication apart from hard clinical skills.

Unfortunately, majority of the respondents were not even aware that BBN is a separate subject having specific procedures and protocols followed globally. This in spite of the fact that majority of them were encountering BBN situations regularly in course of their work. The higher frequency of such situations could be partly attributed to the ongoing Covid 19 pandemic.

Current teaching curricula do not adequately focus on soft skills teaching and such delicate topics are seldom covered in continued medical education courses and conferences. This trend needs to be changed urgently so that EMS professionals are better equipped in handling stressful situations like bad prognosis or death of the patient.

Even in the absence of formal training the respondents were aware of the basic individual rules to use while delivering bad news. Although, the lack of training reflected in the meagre 3% correct response to the item which is that effective communication requires eye contact, empathy, finding a right place to deliver bad news and using an understandable language to deliver bad news.

The lack of training instils fear of facing such situations and adversely affects the mental health of EMS professionals. This can be corrected by utilizing tools like simulation and role play to provide adequate exposure to EMS professionals in a safe environment.

**Conclusion**

The findings of the study point towards an emergent need of formal practical training on this crucial yet ignored aspect of the health care professionals’ duties. Comparative Studies can be conducted in the future to assess the effectiveness of this training program.

Assessment of Awareness and Preparedness regarding Management of Major Traumatic Haemorrhage in Prehospital Settings amongst EMS Professionals, Pune, India

Parag Rishipathak¹, Navnita Sengupta², Anand Hinduja³

¹Professor & Director, Symbiosis Centre for Health Skills, Symbiosis International (Deemed University), Pune, India; ²Medical Officer, Academics, Symbiosis Institute of Health Sciences, Symbiosis International (Deemed University), Pune, India; ³Adjunct Faculty, Symbiosis Centre for Health Skills, Symbiosis International (Deemed University), Pune, India

Abstract

Background: In trauma cases acute major hemorrhage in the first few hours of injury is the leading cause of death in as many as 30% – 40% cases. Major hemorrhage can result in the collapse of the circulatory system and the patient can present to the emergency room in a state of shock. EMS professionals are expected to have high degree of awareness as well as should possess the requisite skills and preparedness in the various techniques utilized to control life threatening hemorrhage.

Aim: To assess the Awareness and Preparedness regarding management of major traumatic hemorrhage in prehospital settings among EMS students.

Methodology: The study was conducted amongst 141 Emergency Medical Service professionals. The original questionnaire consisted of 2 parts, first containing two clinical scenarios testing the awareness level and the second one containing twenty four items pertaining to the preparedness of EMS professionals in major traumatic hemorrhagic situations.

Result: The mean score obtained for the parameter awareness was 18.32 out of maximum score of 28. Respondents scored well on the parameter pertaining to the management of venous bleeding and amputated limb while scored relatively lower on the items pertaining to the management of capillary bleeding.

Conclusion: The present study provides encouraging results with regards on the awareness and preparedness levels of EMS professionals. It also provides insight into future training needs to enhance preparedness in cases of infrequent hemorrhagic emergencies.

Keywords: Haemorrhage, Amputated Limb, Venous, Capillary.
and deft management of the Airway, Breathing and Circulation in the patient\textsuperscript{4}

Kauvar \textit{et al} \textsuperscript{5}(2005) in a study emphasized the significance of appropriate triage, early transportation to trauma center, efficient communication along with proper bleeding control steps for effective management of trauma cases.

The corner stone of management in such cases is the effective control of hemorrhage. This requires thorough understanding of the pathophysiology of hemorrhage and presence of mind on part of the Emergency Medical Services professionals. Success in hemorrhage control depends on effective communication between EMS professionals and consultants and strict adherence to guidelines of hemorrhage control.\textsuperscript{5}

The role of EMS professionals is critical as most cases of trauma injury die due to major hemorrhage even before they reach the hospital.\textsuperscript{6}

Hence EMS professionals are expected to have high degree of awareness of the pathophysiology and management of major traumatic hemorrhage as well as possess the requisite skills and preparedness in the various techniques utilized to control life threatening hemorrhage.

**Aim**

To assess the Awareness and Preparedness regarding management of major traumatic hemorrhage in prehospital settings amongst EMS professionals.

**Methodology**

The study was conducted amongst 141 Emergency Medical Service professionals at Symbiosis Center for Health Skills, Pune, India.

A pretested and validated questionnaire developed by Mofrad \textit{et al}\textsuperscript{7} was utilized for the study.

The original questionnaire consisted of two parts, first containing two clinical scenarios testing the awareness level and the second one containing twenty four items pertaining to the preparedness of EMS professionals in major traumatic hemorrhagic situations.

Within the twenty four items, four items dealt with the management of capillary bleeding, six with venous bleeding, ten with arterial bleeding and four with amputation of the limb.

Each clinical scenario consisted of Multiple Choice Questions with four correct options and four incorrect options. Each correct option marked by the respondent was given a score of one. The maximum score that could be obtained in the first section of awareness was twenty eight (Maximum score of four in each of the seven MCQs).

Preparedness was graded on a three point Likert scale ranging from Cannot do (Score 0), Can do but not perfectly (Score 1) and Can do perfectly (Score 2).The maximum score that could be obtained was eight for management of capillary bleeding, twelve for management of venous bleeding, twenty for management of arterial bleeding and eight for amputation of the limb.

Written informed consent was obtained from all the respondents before administration of the questionnaire. The questionnaire was emailed to the respondents and they were given a time of one day to revert back with the completely filled questionnaire.

The data collected was tabulated and statistically analyzed using SPSS version 23.

Fig 1. Percentage mean score of Preparedness

As seen in Fig 1. The respondents scored well on the parameter pertaining to the management of venous bleeding and amputated limb while scored relatively lower on the items pertaining to the management of capillary bleeding.

**Discussion**

The present study was aimed at assessing the level of awareness and preparedness with regards to the management of major traumatic haemorrhage amongst working EMS professionals.

Although the EMS professionals in the study has limited years of work experience they possessed above average level of awareness regarding the clinical presentation of major traumatic haemorrhage. The respondents scored better on the questions related to the symptomatology and diagnosis but scored relatively lower on the questions testing awareness of management principles.

In terms of practical preparedness the respondents scored relatively better and showed confidence in the skills related to various interventions required in a case of major traumatic haemorrhage. Within the four kinds of haemorrhage scenario the responses reflected least preparedness in the emergency management of capillary bleeding. The respondents showed greater degree of confidence and preparedness in management of venous bleeding, arterial bleeding and amputated limb. The lower score obtained of capillary bleeding could be attributed to lack of adequate training or the relative low frequency of such emergencies in clinical practice. Nevertheless the data points towards the need of reinforcement and regular training in all kinds of traumatic haemorrhage to further boost the preparedness of EMS professionals.

Many causes of major traumatic haemorrhage are relatively rare yet life threatening as they occur seldom in clinical practice the EMS professionals failed to get adequate on-the-job-training for such emergencies. Use of clinical simulation is an effective way of training EMS professionals in rare hemorrhagic emergencies. With the utilization of high fidelity manikins and part task trainers scenarios can be created and training can be provided in safe environment.

**Conclusion**

Major traumatic hemorrhage is an extremely important and frequent emergency encountered by EMS professionals. The present study provides encouraging results with regards on the awareness and preparedness levels of EMS professionals. It also provides insight into future training needs to enhance preparedness in cases of infrequent hemorrhagic emergencies.

To Assess Awareness Regarding Child Abuse and Neglect, amongst Emergency Medical Professionals in Pune, India – A Pilot Study

Parag Rishipathak¹, Monesh Bhandari², Anand Hinduja³
¹Professor & Director, Symbiosis Centre for Health Skills, Symbiosis International (Deemed University), Pune, India, ²Medical Officer, Academics, Symbiosis Centre for Health Skills, Symbiosis International (Deemed University), Pune, India, ³Adjunct Faculty, Symbiosis Centre for Health Skills, Symbiosis International (Deemed University), Pune, India

Abstract

Introduction: Violence against children is widespread and affects millions of children globally. Violence against children occurs in various forms including physical violence, maltreatment, bullying, emotional or psychological violence, forced and bonded labour, and trafficking.

To prevent child abuse, it is essential that a high degree of awareness is essential amongst all stakeholders including parents, educators and medical professionals. The common thread among all studies conducted in medical professionals is the lack of focused training and sensitisation that can enhance the ability to detect such cases and respond to them promptly.

Objective: To Assess Awareness Regarding Child Abuse and Neglect among Emergency Medical Professionals in Pune.

Methodology: As part of an awareness initiative by the Institute, an online session was conducted for the Emergency Medical Professionals (EMP) in Pune city. 65 Emergency Medical Professionals working in various hospitals located around all parts of Pune participated in the session. After the session was completed, informed consent was taken from the participants for answering a questionnaire based on the subject.

The questionnaire chosen for the study was Child Abuse and Neglect Awareness Scale (CANA-S) a pretested and validated tool. The CANA-S tool comprises 4 sections, each section comprising a subscale dedicated to one of the major categories of child abuse and neglect i.e. physical abuse, sexual abuse, emotional abuse, and neglect.

Conclusion: Though the overall awareness about Child Abuse and Neglect is satisfactory, further training programs should be encouraged, to achieve near 100 % awareness amongst EMS professionals in order to prevent and report every single case of Child Abuse and Neglect.

Keywords: Child abuse, awareness, sexual abuse

Introduction

Violence against children is widespread and affects millions of children globally. Violence against children occurs in various forms including physical violence, maltreatment, bullying, emotional or psychological violence, forced and bonded labour, and trafficking.¹

Shockingly even children of the tender age of 2 - 4 years are not spared. 3 in 4 children in this age group are inflicted with physical punishment and/or psychological violence at the hands of parents and caregivers. This apart, as many as 1 in 5 women and 1 in 13 men report...
having been sexually abused as a child.  

India is home to over 19 percent of the world’s children, making it the country with the largest child population in the world. Hence the responsibility of our country in setting an example for child safety and abuse prevention is paramount.  

To prevent child abuse, it is essential that a high degree of awareness is essential amongst all stakeholders including parents, educators and medical professionals. A study by Ghanem E. et al (2015) meant to assess awareness of Child abuse among Egyptian Medical Students concluded that the majority of the respondents encountered cases of child abuse but their knowledge of child maltreatment still remains insufficient. 

Closer to home, a study conducted in Bagalkot district of North Karnataka by Kirankumar et al (2011) showed the glaring lack of knowledge accompanied with poor attitude and perception about Child Abuse Neglect. 

This was further reiterated in a study by Deshpande et al (2015) conducted in the state of Gujarat who assessed knowledge and attitude in regards to physical child abuse amongst medical and dental residents. The study signifies the gaps between recognizing signs of physical child abuse and responding effectively to it. 

The common thread among all studies conducted in medical professionals is the lack of focused training and sensitisation that can enhance the ability to detect such cases and respond to them promptly. 

Among all medical professionals, Emergency Medical Services (EMS) providers would most frequently encounter potential child abuse situations. The duty of EMS professionals is not restricted in only providing emergency medical care but extends to reporting the suspicion to the appropriate authorities in order to ensure child safety and prevent further abuse. 

A systematic review conducted by Johnson et al emphasized the importance of targeted training programs among EMS professionals to improve their ability to identify and report child abuse and neglect. 

The first step towards designing an effective training program is to assess the baseline awareness of Child Abuse and Neglect amongst EMS professionals. 

**Objective**

To Assess Awareness Regarding Child Abuse and Neglect among Emergency Medical Professionals in Pune

**Methodology**

As part of an awareness initiative by the Institute, an online session was conducted for the Emergency Medical Professionals (EMP) in Pune city. 65 Emergency Medical Professionals working in various hospitals located around all parts of Pune participated in the session. The session comprehensively covered subject of Abuse, Neglect and Assault with focus on identification of cases, legal aspects, roles and responsibilities of medical professionals, measures of intervention and management. It was an interactive session and the participants were given ample opportunity to share their views and clear their doubts on the subject. The information pertaining to the subject was shared through Power point presentation and the session was conducted by Medical Officer with five years of experience. The session was conducted via Microsoft Teams application for two hours and the participants interacted verbally, by unmuting themselves and messaging their views, doubts and inputs via chat in the Microsoft Teams application. 

After the session was completed, informed consent was taken from the participants for answering a questionnaire based on the subject. The questionnaire chosen for the study was Child Abuse and Neglect Awareness Scale (CANA-S) a pretested and validated tool, developed by Altan et al (2017). The reliability of the questionnaire is found to be high (Cronbach’s alpha value 0.768) for evaluating awareness about child abuse and neglect among the medical students. 

The CANA-S tool comprises 4 sections, each section comprising a subscale dedicated to one of the major categories of child abuse and neglect i.e. physical abuse, sexual abuse, emotional abuse, and neglect. Each section consists of 5 vignettes which requires response on a five-point Likert scale ranging from 5 to 1 as “definitely appropriate=5,” “appropriate= 4,” “uncertain=3,” “inappropriate=2,” and “definitely inappropriate=1”.
The highest and lowest possible scores for the full scale are 100 (indicating the highest level of awareness) and 20 (indicating the lowest level of awareness), respectively. All 20 items were retained and required to be mandatorily filled. The tool was administered through online mode. The respondents were given one-day deadline to revert with responses. Any queries pertaining to the tool questionnaire were clarified during data collection. 62 respondents reverted with completely filled questionnaire. The data was tabulated and statistically analysed with the help of SPSS version 23.

### Result

**Demographic Data:**

</tr>
</tbody>
</table>

The total scores were calculated for all the 20 items of the tool. The mean of Total score for all respondents is 70.49 with standard deviation of 7.59. The highest total score is 88 and the lowest is 50.
As shown in Figure 1, the mean awareness score for Physical and Emotional abuse is much lower as compared to Sexual Abuse and Neglect.

**PHYSICAL ABUSE:**

**EMOTIONAL ABUSE:**
As shown in Figures 2 & 3, the participants showed relatively lower awareness levels in 2 of the 5 vignettes based on both physical and emotional abuse.

**Sexual Abuse:**

![Sexual Abuse Mean Score](image)

As shown in Figures 4 & 5, the vignettes based on sexual abuse and neglect were responded with high degrees of awareness.

**Neglect:**

![Neglect Mean Score](image)
Discussion

The study was aimed to gauge the awareness levels of child abuse and neglect amongst EMP. The mean total score of 70.49 out of 100 is encouraging and reflects the fairly good degree of awareness. The sample included a majority of married female EMP’s which could partly be responsible for the higher degree of sensitivity on the subject. Even though the overall score is high there is a clear distinction in the level of awareness on the individual subscale. Due to greater emphasis on sexual abuse and neglect, both in the curriculum and the media; the understanding of the sign is better.

The results point towards greater focus on the presentations of cases of physical and emotional abuse in training programs. Sensitization programs and role play workshop can play a significant role in raising the knowledge and improving the attitude towards child abuse and neglect. Similar vignettes can be used to coach EMS professionals in correct identification and response in suspected cases of Abuse and Neglect.

The study is limited by its concise sample size but provides significant perspective on this longed ignored issue. Larger studies can further study the correlation of Sex and Marital Status on the degree of awareness of Abuse.

Conclusion

Though the overall awareness about Child Abuse and Neglect is satisfactory, further training programs should be encouraged, to achieve near 100% awareness amongst EMS professionals in order to prevent and report every single case of Child Abuse and Neglect.

To Assess Preparedness in Disaster Management among EMS Professionals in Pune, India

Parag Rishipathak¹, Monesh Bhandari², Anand Hinduja³

¹Professor & Director, Symbiosis Centre for Health Skills, Symbiosis International (Deemed University), Pune, India, ²Medical Officer, Academics, Symbiosis Centre for Health Skills, Symbiosis International (Deemed University), Pune, India, ³Adjunct Faculty, Symbiosis Centre for Health Skills, Symbiosis International (Deemed University), Pune, India

Abstract

Introduction: Natural disasters cause an estimated 60,000 deaths every year. Although low-frequency, high-impact events like earthquakes and tsunamis are not preventable, albeit loss of human lives can be prevented by developing an efficient disaster management system. In the last few decades robust emergency response systems, emergency preparedness, resilient infrastructure and accurate forecasting have significantly reduced the death rate caused due to such calamities. Similar to natural disasters, MCIs drastically impact the healthcare system and society at large.

Emergency medical services (EMS) professionals play a pivotal role during disasters, mass casualty incidents etc. and are an integral part of disaster management apparatus. The level of awareness and preparedness amongst EMPs with regards to disaster management is primordial. The areas requiring improvement include skillset training strategic and operational planning and familiarity with the emergency preparedness in disaster management. Designing an effective training program for Indian EMS professionals, would require a thorough understanding of the baseline level of preparedness among them.

Objective: To assess preparedness in disaster management among Emergency Medical Professionals.

Methodology: The study was conducted among Emergency Medical Professionals (EMPs) employed in various hospitals in the city of Pune, India. The questionnaire tool utilized for the study was Emergency Preparedness Information Questionnaire (EPIQ) a pretested and validated tool. The revised EPIQ tool comprises of 42 items and is divided into eight sections.

All 42 items were required to be mandatorily filled. The tool was administered through online mode. 119 respondents reverted with completely filled questionnaire.

Conclusion: Disasters although infrequent, cause significant morbidity and mortality. A high degree of preparedness is expected amongst EMP’s which can only be achieved with regular training and feedback.

Keywords: Disaster, preparedness, emergency medical professionals, mass casualty

Introduction

Natural disasters cause an estimated 60,000 deaths every year. Although low-frequency, high-impact events like earthquakes and tsunamis are not preventable, albeit loss of human lives can be prevented by developing an efficient disaster management system. In the last few decades robust emergency response systems, emergency preparedness, resilient infrastructure and accurate forecasting have significantly reduced the death rate caused due to such calamities.¹
Mass casualty incidents (MCIs) defined as “events which generate more patients at one time, than locally available resources can manage using routine procedures” are increasing in frequency across the globe. Similar to natural disasters, MCIs drastically impact the healthcare system and society at large.\(^{2}\)

Emergency medical services (EMS) professionals play a pivotal role during disasters, mass casualty incidents etc. and are an integral part of disaster management apparatus.\(^{3}\) The role of EMS professionals in providing emergent healthcare services and upgrading the skill sets of the allied healthcare providers has been highlighted in a study by Catlett C.L \textit{et al} (2011).\(^{4}\)

Emergency Medical Professionals (EMP’s) can mitigate the damage caused by disasters only if they possess optimum levels of preparedness. Unfortunately, studies in the past have shown that the level of awareness and preparedness amongst EMPs with regards to disaster management is primordial. The areas requiring improvement include skillset training strategic and operational planning and familiarity with the emergency preparedness in disaster management.\(^{5,6}\) Regular training of EMS professionals, in disaster management is a need of the hour. Designing an effective training program for Indian EMS professionals, would require a thorough understanding of the baseline level of preparedness among them.

**Objective**

To assess preparedness in disaster management among Emergency Medical Professionals.

**Methodology**

The study was conducted among Emergency Medical Professionals (EMPs) employed in various hospitals in the city of Pune, India. The questionnaire tool utilized for the study was Emergency Preparedness Information Questionnaire (EPIQ) a pretested and validated tool, developed by Wisniewski \textit{et al} (2004)\(^{7}\) and later revised by Garbutt S.J. \textit{et al} (2008)\(^{8}\). The reliability of the questionnaire is found to be high (Cronbach’s alpha value 0.97) for evaluating awareness about disaster preparedness among the healthcare professionals.

The revised EPIQ tool comprises of 42 items and is divided into eight sections viz., (i) Incident command system factor (eight items) (ii) Triage factor (five items), (iii) Communication and connectivity factor (six items), (iv) Psychological issues and special populations factor (six items), (v) Isolation, decontamination, and quarantine factor (five items), (vi) Epidemiology and clinical decision-making factor (four items), (vii) Reporting and accessing critical resources factor (four items), (viii) Biological agents factor (four items). Each item requires response on a five-point Likert scale ranging from scores of 5 to 1 wherein 5 stands for “Very Familiar”, 4 stands for “Somewhat Familiar”, 3 stands for “Familiar to Neutral”, 2 stands for “Somewhat Unfamiliar” and 1 stands for “Not Familiar”. Informed consent was taken from the participants for answering the questionnaire based on the subject

All 42 items were required to be mandatorily filled. The tool was administered through online mode. The respondents were given one-day deadline to revert with responses. Any queries pertaining to the questionnaire were clarified during data collection. 119 respondents reverted with completely filled questionnaire. The data was tabulated and statistically analysed with the help of SPSS version 23.

</tr>
</tbody>
</table>

As seen in the Table 2, the familiarity across all parameters range between 3 to 4 indicating moderate degree of familiarity with all the aspects of Disaster Management
As seen in Figure 1 the most common response across parameters was found to be, ‘Somewhat Familiar’

Similarly, as shown in Figure 2 EMP’s were ‘Somewhat Familiar’ with the parameters regarding Disaster Management

Significantly as many as 6 to 10 % of the respondents, inspite of being working EMP’s had no familiarity with any disaster management protocol. Approximately, 10 to 14 % of the respondents had some vague idea but displayed lack of preparedness across all parameters of disaster management.

Discussion

The study was conducted with an aim to assess the degree of preparedness with regards to natural disasters and mass casualty incidents (MCI) among EMP’s. The results are somewhat encouraging as majority of the respondents displayed some degree of familiarity with the all-round aspect of disaster management.
It is crucial for working EMP’s to possess a high degree of knowledge and skill set with regards to disaster management as they are first responders. The results therefore highlight the emergent need of continuing medical education (CME) and practical workshops to equip EMP’s with the required skill set and knowledge. Although Disaster management is covered as a part of EMS curricula, periodic re–enforcement is essential to maintain optimum level of preparedness among EMP’s. Pre and post testing during disaster management workshops can help in objectively identifying the degree of improvement in preparedness and the effectiveness of the practical sessions.

**Conclusion**

Disasters although infrequent, cause significant morbidity and mortality. The role of EMP’s in positively impacting lives during disasters cannot be overemphasized. A high degree of preparedness is expected amongst EMP’s which can only be achieved with regular training and feedback.

A Comparative Study between Nineveh and Tikrit Medical School Teachers Perceptions regarding the Effectiveness of OSCE in Clinical Examination

Wafa Mahmood Jasim¹, Zahraa Ahmed Hassan²

¹Lecturer, Family & Community Medicine / Northern technical university / Kirkuk Technical Institute, ²Community Medicine/ Collage of Medicine / Kirkuk University, Researcher

Abstract

Assessment students competence is of much importance especially when evaluation the expected learning out come of medical education and because of increasing students number enrolled in medical colleges, this lead to enhance the chance of malpractice that compromise patient conditions, therefore it is challenging to develop and implement such an objective assessment method in clinical examination. Objective of the study: The study aim is to compare the traditional and innovative medical school teachers perceptions regarding the effectiveness of OSCE in clinical examination. A descriptive cross sectional study has been conducted in both (Nineveh and Tikrit medical college from the period of 15th February till 20 th April / 2014. The study was included 95 medical teachers from both traditional and innovative schools (55 teachers from the traditional school and 40 from innovative school). A special questionnaire form was prepared by the researcher through direct interviewing with the study sample. The results show that 63.1% of medical teachers are male, 49.5% aged between 40-49 years, 65.3% from basic specialty sciences, 51.6% having a period more than 10 years in teaching, 70.9% of traditional school teachers agree that OSCE evaluate the practical objectives in comparison to 67.5% of innovative school teachers agree with that OSCE evaluate knowledge, understanding, practical, and intellectual objectives. The study concluded that more than half of traditional medical teachers agree with the affectivity of OSCE in assessing large number of students without bias while medical teachers from innovative school agree with the objectivity of OSCE in clinical evaluation.

Key words :- Medical teachers, Perceptions, clinical examination, Kirkuk, Iraq.

Introduction

Assessment usually referred to as a evaluation system for all professional accomplishments by using a different defined criteria which mainly having an attempt at a measurement point either by assigning numerical value or grading on a rough scale. Assessment of medical students skills and their knowledge is of necessary benefits because it is not only filters the best students but continuous monitoring which leads for better future physician. A specific documented assessment test should produce the similar scores for two or more situations occasions or if corrected by two or more examiners. The validity of a test is determined by the extent to which it measures whatever it sets out to measure.

Usually many different methods of medical students assessment such as multiple choice questions (MCQ), modified assay questions (MAQ), viva voce (VV), long case discussion and lastly objective structured clinical examination (OSCE).

Each one of these evaluation method may express the psychomotor, cognitive or students behavioral skill but rarely it can prudent all these skills in one single method but the most best one of these that encounter the
indicative purpose is OSCE where the medical students face a standardized patient prepared for examination purpose in front of the examiner. OSCE was first mentioned in clinical examination by Harden since 1975 and during this period OSCE was suitable for both of students and faculty.

OSCE is mainly used for evaluation of basic and clinical skills. Students are assessed at different a number of “stations” on discrete focused activities that simulate many parts of clinical competence. For each station a standardized patients (SPs), real patients or simulators may be used and full explained demonstration of each specific skills can be observed, monitored and measured. OSCE stations also have the ability to incorporate the assessment of non-patient skills, technical skills, and interpretation.

Although of a complete comprehensive coverage of the whole curriculum that is possible to done, OSCE has one disadvantage through losing the real aspect to a patient due to segregated encounters at many different station of it. In order to obtain a specific measurable test of performance reliability is a function of sampling, it should have a number of competences tested and stations. So for calculating the score with a task specific checklist or a combination of a rating scale and checklist together.

The aim of the study is to compare the traditional and innovative medical school teachers perceptions regarding the effectiveness of OSCE in clinical examination.

Subjects and methods:

Sampling methods:

A cross-sectional study was done among medical teachers in Nineveh and Tikrit medical college and 95 teachers from both basic and clinical departments were included in the study (55 teachers from traditional school and 40 from innovative school).

A certain specific questionnaire sheet was distributed to all participants after taking their written agreements and the data was obtained through face to face method after full brief explanation of the study aim.

Study period and setting:

The study was preformed during the period from 15th February until 20th April/2014 according to special time table which has been prepared by the investigator in both Nineveh and Tikrit college of medicine.

Tool for obtaining the data:

A certain questionnaire sheet has been designed by the investigator contain the following parts:

Part-1- Demographic characteristics including (age, gender, certificate, period in teaching, specialty and scientific degree) which has been taken from the unite of human resources at each medical collage.

Part-2- Teachers perceptions about the main objectives evaluated by OSCE.

Part-3- Teachers perceptions about the affectivity of OSCE in clinical examination.

Part-4- Teachers perceptions regarding the factors affecting the application of OSCE.

Part-5- Teachers suggestions for future high quality OSCE clinical examination.

Ethical issues:

Agreements were obtained from both Nineveh and Tikrit college of medicine before starting the research.

Analysis of the data statistically:-

For the statements contain yes and no answer, number and % was done.

The relation between the studied variables was done by calculating Chi-square test and (P < 0.05) was regarded significance at level 5%.

Results:

Table 1 show that 63.1% of medical teachers are male, 49.5% aged between 40-49 years, 65.3% from basic specialty sciences, 51.6% having a period more than 10 years in teaching, and 37.9% are lecturers. Table 2 show that 70.9% of traditional school teachers agree that OSCE evaluate knowledge, understanding, intellectual and practical objectives with p value = 0.000. Table 3 presents that 69.1% of
traditional medical teachers agreed with the affectivity of OSCE in assessing large number of students without bias while 80% of innovative medical teachers agree with the objectivity of OSCE in clinical evaluation in different specialties with a p value = 0.084

On the other hand both of traditional and innovative medical teachers disagree that OSCE is saving time and effort with a p value =0.073 . Table 4 shows that male teachers from both traditional and innovative schools go with the OSCE tasks and commands did not demonstrated correctly before exam (41.9% 51.7%) respectively with a p value =0.448. On the other hand 41.7% females from traditional schools agree that there was no adequate time for each station while 54.5% female from innovative schools agree that there was an interference during exam which disturb it with a p value =0.261 . Table 5 presents that traditional medical teachers from both basic and clinical departments suggested a combination of innovative and traditional assessment methods to get a better future results (43.6%, and 50.0%) respectively with a p value =0.593. For the innovative school, the medical teachers from basic departments suggested the necessity for more advanced training educational program for staff member to increase their ability about the correct application of OSCE (47.8%), while (58.9%) teachers from clinical departments suggested the support from college administration to implement and development of OSCE with a p value =0.045.

χ² test was used

Discussion

The current study show that traditional school teachers agree with the OSCE evaluate the practical objectives in comparison to innovative school teachers who agree with that OSCE evaluate knowledge, understanding, practical, and intellectual objectives.

A study was conducted by 13. In Qassim university / King fahad specialists hospital to evaluate the reliability and validity of the interactive OSCE in the medicine and to evaluate the appropriate time for each station. They found that 84% of the external and internal examiner that OSCE satisfy covering the whole skills needed by the junior physician who well work under supervision but they reported that the duration of each station can be increased to get a better results during the examination.

Similar results were obtained by 14, 15. and Siddiqui 16. that OSCE is a very reliable and valid performance test through using an evaluating sheet and it is a satisfactory method in addressing the intended purposes which were designed for it if correctly applied.
Regarding the affectivity of OSCE in clinical examination, the present study revealed that traditional medical teachers agree with the affectivity of OSCE in assessing a large number of students without bias while innovative medical teachers agree with the objectivity of OSCE in clinical evaluation in different specialties.

A study was done by Alaa et al in Tikrit university / medical college / 2013\textsuperscript{17} to overcome rater variation in clinical assessment of medical students through improving the use of OSCE as an assessment tool in Tikrit university / College of medicine.

They found that OSCE is used by 30% for assessment at the end of their clinical clerkship for 6\textsuperscript{th} year study only and there was no suitable comfortable place for OSCE application and only 40% of faculty members were interested in development and implementation of OSCE in clinical evaluation.

They mentioned that the main obstacles and root causes of OSCE development are (some faculty and students don’t know what is OSCE, its validity and reliability in addition to that some staff members are not adequate trained about how to implement OSCE).

The current study show male teachers from both traditional and innovative schools go with that the main factor affecting OSCE is the tasks and commands did not demonstrated correctly before exam.

A study done by \textsuperscript{18} in Cairo and Ain Shams university / Egypt to build a capacity of nursing faculties and staff member for OSCE establishing simulated learning experience in clinical practice and comparing the feasibility, utility and effectiveness of using OSCE as an assessment method with the comparison between students and faculties perceptions for OSCE validity and reliability. They reported from their study that 57% of faculty member knew nothing about OSCE and 98% of them had no experience previously in using OSCE.

They concluded that OSCE provide an attractive options for students assessment competency and giving a practical strength points for faculty staff objectivity and reliability for all students assessment especially when OSCE compared with traditional practical assessment methods and the most important factor attributing for OSCE evaluation is the adequate time for each station.

Concerning the future suggestions for better OSCE, the current study show that traditional medical teachers from both basic and clinical departments suggested a combination of innovative and traditional assessment methods.

This result is agree with a study done by \textsuperscript{19} 2008 about the OSCE and its reliability and validity in medical students evaluation with a review of the consequences of OSCE method and outlines the important issues for medical educators in order to consider when there is a need for its application in the educational program in the future. They found that medical educators usually needed the most useful reliable valid method for both formative and summative students evaluation because such method is regarded as a useful for learner, faculty, institutional, and for the public at large are great.

They mentioned that OSCE has become the standardized practice in modern assessment of students clinical competence and the outcomes for this test are generally used for high – stakes decision making at different levels, in addition to that, they said that the correct suitable planning coordination of multiple resources, commitment to large scale testing in order to get a significant results.

**Limitation of the study:**

Difficulty in collecting the questioners sheet with the over load students schedule

**Conclusions**

1- OSCE evaluate the knowledge, understanding, intellectual and practical objectives.

2- Affectivity of OSCE through assessing a large number of students without bias and the objectivity of OSCE in clinical evaluation in different specialties.

3- There is a need for OSCE tasks and commands to be demonstrated correctly before exam.

4- Adequate time is necessary and avoid interference during exam.

**Acknowledgment:** My special thanks to all the staff for both Nineveh and Tikrit medical college and all the students who participated in the study.
Ethical issues: Agreements were obtained from both Nineveh and Tikrit college of medicine before starting the research.

Assessment of Nurses Knowledge about Alzheimer’s disease

Hussein A. Dabis¹, Amer A. Sachit¹, Fatima J. Shinjar¹
¹Assistant Lecturer, Adult Nursing Department, College of Nursing/University of Thi-Qar, Iraq

Abstract

Insufficient information regarding Alzheimer’s disease (AD) among the healthcare workers can harmfully affect outcomes of the patient. This designate the necessity for constant knowledge supplement on AD among them in order to deliver the best care to AD patients as possible and propose the necessity to evaluate the level of AD understanding among nurses and identify their shortages so as to improve care quality and promote life quality for individuals with AD. Aims of the study: Current study designed to (i) evaluate the knowledge concerning AD among the nurses working in the hospitals of Thi-Qar governorate/Iraq, and (ii) measure the relationship between selected nurses’ demographics and their knowledge on AD. A survey design was applied to assess the nurses’ knowledge regarding AD.

(i) Self-designed questionnaire was used to collect Socio-demographic characteristics of the participants which included of 7 items (age, gender, years of experience, educational level, department of work, previous training, and previous caregiving experience).

(ii) Alzheimer’s Disease Knowledge Scale (ADKS) were used to assess nurses’ knowledge regarding AD. This study was conducted in four Teaching Hospitals in Thi-Qar governorate/Iraq. A 622 nurses were participated in the study. The results involved answers from 622 nurses. Nurses knowledge was in average (Mean=15.93). Also, there were a statistically significant relationship between certain demographic characteristics (Age, previous training, and previous caregiving experience) and knowledge of the nurses concerning AD. This study exhibited many findings on this important subject, in addition to the demographic characteristics and its relation to nurses’ knowledge.

Keywords: Nurses, knowledge, Alzheimer’s disease, Iraq

Introduction

The incidence of AD has escalated concerning the rapid rising of elderly population, thus reveal major challenges to delivery of care for patients with AD.

AD is a progressive and chronic disease with an average period of 7 to 10 years. Adults having AD spend more duration in the final phase, including severe dementia, compared with previous moderate and mild phases (¹) current approximations set the prevalence of individuals with AD at just under 5 million where almost every 60 seconds someone in the United States develops AD (²) and predict that until 2050 approximately 14 million individuals will match the diagnostic standards in the United States only (³).

This will impose challenges to healthcare professionals that is already scarce in number and preparation. Moreover, staff preparation must start with understanding the diverse requirements of care that are specified for the 3 phases of AD (initial, central, and final).

In contrast to individuals with other chronic diseases, older people looking for aid for AD are usually got the consideration of a healthcare professional through their relatives. Pursuing a diagnosis of AD may be difficult, as the individuals having the illness may not own understandings concerning their symptoms. Furthermore, since there is a stigma linked to AD,
families might be unwilling to look for a diagnosis or assistance for their patients (4).

While the cognitive and practical restrictions of an individual having AD rise, long-term care and support are essential to help them with daily responsibilities for instance cleaning, wearing clothes, and taking medications. Around 87% of people needs long-term care, many of individuals having AD, obtain these services by unpaid relative care providers (5,6).

Finally, once cognitive deterioration develops and brain injury turns more aggressive, people having AD go through a sharp physical deterioration and need concentrated support. Certain families can be able to assist a relative having final-phase AD in their houses. Still, many individuals will spend a period in medical institutions (7).

Insufficient information regarding Alzheimer’s disease (AD) among the healthcare workers can harmfully affect outcomes of the patient. This designate the necessity for constant knowledge supplement on AD among them in order to deliver the best care to AD patients as possible (8). And it crucial to evaluate the knowledge level of AD among staff nurses and report their knowledge gaps with the purpose of improve the care quality and enhance life quality for AD patients (7).

Literature evidence collected from developing countries is limited because of poor AD services and scarce studies that were carried out to evaluate healthcare personal knowledge on AD (9). Consequently, current study designed to (i) evaluate the knowledge concerning AD among the nurses working in the hospitals of Thi-Qar governorate/Iraq, and (ii) measure the relationship between selected nurses’ demographics and their knowledge on AD.

Methods -Setting and Participants of the Study

Descriptive (survey design) was used during the period from 9th of September 2019 to 21st of February 2020 in four teaching hospitals in Thi-Qar governorate/Iraq. A random sample of 640 nurses were requested to participate in the study with a response rate of ≈97% (622 nurses). The sample was selected through the use of simple random sampling technique.

The Study Instrument:

Self-administrated questionnaire was used to collect the data, the questionnaire consists of two parts:

(i) Self-designed form was used to gather Socio-demographic characteristics of the participants, it composed of 7 items (age, gender, years of experience, educational level, department of work, previous training, and previous caregiving experience).

(ii) The tool that used to measure nurse’s knowledge was Arabic version of Alzheimer’s Disease Knowledge Scale (ADKS), as its easy to use, proven validity and reliability, and feasibility for variety of participants. It includes 30 false/true items with the end score is the items number that correctly answered (Example items: (i) People with AD are mainly susceptible to depression, (ii) mental exercise is scientifically proven to prevent a person from getting AD, (iii) After the appearance of AD symptoms, the average life expectancy is 6 to 12 years). Tool reliability was calculated through test-retest correlation = .81. The ADKS is theoretically divided into 7 content domains “risk factors, assessment and diagnosis, symptoms, course of disease, life impact, caregiving, and treatment and management” (10). The overall score was calculated by the addition of the correct responses to reach a score that ranges from 0 to 30.

- Pilot Study:

Pilot study was conducted on 30 nurses to test the validation of the questionnaire before the start of the study. The data from the pilot study were analyzed as the data of the main study. The internal consistency of the questionnaire for the study variables was performed by applying Cronbach’s alpha test (α = 0.82).

- Data Analysis:

With the purpose of analyze the collected data, the statistical package of social sciences (SPSS) ver. (23) were used. For descriptive statistics, percentage, frequency, mean, and standard deviation (SD) were used to analyze demographics and ADKS scores. The predictor of ADKS score was determined using multiple linear regression.

- Ethical Considerations:

Ethical agreement was approved from the Committee.
of Ethics of Thi-Qar health directorate. Approval to use the ADKS was attained from their developers. A cover letter has been introduced along with the questionnaire that distributed to clarify the objectives and course of the study. Contribution in the present study was confidential and voluntary, in addition to an informed consent that was attained from every participant before participating in the current study.

**Results**

-Socio – demographic variables:

Out of the (640) questionnaires distributed, 622 questionnaires were returned (response rate = 97). The mainstream of respondents were females (63.3%) and 34.2% were aged between 18 and 25 years (mean = 23.5 years, SD = 2.6), and over a half of them (55.8%) had 1-5 years of experience at work. The vast majority of participant (89.1%) reported no previous training concerning AD, and (71.9%) stated no previous caregiving experience for patients with AD. Other demographical features of the participants are mentioned in Table 1.

**Predictors for the ADKS scores:**

Predictors of significance to participants knowledge in this study were age and previous caregiving experience. Age was the factor of highest effect on overall knowledge ($\beta = -.27; p=.021$), followed by previous caregiving experience ($\beta = .12; p <.001$). Other variables show no significant relationship with overall knowledge, other details Table (3).

**Discussion**

Caring for patient with AD is regarded as one of the trending issues in public health globally nowadays especially in developing countries (including Iraq), which somehow have a less developed healthcare systems. This study investigated nurses’ knowledge regarding AD in Al-Nasiriyah city/Iraq.

The findings of this study reveal different levels of knowledge concerning the study subject where certain ADKS domains (life impact and symptoms) score highest percentage of correct answers while other domains (course of disease, risk factors) score the lowest, which is agreed with other studies (11,12) and this proposes that AD knowledge and training activities is a chief concern that needs to be addressed in Iraq especially that handling the health of individuals with AD necessitates continuing education and training and particular knowledge in AD care for healthcare professionals participating in primary care (13,14).

AD knowledge among nurses should be a major concern in public health, nurses that work in hospitals must have wider understanding and knowledge of AD and the management methods and they should be trained to preserve the residual intellectual capacities of the patient, aid them to sustain the independence in carrying out their everyday activities and evade injuries and deliver better life quality (15,16).

AD management is considered effective when it based on a firm base knowledge including the physiology, pathology, psychology, pharmacological therapy and caregiving of AD among healthcare providers (17). Deficits are present across nearly all participants in certain parts of the assessment, specifically in the risk factors, course of the disease, and care giving domains. Our results closely resemble the findings from the previous studies (11,17,18).

Other findings of the current study reveal significant relationship between certain demographic variables
(age and previous caring experience). Age variable was of the highest effect on overall knowledge followed by previous caring experience variable, and multiple studies agrees with current findings \(^{(11,13,16)}\)

**Conclusion**

In the current study, the mainstream of the nurses has moderate ADKS score, and this indicates a necessity for better educational grounding in AD care. Also, Age and previous caregiving experience are the most effective factors on overall knowledge about AD which should be considered in production of a specifically-tailored programs that help increasing AD Knowledge among nurses.

Two main limitations were faced during the current study. The first one is that the staff population in the 4 hospitals may not reflect hospitals in other districts of Thi-Qar governate or other parts of Iraq when generalizing the findings. Second, True and false designed questionnaire (even when its validated) make it complex to comprehend the real knowledge level of AD. Tools that simulate case studies may be used as a more effective tool that may be used in future studies.

**Disclosure**

Authors declare no conflicts of interest in this study.

Demographic and Clinicohistological Profiles of Women Diagnosed with Breast Cancer at Al-El Wiya Maternity Teaching Hospital / Baghdad: A Retrospective Study

Zaynab S. Abdulghany1*, Najim Al-Kalidy2, Maeda H. Mohammad1, Noor H. Ismail1

1Lecturer, Iraqi Center For Cancer And Medical Genetics Research / Mustansiriyah University / Baghdad / Iraq,
2Consultant General Surgeon Women tumor center at Al-El Wiya maternity teaching hospital/Baghdad / Iraq

Abstract

Knowing the incidence of, breast cancer, diagnosis, and treatment methods given a strategic approach for community awareness and rapid management. This study was aimed to: Estimate the demographic pattern including age, marital status, number of children, mass location, lactation, using contraceptive and smoking habit and to estimate the pattern of BC risk factors including family history, histological type, grading, and staging. The retrospective cross-sectional descriptive design was utilized. A total of 282 confirmed breast cancer female patients for the years 2016 to 2018 were included. Overall result showed that the age of Breast cancer female patients ranged from (25-80) years with a mean (49.12±0.67). Most Breast Cancer cases were diagnosed with infiltrating ductal carcinoma (73.4%). The percentage of the discovered tumor was dominating the right side of the breast (52.8%). Also, 11% of BC females were diagnosed with stage Ila. And 31.2 % of BC cases were diagnosed as grade II. However, 20.2% of the cases were having a family history with breast cancer. Most of the cases (94.7%) were did not checked for biomarker testing, just 12 cases (4.3%) were positive ER. And 3.9% of cases tested for PR only 11 cases were positive. While negative results for HER2/neu was only in 9 cases (3.2%). Current study validates scientific knowledge about BC in Baghdad. Each year, the incidence rates increase especially for age above 49.

Keywords: Iraqi breast cancer, awareness, early detection, biomarkers, retrospective, ductal carcinoma

Introduction

Cancer incidence looks like a scale of diatonic, the increasing faced by increasing in society age and unhealthy lifestyles and premature death that would reduce the country’s productivity. According to data published by the Globocan site that in the 2030 year about 13 million people may die from cancer incidence worldwide, three-quarter of them may be in low income and middle-income countries (1). The breast cancer new cases increasing gradually and stand at the top first rank among other cancer in Iraq depending to the Annual report of the Iraqi cancer registry and this affected the community population (2). The innovation of several genetic factors has been found to detect breast cancer for example; BRCA1 and BRCA2 were the most important tests, followed by MYC and P53. These tests are available, more specific

The Iraqi national program for early detection of breast cancer, which was initiated since 2001, in an attempt to down-stage this disease at the time of presentation. Since then, specialized centers and clinics for early detection of breast tumors have been established in the major hospitals in all Iraqi provinces. Most screening and biological detection techniques simplify the early diagnosis of breast cancer; immunohistochemistry for biomarkers detection (2), ELISA for blood assay analysis (3), and the golden standard method is the presence of screening programs using mammography as an imaging technique (4,5). Still, self-breast screening is the major easy early detection method (5). All these techniques were present in the Iraq strategy of screening programs.

The innovation of several genetic factors has been found to detect breast cancer for example; BRCA1 and BRCA2 were the most important tests, followed by MYC and P53. These tests are available, more specific
but very costly for in low come countries, as in Iraq (6). Then adventure of new assays for gene detection using mammmaprint and Oncotype DX (7) but still not very widely in use.

Pieces of information about the incidence rate of breast cancer are important in planning health issues. In Iraq, the respective nesses of the present project were largely unclear partly due to inconsistency in data collection, an outcome that may be linked to the absence of a true cancer registry. This study was aimed to:

1. Estimate the demographic pattern including age, marital status, number of children, mass location, lactation, using contraceptive and smoking habit

2. Estimate the pattern of BC risk factors including family history, histological type, grading, and staging.

3. Due to lack of biomarker data for almost patient data here not shown in the result. Assess the pattern of BC characteristics, including HER2/neu status, estrogen and progesterone receptor status, CA15-3, CEA, P53, and Ki-67 biomarkers.

**Methods**

A descriptive – retrospective study has been conducted by using an information system data base from Al-Alwyia / oncology unit/ breast cancer center/ Baghdad /Iraq. In order to obtain representative data of patients, these data were collected during women visiting the center for checkup and examination for any breast problems 2016, 2017, and 2018 years. A total of 282 patients were included during these years.

The patients were asked for several pieces of information and each patient has his own file according to the Iraqi Cancer Registry, the list of questions contains age, number of children, using the contraceptive, side of the mass, smoking habit, family history with breast cancer, marital status and lactation. Then the data of results from their consequence visiting the center were collected and included: mammography result, FNA test, type of tissue, histological result, TNM, the grade of tissue, BI-RADs, and the result of biomarkers (ER, PR, Her2/neu, P53, Ki-67, CEA, CA15-3, AFP, and Keratin).

**Statistical Analyses**

Statistical analyses were run using SPSS software for Windows (version 24; IBM SPSS). The variables that were significant in the univariate analysis were included in the multivariate model. The data were analyzed and the frequency and the percentage were calculated accordingly. All of the statistical tests were P<0.05 indicated a significant difference.

**Ethical statement**

The present study was approved by the Research Ethics Committee of the cancer research center and according to the ethical standards laid down by the declaration of Helsinki. The ethical committee was obtained from the Health Research Unite and protocol Review Committee in the Ministry of Health / Baghdad / Iraq.

**Results**

The demographic characteristics of the patients were presented in Table 1, and their age distribution was presented in figure- 1. The main clinical features and the histopathological features were shown in Tables 1, 2, and 3, respectively. In total, 282 cases of women diagnosed with breast cancer were included in this study from 2016-2018 years. The age at diagnosis of the women was ranged from 25-80 years old with a mean of 49.21 (SD+0.67) years. The majority of the age group was 45-55 years and represented 31.1%.

![Figure 1: Patients age distribution during 2016-2018 years and age ranged from (25-80) years.](image-url)

Generally according to data collected and summarized in table 1, increasing in frequency of
patients age. However, the range of 45-55 years was recorded as the highest incidence rate, about 31.1% (88) of total patients compared to other age ranges.

In table-2, illustrate the socio-demographic characteristics and clinical history of 282 female patients diagnosed with breast cancer. The peak frequency occurred among the age group 25-80 years. Selected equal patient age above and under 49 years were 141 females. About 65.6% of them were determined as married and 44% were having less than four children. Also, 52.8% having a mass on their right side of the breast. Their history of lactation was recorded in 70.2%, on the other hand, 72.7% doesn’t take contraceptive pills and 90.4% doesn’t have a smoking habit.

Next, the histological trend and grade of common pathological type between patients with breast cancer were represented in table- 3. The predominant tumor histological patterns were: invasive ductal carcinoma 207 (74.4%), metastatic carcinoma 20 (7.1%), and invasive lobular carcinoma 13 (4.6%). On the other hand, the histological tumor grade was available for 121 patients (42.9%). The common grade was II in 88 patients (31.2%), grade III 25 (8.9%), and grade I 8 (2.2%). Also, stage II a recorded in 31 patients (11%), stage IIb in 22 (7.8%) followed by stage III c in 17 (6%).

While tested biomarkers faced almost missing data during recording follow up. The main problem for patients following up, and missing data recorded to reach 94% of the tested cases (data not shown). Even several types of biomarkers were available but need more following up documentation, and more control.

In an attempt to classify patients according to median age into those who above 49 years old and those who lower than 49 years old and data presented in the table- 4. Significant statistical differences were noticed regarding using contraceptive pills, smoking habits, marital status, and the number of having children. Patients <49 years age utilize significantly more contraceptive compared to those above 49 years old (P<0.024), the smoking habit was noticed in women >49 years old significantly more than those <49 years old (P<0.026). While the older age >49 years was prefer breastfeeding significantly higher than <49 years old (P<0.08), the number of having children >4 was significantly in <49 years old (P<0.044). The frequency of unmarried (single) women <49 years old was a significantly higher number than above 49 years old.

On the other hand, couldn’t notice any statistical differences in respect to the clinicopathological data including histological tissue type, stage group, and tissue grading as presented in table-5. But patients under 49 years old were in stage two (a, b, and c) recorded in 18, 17, and 11 patients respectively. And grade II recorded in 51 patients under 49 years old.

In table-6, the comparison between tumor grading and staging was recorded in 93 patients, significant differences (P<0.001) was shown between grading and staging; grade II/ stage IIa was higher in 28 patients. There were significant statistical differences as shown in table-7, in comparing tumor histological type and grading (P<0.002). Ductal carcinoma has a higher number of patients among other types and stage IIa and stage IIb was recorded in 21 patients for both.

Discussion

Breast cancer with estrogen receptor ER +ve accounts for three quarter percent of western women while Arab women have a majority in ER -ve expression with 20%, 30%, and 9.3% in the UAE, Saudi women, and Lebanese women respectively compared to 9% in European women (9%) (10).

Women in low- income countries especially as presented in the review of Munzone E (2014) (11), the study was focusing on Africa region were women seek treatment in advanced stages or when the tumor spread to other organs and care has a relief aspect in these women; while in comparison to European countries very few women were diagnosed in late stages of cancer. In Kenya and Uganda for example in the study, all women were diagnosed at a late stage and assumed to be associated with high mortality rates (11).

The tests for breast cancer which are commercially available and currently used in the clinical practice were: the Oncotype DX test (Genomic Health, Redwood, CA, USA), the MammaPrint test (Netherlands Cancer Institute™ and Agendia™, Netherland), and the Prosima one (NanoString Technologies, Seattle, WA, USA) very expensive and not very widely in use in our country (Iraq especially in Baghdad). The Oncotype DX test represent the most widely used molecular test in the therapeutic decision-making and predictive for endocrine responsiveness in hormone receptor-positive breast cancers with 0–3 positive nodes, also it is recommended by both the National Comprehensive Cancer Network (NCCN) and the St. Gallen Consensus (7).

In comparison between Arabic women and the United States, the recording average age of newly diagnosed breast cancer was high and estimated at 60 years old and these are the result of increases in the age specifically in the status of ER+ /PR+ in post-menopausal US women (12). While in Northern Iraq the status of incidence at age is different, it was recorded to be less 50 years old in Sulaimaniyah for Kurdish people (13),
the authors suggested that the increase in the age rate of breast cancer in Iraq and other Middle-East countries was might be the increased establishment of new cancer centers for early detection.

In the present retrospective study, results were parallel to published records and gives an idea about disease diagnosis and incidence rates that would help to ensure accurate records and next to proper disease diagnosis and management in the future. For sure, more studies with more significant periods and risk factors were required to explain more accurate findings.

Breast cancer management programs require multi-disciplinary teams starting from surgery, radiation and chemotherapy and that will need more resources and related expertise to identify genes associated with breast cancer that would need more accurate procedures and expenses a lot (14).

In Iraq, a preliminary analysis study carried by Alwan 2016, 855 patients were recruited and the study findings were: 35% of the women were diagnosed at the age of 45-54 years old, their history of lactation and hormonal therapy was reported in 48 %, and 20.5% respectively. Only 18.5 % of the group with breast cancer family history. Depending on TNM classification, 9.8% stage I of the disease and 46% at stage II and IV. Infiltration ductal carcinoma was the most common pathology about 67% (the same of this study findings), followed by ductal carcinoma, lobular carcinoma, and malignant tumor 13.6%, 18.5 %, and 7 % respectively (15).

In a recent study carried by Alwan and her team work 2019, 1172 females have participated in their study from Baghdad city. They found that the main age was 51 years old and the patient’s groupage under 50 years demonstrated about 46.8%. Participants with breast cancer family history were recorded in 18.7%. Stages I-IV were recorded in 12%, 47.5%, 31.9% and 8.6% respectively. The frequency of age at diagnosis was significantly estimated higher among younger women under 50 years old. Alwan and her colleague give a conclusion that “breast cancer in Iraq represent an advanced disease at the time of diagnosis that justifies the necessity to promote public awareness educational campaigns to strengthen our national early detection programs” (16).

Limitations

There were several limitations while collecting data in this study: 1) most of the results of the biomarker were not included in patents file records, 2) also most of the FNA result not included, 3) the most importantly missing the follow-up of each patient that undergo surgery and 4) wither patients started chemotherapy or hormonal therapy cycles. These limitations might effects Iraqi cancer registration processes for breast cancer future information also affects planning for the new strategy of facilities, Mammography and MRI devices have the ability to detect small mass and in situ breast cancer that might be helpful in early detection programs.

Also, the unavailability of breast cancer mortality records was faced during data collection, it would be a predictor of effects caused by any disease or complications. Asian countries as mentioned in the study (17) don’t have proper records and data of incidence rate and mortality were collected from hospital-based registries and records.

Knowledge about COVID-19 among Citizens in Thi-Qar Governorate/Iraq: an Online Survey

Fatima J. Shinjar1, and Ali T. Hameed2, Hussein A. Dabis

1Assistant Lecturer, Adult Nursing Department, College of Nursing/University of Thi-Qar/Iraq, 2Assistant Lecturer, Nursing Department, Technical Institute-Nasiriya/Southern Technical University/Iraq

Abstract

Epidemics of infectious disease, such as coronavirus disease 2019 (COVID-19), necessitates knowledge assessment of pertinent populations as fast as possible because the findings are of great importance to the public health response. This study aims to (i) Assess the knowledge of Iraqi residents about COVID-19 and (ii) Identify the relationship between certain demographic features and the overall knowledge. This study was conducted in Thi-Qar governorate/Iraq, the researcher used an electronic survey questionnaire (using google form), the Uniform Resource Locator was distributed through social media platforms with brief introduction concerning the study. The tool of the study (questionnaire) involved of two parts: demographics (4 items) and knowledge questionnaire (3 sub-domains including 12 items). The total correct answers rate was (88.1%). Lowest answers rate scored in routes of transmission sub-domain (82.5%) while control and prevention (92.7%) sub-domain scored the highest rate. Mean knowledge score of 10.57 (standard deviation: 1.5, Range: 0-12). Also, results display highly significant relationships between overall knowledge and demographic characteristics (P <0.001).

Conclusion: Most well-educated Iraqi residents, particularly males, are knowledgeable about COVID-19. However, this result should be generalized with caution due to limited sample representativeness.

Keywords: COVID-19, Coronavirus disease, Knowledge, Control, Iraq.

Introduction

COVID-19 was reported for the first time in Wuhan, China, in December 2019 as unknown cause pneumonia cases in a cluster of individuals (1). On 11th of March 2020, the World Health Organization (WHO) declared Covid-19 a pandemic (2) and by June 30th 2020, there were 10,185,374 confirmed cases and 503,862 reported deaths internationally (3). Therefore, an organized universal reaction is needed urgently to help in preparation of health systems to encounter this exceptional challenge. Even though the measures of containment applied in China have lowered new incidents by over than 90%, the situation is different in other countries (ex: Italy and Iran) (4)

Studies identified various risky groups, infection appears to be more severe in older adults, obese people, and individuals with previous medical conditions. However, severity of infections during pregnancy have not been reported, and a small number of incidents have been reported in children (5). Majority of COVID-19 patients have exhibited mild manifestations including sore throat, fever, and dry cough. Most of cases have cured spontaneously. Still, some have showed multiple deadly complications such as septic shock, pulmonary edema, severe pneumonia, organ failure, and Acute Respiratory Distress Syndrome (ARDS) (6)

Multiple actions can be taken to contain an emergent infection such as COVID-19. Globally, the previous months has seen an increasing countries number that declare precautions on travel or complete entry prohibitions on individuals from certain affected areas. These restrictions of mobility can be evaluated to confirm their potential efficiency in hindering local
epidemics (7). Furthermore, it may give an idea how and when to stop such restrictions (8).

In Iraq, various exceptional actions have been taken in order to delay the spread of COVID-19, including schools and universities closure, mass transportation prohibition, public spaces lock up, prevention of Human gatherings, and separation and care for people with infection and suspected individuals. In March 17, government had declared complete curfew, and started Awareness campaigns for people to stay at home and avoid unnecessary contact with each other.

Covid-19 pandemic course is highly impacted by the way individuals behave, and that is affected by what their knowledge and beliefs about this disease (9). Misinformed people in regard to COVID-19 spread (especially through social media) needs an urgent and serious handling, and that’s why WHO has established “myth busters” page on their website (10).

The world still continuing to fight against COVID-19 to ensure the ultimate victory, and the commitment and adherence of population to the measures of control are indispensable. previous experience with the 2003 SARS outbreak recommend that fright sensation among the individuals from infectious diseases will have negative effects toward knowledge and attitudes, and this have further confuse efforts to control the infestation of the disease (11,12). This needs quick population’s assessments of knowledge about COVID-19 (13). In this study, authors aimed to investigate the knowledge about COVID-19 of Iraqi citizens in Thi-Qar governorate and to Identify any significant relationship between certain demographic characteristics with the overall knowledge.

Methods

Design, sitting, and sample

Cross-sectional study was conducted from 10 to 22 of April in Thi-Qar governorate, and because of this special circumstances, population-based assessment was not feasible. So, authors collected the data online using random sampling technique. Goggle form was prepared and the Uniform Resource Locator (URL) was distributed through social media platforms (i.e. Facebook, WhatsApp, WeChat, Twitter) counting on the authors’ connections with local citizens living in Thi-Qar governorate. Also, recruitment poster was posted on official accounts of Thi-Qar health directorate on previously mentioned platforms, with brief information about importance, aims, measures, voluntary contribution with anonymity, and notes about how to fill the questionnaire. Contributors have to choose yes or no options to approve their readiness for voluntary participation. Individuals of Iraqi nationality who aged 15 years or more were directed to answer the questionnaire.

Instruments

The tool of the study (questionnaire) involved of two parts: demographics and knowledge questionnaire. Demographic characteristics involves (gender, age, educational level, and source of information about COVID-19), knowledge questionnaire was adapted from (14) with permission. The authors translated the questionnaire into Arabic following the recommended guidelines (15), internal consistency was at acceptable level (the alpha-Cronbach coefficient of the questionnaire was 0.83).

Knowledge questionnaire is consisted of 12 items: clinical manifestations (4 items) (ex: Fever, dry cough, myalgia, and fatigue are the chief clinical manifestations of COVID-19 infection), routes of transmission (3 items) (ex: Eating or contacting wild animals would cause COVID-19 infection), and control and prevention (5 items) (Isolation and treatment of people who are infected with the COVID-19 virus are effective ways to reduce the spread of the virus). True, false, and I don’t know options were provided as answers. 1 point awarded to correct answer and for incorrect/I don’t know answers, 0 point was awarded. Higher score indicates higher knowledge.

Statistical Analysis

The analysis of data was accomplished through the usage of statistical package for social sciences (SPSS) version 26. Frequency, percentage, mean, and standard deviation were used. Independent sample t-test and Analysis of variance (ANOVA) were used to determine differences in mean knowledge scores among groups as convenient, Multiple linear regression was conducted to identify demographic factors association with overall knowledge.
Results

Demographic Characteristics

Study involved the contribution of 5280 participants. Majority of study sample were males (65.8%) with (55%) of 15-29 age group. (41.9%) of participant have bachelor degree, and (45.6%) were depending on social media as a source for information about COVID-19. Other demographics are shown in (Table 1).

Knowledge Score

The correct answers rate was (88.1%), sub-domains show different rates as follow: clinical manifestations (86.6%), routes of transmission (82.5%), and control and prevention (92.7%). Item 10 was the highest correct answered item (98.3%) while item 6 was the lowest with (74.1%), other individual rates of correct answers as shown in Table 2. The mean knowledge score about COVID-19 was 10.57 (standard deviation: 1.5, Range: 0-12).

Table (3) Predictors of significance to participant knowledge in this study were age, gender, educational level, and source of information about COVID-19. Age was the factor of highest effect on overall knowledge ($\beta = .234; p <.001$), followed by gender ($\beta = -.202; p <.001$), educational level ($\beta = .131; p <.001$), and source of information about COVID ($\beta = .105; p <.001$).

Discussion

Rapid and unpredictable spread of COVID-19 disease made it the most international pressing health issue currently with a close follow up from the concerned authorities. Also, this disease has become a cross topic for the public with a lot of inaccurate material from variety of sources, and that reflect the importance of taking the reliable information and apply it in our daily actions. Hence, good base of knowledge will help in the eradication efforts and in spreading of healthy behavior among the population.

As far as the author know, this is the first study to assess the knowledge of residents about COVID-19 in Iraq. The findings exhibit average correct rate of 88.1% in the questionnaire compared to studies from America and China which show approximate rates of 80% and 90% respectively (14,16). Our results reflect that majority of sample have a good level of knowledge. This may be related to the fact that majority of sample was well-educated and have the proper awareness to look for accurate information from its official sources and this assumption is supported by the significant positive association between knowledge scores on COVID-19 and educational level. Also, this study was conducted after approximately 1 month of pandemic declaration by WHO and a significant amount of information were published to the public during this period.

From the beginning of this crises, Iraqi authorities started awareness campaigns through all media platforms to ensure that individuals commit to international guidelines on COVID-19. However, not all of the community is expected to percept these instructions equally and some of the underprivileged groups such as emigrants, poor people, and residents of rural areas may even not have the means to reach for such information. Therefore, knowledge about COVID-19 in such vulnerable groups needs superior attention by both authorities and researchers. Factors such as poor socioeconomic status and low educational levels may be a determinants of knowledge levels (17). Specific educational programs can be tailored to target specific populations and may be of a huge benefit in increasing knowledge levels.

Individuals who depend on social media and on family and friends as a source of information have the lower knowledge score (9.04 and 9.10 respectively) in comparison to those who takes information from official sources (11.10) and television (10.96). This result emphasize on the importance to investigate the accuracy of information on COVID-19, responsible health authorities and relevant studies advised that widespread unsupported information about COVID-19 is a significant issue that may cause xenophobia internationally (18,19).

Other findings show significant association between demographic variables and overall level of knowledge. Age was the factor of highest effect on overall knowledge, followed by gender, educational level, and source of information about COVID. This result is reinforced by multiple studies that have disclosed that older, females, and higher educated respondents are more knowledgeable about emerging communicable diseases (14,20,21,22). However, even with the large sample in this study which may be considered as a favorable point, sample was more demonstrative of male and well-educated participants. So, the results may be generalized with caution.

Multiple limitation was encountered during this study, one of them is that due to limited internet access and low socioeconomic status, some groups were less representative in the study sample as mentioned above. Also, study was limited to one governorate in Iraq and that is another reason why findings are not fully representative. Another one concerning that the data presented in this study depends on participants recall of information which may be subjected to bias.

Conclusion/Recommendation

Most well-educated Iraqi residents, particularly males, are knowledgeable about COVID-19. However, this result should be generalized with caution due to limited sample representativeness. Authors recommend that wider and more representative sample should be studied to get more applicable results.

Acknowledgements: The author would like to thank all the participant of the study for their treasured time. Also, great thanks to Dr. Yi Li for his valuable assistant during questionnaire preparation.

Conflicting Interests: No conflicts of interest declared by the authors.

Funding: The author disclosed receipt of no funding.
Ethical Permissions

Ethical Board of Thi-Qar health directorate permitted the study plan and procedures [Reference no: 33/3588 in 23/4/2020]. Informed consent was introduced before the official questionnaire were offered. Contributors have to choose yes or no options to approve their readiness for voluntary participation.

Abstract

Placenta previa refers to placenta which is totally or partly implanted in lower segment of the uterus. Mortality and morbidity of mother increase with placenta previa due to the increase in the incidence of bleeding during pregnancy. This study aims to define placenta previa prevalence among pregnant women at AL-Fallujah teaching hospital and to determine the risk factors and their association with placenta previa incidence in al-Fallujah city population.

This retrospective cohort study investigated medical registry of 6339 gravid women in al-Fallujah teaching Hospital in Iraq. We find 13 cases of placenta previa (0.21%) amongst the 6339 cases registered. The risk factors that strongly appeared to affect the complication of pregnancy with placenta previa were; advanced maternal age of ≥ 35, parity, previous curettage and previous cesarean section (P<0.01).

The most important pregnancy outcomes of the placenta previa were lost blood of mother more than five hundred cubic centimeter (P = 0.000) and Apgar score of the baby at first minute equal or less than 7 (P = 0.003), Placenta accreta and cesarean hysterectomy (P< 0.01).

These findings are the same as those recorded in other research for Asian, American and European gravid women, with some other detected factors.

Keywords: Prevalence, Placenta previa, Risk factors, maternal age, Parity, Previous curettage, previous cesarean section

Introduction

Placenta previa refers to placenta which is totally or partly implanted in lower segment of the uterus. Around 1/3 of the ante partum bleeding is due to placenta previa. The classical features of placenta previa are usually bleeding which could be abrupt starting, recurrent, no pain, apparently no cause ¹. Mortality and morbidity of mother will increase with placenta previa, this is due to raise in the incidence of bleeding during pregnancy, hemorrhagic shock with its sequel as circulatory hypovolemia , anemia, with long staying in hospital. Placenta previa also can be a cause of increasing in the incidence of operative interference, postpartum bleeding and sepsis ¹.

Other risks associated with placenta previa are: around four fold increases in the risk of 2nd trimester vaginal hemorrhage, peripartum hysterectomy, transfusion of blood, and accreta placentaæ ².

Placenta previa can be a cause of preterm delivery which is associated with higher incidence of perinatal morbidity and mortality. Preterm delivery is associated with many complications as neonatal sepsis, asphyxia at birth and birth weight less than 10th centile for gestational age. Placenta previa incidence is about 1 in 300 deliveries ¹,³. Maternal age is related to the risk of placenta previa , women who are 19 years old or less its incidence around 1 in 1500 and for women aged 35 years or more it is 1 in 100 ⁴. Multiparity, previous cesarean scar increase the possibility of placenta previa ⁵. Incidence
accreta is a remarkable risk factor for the occurrence of placenta previa. A previous cesarean operation is considered the most significant factor for placenta previa, including presentation, hemorrhage, and morbidity of the mother. The uterine serosa and more invasion, more risks for percreta refer to invasion of myometrium reaching the endometrium, and embolization of uterine artery. Increta refer to deep invasion of myometrium while superficial invasion of myometrium by placental villi leads to a cesarean hysterectomy as the leading reason for postpartum bleeding and indication for a cesarean hysterectomy. Usually, accreta refer to superficial invasion of myometrium by placental villi, increta refer to deep invasion of myometrium while percreta refer to invasion of myometrium reaching the uterine serosa and more invasion, more risks for hemorrhage and morbidity of the mother. Predisposing factors for placenta accreta could be uterine curettage, surgery by hysteroscope, myomectomy a trial of endometrium, and embolization of uterine artery. A previous cesarean operation is considered the most remarkable risk factor for the occurrence of placenta accreta and the continual increase in the cesarean operation rates throughout the world insures that accretas will stay a bothersome clinical matter. The risk for accreta occurrence is significantly increased if the woman has a history of a prior Cesarean operation and the placenta previa at same time.

**Methods**

Ethical approval was taken from AL Fallujah teaching hospital, a retrospective rehearsal was done for in-patient medical register of gravid women with singleton pregnancy (running state respectively) who were gestational age 28 weeks and delivered at AL-Falluja Hospital was studied. Last menstrual period (LMP) was used for estimation of the gestational age or dating US (ultrasound) for women with unknown or uncertain LMP. The cases which were excluded include multiple pregnancies, uncertain gestational age which is not approved by US dating and women with incomplete medical record. Location of placenta was determined before the delivery by US during the 3rd trimester at 28 weeks’ gestation or during the operation, visualization of placenta previa during cesarean delivery, including 2 types of placenta previa which are placenta covers the internal osseous partially or completely (previously, these were classified as total centralis or partial centralis) and low-lying placenta which refer to implantation in the lower uterine segment (placental edge does not cover the internal osseous but lies within a two centimeters wide perimeter around the osseous). We reviewed prenatal record of all pregnant women in our sample population, their labor and delivery visits in order to extract the maternal medical and obstetric complications and demographic features, as well as factors related to placenta previa. The variables which are evaluated including age of the mother at time of delivery, parity, prior cesarean operation, uterine curettage, obstetric complications, underlying disease, weeks of pregnancy at birth, Apgar score and gender of newborn. We performed Statistical analysis using the IBM SPSS statistics 26.Inc for Windows. At first a descriptive statistics for each variable was done which included frequencies for categorical variables and average value with standard deviation for continuous variables. Chi-Square Test of Independence (also called Chi-Square Test of Association) which determines whether there is an association between categorical variables (i.e., whether the variables are independent or related) was used to compare cases with and without placenta previa. P value of 0.01 or less was considered highly statistically significant in this study.

**Results**

Data used for this study was medical records of
6339 pregnant women collected between October 2018 and March 2019 from AL-Fallujah teaching hospital. It was found that placenta previa affected 13 (0.21%) of the 6339 pregnancy cases analyzed in this study. It was noticed that the placenta previa prevalence is higher among women whom age was more than 35 years or were multiparous, or had a previous cesarean labor, or had previous obstetrical complications. Table 1 shows the main characteristics of the study population. At delivery the mean maternal age was 26.5 ± 6.65 years old, while nearly half of the study population was nulliparous (52.6%), on the other hand the percentage of delivery after 37 weeks of gestation was the predominant and comprises (88.1%). For the methods of labor, 62.7% were normal vertex labor, 24.5% for emergency cesarean operation, 10.1% for elective cesarean section and 2.7% for vaginal breech assisting mode. The baby mean weight at birth was 3,049.9 ± 496.1 grams. Table 2 indicates the factors that are related to placenta previa. Major differences were noted among pregnancies with and without placenta previa for the following factors maternal age, parity, previous curettage and previous cesarean operation where these factors showed strong association (P value <0.01) with placenta previa.

Table 3 displays the frequency of different maternal complications and pregnancy outcomes in women with and without placenta previa. Generally, it was noticed that complications included placenta accreta, cesarean hysterectomy, 1-minute and 5-minute Apgar score less than 7, and neonatal intensive care unit admission, are more possible to happen to cases with placenta previa. Also it can be observed from table 3 that lost blood of mother more than five hundred cubic centimeter (P = 0.000), placenta accreta (P value = 0.000), previous cesarean hysterectomy (P value = 0.000) and Apgar score at 1st minute (P value = 0.003) were strongly related to placenta previa.

### Discussion

Currently, one of the most popular causes of antepartum hemorrhage which might lead to maternal death is placenta previa. This is the reason why it should be diagnosed earlier in order to improve maternal outcome. This condition is usually diagnosed either by using transvaginal ultrasonography or transabdominal sonography. Some of the most associated factors to this condition are previous cesarean delivery, multiparity, previous curettage, and maternal age. The results of this study showed similarity to the prevalence of placenta previa in the population of Asia and in the same span of previous research. It was found that previous history of previous curettage, previous cesarean operation, multiparity and maternal ages were strongly associated with placenta previa. The effect of maternal age on the prevalence of placenta previa is probably due to the aging of uterus and the influence of recurrent pregnancies. This inference is of clinical importance for women who are delaying childbearing and decide to have children at a later or future time. On the other hand, unlike previous research, common risk factors like smoking was proved to be not related with placenta previa in our study. The reason behind this is that it is uncommon for Iraqi women to smoke as it is obvious from data only 70 of 6339 pregnant women had been reported having experience of smoking.

The results showed that the relation between parity and the incidence of placenta previa is significant; the explanation of this might be because Fallujah families are having more than 3 children.

Although our results showed that preterm delivery before 37 weeks’ and small birth weight are not related to placenta previa, it is known that placenta previa can be a cause of preterm labor and delivery which is considered an important reason of perinatal morbidity and death particularly lung immaturity and asphyxia at birth. This might be explained by the early diagnosis of placenta previa which might lead to permanence of pregnancy to term with no complication. Nevertheless, it is hard to confirm that the association of these factors same as previous research.

There were some limitations identified in this study. First, the percentage of placenta previa may have been underestimated because of the inaccurate birth certificates and data of hospital discharge, thus since our study is hospital-based it may not represent the prevalence of placenta previa in al- Fallujah community. The second limitation is that this study might lack for some information, for example, factors like total weight gain, uterine fibroids the use of reproductive technology, working throughout pregnancy, and body mass index.

- Indian Journal of Forensic Medicine & Toxicology, January-March 2021, Vol. 15, No. 1
Conclusion

In this study the effect of risk factors on the frequency of placenta previa was examined. It was found that the prevalence of placenta previa was 0.21% among Fallujah city pregnant women population. Previous uterine curettage, previous cesarean section, maternal age and multiparity showed to be strongly associated with placenta previa.

Prof. Department of Basic Science, College of Veterinary Medicine, Sulaimani University, Kurdistan-Iraq

Abstract

The request for more efficient and lower-cost therapeutic methods for wound healing remains a challenge for modern medicine. The goals of this investigation were to recognize and look at the impacts of *Mastic Gum Resin, Lawsonia Inermis*, and *Quercus Brantii* in wound healing by using histopathological study and blood parameters in *BALB/c* Mice. Mice were comprised into four groups: Control negative group (n=10), mice were not treated with plant suspension only applied with normal saline; Treatment group I, mice were applied by *Mastic Gum Resin (MGR)* (n=10), Treatment group II, mice were applied with the *Quercus Brantii* (n=10), and the last group, Treatment III which were applied with *Lawsonia Inermis* (LI) (n=10). One ml for each suspension of *Mastic Gum Resin (MGR)*, *Quercus Brantii (QB)*, and *Lawsonia Inermis (LI)* was applied to the wound directly without suturing for 4 days/week for about 3 weeks. Wound healing effects were evaluated by utilizing the hematological profile for each group with the histopathological study. The cutaneous wound in *Mastic Gum Resin* and *Quercus Brantii* treated groups were more effective in progressing wound healing than *Lawsonia Inermis* treated group regarding histological changes at day 8 and day 18, respectively and blood parameters at day 21.

Keywords: Albino mice, Lawsonia Inermis, Mastic Gum Resin, Quercus Brantii.

Introduction

Wound healing is an unpredictable procedure that requires a progression of biochemical and cell responses, beginning with homeostasis, re-epithelialization, granulation tissue arrangement, and renovating of the extracellular matrix ¹,². Searches for better and reliable wound healing agents from medicinal plants have become more relevant fields of active research. From time immemorial, wounds were treated topically with various medicinal herbs or their extracts, according to conventional medicine ³. The oleoresin of *Pistacia atlantica* or “ mastic tar” is normally utilized in Pakistan and Iran to treat conditions, for example, gastrointestinal issues ⁴. This natural plant has caught the consideration of investigators because of studies on various areas of this plant, for example, the leaves, bits, frames, and gum showing different organic advantages, for example, antioxidant, antimicrobial, and anti-inflammatory effect. It has been demonstrated that *Pistachio* species are a rich source of phenolic mixes and they have additionally been discovered a source of durable antioxidant ⁵. *Mastic oleoresin* (MO) is fundamentally directed topically (as wound dressing), orally, or by smoking ⁶. Much examination has indicated the constructive outcomes of MO on wound curative ⁷. Other than that, MO has been applied straightforwardly to skin incisions due to its adhesive consistency ⁸. The oaks (genus Quercus) are among the most major groups of flowering plants that dominate large areas of the northern hemisphere. There are even more than 200 species of oak in the western

Corresponding author:
Snur M. A. Hassan
E-mail address: snur.amin@univsul.edu.iq
hemisphere, and a potentially greater number in Asia and fairly few in Europe. The principal significance of the oak tree is the existence of tannins in its various parts. Due to the different characteristics of the tannins present in them, Quercus species can be used in wound treatment according to references and local knowledge. The gall extracts of this plant were historically used on inflamed skin and skin burn in Kurdistan but there are little details about the underlying mechanism. Phenolic compounds, tannic acid, fatty acid, and gallic acid are the major components of The Lawsonia inermis (henna). This plant considered to have certain restorative properties, for example, antibacterial, antioxidant, and anti-inflammatory effects, oral and effective use of Lawsonia Inermis (LI) leaves and its isolated part exhibited wound curative conduct in excision and incision wound models. The aims of this examination were to distinguish and analyze the impacts of Mastic Gum Resin, Lawsonia Inermis, and Quercus Brantii in wound healing in BALB/c mice by utilizing blood parameters and histopathological study.

Materials and Methods

Collection and preparation of plant material

Fresh Mastic Gum Resin, Lawsonia Inermis, and Quercus Brantii were collected from a local market in Sulaimnai city of Kurdistan provinces, Iraq. Two gm of Mastic gum Resin was applied directly without mixing with any materials to the wound area, while the Lawsonia Inermis, and Quercus Brantii (grinded by a mixer till become a powder) were prepared by adding 2 gm of each of them with 4ml of normal saline and mixed by stirrer till become the creamy or suspension like. Each mouse was received 200mg/kg.bw from each types of plant.

Animals

Forty BALB/c mice (six weeks age, male and female with bodyweight 20-40 grams) were housed in the veterinary teaching hospital animal lab, Sulaimani province. Animals were having free access for food and drinking water and they were maintained during the research time on a 12 hours light and dark cycle. The exploration was done with the authorization of the Ethics Committee (1237) at the College of Veterinary Medicine, University of Sulaimani, under the counsel and rules of the College of Veterinary Medicine for the Maintenance and Use of Laboratory Animals.

Experimental design

All surgical procedure was performed under Isoflurane general anesthesia, and all attempts were made to reduce suffering. The surgical procedure was performed in BALB/C mice in an operating room with very good facilities. After 1 week of acclimation, the back of the animal was shaved and a full-thickness skin was incised (1cm x 1cm) from the dorsum as seen in figure 1.

Mice were allotted into four groups: Control negative group (n=10), mice were not treated with plant suspension only applied with normal saline; Treatment group I, mice was applied by Lawsonia Inermis (LI) (n=10), Treatment group II, mice were applied with the Mastic Gum Resin (MGR) (n=10), and the last group, Treatment III which were applied with Quercus Brantii (n=10). Each suspension 200mg/ml was applied to the wound area by sticks directly without suturing for 4 days/week for about 3 weeks. No dressing was used.

Figure 1: The back incised wound.
Histological procedure

The skin biopsies were taken from each wound side on day 8 and 21. Tissue biopsies were fixed in 10% neutral formalin buffer for 48 hours and afterward prepared by paraffin-embedding procedure. Tissue sections 4μm thick were made utilizing a microtome (Leica, Germany). One slide from each example at every period was recolored with hematoxylin and eosin for distinguishing any histological features of the injured tissue. The tissue areas were analyzed by light microscopy and photographed utilizing a camera (Amscope™, Japan).

Haematological Study:

On day 21, animals were sacrificed under general anesthesia and peripheral blood was collected from the tail vein with Ethylene Di-amine Tetra Acetic acid (EDTA). The vacuumed blood collection tubes were shaken immediately to mix well and were analyzed directly. The total white blood cells (WBC) and differential white blood cells [lymphocytes (LYM), granulocytes (GRA)] and Minimum Inhibitory Dilution, a measure of rare cells and several precursor white cells (MID), total red blood cells (RBC), hemoglobin (HGB), packed cell volume (PCV), and platelets in each sample were measured by automatic hematology analyzer (Medonic M-series M32, Sweden).

Results

All mice survived and even no complications reported, including infection, correlated to the method was detected.

1. Histopathological Study:
   a. Microscopical assessments of cutaneous wound healing on days eight:

   On day 8th after wounding, the histological assessment of healed wound area shown inflammatory phase, on the surface, necrosis of skin tissue was placed as a consequence of mechanical damage, a continuous layer of marked granulation (Inflammatory cell, collagen deposition, and angiogenesis) tissue across the entire wound gap and depth, in which the thickness of the granulation tissues was higher in surface layer than in dermal layer, moreover, collagen fibers arranged in a disorganized manner and randomly distributed as fibrils with intense angiogenesis which were a main features of the granulation tissue, the intense inflammatory reaction (inflammatory cells including, neutrophils, macrophages, lymphocytes, plasma cells, and fibroblasts) was dominant in Control negative group (Figure 2 a and b), in comparison to treated group I that showed the late phase of granulation tissue and healing more progressed as in (Figure 2 c and d). While in Treatment groups of II and III, the healing became more pronounced and displayed an early stage of the re-epithelization phase, with forming immature-hyperplastic and disorganized epidermis surrounding the wound area with an increase in the thickness of the dermal layer by the presence of mature collagen fibers (Figure 3).

   b. Microscopical assessments of cutaneous wound healing on days eighteen:

   On day 21, after wounding, wound healing more progressed (proliferative phase) was apparent in Control negative group, epidermis formed as immature-hyperplastic and disorganized that overlying the area of the wound, the mild inflammatory reaction is seen in dermis and hypodermis with an increase in the thickness of dermal layer due to presence of well-organized collagen fibers as bundles with proliferative fibroblast (Figure 4 a and b). In Treatment group I, the wound thickness increased and covered by small scab and the wound showed the late stage of proliferation as in figure 4 c and d, tissue regenerated very well, while in Treatment groups II and III, the wound area covered by a normal epidermis and in the dermis, collagen fibers were thicker and denser. In the center of the wound the scar tissue was formed but in diverse levels in each group, for instance, in Treatment group II, new epidermis was formed with a mild thickness of keratinization, but marked density of scar tissue (granulation tissues beneath all wounds had matured to form scar tissues) were observed in the center of the wound, in dermal layer well organized thick bundles of collagen fibers was observed (Figure 5 a and b) if compared to the Treatment group III, that had well-uniformed epidermis with organized skin histological tissue layers encircle the wound area completely, with mild-moderate keratinization thickness, also, the moderate density of scar tissue and thick and well-arranged bundles of collagen fibers found in the dermis (Figure 5 c and d).
Figure 2: Histological sections of skin wound in Control negative group and Treatment group I showing granulation stage of healing wounds on day 8 following wounding. a and b: Presence of necrotic debris in the tissue surface with marked granulation tissue in the epidermis and dermal layers, epidermis, and dermis rich with newly formed granulation tissue, newly blood vessels (black arrows), and infiltration of inflammatory cells (PMN) as designated by red arrows, c and d: Thicken granulation tissue in dermis, neovascularization (black arrows), and intense infiltration of inflammatory cells as shown by red arrows, stained by H&E stain, (the scale bar of photo (a, c) 50µm, and (b, d) 20µm).
Figure 3: Histological sections of the cutaneous wound site in Treatment groups of II and III at day 8 following wounding showed the middle stage and the late stage of the proliferative phase respectively. b and b: Typical hyperplastic disorganized re-epithelialization formed for bridging the gap as indicated by red dash line, increased in the thickness of the dermal layer by a mature bundle of collagen fibers (black arrows); c and d: Hyperplastic-immature epithelium as designated by red dash lines with an improved in the thickness of the dermal layer by an extreme, mature bundle of collagen fibers (black arrows), stained by H&E stain, (the scale bar of photo (a, c) 50µm, and (b, d) 20µm).
Figure 4: Histological sections of skin wound in Control negative group and Treatment group I at day 21 following wounding. a and b: Immature disorganized epidermis (red dash line). Intense, mature bundle of collagen fibers increased the thickness of the dermal layer (black arrows) with proliferative fibroblasts as designated by yellow arrows. c and d: Small scab that contains fibrin and PMNs completely covered the wound area, epidermis formation (red dash line), thick compact and irregularly arranged collagen fibers as indicated by red arrows and insert. Few numbers of PMN that separate the wound from newly formed epidermis as in section d indicated by red dash line, stained by H&E stain, (the scale bar for photo (a, c) 50 μm, scale bar (b, d) 20 μm).
Figure 5: Histological skin wound section in Treatment groups of II and III at day 21 after wounding showed remodeling phase. a and b: Developing of the new epidermis with a mild-moderate keratinization thickness, the center of the wound contain the moderate-marked density of scar tissue (red dash lines) and proliferation of fibroblast (black arrows), well organized thick bundles of collagen fibers observed in the dermis. c and d: Developing of the new epidermis with a mild keratinization thickness, the center of the wound contain the marked density of scar tissue (red dash lines and black arrows), well structured, dense bundles of collagen fibers with inflammatory cell infiltration seen in the dermis as shown by black arrows, stained by H&E stain, (the scale bar of photo (a, c) 50µm, and (b,d) 20µm).

2. Hematological Study:

In this study, the hematological results of all treated mice shown in table 1; A significant mild-moderate increasing in the mean value of WBC ($P=0.02$), and Platelets ($P = 0.005$) were found in Treatment group II, as well as a decrease in the mean values of HGB ($P =0.01$), MCV ($P =0.01$) and MCH ($P =0.01$) also detected, while in Treatment group III, significant elevation only detected in the mean value of Platelets ($P =0.000$) besides, to decrease in MCH ($P =0.01$) and
MCHC ($P = 0.05$) mean values, additionally, the result revealed a significant decrease in the mean values of PCV% ($P = 0.01$) and MCH ($P = 0.000$) in Treatment group I, when compared with a control negative group. On the other hands the result of hematological analysis in table 1 showed non-significant effects in the following parameters in each groups; For instance in Treatment group II, there were an increase in RBC ($P = 0.68$), LYM ($P = 0.6$), and GRAN ($P = 0.67$) means, whereas in the same group PCV% ($P = 0.5$), MCHC ($P = 0.1$), and MPV ($P = 0.6$) showed non-significant reduction in there means, while in Treatment group III there was decrease in the means of RBC ($P = 0.06$), LYM ($P = 0.2$), HGB ($P = 0.16$), PCV% ($P = 0.36$), and MCV ($P = 0.3$) in addition to increase in WBC ($P = 0.7$), GRAN ($P = 0.52$), and MPV ($P = 0.5$) means, furthermore, there was non-significant decrease in the means of RBC ($P = 0.34$), MCV ($P = 0.1$), MPV ($P = 0.2$), and HGB ($P = 0.38$) besides elevation in the means of WBC ($P = 0.91$), LYM ($P = 0.3$), GRAN ($P = 0.32$), Platelet ($P = 0.2$), and MCHC ($P = 0.32$) in Treatment group I in comparison to the control negative group.

Discussion

In the current study we reported the wound healing potential of the Mustic Gum Resin (MGR), Quercus Brantii (QB), and Lawsonia Inermis, applied on wounds in BALB/c mice. MGR is a natural constituent and has many biological impacts such as analgesic, antioxidant, anti-inflammatory, and antimicrobial activities. Henna (LI), has antiseptic, anti-inflammatory and antimicrobial possessions. Along these lines, if any plant material has antimicrobial, pain-relieving, and anti-inflammatory effects together, this substance may likewise be required to help advance injury healing and lead to skin renewal. We observed that after 8 days of the topical application of Treatment group I (LI) enhanced late phase of granulation tissue and healing more progressed than in mice of control negative group. While in Treatment group II and III (MGR and QB) respectively, the healing became more pronounced and showed an early phase of the re-epithelization process.

The first reaction of wound healing is inflammation, which serves as a tissue protection mechanism that can withstand microbial contamination. Therefore, the significant wound healing activity of MGR and QB substances might be identified with its amazing anti-inflammatory impact. For the injury repairing period, the antimicrobial effort is significant because the injury that is presented to the external circumstance is progressively powerless against microbial assaults which ordinarily lead to delays in the healing procedure. Threat factors like pathogens can thus jeopardize the repair process. The most common pathogen responsible for infection of skin wounds is S. aureus and P. aeruginosa.

Complete wound healing seen in 21 days post-operation more specifically in Treatment group II and III (MGR and QB) respectively, the histological findings showed normal epidermis covered the wound area and unique tissue recovery was a lot more prominent in skin wounds rewarded with Treatment group II and III (MGR and QB) correspondingly, than in wounds of control negative and even Treatment group II (LI). The wound healing effects of (MGR) fruit oil have previously been studied in a rabbit burn model and its ability to increase in re-epithelialization has been established and it’s in agreement with our study. The oil exhibited improved wound healing efficacy, which could be attributable to the synergistic effect of all the components found in Pistacia lentiscus oil, especially fatty acids, tocopherols, and sterols. Such phytochemicals showed desirable wound healing functions and beneficial behaviors through different methods at the various stages of the wound healing cycle involving antimicrobial, anti-inflammatory, antioxidant, collagen synthesis enhancement, cell proliferative and angiogenic impact.

In accordance to our results, other studies proposed that the oak can enhance the angiogenesis phase, reepithelialization and wound recovery process in male adult albino rats. Because of the antimicrobial, antioxidant, and inflammatory effects of most plant extracts, wound healing can aid.

Some research reported the influence of henna on wound healing, which is compatible with the recent report, suggesting that henna’s antibiotic and anti-inflammatory properties are generally effective in wound healing, also demonstrated that henna extract decreased the mean cutaneous wound diameter and improved dramatically healing up to 12 days.

The contraction of wounds is facilitated by specialist myofibroblasts located in the granulated tissue. The increase in wound contraction in in mice of Treatment group II and III (MGR and QB) correspondingly, in our finding might be a result of the enhanced activity of fibroblasts and agrees with the previous report, who has shown that the injury reaction includes the proliferation and migration of cells such as fibroblasts, endothelial and epithelial cells and the deposition of connective tissue and wound contraction.

The results of the hematological evaluation of the blood samples in table 1 showed significant changes in the following parameters; For example in the Treatment group II (MGR) increasing in the mean value of WBC these discoveries associate very well with a past report, this was overwhelmingly accounted by an intensification in the circulating neutrophil infiltration, perhaps as a result of recruitment or demarcation of neutrophils from bone marrow. Also in the MGR treated group there was a significant increase in the mean value of blood platelets count, in agreements with former studies that found the increase in megakaryocytes may lead to increased blood platelets, or platelet production can increase due to inflammatory disease. As well as a slight decrease in the mean of HGB, MCV, and MCH which is corroborated similar findings reported by in mice. While in Treatment group III (QB) significant elevation only detected in the mean value of Platelets, besides, to decrease in MCHC and MCH mean values which is in agreements with that found by. The
decrease in the MCHC value that results from the toxic impact on red blood cell count and hemoglobin concentration of these natural ingredients, as the validity of these indexes is determined by the red cell count, hemoglobin concentration and packaged cell volume values. Additionally, the result revealed a significant decrease in the mean values of PCV% and MCH in Treatment group I (LI) treated group when compared with control negative group similarly decrease in PCV was observed by, which can be disclosed as because of a huge reduction in Hb, this would prompt reduction in the size of RBCs and thus the last decline in PCV. PCV regards are likewise noteworthy in estimating anxiety on animal health and demonstrate the limit of the blood to convey oxygen. Reducing the WBC and PCV values in the treated mice indicates stress.

**Conclusion**

The present study demonstrated that the Mastic Gum Resin, Lawsonia Inermis, and Quercus Brantii plant extracts were more effective in wound healing when used for 21 days after incision; further studies will also be required to study these effects and their mechanism of action in detail.

Abstract

Grape seed extract (GSE) is a complex mixture of several compounds, mostly represented by polyphenols and phenolic acids. The goal of the pilot study was to illustrate the safe dose of GSE in mice model and to assess toxicity that may be initiated by the different concentrations of this plant. Forty-two mice were divided equally into 7 groups; groups 1 attended as control, were only received water, whereas animals of groups 2, 3, 4 were treated orally with 200, 400, and 800 mg/kg b.w. of black grape seed extract respectively, and the remaining groups including 5, 6, and 7 were treated orally with 200, 400, and 800 mg/kg b.w. of red grape seed extract respectively. The animals were observed daily for any sign revealing for activity alterations and toxicity along with their body weight measurement during the experiment for 21 days with histopathological examination. The results gained from this pilot study were recording that the 200 and 400 mg/kg b.w. doses of GSE were safe compared to the 800 mg/kg b.w. in both black and red grape seed extracts because the higher dose led to a reduction in body weight gain and produce changes in the mentioned organs.

Keywords: Albino mice, Black grape seed, Histopathology, Red grape seed, Sharbazher village.

Introduction

Plants can produce a large number of chemical compounds with significant biological effects and they have been used to manufacture numerous kinds of medicines since the creation of human being ¹,²

Grapes, \textit{Vitis vinifera} berries, consider as conventional valued fruits in the world ³. The primary composition of grape pomace is skin, steam, and seeds ⁴. The fresh grape chemical composition is nearly 70-80% water and dissolved solids such as sugars, phenolic compounds, nitrogenous compounds, organic acids, minerals, aroma compounds, pectic substances ⁵. A variety of bioactive compounds such as simple phenolics, flavonoids, anthocyanins, stilbenes, proanthocyanidins, and vitamin E are considered a distinctive mixture of phytochemicals in grapes ⁶. Grape seeds consider as a waste product in industry and consist of protein, carbohydrates, lipids, and 5-8% of polyphenols reliant on the type of grapes ⁷. Different cultivars have a different grape seed composition ⁸. Additionally, revenues and seed quality affected by several environmental and biological factors, such as light, drought, high salinity, cold, metal ions, pollutants, xenobiotics, toxins, experimental manipulations, pathogenic infection, and aging of plants ⁹. A multitude of flavonoids is contained in GSE ¹⁰. The most abundant of these are the proanthocyanidins, which are oligomers of monomeric flavan-3-of units linked by carbon-carbon bonds ¹¹.

The most plentiful biologically active phytonutrients among the polyphenols found in grapes are flavonoids, which are possessing cardioprotective, neuroprotective, antimicrobial, anti-aging, antioxidant, anti-inflammatory, and anti-cancer properties ¹²,¹³.

Oral toxicity studies dealing with grape seed safety in experimental animals are few in the Iraq/Kurdistan region. Therefore, the main objective of this pilot study was to determine the oral toxicity of acetone-extracted
grape seed (black and red) extract at different doses in mice, through clinical observations and evaluation of histopathological changes in multiple organs.

**Materials and methods**

**Grape seed sampling and extraction**

The work was carried out on two different varieties of grape (*Vitis Vinifera*) the red and black, which were taken manually from Sulaimani (Sharbazher-Kurdistan region) in the middle of July. The grapes were isolated manually from the skin, dried in the open air away from direct sunlight, and grounded into powder by the electrical grinder. The powders were stored in dark glass containers at -20°C until the use.

Each sample of (72.2 g) of red grape seed and (40.73 g) of black grape seed powders was suspended with 202 mL and 114 mL of (70%) aqueous acetone respectively in a 500 mL Erlenmeyer flask. The mixtures were left on a magnetic stirrer for 24 hours at room temperature. The resultant extracts were filtered on a Buchner funnel then firstly evaporated with a rotatory evaporator to remove acetone, finally were freeze-dried for 24 hours to remove the water.

**GC–MS analysis**

Gas Chromatography-Mass Spectrometry (GC-MS) analysis was used to ascertain the compounds present in the purified samples of the red and black types of grape seed (*Vitis Vinifera*) from Sulaimania (Sharbazhear-Kurdistan region). Our natural plant was evaluated by (GCMS-QP2010 Ultra) GC systems combined with a mass spectrometer.

Animals and grape seed extract treatments

Forty-two mice (Male and female *Mus Muscular* species, *BALB/c* strain) weighing 25-30 g, at 4 weeks age were purchased from the Animal House at the College of Veterinary Medicine, University of Sulaimani (Sulaimani, Iraq/Kurdistan region), the mice were provided tap water and standard food *ad libitum* and were permitted to acclimate for one week before the start of the experiment accommodated in temperature and light-controlled environment. All of the in vivo experimentation in this pilot study was performed humanely according to and the ethical approval that was obtained from the Ethics Committee at the College of Veterinary Medicine, the University of Sulaimani in number (01589).

Consequently, the mice were assigned into 7 groups (6 mice per group) as follows: Group 1 (control): the animal of which were received normal saline without treatment; Group 2, 3, and 4, the animal of which treated orally with 200, 400, and 800 mg/kg b.w. of black GSE, respectively; Group 5, 6, and 7, the animal of which were treated orally with 200, 400, and 800 mg/kg b.w. of red GSE respectively. All treatments were given as a single daily dose by oral gavages every two days with a third-day free treatment and this study continued for about 21 days.

**Clinical observations and body weight measurements**

The animals were examined daily during this pilot study (for 21 days) for signs of acute toxicity such as diarrhea, curved tail, falling of hair, mortality and any other sign indicative for activity alterations, and the body weights of mice were recorded 2 times throughout the pilot study (day 0 and at the third week).

**Tissue sampling and histopathological examination**

At the end of the experimental period, the mice were euthanized with (Xylazine-Ketamine: 0.1 mL/10 gm of body weight) as recommended dose intraperitoneally and cervical dislocation. The liver, kidney, spleen, and lung tissues of the sacrificed mice were excised, cleaned by normal saline, cut into the 4mm, fixed in 10% neutral buffered formalin (PH 7.6) for 24 hours and underwent a series of histopathological processes, tissue slices of 4 μm thick were attained and stained using the standard H and E technique and envisioned by light microscope (Leica, Germany), connected with an image analyzer software (Am Scope, AmView, MU1000B).

**Statistical Analysis**

Statistical analysis was performed using the ANOVA (One-way) analyses of variance. Results were presented as a mean±standard error (Mean±SE) and *P* values less than 0.05 were considered significant. All statistical explorations were accomplished using the SPSS software version 22 (SPSS Inc., USA).

**Results**

Gas chromatography-MASS Spectroscopy

The secondary metabolites present in red and black grape seeds were detected in GC-MS (Table 1and 2).
The Grape Seed (GSD) peak region percentage and peak area coverage are specified below.

**Clinical observations**

The animals were healthy in general with no clinical signs of toxicity. There were no unusual changes in behavior or locomotor activity during the 21-day observation period. No deaths occurred during the study.

**Body weight measurements**

All groups gained weight during the pilot study period compared to day 0 of the study. The mean body weight of the mice of all groups showed a significant increase ($P<0.05$) in their body weight measurements in comparison to the initial day, no significant variations ($P>0.05$) were seen in the mean of the body weight gain of mice in the treatment groups of 200 mg/kg b.w. and 400 mg/kg b.w. in comparison with that of the control groups. While significant reduction ($P<0.05$) in the mean body weights gain was recorded for 800 mg/kg b.w. groups in the last week of an experiment in comparison with that of the mice in the control and other treated groups (Table 3 and 4).

Histopathological Results

Regarding histopathological findings, the liver section of control, and 200 mg/kg b.w. treated groups in the black and red GSE exhibited normal histomorphological features including, central vein, sinusoidal capillaries with normal appearance of hepatocytes (Figure 1a-d), in comparison to 400mg/kg b.w. treated groups in the black and red GSE, the liver cells showed karyolitic features (Figure 1e and f), while the hepatocytes in 800mg/kg b.w. treated groups in both types of GSE undergo coagulative necrosis, characterized by eosinophilic cytoplasm with features of karyolysis and karyorrhexis of the nucleus and kupffer cell proliferation (Figure 1g and h). The microscopical section of the kidney in the control group showed; normal and intact appearance of glomeruli, proximal and distal convoluted tubules with normal renal vasculature in control, and 200mg/kg b.w. in black and red GSE treated groups (Figure 2a-d). While in 400 mg/kg b.w. in black and red GSE treated groups the epithelial lining of collecting tubules showed slightly swollen. In the 800mg/kg b.w. in both types of GSE treated groups, the kidney showed dilation of Bowman’s capsule, glomerular atrophy with the segmentation of glomerular capillaries and increasing the mesangial cells, also moderate swollen of the epithelial lining of convoluted tubules with interstitial hemorrhage (Figure 2e-h). Microscopical section of the spleen revealed normal histological appearance in control and 200mg/kg b.w. in black and red GSE treated groups, whereas in 400mg/kg b.w. in both types of GSE treated groups showed mild-moderate lymphocytic hyperplasia in the white pulp region and congestion in the red pulp area if compared to the 800mg/kg b.w. in black and red GSE treated groups that showed moderate lymphocytic hyperplasia in white pulp region and congestion in the red pulp area (Figure 3a-h and 6a-h). The histopathological finding of lung parenchyma in black and red GSE treated groups revealed normal histological structures of bronchi, bronchioles, alveolar ducts, alveolar sac, and alveoli with normal vasculatures in control and 200mg/kg b.w. treated groups, but the minimum-mild proteinous fluid was found in the alveolar lumen of 400 and 800mg/kg b.w. black and red GSE treated groups in addition to vascular congestion particularly in the 800mg/kg b.w. black and red GSE treated groups.

Figure 1- histomicrograph of liver sections in control, black and red GSE treated groups. a and b: The normal liver histology in the control group, c and d: The normal histological features of liver parenchyma in 200mg/kg b.w. treated groups, e, and f: The hepatocytes showed slightly swollen (black arrows) with karyolysis in few hepatocytes (yellow arrows) in 400mg/kg b.w. treated groups, g and h: The hepatic cells undergo coagulative necrosis as indicated by black arrows in 800mg/kg b.w. treated groups, (S) sinusoidal capillaries, (H&E stain, scale bar 50 μm, scale bar 20 μm).
Figure 2- Histomicrograph of kidney sections in control, black and red GSE extract treated groups. a and b: The normal kidney histology in the control group, c and d: The normal histological structures of kidney parenchyma in 200mg/kg b.w. treated groups, e, and f: The epithelial lining of PCT and DCT showed slightly swollen (black arrows) in 400mg/kg b.w. treated groups, g and h: The swollen of the Bowmans’ space (blackhead arrows), segmentation of glomerular capillary tuft with mesangial hypercellularity and glomerular atrophy, the epithelial lining of PCT and DCT showed moderately swollen (black arrows) with interstitial hemorrhage indicated by yellow arrows in 800mg/kg b.w. treated groups, (DCT) convoluted tubules, and (DCT) distal convoluted tubules, (H&E stain, scale bar 50 μm, scale bar 20 μm).

Figure 3- Histomicrograph of spleen parenchyma in control, black and red GSE treated groups. a and b: The normal spleen structures in the control group, c and d: Normal microscopical features of the spleen in 200mg/kg b.w. the treated groups, e, and f: Slightly lymphocytic hyperplasia (black arrows) in the white pulp regions (black arrows) in 400mg/kg b.w. treated groups, g and h: Mild-moderate lymphocytic hyperplasia (black arrows) in the white pulp regions and congestion of the red pulp sinusoids as indicated by blackhead arrows in 800mg/kg b.w. treated groups, (WP) white pulp, and (RP) red pulp, (H&E stain, scale bar 50 μm, scale bar 20 μm).
Discussion

For the continuous development of phytochemicals under-regulated plant cell cultures, prospective replacements are generally considered 18,19. In recent years, plant cell biotechnology of grapes and particularly of grape cell suspensions have enjoyed great scientific and industrial consideration 20. New research aims to decode the benefits of grapes as a rich source of essential phytoneutrients with remarkable beneficial impacts on human health 21.

No mortality was reported with no significant changes in body weight gain or physical appearance, and no abnormal histopathological changes in the liver, kidney, spleen, and lung were observed during this pilot study in that groups received the 200, and 400mg/kg b.w. doses of both black and red GSE and the outcomes attained from this study are, in agreement with the results of other studies that revealed using of the GSE in experimental animals did not result in any disturbances in clinical activities or body weight loss 22,23.

However, the significant decrease in body weight gain was found in mice of group 800mg/kg b.w. of GSE, Yamakoshi, et al, (2002), who reported a similar result in which the high dose of GSE may lead to slightly significant weight loss in an animal model 24, while the observed result may disagree with the Mittal et al, (2003), study who documented that the high dose of GSE did not interfere with physical activity and significant difference in body weights or other signs of clinical toxicity 25. Also, the other study on Sprague-Dawley rats documented no significant decrease in body weight was observed even after 90 days of oral administration of GSE 26. The decrease in body weight gain may correlate with the high antioxidant activity in induced to enhance the lipase effect and enhancing lipolysis 27.
Additionally, it is obvious from the present study the histopathological changes in 800mg/kg b.w. dose groups of GSE represented by the mild-moderate swollen in the hepatocytes with a moderate degree of necrosis, segmentation of glomerular capillaries and moderate swollen of the epithelial lining of convoluted tubules with interstitial hemorrhage in kidney organ, the histological changes in spleen revealed mild-moderate lymphocytic hyperplasia in the white pulp region and congestion in the red pulp area, and the lung parenchyma showed mild accumulation of eosinophilic fluid the alveolar lumen. Our findings disagree with the other studies that mentioned no significant histopathological lesions in multiple organs after administration of GSE high dose \(^{28,29}\).

**Conclusion**

Consequently, it is concluded that the results of this study support the health of GSE dietary components for human use. No observed level of adverse effects (NOAEL) was deemed approximately in a dose of 400 mg/kg b. w. /day for administration in both types of GSE. While a mild-moderate changes microscopically was seen in the mice’s organs that treated by 800mg/kg b.w. black and red GSE treated groups.

Detection of Pork in Canned Meat Products by using DNA-based Methods

Alaa Tariq Abdulwahid
Assist. Prof., Department of Veterinary Public Medicine, College of Veterinary Medicine, University of Basrah, Iraq

Abstract

Adulteration of meat products became a matter of great concerns of religious, economical, legal and hygienic aspects. Canned meat is one of the most favorable in a lot of countries, which makes it prone to adulteration. The objective of the current study was to identify pork in canned meat for the presence of adulteration in commercial market of Basrah city/Iraq. Thirty canned meat were collected from commercial market. The possibility of a species mixture was tested with polymerase chain reaction (PCR), targeting pork (290bp). Analysis of canned meat revealed negativity results of all samples to pork meat. In conclusion, samples analysed in the current study showed that there was no adulteration by mixing pork meat in canned meat products due to absent production of pork flesh for religion and hygienic aspects. Beef and mutton flesh might be replaced in chicken, horse, and donkey flesh for economic reason.

Key words: Canned meat, fraud, meat species identification, mislabeling, PCR.

Introduction

Meat is the muscle tissue of an animal that is consumed as food. It is composed of high amount of water (75%), protein (20%), fat (5%) and small amount of carbohydrates, vitamins, and minerals. Meat products are considered a favorite item in a lot of countries and due to the consumption of meat products continues to elevate, mislabeling and adulteration of meat products have become common. Consumers usually rely on food labeling to make right choices for religious and public health reasons. The success this kind of adulteration in processed meat is invisible changes in the appearance, color, texture, and flavor of the processed meats. Under food labeling regulations, adulteration by mixing or replacement undeclared species in meat products is illegal. Recently, detecting the meat species in meat product is considerable importance issue to ensure the food safety for public health.

Methods have been used to detect species of meat are based on either protein or DNA detections. The protein detection techniques are unable to identify between close relatives species. In addition, these techniques are required complicated isolation procedure and time consuming. However, DNA detection technique is considered as reliable, efficient, simple and a quick method to identify meat species. In previous studies, testing processed of meat products by DNA detection technique revealed the use of a label that is incorrect. Since becoming aware of these issues, this work aimed to identify pork in canned meat products by detection the meat specie in it under laboratory conditions.

Materials and Method

2.1 Sample collection

A total of 30 sample (3 canned meats from each product) were collected from various commercial markets in Basrah city/ Iraq. These samples including products labeled as beef luncheon meat (Baidar, Kingdom of Saudi Arabia), beef luncheon meat (Hena, United Arab Emirates), beef luncheon meat (Ghadeer, Jordan), corned beef loaf (Burdon, Brazil), beef hot dog (AlTaghziah, Lebanon), beef hot dog (Al Qaisar, Kingdom of Saudi Arabia), chicken luncheon meat (Hena, United Arab Emirates), chicken luncheon meat (Baidar, Kingdom of Saudi Arabia), chicken luncheon meat (Alatyab, Turkey), and chicken hot dog (AlTaghziah, Lebanon). Following collection, samples were kept at room temperature until analysed. The collected samples were marked numerically (Table 1).

2.2 Sample Preparation for DNA extraction

The sample (2 g) was aseptically collected using sterile forceps, cut using a sterile scalpel, and mixed thoroughly with distal water (60 ml) in a blender (230 rpm for 120 sec) to homogenize (Figure 1). The sample was then transferred into two microcentrifuge tube (1.5 ml). To prevent DNA degradation, samples stored at -20 °C until analysis.

2.3 DNA extraction and detection

DNA extraction was carried out for all canned meat samples in triplicate using the DNA extraction kit GsyncTMDNA (Geneaid Biotech Ltd., Taiwan). The extraction procedure was done according to the manufacturer’s instruction. Briefly, the tissue sample (25 mg) was lysed with ATL buffer (200 μL) and Proteinase K (20 μl), vortexed at 30 min, and incubated overnight at 60 °C. Then, GSB buffer (200 μl) and absolute ethanol (200 μl) was added and vortexed (10 sec). The sample was then transferred to GC columns, washed with W1 buffer (400 μl), centrifuged (14,000 xg for 30 sec), followed by second washed with W2 buffer (600 μl), centrifuged (16,000 xg for 30 sec), and discard the flow through. To dry the column matrix, the GC column centrifuged at 16,000 xg for 3 min. After that, preheated elution buffer (100 μl) was added, stand at room temperature for 3 min to allow elution buffer, and finally centrifuged (16,000 xg for 30 sec) to elute purified DNA. DNA quantity was determined by using a Nano-Drop 2000 spectrophotometer (Nano Drop Technologies, Wilmington, USA).

2.4 PCR primers and amplification

The primers described in previous study were used to amplify a 12S rRNA region (Table 2).

<td>183 bp</td>
</tr>
</tbody>
</table>

2.5 Polymerase Chain Reaction (PCR) assay for gene amplification

DNA from the samples was amplified in a total 25 μL reaction volume containing genomic DNA (1μg) of each species, primers (1μM), MgCl₂ (2mM), dNTP (0.2mM), PCR buffer (2.5μL of 10X) and the enzyme Taq DNA polymerase (1 unit). The Polymerase chain reaction assay conditions were performed by thermal cycler as follows: initial denaturation step (94°C for 4 min) followed by 30 cycles of: denaturation step (94°C for 30 sec), annealing step (57-64°C for 30 sec), extension step (72°C for 30 sec), and a final elongation (72°C for 30 sec) 10.

2.6 PCR products detection

The PCR production was detected on agarose gels (1.5%) prepared with agarose in Tris-borate-EDTA buffer (1x) at 100 V for 30 min, stained with a fluorescent stain (Ethidium Bromide) and images by gel-documentation systems (UViDoc UK). The size of the band was determined by comparison with a standard DNA ladder 10.

Results and discussion

Under food labeling regulations, adulteration by mixing undeclared species in meat products is illegal. Recently, detecting the meat species in meat products is an important issue for public health. A target fragment of pork (290 bp) was amplified. PCR analysis of canned meat revealed negativity results of all samples for pork meat (Table 3)(Figure 2). This find is in agreement with previous studies, in which there was no adulteration by mixing pork meat in meat products 10, 11, 12. It has been found that pork meat replacement in some countries is rarely due to absent production of pork flesh for halal food status. However, the tendency to mix pork meat and fat into the processed meats is more frequent in other countries due to high production of pork flesh and its cheapness. The previous study found that meat products that were declared as buffalo contained pork 7, 13. In addition, beef and mutton meat might replace in chicken, horse, and donkey meat. In Turkey, meat products (uncooked beef burger, kofta, sausage, and luncheon) that were declared as beef contained poultry and donkey meat 10. In addition, raw meat that was declared as beef contained mix of horse and deer meat.

![Analysis the DNA using PCR system](image1)

![Gel electrophoresis and results analysis](image2)
In China, meat products that were declared as buffalo contained cattle, pork, and duck meat. In Iran, raw burgers that were declared as beef contained poultry. One of the reasons for the replacement of chicken, horse, and donkey flesh in beef and mutton flesh is economic. The success of this kind of adulteration in processed meats is invisible changes in the visual inspection (appearance, color, texture, and flavor) of the processed meats.

Figure 2: PCR product with 290 bp using pork specific primer in 1.5% agarose gel electrophoresis. PCR analysis showing the negativity result of all samples for regarding to pork meat (L1-L10). M: molecular marker (100 bp ladder); lane 1: beef luncheon meat (Baidar, Kingdom of Saudi Arabia); lane 2: beef luncheon meat (Hena, United Arab Emirates); lane 3: beef luncheon meat (Ghadeer, Jordan); lane 4: corned beef loaf (Burdon, Brazil); lane 5: beef hot dog (AlTaghziah, Lebanon); lane 6: beef hot dog (Al Qaisar, Kingdom of Saudi Arabia); lane 7: chicken luncheon meat (Hena, United Arab Emirates); lane 8: chicken luncheon meat (Baidar, Kingdom of Saudi Arabia); lane 9: chicken luncheon meat (Alatyab, Turkey); lane 10: chicken hot dog (AlTaghziah, Lebanon).

**Conclusion**, samples analysed in the current study revealed that there was no adulteration by mixing pork meat in canned meat products. Pork meat replacement in some countries is rarely due to absent production of pork flesh for halal food status. However, Beef and mutton flesh (more expensive) might be replaced in chicken, horse, and donkey flesh (cheaper). To allow the consumer to make right choices when purchasing canned meat, canned meat must be frequently analysed using effective methods by governmental institutions.

Abstract

This experimental study was conducted at the animal farm of the College of Veterinary Medicine of Baghdad University during the period 15/3/2019 until 30/4/2019. Fourteen female local breed goats, at aged between 1.5–2 years and range weight 23–27kg. The animals were divided into two equal groups as following G1(control) was fed on concentrate diet 2% B.W and alfa - alfa hay. G2 group was fed the same diet and 2% grinding Mulberry leaves of concentrate diet. water was offered freely. For evaluation some animal performance. Bodyweight, some nutrients digestibility, blood picture and biochemical parameters. Results revealed that an excellent improvement was observed in body weight and nutrients digestibility were significantly (P<0.05). Similar effects in blood biochemical parameters (total protein and urea), while no differences were determined in triglycerides and cholesterol. Other blood parameters showed that hemoglobin (Hb) and packed cell volume (PCV) which were significantly higher (P <0.05) and further improved in erythrocytes, leucocytes, lymphocytes and neutrophils in the group received Mulberry leaves than control groups.

Keywords: goat, Mulberry leaves, cholesterol, performance, digestibility, leucocytes

Introduction

Livestock, mainly goats and sheep, rearing are a mainstay in many countries and most of the rural population depends on livestock and them by-products¹. The lack of feedstuffs and their high prices, especially in dry seasons, are among the most important difficulties that stand in front of ruminants’ breeders²,³. Livestock have the ability to respond to the different feed additives that improve their overall performance by improving the efficiency of utilizing nutritional content and reducing the risk of metabolism⁴. There are a number of non-food additives, such as antibiotics, they are improve the performance of the animal, but they have a number of side effects due to their toxicity the rumen microorganisms. In addition to their sedimentation inside living tissue cells and the transmission to their products⁵. This led to the searcher for sources for other natural food additives such as Mulberry tree leaves, which are distinguished by their high ability to produce green leaves containing different nutrients⁶. High the protein content with slightly dissolving in the rumen and soluble carbohydrates⁷,⁸. In addition to being rich in sulfur and other mineral elements and they are free of toxic substances, they are highly palatable by ruminant animals⁹,¹⁰. It isfurther; contribute to improve the digestion nutrients, rumen fermentation by improving the internal environment of the rumen¹¹. Flavonoids, the most important were isolated from the leaves of Mulberries which have nine flavonoids¹². It was found when adding the Mours leaves to the diets lead to improve the overall animals performance, increases the feed intake improved digestion, absorption, growth and development of the mammary glands and improve the immune functions of the body¹³,¹⁴. Also it, could be used fresh or dry berries leaves as natural food additives with concentrated or roughages in poor-quality feed-in ruminants¹⁵. For that, this study was conducted to evaluate the effect of adding Mours leaves to the concentrated diet on the performance and some blood parameters in female goats.
Materials and Methods

Animals and diets.

This study was carried out from 15/March till 30/April, 2019 at the animal farm of College Veterinary / University of Baghdad. Total animals, fourteen female local bred goats, aged 1.5-2 years and weight range 23-27kg. The animals were divided into two equal groups . Group 1(G1) received concentrate diet by 2%B.Was the control. Group 2(G2) received concentrate diet (2%B.W) contain 2% Mulberry leaves dry (grinding), each group had water ad libitum and green grass while the concentrate diet was offered twice daily. Considerationa basal diet16,dietary ingredient (Table 1) and chemical compositions in table 2 .

Samples collection and laboratory analysis.

Diet and feed refusals measured and samples were collected daily for five sequential days on the end week. Also the fecal samples were collected twice daily from each goat before each feeding, daily feed consumed was calculated for each goat for digestibility, subsampled, and then stored at −20°C until analysis. Fecal samples were composited for each pen for 5days and subsequently stored at −20°C until analysis. Blood samples, 5 ml from each animal into two tubes with and without EDTA, were collected 2 hours after morning feeding at 8:00 on the final week by jugular venipuncture for CBC analyses and for serum separation by centrifuged for the 10-15 min at 2500 rpm. Sera was separated and stored in refrigerator at −20°C until analyzes for total protein, urea, triglycerides and cholesterolwere determined by using commercial kits,and according to the manufacturer’s instructions. All data received were statistically analyzed using SPSS17.0.

2 Added per kilogram of dietary DM: 15 mg of Cu, 65 mg of Zn, 28 mg of Mn, 0.7 mg of I, 0.2 mg of Co, 0.3 mg of Se, 6,000 IU of vitamin A, 600 IU of vitamin D, and 47 IU of vitamin E.

Results and Discussion

Effects of Mulberry leaves on body weight gain and nutrient digestibility.

The bodyweight gain was affected by Mulberry leaves powder in the concentrate diet as presented in Table 3. as shown, goats fed concentrate diet content Mulberry leaves powder, a noticeable increase in body weight while the total gain (kg) elevate (P<0.05) than those goats fed the concentrate diet without content Mulberry leaves. The positive effects of Mulberry leaves in general has been reported by many researchers.

This may be caused improvement in the rumen environment and increased rumen microorganisms, which has a role in raising levels of dry matter digestion and more nutrient absorption. Similar attribution was derived by which showed that the effects of adding flavonoids of Morus leaves, 0 and 2 g/animal/day to the diets of Dorper x Thin tailed ewes has caused an increase in the digestion of organic matter, total nitrogen and fiber extract. Moreover, the flavonoids are available to the animal when adding the berry leaves to the diets lead to improves the overall animals performance, improves digestion, absorption, growth and development of the mammary glands in addition to improving the immune function of the body.

While explained that adding dry berries leaves (Morus) by 0, 0.5, 1.5 and 2.5% of the live weight to the grass hay which provided freely to the Wollo sheep has resulted in overweight at end of experiment at a rate 21.4, 23.2, 25.6 and 25.0 kg/animal respectively. On the contrary, showed no significant differences in body weight for Abergelle sheep supplied to wheat bran and Guizotia abyssinica seeds in addition to the natural grass when adding dry berries leaves 0.25, 50 and 75%. Regarding the nutrient digestibility, the statistical analysis as shown in table 4) revealed that dry matter (DM), organic matter (OM), and other nutrient digestibility, were significantly affected by dietary Morus. This may attribute to the phytonutrients in the Morus leave ‘, impacted diet taste. Furthermore, the presence of flavonoids in leaves enhances the digestive enzyme that has a positive effect on nutrients digestibility. This confirms with mentioned, the flavonoids have been used as feed additives to improve the production efficiency and health of adult cattle. Also consistent with showed that the effect of adding flavonoids of berries leaves, 0 and 2 g / animal/day to the diets of Dorper x Thin tailed ewes has caused an increase in the digestion coefficient of dry matter, organic matter, total nitrogen and fiber extract. Rodriguez mentioned that adding four different of dry tree leaves varieties, including Moringastenopetala), Murule leaves, Trichanthera and Leucaena, by 0 and 1 g to the rumen liquor dairy cattle with fistula which nutrients on natural grass in a free form, the addition led to an increase in laboratory digestion for dry matter and organic matter. While the feeding local male goats on corn bran and green raspberry leaves or dry raspberry leaves have caused an increase in the digestibility of the dry matter.

The effect of adding *Mulberry* leaves on blood biochemical parameters.

The blood parameters investigated the biochemical changes, that may occurs during the nutritional circumstances mainly due to metabolic processes in addition to the correlation with characteristics of ruminal fermentation. Therefore, the changes in some blood parameters may possibly help to explain the beneficial effect of additives in the diet. On this basis, the variations in ruminal NH3-N concentrations and blood urea concentrations were greatly influenced by the feeding patterns of the diet. The effects of *Mulberry* leaves on the blood biochemical parameters are shown in Table 5.

There were differences (P<0.05) in the total protein and blood plasma urea nitrogen. Blood urea nitrogen is the end product of proteolysis of protein metabolism; its concentration is dependent on the crude protein level. Additionally, blood urea nitrogen is negatively correlated with body nitrogen deposition and the utilization rate of proteins. increase blood urea-N concentrations, when increased levels of casein in the diet conception.

These significant (P<0.05) changes it may be dietary *Mulberry* leaves which have positive effect on the nutrient utilization leads to increased blood protein and urea. The similar result concerning total protein and urea were also, reported by via increased digestibility of organic matter and total nitrogen. Whereasa supplemental energy or glucose decreasing the blood urea nitrogen concentrations. The *Mulberry* leaves have improve the nutrients digestion and rumen fermentation by improving the ruminal environment. Regarding triglycerides and cholesterol concentration, they were observed that group fed *Mulberry* leaves with concentrate diet resulted in a significantly less than control group, that agreement with several studies showed that use of *Mulberry* leaves in animals diet, decreased level of serum triglycerides and cholesterol. It is noting that elevated cholesterol can be indicative of dietary lipid content or tissue...
catabolism. On the other hand, that triglycerides and cholesterol was not affected by the supplemented feeds with the Mulberry leaves according to reported by.

Effect of adding Mulberry leaves on blood parameters.

Statistical analysis was conducted on a group fed diet content Mulberry leaves were compared to the control group, during this experimental period to determine the changes in hematological parameters at the end of the treatment period Table 6. There were a significant differences (P<0.05) in hemoglobin percentage and the mean of PCV%, while the good effect on red blood cell count, white blood cell count, lymphocytes and neutrophils respectively.

The improvement in the hematological parameters in the treated group that is possibility due to an increase in nutrients absorption in the intestine and an increase the microbial activity in the rumen, provide high nitrogenous and condensed tannins, because the presence of condensed tannins could be useful in enhancing rumen fermentation. Also the increasing bodyweight might be enhance the blood-producing to maintenance tissue requirement. In the same direction, the indicated that hemoglobin concentration was significantly (p<0.05) higher in treated group than the control group in goat kids. In addition to the mulberry leaves is rich in nutrients, also contain bioactive substances, such as anthocyanin, flavonoids, jasmonic acid, stilbene, and terpenoids. These bioactive substances have positive effects, such as antibacterial, antipyretic, anticancer, anti-oxidation, hypoglycemic and metabolism-improving properties.

Also, they could be influence the physiology of animals, that confirmed by which reported the Mulberry leaves can be considered safe, and no adverse effects on general behaviour, BW, hematology, and coagulation parameters obtained in the SD rats tested.

Conclusion

This study has compared the female goats' performance variables, between those fed on a standard ration and those that included these ration with Mulberry, that led to positive affects on general performance, blood pictures and biochemical parameters. According to this study, the use of dry Mulberry leaves (2%) from concentrate diet, improve the animal health.

Abstract

This study was undertaken to show the effect of follicular size and culture media on the results of IVF and IVEP in sheep. A hundred ovaries of slaughtered ewes were taken during non-breeding season. The total number of follicles were 256, while the number of recovered oocytes were 189. The recovery rate of oocyte from large and small follicles were 85.8% and 64.7% respectively. Only grades A and B oocyte have been used with a total number of 148 oocytes. Maturation and fertilization rates in different media; MEM, RPMI1640, DMEM low glucose and DMEM high glucose were 64.4%, 51.2%, 32.4% and 26.6% for maturation rate and 66.6%, 55%, 50% and 37.5% for fertilization rate respectively. There was a statistical difference (p≤0.05) in maturation and fertilization rate between different media; the total fertilization and cleavage rate was 56.7% and 70% respectively. The numbers of morula and blastocyst stage were 40% and 35% respectively. There was a statistical difference (p≤0.05) in morula and blastocyst production in different media. It was concluded that abattoir was a good source of oocyte recovery, and the large follicle give the best morula and blastocyst stage. MEM was a good diluent of semen. mMEM give the best result as cultured media as compared with the other media used in this study.

Keywords: IVF, IVEP, Local Iraqi breed sheep Non-breeding season.

Introduction

In Vitro Fertilization (IVF) technique provides large scale, low cost production of early and late stage embryos for gene integration and cloning, expected to make efficient utilization of high numbers of ova left in the ovaries. Ruminant embryo have been cultured in a numbers of defined, semi defined or undefined media. A defined medium should prepared prior to embryo culture by using Identifiable ingredients that facilitate embryo metabolism requirements and promoting culture environment to be similar as it in vivo. IVF procedure includes; Maturation, fertilization of oocyte and culture of zygote until production of blastocyst within 7 days which transferred to recipient or preserved in a liquid nitrogen for future use. There are many factors plays a role in successful of IVF technology including culture media, breeding season, size of follicles, age of recipient, semen donor and the method of oocyte collection. The study was undertaken to establish a reliable procedure of ovine embryo production and effects of certain factors such as season, method of collection of oocytes, follicular size and culture media on embryo production.

Materials and Methods

Oocytes Collections:

Fifty ovine female genital system were collected from abattoir of Fallujah during the period from November, 2019 to the February, 2020, and transported within an hour in a cool box containing NaCl 90% at 33-35°C to the Reproductive Biotechnology Lab., Dept. of surgery and obstetrics, Coll. Vet. Med, Uni. of Fallujah. The ovaries were isolated and subjected to three washing processes with collecting media (MEM, RRMI 1640, DMEM low glucose or DMEM high glucose). Follicles were calculated whether in right or left ovary and measurement of its diameter with an automatic vernier. (2-8mm) follicles were aspirated with a needle (18 gauge) connected with a disposable syringe filled with 3ml of collecting media. The culture media with recovered ova were culture in a well out of 24-wells plate.
Grading of oocytes:

The collected oocytes were evaluated with light inverted microscope according to the classification of 7 grades A, B and C as good, fair and poor respectively in the basis of cytoplasm uniformity and presence of cumulus cells.

The maturation of oocytes in vitro:

Grade A and B ova were chosen and washed two times with maturation medium MEM or DMEM low glucose. Then incubated 38°C, 5% CO₂ with a full humidify environment for 24-27 hours and the incubated wells were evaluated under light inverted microscope. First polar body presence was an indicative of ova maturation 3. Calculation of matured ova were done.

Semen preparation:

Fresh semen were collected from two rams via electro ejaculator (India Instrument, 620 Lesher place, Lansing, MI 48912., USA) and transferred within few minutes to the Reproductive Biotechnology Lab. Semen were evaluated with light microscope then warmed at 35°C, then diluted 1:20 with MEM solution. Heparin sodium (Sundent, China) 10 μg/ml were added to diluted semen for sperm capacitation 3.

In vitro fertilization (IVF):

Diluted capacitated sperm in a value of 1×10⁶ sperm/ml were added to fertilization medium containing mature oocyte kept in a group of 5-8 oocytes for each well, and put it into CO₂ incubator at 38°C, 5% CO₂ and full humidify environment for 24-27 hours 1. The presence of 2nd polar body in the oocyte or sperm head in its cytoplasm was an indicative of IVF within 24 hours of insemination 3. Calculation of fertilized oocytes were done.

In vitro culture:

Zygotes culture were performed in different modified “m” cultural media (mMEM, mRPMI 1640, mDMEM low glucose or mDMEM high glucose) incubated at 38-38.5°C, 5% CO₂ and humidify environment. The development of embryo was noticed every 24 hours and culture media were refreshed by changing 50% of it with a fresh one. 2 to 4 stage proportions were counted within 48 hours. Morula and blastocyst were checked within 120 and 168 hours after fertilization respectively 3.

Analysis of data:

Data were analyzed according to 8 with application of chi-square test & t-test.

Results and Discussion

Follicles numbers counted in 100 ovaries was 256 with a mean of 2.56 follicles for every ovary. The numbers of follicles found in the right ovary was 104 with a mean of 2.08 follicle per ovary. While that found in the left ovary was 152 with a mean of 3.04 follicles per ovary (Table -1). The result showed statistical difference (p≤0.05) in the site of ovary between the right and left one in the numbers of follicles found. Similar observations have been reported by several authors 9, 11. This result might be due to the fact that the left ovary in ewe more active than the right one 12.

Values: mean ± SE.
Different small manuscripts indicate statistical difference (p≤0.05).
Table-2 explain the effect of follicle size on ova obtained and their grade. The total numbers of small follicles (2-4mm) observed was 142 (55.4%) with a mean size 3.9±0.6. While the numbers of large follicles (5-8 mm) observed was 114 (44.5%) with a mean size of 6.6±0.8. There was a statistical difference in the size of the follicles (p≤0.05) between small and large one. Similar results have been reported by several investigators 1, 3, 11, 13-17. It has been noted that follicular size is affected by several factors; reproductive status of the animals, breeding seasons, age, hormonal stimulation and nutritional state of the animals 10. The results showed that a higher recovery rates were obtained with fair oocyte (grade B) 48.1% (91/189) followed by good oocytes (grade A) 30% (57/189) and poor oocytes (grade c) 21.7% (41/189). There was a statistical difference (p≤0.05) were observed between different grades of oocytes. Similar observations have been made by 7, 18 in ewes, and 19 in goats. It has been reported that high quality oocytes recovered by aspiration in sheep and goats 20. The low quality oocytes obtained might be due to slaughtering of bad quality ewes.

In vitro maturation (IVM):

The development of embryo affected the event occurred during maturation of the ova and for the success of IVM, the ova must undergo cytoplasmic and nuclear maturation. Only grade A and B oocytes (148/256) 57.8% of the recovered oocytes were cultured (Table-3). The maturation rate was 45.2% (67/148). Similar recorded has been observed by other workers 3, 5, 18.

Values: mean ± SE.
Different small manuscripts indicate statistical difference (p≤0.05).
The maturation rate of oocyte obtained from small follicles was 35.0% (21/60), while it was 52.2% (46/88) from the large follicle. It was observed that there was a statistical difference (p≤0.05) in the maturation rate between oocytes obtained from large follicles as compared with small one. It has been reported that oocytes recovered from large diameter follicle showed successful development 3, 11, 18, 21 (Fig-1) showed mature follicle with 1st polar body. The effect of culture Media on Maturation rate showed in Table-4, the total Maturation rate in different media was 45.5% (67/148). Highest maturation rate was observed in MEM media 64.4% (27/42), followed by RPMI 1640 51.2% (20/39), then in DMEM Low glucose media 32.4% (12/37) and in DMEM high glucose media 26.6% (8/30). Similar results have been made by several investigators 5, 22, 23. It has been also noticed that the medium used for maturation and its supplemented components such as hormones, and amino acids play a great roles in IVM, IVF and in vitro culture 5, 24, 25. There was a statistical differences (p≤0.05) were observed in a rate of maturation between different media.

</tr>
</tbody>
</table>

Media enriched with 10% FBS as a complete medium. Different small manuscripts indicate statistical difference (p≤0.05).
Table -5 showed fertilization rate in different complete fertilization media (media enriched with 10% fetal bovine serum (FBS)): The total fertilization rate was 56.7-% in different culture media. Similar findings have been made by [16, 22, 23, 26]. Fig-2 showed fertilized oocyte with the second polar body. It has been reported that there are several factors plays a role in successful IVF, such as oocyte collection technique, follicle size, season, age, semen preparation with capacitating agent and cultural media. Fertilization rate was 66.66% for oocytes cultured in complete MEM, while those cultured in complete RPMI 1640, complete DMEM low glucose and complete DMEM high glucose were 55%, 50% and 37.5% respectively. There was a statistical difference (p≤0.05) in fertilization rate among different media. These findings might be attributed to the inclusion of FBS in the media that may give the best results. The percent of fertilization were in the acceptable limit in this works and agreed with. Also the difference in fertilization rate in different media might be attributed to the components of the media.

In Vitro Culture and Blastocysts production:

Table -6 showed the results of in vitro Culture of fertilized oocytes (zygotes) in different stages (2, 4, 8-Cells and Morula stage) till Blastocyst production. The proportion of cleaved zygote was 52.6% (20/38) fig-3, 4-cells fig-4 was 70% (14/20), 8-cells fig-5 55% (11/20) and morula was 40% (8/20) fig-6, the blastocysts production was 35% (7/20) (fig-7). These results agreed with several investigators [3, 4, 22, 23]. It has been observed that the expected Blastocysts percent under in vitro fertilization conditions is around 30% to 40%.

Blastocysts production in a complete MEM medium was 22.2% (4/18), while it was 18.1% (2/11) in a complete RPMI 1640 media, 16% (1/6) in a complete DMEM low glucose and Zero in a complete DMEM high glucose. There was a statistical difference (p≤0.05) observed in blastocysts production in various media. These variations might be due to various factors like, age, breed, technique, media, pH and temperature. Also oocyte quality plays as an important factor for embryonic development [29, 30]. The study suggested that MEIM media give a better result than other media used in this work. Also the study was carried out on non-breeding season so the results show a decrease in development of blastocyst production. So this partially might be due to the effect of season on embryo production.

</table>

All media enriched with 10% FBS as a complete medium. Different small manuscripts indicate statistical difference (p≤0.05).
Conclusions

It may be concluded that abattoir was a good source of oocyte recovery, and the large follicle give the best morula and blastocyst stage. MEM was a good diluent of semen. mMEM give the best result as cultured media as compared with the other media used in this study.

Isolation and Identification of Lactic Acid Bacteria from Buffalo’s Raw Milk in Basrah Province by Sequencing the 16S rRNA.

Hiba A. Nasear1, Samar S. Ghazi1, Alaa T. Abdulwahid2

1Assist. Lecturer, 2Assist. Prof.: Department of Veterinary public health, Collage of Veterinary Medicine, University of Basrah, Basrah, Iraq

Abstract

Milk is a nutrient white fluid that comes from mammary glands of mammals. Lactic acid bacteria (LAB) of raw milk are natural microflora and might be starter cultures for milk fermentation. This study aimed to isolate LABs from raw buffalo’s milk and identify them by 16S rRNA sequencing for possible uses in the manufacture of food product. A total of 30 buffalo’s raw milk samples were collected from different areas of Basrah province (Shut-Alarab, Al-Zubair, Al-Qurna, Basrah conter and Abi-Elkhisib through the period extended from October to December 2019 to isolate the LABs using conventional bacteriology test and identify them by 16S rRNA sequencing using Polymerase Chain Reaction assay (DNA-based method). DNA extraction was carried out in duplicate for all raw milk samples. The results showed buffalo’s milk raw showed positive result for bacteriological test (Gram positive-catalase negative) and for the presence of the 16S rRNA gene. There was no significant difference among ages, months, and area of the current study. Buffalo’s raw milk at >4-8 year of age showed a higher ratio of LABs (71.43%) compared with that of buffalo at >1-4 year of age (47.83%). In addition, the highest ratio of LABs in buffalo’s raw milk was in October (66.6%) and the lowest one was in November (36.3%). Furthermore, the highest ratio of LABs in buffalo’s raw milk was in Abi-Elkhisib (100 %) and the lowest one was in AL-Zubair (20%). In conclusion Lactic acid bacteria were found in buffalo’s raw milk. Biochemical and genotypic tests are effectively used to identify the LABs. All LABs isolates could be survived well in buffalo’s raw milk in any age per year, months, and area of study. These findings suggest the possibility that LABs isolates from buffalo’s raw milk might use to inhibit pathogenic and spoilage bacteria in the food products and might improve flavour and quality of the food products.

Key words: Lactic acid bacteria, 16S rRNA gene, buffalo’s raw milk, starter cultures and probiotics

Introduction

Raw milk is a nutrient white fluid that comes from mammary glands of mammals. It is the main source of nutrition for infant. It consists of a wide variety of bacterial species as a natural microflora of animals and human being. The majority of them belong to genera of lactic acid bacteria. A lactic acid bacterium (LABs) is widely distributed in raw milk, dairy products, and decaying plant materials.

A lactic acid bacterium is considered the most general and significant starter cultures used in fermented dairy products. It has been applied in milk fermentation process worldwide. Milk fermentation process has been relied on the activity of LABs which produce organic acid as the end product of carbohydrates fermentation. In addition, LABs are widely used in inhibiting pathogenic and spoilage bacteria in the food products. Furthermore, LABs in milk are used to improve of gastrointestinal disorders and prevent of certain allergies. LABs used as preservation substance and improving both of flavour and quality of the food products. Applications of LABs have a long history in developed countries. Significant importance of LAB in food industry and health enhancement has prompted...
the developing countries to isolate and identify LABs from raw milk animals and optimize them for industrial applications. Recently, many scientists around the world (Iran, Malaysia, Egypt) have been working on LABs. From this point of view, this work aimed to isolate the LABs from raw buffalo’s milk and identify them by 16S rRNA sequencing for possible uses in the manufacture of food product.

**Material and Methods**

**Samples collection**

A total of 30 raw milk samples were collected from different areas of Basrah province (Shut-Alarab, Al-Zubair, Al-Qurna, Basrah center and Abi-Elkhasib). Before sample collection, udders were washed and dried. Then, the milk samples were collected in the sterile tubes, transferred to the laboratory in an ice box, and stored at -20°C until analysis. The samples were collected from five different regions of Basrah province through period extended from October to December 2019.

**Isolation of lactic acid bacteria**

For LABs isolation, raw milk sample (0.1 ml) was spread on the de Man, Rogosa & Sharpe agar surface (MRS agar, Merck, Germany) and the plate was incubated at 37°C for 24 h. A loopful an overnight culture was then transferred from MRS agar, inoculated in the MRS broth (10 ml), and incubated at 37°C for 24h. From each tube, 0.1 ml was cultured two times on the surface of the MRS agar (Merck, Germany) for further purification. The streaks plating were then incubated using anaerobic incubation jar at 37°C for 48h to provide a good environment condition for growing LABs. After incubation, colonies with distinguished morphologies (white and cream colonies) was swabbed on clean slide, stained with Gram’s stain, and examined under light microscope.

**Biochemical test**

For catalase test, a small amount of white and cream colonies was swabbed on clear slide using wooden stick and a drop of H₂O₂ was then added. Gas bubbles evolutions indicate a positive reaction. Colonies with distinguished morphologies (white and cream colonies) and physiologies (Gram positive-catalase negative) were collected. To identify LABs isolates, 16S rRNA gene sequences were analysed by PCR.

**Analysis of the 16S rRNA gene sequences**

**DNA extraction and detection**

DNA extraction was carried out in duplicate for all raw milk samples using the genomic DNA extraction kit (Qiagen- Germany). The DNA extraction kit consists of GB Buffer, W1 Buffer, Wash Buffer, and Elution Buffer. DNA extraction was performed according to the manufacturer’s instruction manual in following steps: Cell harvesting, lysis, DNA binding, washing, and DNA elution. For cell harvesting: bacterial cultured (1 ml) was transferred to a microcentrifuge tube (1.5 ml), centrifuged at 8,000 rpm for 1min to discard the supernatant. Lysozyme buffer (200μl) was added to the tube to re-suspend the cell pellet at room temperature. For lysis: GB buffer (200 μl) was added to the tube in water bath at 60 °C for 10 min to lysate. For DNA binding: absolute ethanol (200 μl) was added to lysate and mixed thoroughly, transferred to the GD column in 2 ml collection tube, centrifuged at 8,000 rpm for 2min. For wash step: W1 buffer (400 μl) was added to the GD column in 2 ml collection tube and centrifuged at 8,000 rpm for 30 sec to dry the column matrix. Then, wash buffer (600 μl) was added to the GD column in 2 ml collection tube and centrifuged at 8,000 rpm for 30 sec to dry the column matrix. For DNA elution: The dried GD column was transferred to microcentrifuge tube (1.5 ml). Pre-heat elution buffer (100 μl ) was then added to the center of the column matrix, stand for at least 3 min to ensure the elution buffer absorbed by the matrix, and centrifuged at 8,000 rpm for 30 sec to elute the purified DNA.

**PCR primers and amplification**

The primers described in previous study (F: 5’-GCGGCGTGCTAATACATGC -3’; R: 5’-ATCTACGATTTCACCCTAC -3’) were used to amplify a 16S rRNA gene sequences (700bp).

**Polymerase Chain Reaction assay for gene amplification**

DNA from the samples was amplified in a total reaction volume (25 μL) containing genomic DNA (1μg), primers (1μM), Mgcl2 (2mM), dNTP (0.2mM), PCR buffer (2.5μL of 10X) and the enzyme Taq DNA polymerase (1unit). The Polymerase Chain Reaction (PCR) assay was done as follows: Initial denaturation step (95°C for 5 min) followed by 30 cycles of: Denaturation step (95°C for 1 min), annealing step (42°C for 1 min),
extension step (72°C for 1 min), and a final elongation
(72°C for 10 min) using a thermocycler(Techne-UK)
(12,13).

**PCR products detection** The amplified PCR product
was detected on agarose gels (1.5%) prepared with
agarose in Tris-borate-EDTA buffer (1x), stained with
a fluorescent stain, and images by gel-documentation
systems. The size of the band was selected by comparison
with a standard (100 bp) DNA ladder 14.

**Statistical analysis** The Pearson’s chi-square test
was done by using statistical program, SPSS 15

**Results and discussion** In the current study, the
LABs was isolated from buffalo’s raw milk, identified
through conventional bacteriology and genotypic tests,
and investigated their distribution rates based on age per
year, months, and area of study.

**Biochemical test**

In the present study, the isolation results of LABs
from buffalo’s raw milk using MRS medium revealed
that 16 out of 30 (53.3%) were positive for Gram stain,
negative for catalase test, and live under anaerobic
condition. This finding is in agreement with previous
study in which that conventional phenotypic method
(biochemical reactions-based method) using MRS
medium is suitable to identify the LABs in the breast
milk and both of cow and goat raw milk providing a
reliable identification of the isolates 13.

**Polymerase Chain Reaction (PCR) assay**

In the current study, 16 out of 30 (53.3%) buffalo’s
raw milk showed positive result for the 16S rRNA
gene. The amplification length of the 16S rRNA gene
was 700bp (Figure 1). Gene sequences (16S rRNA) for
the identification of buffalo’s raw milk was effectively
done by using PCR. This finding is in agreement with
previous study, in which that sequencing of the V1
region (700 bp and 90 bp) for the gene sequences (16S
rRNA) are sufficient to identify the LABs in the breast
milk and both of cow and goat raw milk providing a
reliable identification of the isolates 16. It has been found
that molecular method (DNA–based method) is possibly
accurate for identification of bacteria 17.

![Image](image_url)

**Figure 1**: The amplification of the 16S rRNA gene (700bp) by using PCR in agarose gel electrophoresis of
DNA. M: ladder (100 bp); lane (1-19) raw milk samples.

**Distribution of LABs in buffalo’s raw milk based
on age per year**

The difference among ages showed that there was
no significant difference (P>0.05) of LABs in buffalo’s
raw milk. Raw milk of buffalo at age >4-8 year showed
a higher ratio of LABs (71.43%) compared with that of
buffalo at age >1-4 year (47.83%)(Table1). This finding
is in agreement with previous study, in which ages did
not effect on the LABs in goat’s raw milk (13).However,
this finding disagreement with previous study, in which
ages effect on the LABs in cow’s raw milk. It has been
found that the number of parturition significantly effect
on the LABs distribution in cow’s raw milk 13.

### Conclusion

A lactic acid bacterium was found in the buffalo’s raw milk. Biochemical and genotypic tests are effectively applied to identify the LABs. All LABs isolates could survive well in buffalo’s raw milk based on any age per year, months, and area of study. These findings suggest the possibility that LABs isolates from buffalo’s raw milk might use as probiotics (live bacteria that are helpful for human beings) and improve flavour and quality of the food products and might use as preserve agents.

Evaluating the Efficacy of Some Disinfectants, Sterilizers and Detergents Against Streptococcus Pyogenes Isolates from Tonsillitis Patient in Kirkuk City

Aylan Arslan Ali¹, Shymaa Hassan Ali²
¹Assist. Lecturer, Central Public Health Kirkuk, ²Assist. Lecturer, Education Directorate Kirkuk

Abstract

The aim of the study was to evaluate the inhibitory effectiveness of some disinfectants, sterilizers and detergents commonly used, including: Dettol (Sabtol), Bleach, ethanol alcohol, liquid soap, dishwashing liquid, ActiveX and Sterile Gel 85 on bacterial growth Streptococcus pyogenes. The study included collecting (150) swabs from Patients referred to the hospital and from private medical laboratories (age groups were 16-40 years), the swabs were taken by (Transport media) containing the prepared agricultural medium and transported to the laboratory for the purpose of isolation and diagnosis.

The results of the bacterial sensitivity test under study for these disinfectants, sterilizers and detergents according to the type and concentrations of the preparation (50, 25, 12.5)%, and that alcohol ethanol, hypochlorite sodium and sterile gel (Gel 85) have a high effect on the growth of bacteria Streptococcus pyogenes and with all the concentrations prepared, and while detergents Liquid and liquid soap, dishwashing, had less effect on the bacteria under study, according to the prepared concentrations.

Key words: Streptococcus pyogenes, disinfectants, sterilizers, chemical detergent

Introduction

Inflammation of the upper respiratory tract is one of the most common diseases, especially the tonsils, and its treatment depends mainly on taking antibiotics. Hand contamination and respiratory secretions such as cold and mucus are among the most important ways for infection to spread between patients or health care workers and social and economic institutions to a healthy person.

The discovery of antibiotics had a great impact on reducing the rate of bacterial infections, which encouraged the production of these antibiotics industrially, but nowadays we find a large number of antibiotics used in treating diseases and bacterial infections, but the effectiveness of these antibiotics is constantly decreasing with the ability of germs to develop Means of self-defense and resistance to the action of antibiotics in several ways. As this resistance has the ability to transmit from one bacterial genus to another that was previously sensitive to a specific antibiotic, and this resistance spreads in direct proportion to the increase in the randomized use of antibiotics.

Sterilization is defined as the process by which all microorganisms and their forms (germs, their spores, filtrates, fungi and their spores) are killed or removed, while disinfection is the process in which part or not all living organisms are removed or killed and it does not affect the spores, germs vary in their sensitivity to sterilizers and disinfectants, the germs negative for the dye of honor are less sensitive to disinfectants than the germs that are positive for the dye of generosity, perhaps due to the nature of their composition and their possession of the outer coating, which may hinder the action of disinfectants, and Mycobacteria is relatively resistant, while spores are highly resistant, and the random and increasing use has led to the emergence of resistant strains and made the disinfectant lose its effectiveness and a few of them have the ability to kill spores, and from the need to touch the disinfectant to the area to be disinfected, because Most of these disinfectants do not have the ability to penetrate into the materials surrounding the micro-organism, such as (blood, pus, wounds). Chemical disinfectants are also characterized by instability as it sometimes decomposes into other compounds that help the growth of the microorganism, and some microorganisms have the ability to transform.
and change to become resistant to disinfectants.  

Antiseptic term refers to non-toxic chemical sterilizers when used externally to disinfect skin or wounds and do not affect living tissues, as for detergents is an important and inexpensive way to prevent the transmission of infection in microorganisms because they are effective in removing contaminants that include bacteria, viruses or parasites. As Antibacterial or Antimicrobial, which is characterized by containing the compound Ingredients with an active anti-microbial activity, the current industrial cleaners are made either from petrochemicals (derived from fats and oils) or other chemical materials such as (sulfur trioxide, sulfuric acid, ethylene oxide and alkalis) and all have microbial effectiveness. Bactericidal.

Studies indicate that this efficacy increases with an increase in temperature, so washing hands with soap and hot water eliminates a large part of the pathological bacteria, and the vital effectiveness of these compounds may be due to their entry into the cells cytoplasm and its interference in its own cell interactions to form metabolites that lead to bacterial cell death or The similarity of fatty acids to compounds with those that enter into the formation of the cell wall, which leads to the failure to complete its construction and consequently the death of the cell, or the effect may extend to itself, which leads to an increase in its clarification of these cells and consequently their death.

The bacteria *Streptococcus pyogenes* is one of the common causes of disease events in humans and is responsible for at least 616 million cases of tonsillitis and pharyngitis per year in the world and 111 million cases of infections in children in developing countries as well as causing many diseases, including tissue inflammation. Cellular and cutaneous trauma and toxic shock syndrome, *Streptococcus pyogenes* susceptibility to infection is due to its possession of many virulence factors, including capsule, surface proteins of the cell wall.

Given the importance of evaluating the effectiveness of sterilizers, disinfectants and detergents against *Streptococcus pyogenes*, we decided to conduct this study, which aims to measure the effectiveness of disinfectants and sterilizers, in inhibiting or killing bacteria.

**Materials and working Methods**

Collecting (150) swabs from the nasopharynx area from patients (male and female) using ready-made swabs containing the culture medium, after they were transferred to the laboratory, they were incubated for 24 hours, after which they were implanted on a blood agar medium and incubated on 37°C for 24 hours, (20) of the bacteria *Streptococcus pyogenes* were isolated, and was diagnosed based on the dorsal characteristics that included the size, shape, color, texture of the colonies, and the type of hemolysis, and then microscopically diagnosed for the purpose of describing the shape of the cells by staining them with the Cram statin, Catalase test, sensitivity to bacitracin test, APE20.

| Table (1) Types of disinfectants, chemical sterilizers and detergents used: |
|---------------------------------|------------------|---------|
| **Trade Name** | **The scientific name** | **Origin** |
| 1 | Dettol (Sabtol) | Chloroxylenol | Iraq |
| 2 | Bleach | Hypochlorite Sodium | Iraq |
| 3 | Ethanol alcohol | Ethyl alcohol | Iraq |
| 4 | Liquid Soap | Bright | Iraq |
| 5 | Dishwashing liquid | O2 | Iraq |
| 6 | Sterile gel | Activex | Turkey |
| 7 | Sterile gel | Aniosgel 85 NPC | France |
The test to detect contamination of disinfectants before performing an allergy test:

For the purpose of ensuring that the disinfectants used in this study are free from bacterial contamination, in order to conduct a sensitivity test for bacteria, the following test was performed according to the method 2,11

1- Inoculating the blood agar with a spreading method with (0.1) ml of disinfectant and incubating at 37 °C for 7 days.

2 - Take (1) ml of antiseptic and add (1) ml of the (heart and brain broth), the tubes were incubated at 37 °C for 7 days. The appearance of more than 5 colonies on the plate and the appearance of turbidity in tubes in the middle of the infusion of the heart and brain broth (BHI) indicates Contamination of the disinfectant and its unfit for testing.

Preparation of disinfectant concentrations:

According to the method 2, The stock solution was prepared for seven sterilizers and disinfectants (Dettol (sabot), Bleach, liquid soap, sterile gel, dishwashing liquid, ethanol alcohol) by taking 10 ml of commercially prepared concentrations of these chemical disinfectants and disinfectants and adding it to 90 ml of Sterile distilled water, The final concentration becomes 100%, and under sterilization conditions the following concentrations were prepared (12.5, 25, and 50%).

The sensitivity of bacterial isolation testing to disinfectants, sterilizers and detergents using the diffusion drill method:

Results and discussion:

20 samples of Streptococcus pyogenes were isolated out of (150) swabs, and were diagnosed based on Phenotypic, Microscopic, Chemical and APE20 tests.

Sensitivity testing of bacterial isolation to disinfectants, sterilizers, and detergents:
Table (2) shows the bacterial isolation under study showed different sensitivity to the disinfectants, sterilizers and detergents used, and this discrepancy was evident depending on the type and concentration of the disinfectant used. The results showed that all the disinfectants used at a concentration of 100% have a great effect on the growth of bacteria compared to other concentrations, and the disinfectants (Bleach, ethanol alcohol and Gel85) are among the most sterilizers and disinfectants that affect the growth of *Streptococcus pyogenes* and in all the prepared concentrations, as shown in picture (1) This is consistent with the study 5 which indicated that *Streptococcus spp*. Kill with specified time and concentration when exposed to the Bleach, The Bleach is one of the disinfectants with a wide range of effectiveness against many microbes by destroying bacteria cells through the production of hypochlorous acid, which is a strong oxidizing agent that binds directly with cellular membrane proteins and enzymes as well as its effect on DNA by inhibiting its synthesis in the bacterial cell, Likewise, ethyl alcohol has the advantage of its ability to affect bacteria by drawing water from the cell and draining it or depleting it inside the cell, working on coagulation, denaturing protein and depositing fats 15.

As for the antiseptic Dettol, the bacteria under study showed resistance to it at the concentration (12.5), while the sensitivity to it was shown at the concentration (25)% in the inhibition area (25) mm and at the concentration (50)% in the inhibition area (30) mm, as in the picture (2), And Al-Khalidi indicated in her study that Dettol disinfectant was the least effective on its bacterial isolates, and this is not in agreement with the current results that showed that the dettol has a high efficiency in inhibiting the bacterial isolation under study at a concentration of (25 and 50)% 5.

Activex sterile gel had an effect on the growth of the bacteria under study at the concentration (25)% in the inhibition area (16) mm and at the concentration (50)% in the inhibition area (18) mm, while the bacteria did not show any sensitivity at the concentration (12.5%), as shown in Image (2).

As for detergents, liquid soap and dishwashing liquid are among the least disinfectants affecting the growth of bacteria under study, especially at concentrations (12.5 and 25)% compared to a concentration of (50)%, as in picture (3), The present study agrees with Rama when it was mentioned that the detergent inhibitory concentration increases with the increase in the detergent concentrations used in the study, due to a number of components included in the composition of the detergents that work to inhibit the metabolic activities and kill the bacteria 18,4.

The resistance of bacteria under study to sterilizers, disinfectants and chemical cleaners may be due to the bacteria acquiring the characteristic of resistance resulting from mutations that lead to mutations in cellular metabolism or the bacteria acquiring resistance genes from plasmids or transposone genes, or the occurrence of a change in the target sites or a change in the permeability of the outer membranes of the bacterial cell walls 4,2.

---

**Image (1) The effect of ethyl alcohol, Gel85 and Bleach on the growth of *Streptococcus pyogenes* and at all the prepared concentrations.**
Conclusions

The results of this study showed that the most disinfectants and sterilizers affected the growth of *Streptococcus pyogenes*, with all prepared concentrations being alcohol Ethanol, Bleach and Sterile gel Gel 85, and while detergents, Liquid soap and Dishwashing liquid, had less effect on the bacteria under study, according to the concentrations used.

I recommend that chemical disinfectants and sterilizers be used randomly and without referring to the manufacturer’s instructions and installed on the packaging of the chemical disinfectant, which makes the disinfectants lose their effectiveness due to inappropriate use and in the wrong place or because they are used in inappropriate concentrations, as this leads to the emergence of many resistant bacterial strains. For many disinfectants, sterilizers and antibiotics alike, which results in a serious problem that lies in the difficulty of controlling infectious diseases, and conducting a molecular and genetic scientific study to find out the relationship between bacterial resistance to antibiotics and their resistance to disinfectants and chemical sterilizers.

Study the Role of Selenium or Zinc as Organic form on some Antioxidant and Liver Enzymes of Rams

Mohannad. K. Aremmt¹, Saad Thabit Jassim Alrawi², T.R. Mohammed³

¹Assist. Lecturer, ²Assist. Prof., Dep. of Public Health, College of Veterinary Medicine, University of Fallujah, Iraq, ³Prof., College of Agriculture, University of Anbar, Iraq

Abstract

This study was conducted to detect the role of the organic form of Selenium or Zinc that supported with yeast (Saccharomyces cerevisiae) on the liver function and antioxidant enzymes. Twenty-one rams that their average weight of 38±2 kg. The males divided into three groups. The first group (G1) late without treatment, group two (G2) was administrated with (Saccharomyces cerevisiae-Zinc) (0.2 g/kg/ body weight), while group three (G3) was administrated with (Saccharomyces cerevisiae-Selenium) (0.03 g/kg/ body weight). Blood samples were collected from males at zero 45 and 90 days of experiment. The results of AST, ALT and ALP showed non-significant differences between different groups. While the activity antioxidant enzymes recorded a significant improvement, through a significant increased (P≤0.05) of Glutathione peroxidase and catalase concentrations of the group that treated with organic selenium or zinc compare with a control group, from another hand, the treated group with organic selenium has been shown the significant increases (P≤0.05) of Glutathione peroxidase compared with the animals that treated zinc at the third period. Whereas, the treated groups recoded a significant increment (P≤0.05) with the progress of ages. From results concluded that the feeding selenium and zinc as an organic form that fortified by yeast Saccharomyces cerevisiae significantly increases antioxidant enzyme activity and have a protective role to the liver.

Keywords: Selenium, Zinc, Yeast, Antioxidant, Sheep.

Introduction

Animals production depend on a healthy and normal physiological status. The disorder in the oxidative stability and the physiological factors in the body caused many problems in animal and the human body. Alteration in the activity of the ant oxidative enzymes is a considerable bio indicator due to the significant role of ant oxidative enzymes in establishing the reactive oxygen species stability of the organism. Trace elements play an important role in certain physiological and biochemical processes and vitally important Human and animals development. Therefore, it is important to provide trace elements to a ration of the animal, especially ruminant, the imbalance of antioxidants which triggers dramatic changes in the behavior of an animal as well as the influence of livestock production and also some modifying the blood components and causes diseases that may not respond to the medication. Dietary antioxidants such as vitamins have been reported to inhibit physiological disorders, thus increasing the performance and consistency of the meat. Selenium is complicated in cellular antioxidant protection by the action of glutathione peroxidase, a self-dependent enzyme catalyses, its significant decrease of hydrogen peroxide as well as organic peroxide to water and the corresponding stable alcohol, while still suppressing the production of free radicals. Selenium, it is one of the rare and naturally occurring elements in many foods that are used as a nutritional supplement, and it is one of the necessary and important nutrients for organism, and it consists of further than about 20 kinds of selenoprotein, which have important role in the thyroid hormone activity as well as the construction of DNA, in addition antioxidant and protection against many infections as well as in reproduction.

Since there was an acute deficiency of selenium in the blood of sheep, it was found necessary to add selenium to their ration, which is among the necessary requirements for the animal to provide the largest production and health of the animal. zinc, it is the instant and most copious element and it is very necessary for all living organisms, as it does not oxidize under biological situations, and
this describes why the element zinc achieves important physiological roles and is different from biological processes. It cannot be stored in the body so it requires its addition its importance in promoting growth, it is an anti-bacterial agent, and it regulates interactions and reproduction in animals. It also affects the activity and potency of antioxidant enzymes.

The using Saccharomyces Cerevisiae is necessary to enhance the microbial growth and enhancing the permanence of the fermentation of rumen. From another hand, the supplement yeast be responsible for most of the important mineral nutrients during the digestion process that will positively affect the microbial assemblages and their functions in the rumen, as many studies have indicated that there are beneficial effects of the yeast on the number and activity of microbes in the rumen. Therefore, this study aimed to the study the role Saccharomyces cerevisiae fortified with organic selenium and Saccharomyces cerevisiae fortified with organic zinc as an organic form on the enzymes transporting amines (ALT), (AST) and (ALP) and antioxidant enzymes in the blood serum of domestic male sheep as protective and improvement effect.

Materials and Methods

This study was conducted on the Twenty-one males sheep 1 to 1.5 years of age, with an average weight 38±2 kg. The animals were fed with concentrated feed, as recommended (2%) of the body weight of all study animals, while hay and alfalfa were fed ad libitum. The animals were divided into three treated groups of equal number (seven males for each group). The first treatment group (G1) left untreated as a control group. Second treatment group (G2) was administrated the yeast (Saccharomyces cerevisiae) fortified with organic zinc at a dose of 0.2 g / kg. Live weight) according to 13, the third treatment (G3) was administrated yeast (Saccharomyces cerevisiae) fortified with organic selenium at a dose of (0.03 g / kg / live weight) according to 13.

Samples of blood were collected from the jugular vein throughout three time periods. (beginning (Zero time), middle (45 days) and end of the experiment (90 days), which lasted for 90 days, to measure the level of amine transporting enzymes, which are amine transporter alanine (ALT), amine transporter aspartate (AST) and alkaline phosphatase (ALP) in the blood serum by CORMAY Kit made in Poland by an auto biochemistry analyzer (Model accent 200) made in Poland.

Statistical analysis between the parameters was performed for each time period using Analysis of Variance for complete random design, and the Least significant difference between the means of the different parameters used to identify significant differences under P≤0.05 by using the statistical program SPSS. Issue 25.

Results and Discussion

Table (1, and 2) it has been shown non-significant differences in the concentration of AST, ALT and ALP between the experiment treated groups over the length of the study period, but a significant increase (P≤0.05) was observed during the time period within the one column for the three treatments compared to the first week of the experiment. The results of the current study are in agreement with 14, who found, the adding selenium with vitamin E at 2 ml/animal, showed non-significant differences between treated groups, and agreed with 15 when adding zinc as organic and inorganic forms, observed non-significant differences in ALT concentration. As well as the results are agreement with 16, who recorded that were non-significant differences in the enzymes transporting the amine ALT, AST and ALP after added organic and inorganic selenium (sodium selenate) at a concentration of 0.3 mg/kg feed in lambs. Also, the results were agreement with 17 who observed, non-significant differences in the level of ALT, AST and ALP between the treatments compared with the control when administering Saccharomyces cerevisiae yeast. While the results disagree with 15 who found, the adding zinc as organic and inorganic forms, caused an increase in the level of ALP and a decrease in AST, and disagreed with 18 when adding the inorganic selenium and zinc and their mixtures, an increase in the level of ALT and AST. From other hand, results agree with 19,20, whereas recorded increased ALT, AST and ALP in the selenium addition group compared with the control group. The major benefit high intake of Se is to preserve liver damage under certain circumstances 21, 22. Dietary Se has been reported to protect toward toxic substance, leading to reduced serum ALT. While 23 has been recorded a dramatic increase concentration of zinc in the serum, a decline concentration of CRP, II-6 and TNF-a in the ability to respond to zinc supplementation. In the inflammatory condition, adipose tissue generates cytokines including (interleukin-6) IL-6, that the liver release of C reactive protein. Certain researches have also shown beneficial properties of zinc toward oxidative
damage 24.

Table (3) showed that there are significant differences (P≤0.05) in the concentration of antioxidant enzymes between different treated groups during the study period. The results recorded a significant increment (P≤0.05) of Glutathione peroxidase and catalase concentration of the group that treated with Saccharomyces-selenium or Saccharomyces-zinc compare with a control group, from other hands, the animals that treated with Saccharomyces-selenium showed a significant increment (P≤0.05) of Glutathione peroxidase compared with the animals that treated Saccharomyces-zinc at the third period. Whereas, the treated groups recoded a significant increment (P≤0.05) with the progress of ages. The results of the study are agreed with 25, 26 who concluded the zinc and selenium have improved effect on antioxidant enzymes in chicken muscles, results are also consistent with results of study 27, 28 that the glutathione peroxidase in the meat of beef and hogs meat was increased when they had been fed with saccharomyces cerevisiae that supported with selenium. This results can explain by the role of zinc and selenium as antioxidants the decreased the against reactive oxygen species and it’s the most major elements of the antioxidant protective mechanism 1. Selenium have a high efficiency of the Se-dependent enzyme Glutathione 29 Selenium plays a lot of significant biological activity, such as the regulation of antioxidant enzymes activity improvement of health and productivity 30.

In ruminants, selenium as an organic form, including selenomethionine, is mainly excellently absorbed compared to inorganic selenium, mainly requires the addition of inorganic selenium to amino acids by microflora 31.

Organic selenium has been much more efficiently absorbed into the body than inorganic selenium, contributing to higher glutathione peroxidase activity in the cow 32. Therefore, using the organic form in the current study. In addition, Zinc helps to reduce oxidative damage by engaging in the production of antioxidative enzymes 33. Biological zinc accumulation prevents the development of ROS products, includes, superoxide anion and radical hydroxyl and H2O2 34. Zinc play a pro-antioxidant role and protect against oxidative stress 35. Zinc consumption improves the scavenging functions including its antioxidative enzymes Catalase and glutathione toward oxidation 36 these roles and function of Se and Zn have act a protect the livers and other organs.

Conclusion

Selenium and zinc as organic form that fortified by yeast Saccharomyces cerevisiae significantly increases antioxidant enzyme activity and have a protective role to liver. Therefore, the dietary organic Se and zinc may exert a favorable effect on antioxidant ability through enhancing enzymes activities.

Cytotoxic activity of Green Zinc Selenide Nanoparticles Against Hep-G2 Cell Lines

Sabah N. Mazhir¹, Kadhim A. Aadin², Mohammad M. F. Al-Halbosiy³, Nisreen Kh. Abdalameer⁴

¹Prof, College of Science for women, a University of Baghdad, Baghdad, Iraq, ²Prof, College of Science, University of Baghdad, Baghdad, Iraq, ³Prof, Biotechnology Research Center/ Al-Nahrain University/ Iraq, ⁴Lecturer, College of Science for Women, a University of Baghdad, Baghdad, Iraq

Abstract

In the current study a new technique between the plasma physics, nanoparticle and Biotechnology, structured (ZnSe) prepared by cold plasma technique using atmospheric pressure plasmajet system, ZnSe NPs were prepared from selenium nitrate and zinc metal sheets to reduce selenium toxicity. The structural and optical properties were characterized by X-ray diffraction (XRD) and absorbance measurements of ZnSe green NPs. The liver cancer cell line (hepG2) was exposed to the ZnSe nanoparticles, and The percentage of cytotoxicity was suppressed after 24, and 48 from exposure, induced cytotoxicity is found to be 70.3% in hepG2 after exposed 48h ZnSe green nanoparticle, and the maximum cytotoxicity of the normal cell line (REF) was also examined 42.62% when exposure ZnSe nanoparticles and 16.6% when exposure ZnSe green nanoparticles.

Keywords: Cancer cell, Cytotoxicity, ZnSe green NPs, HepG2, Plasma jet.

Introduction

Many researchers are highly interested in nanoparticles and the diversity of their fields of application such as electronics, photonics, medicine, which often use toxic substances that have the potential to cause environmental toxicity, cellular toxicity, and carcinogenesis. safe and easy to prepare, non-toxic and strong need no preparation or a long time to prepare them needed techniques have the potential to commonly use medical procedures for bacteria and fungi techniques. Composite nanoparticles have the potential to be used in the supply of antimicrobial compounds for use as agricultural pesticides, the mechanisms of the composition of nanoparticles vary between different plant species. Nanoparticles are material groups with unique characteristics due to their greater surface area in contrast to macroparticles¹. The smaller and larger volume ratio of NPs are the main features that make biomedical applications useful, which leads to many new properties such as easy operation, biomolecular conjugation, etc. Nanomedicine is the most significant nanotechnological technology health conditions and new ways of treating other illnesses, such as cancer.

Nanomaterials are nanoscale particles, which have optical properties, catalytic reactions, and chemical stability because of their high surface-to-volume rates. Such features have motivated researchers to find new techniques for nanoparticle synthesis²,³. Physical and chemical techniques spend less time creating nanoparticles, but defense materials that are poisonous and cause environmental toxicity are needed to protect them. The green method with plants is being increased as an active, healthy, non-toxic, and environmentally friendly method⁴. Nanoparticles like iron oxide, zinc oxide and titanium dioxide are selectively cytotoxic to cancer cells and can be used for the treatment of cancer⁵. Zinc Selenide (ZnSe) is also called II-VI semiconductor because it is a light yellow binary stable compound in which Zinc and Selenium form the 2nd and 6th sets of the periodic table. It is an intrinsic semiconductor with a bandgap of approximately 25 °C of 2.70 eV. Because of the quantity impact and the presence of a relatively large proportion of surface atoms, ZnSe is one of the most common and essential glass materials both for use
Non-thermal plasma processing techniques have emerged as promising all-gas phase protocols for synthesizing a wide range of NPs, including semiconductors, metal oxides, ceramics, and more complex core-shell nanostructures among a variety of potential candidates. Therefore, the preparation of ZnSe-NPs was needed with cold plasma and (core-shell) methods to reduce toxicity in an easy, green, economic and environmental manner. There is growing interest in the use of plasma for biomedical applications, especially under the so-called ‘plasmadrug’ to take advantage of the action of low-power, air-pressure plasmas for therapeutic purposes. We have studied the feasibility of the synthesis of ZnSe NPs with an aqueous solution extracted from Milk Thistle seeds. A very mild and solvent-free procedure for obtaining the herbal material was used at a low temperature. We suggest that this bio-safe extract acts as both a reduction and a stabilizing agent. In terms of Cytotoxicity, the synthesized nanoparticles were evaluated as antitumor agent.

### Material and Methods

Aqueous solution extracted from Milk Thistle seeds, metallic zinc, Deionized water, and Selenium nitrate \([\text{SeO(NO}_3\text{)}_2]\) was Purchased from Al-Bashir Company, Baghdad / Iraq. The Liver (Hep-G2) was obtained from Biotechnology Research Center/ Al-Nahrain University/ Iraq, and (REF) cell line was Obtained from Iraqi Center for Cancer and Medical Genetics Research, Mustansiriyyah University, Baghdad, Iraq.

### Preparation the extract of Silybum marianum

The extract contains the metabolites of cells in addition to their components. The components are usually of anti-oxidant properties, i.e. they act as substances with a reducing ability that converts selenium ions into nano selenium and changes colour after exposure to plasma. Impurities were first removed from seeds which were then washed several times with deionized water. Five grams of the seeds were added to 100 ml of deionized water magnetically stirred for 20 minutes at 60 °C. The extract was placed in the centrifuge device tubes, and the material was reduced to the liquid and filtered with filter paper.

### Green synthesis of Zinc Selenide Nanoparticles (ZnSe NPs)

Selenium nitrate \((\text{SeO(NO}_3\text{)}_2)\) was the source of Selenium in all experiments; it was dissolved in deionized water. In a typical reaction procedure, mixture containing 2 mL of Silybum marianum extract was added to 8 mL of 0.4 mM aqueous solutions of selenium nitrate. The plasma is exposed at the gas flow rate 2 L/min and for a time of 3 min, observed the colour change indicating the obtaining of selenium nanoparticles in the green environment-friendly way. A zinc metal sheet changed the electrode of the system under the same conditions of gas flow rate and time. Thus, the zinc metal enveloped the green nano selenium and altered the colour, leading to the obtaining of the zinc selenide compound in the green method.

### Optical and Structural Measurements

A UV wavelength range of 300 to 1100 nm (Shimadzu UV- 1800 spectroscopy) was used with a double- optical spectrometer (PD-303 UV) to detect Surface Plasmon Resonance (SPR) at room temperature for ZnSe NPs. The structural evolution of the synthesized ZnSe NPs was carried out using an X-ray diffractometer [Shimadzu XRD-6000, AS (3k. NOPC)], with a Cu-Kα -radiation wavelength of \(\lambda = 0.15418 \text{ nm}\) operating at 40 kV and 30 mA in a configuration of \(\theta – 2\theta\). The following Debye-Scherrer equation was used:

\[
\frac{0.9\lambda}{C.S} = \beta \cos \theta \quad (1)
\]

where (CS) is the crystalline size, \((\lambda)\) is the wavelength \((1.5406 \text{ Å})\) of the Xray, \((\beta)\)is the degree
of the peak of diffraction, and ($\beta$) is the full width half maximum (FWHM).

**In Vitro Cytotoxicity Assay**

This study was performed on two types of cells, namely, liver cancer cell line (HepG2,) and normal tissue cell line (REF). For tissue culture, microtiter plates of 96 (12×8) well were used. Each well was used to seed 10,000 cancer cells and incubated at 37°C for 24 hours to generate a monolayer which was confirmed by an inverted microscop. The wells were grouped virtually (four wells in each group) to be ready for the following steps:

Three groups were presented with nanoparticles, namely, Se, ZnSe, and ZnSe with extract MT, by diluting the NPS in the culture medium so that their concentrations for each prepared element were (100, 50, 25, 12.5, and 6.25)µg/ml, and the standard control group (control). The plates were re-incubated at 37°C for three-time intervals of 24, 48, and 72hrs. After incubation, the growth medium was decanted off, and crystal violet dye was added (100μL/well) to stain cancer cells. The cells were then incubated for 20 min at 37ºC, followed by washing of plate by water. Then, an assay Analyzer device was used to Analyze the described staining and calculate the percentage of live cancer cells (inhibition rate). The mean value was computed for each group. The calculated mean of inhibition percentages at 24, 48, and 72 hrs was recorded separately for results analysis. The inhibition rate of cell growth (the percentage of cytotoxicity) was calculated as the following equation:

\[
\text{Inhibition rate} = \frac{A - B}{A} \times 100 \quad \text{(2)}
\]

where A is the optical density of control, and B is the optical density of the samples.

**Statistical Analysis**

It is implemented using a one way (ANOVA) analysis of variance to verify the least significant difference between all treated groups, and (t-test) analysis of variance to verify between control with each treated groups separately using (Graph Pad Prism 6.00) software. The values were presented as the mean ± SEM of triplicate measurements.

**Results and Discussion**

**Ultra Violet Spectroscopic analysis of ZnSe**

UV-Visible absorption spectroscopy was used for the calculation of the band energy. The optical absorbance was measured at room temperature as a function of wavelength (300-1100 nm) for ZnSe NPs with an average thickness of 200 nm, where the absorption spectrum was declined as previously described.

The bandgap energy of films near the absorption edge was determined using the Taucie method through the following formula:

\[
\alpha h\theta = B(h\theta - E_g)^{1/2} 
\]

where $\alpha$ is the linear absorption coefficient, B is a constant, $h\theta$ is the photon energy, and $E_g$ is the bandgap energy for NPs with direct and indirect bandgap energy. It is possible to calculate $E_g$ of the film by plotting $(\alpha h\theta)^{1/2}$ versus $h\theta$ and extrapolating the straight line to the photon energy axis. The value of $E_g$ is higher than the value of ZnSe bulk optical bandgap (2.7 eV) because of the ZnSenanocrystallitesthe quantum confinement. The energy gap is $E_g = 3.61$ eV in ZnSenano this increase in the energy gap in nanoscale solutions may arise from the effect of quantum volume, agree with shown in Figure 1.

**Fig.1.** Energy gap of ZnSe NPs indirect methods ways from the relationship between $(\alpha h\theta)^{1/2}$ as a function with the photon energy.
surface plasmon resonance peak of ZnSe green NPs at 600nm; this characteristic is evident in the visible light area and is responsible for the colour change when the material reaches the nanoscale. This property causes the temperature around the nanoparticle to rise when the light falls on it. Thus, this feature was employed in many applications, including the inhibition of the growth of cancer cells\(^\text{19}\).

The crystalline size of (ZnSe green NPs) indicates that the sizes of samples prepared were below the nanoscale, as appear in the table (1).

In the same way, the energy gap of ZnSe\(_{\text{green}}\) NPs was calculated and found to be greater than ZnSe NPs, figure 2 showing the energy gap for ZnSe green NPs.

Structure Properties Using X-ray Diffractions

ZnSe green NPs synthesised in cold plasma showed Bragg’s X-ray (XRD) patterns reflecting ZnSe green NPs fcc structure. Fig. 5 illustrates the X-ray diffraction patterns for ZnSe green NPs prepared where a maximum of four peaks is observed, equivalent to 26.09°, 36.3 °, 45.45 °, and 47.68 °, corresponding to the (111), (101), (220), and (102). This applies to the ZnSegreen NPs in line with ZnSe’s regular X-ray diffraction model (JCPDSno. 01-088-2345). The above pattern demonstrates that no other materials can replicate the diffraction pattern of any peak that indicates the purity of the prepared sample and the absence of external contamination that matches findings from other studies\(^\text{21-23}\).

Effects of (Se, ZnSe, and ZnSegreen)NPs on Liver Cancer HEP-G2 cell line

After 24h incubation of HEP-G2 cells, maximum Cytotoxicity was 60. 73% which was achieved in the case of Se with a concentration of 100%, as shown in Figure 3.
Fig. 3. Growth inhibition rate of HEP-G2 (24hrs incubation at 37°C).

48 h incubation of HEP-G2 cells, resulted in maximum Cytotoxicity of 68.97% recorded in the case of Se NPs with a concentration of 100%, as shown in Fig. 4.

Fig. 4. Growth inhibition rate of HEP-G2 (48hrs incubation at 37°C).

Effects of Se, ZnSe, and ZnSe green NPs on REF Normal cell line

In REF, 24h incubation caused a maximum cytotoxicity of 56.6% in the case of Se NPs with a concentration of 100%, as shown in Fig 5.

Fig. 5. Growth inhibition rate of REF (24hrs incubation at 37°C)

48h incubation of REF cells caused maximum cytotoxicity of 53.57% in the case of Se with a concentration of 100%, as shown in Fig. 6.

Fig. 6. Growth inhibition rate of REF (48hrs incubation at 37°C)

The results of the in vitro test of this research confirmed the selective effects of the treatment of nanoparticles on cells, i.e. that cancer cells were inhibited without any harm for normal cells, where MT reduced Cytotoxicity on normal cells while increased the inhibition of cancer cells. Nanotechnology has opened up a new area in cancer care by monitoring the release of the medication and reducing the side effects.

An additional factor is that the high nanoparticles surface-volume ratio helps different functional groups in the plant to get an attachment to a nanoparticle and thus tie the tumour cells together. In addition, the tumour cells serve as an active site for collecting nanoparticles due to the small particle size of nanoparticles (< 100 nm) and the lack of an appropriate tumour lymphatic drainage system.

The mechanisms by which the ZnSe NPs and ZnSe green NPs applied their toxic impacts on hep-G2 may include apoptosis, necrosis and ROS generation. Generally, the release of dissolved Zn2+ ions inside the cells is the real action of the ZnSe N.P.s and ZnSe green N.P.s for cancer cells in which ROS actions increase causing cancer cells death by an apoptosis signaling pathway.

Conclusions

In summary, we have prepared ZnSe green NPs by cold plasma using zinc sheet and selenium nitrate. We
prepared ZnSe NPs using a green method by the milk thistle seed at room temperature. We tuned the optical properties with the desired particle size of ZnSe-NPs to improve the absorption coefficient that affects the efficiency of the solar cell. All the nanoparticles showed an absorption peak due to their quantum confinement effects in their optical spectra. This method has many advantages in terms of the cost, speed, reproducibility, and meeting all criteria for “green” preparation of ZnSe-NPs. Work also focused on predicting the possible cytotoxic effects of biosynthesized (Se, ZnSe, ZnSe green) NPs on human HEP-G2 liver cancer, and normal REF cell lines.

Abstract

Lipopolysaccharide was selected to investigate its effect on cell line of breast cancer *in vitro*, therefore lipopolysaccharide was extract from *Salmonella enterica serovar Typhimurium* followed by evaluation of its cytotoxicity. The experiment was divided into three parts. The first part included isolation and identification of *S. enterica serovar Typhimurium* from 302 samples included 201 diarrheic patient samples and 101 food samples of poultry meat and as well as the isolates identification on molecular level through used of three genes (*invA*, STM4497 and *Stn*) genes detected using the technique of PCR, the results shown there were seven bacterial isolates diagnosed as *S. enterica serovar Typhimurium*. The second part of the experiment was extract of LPS from 10.66 g of dry weight of bacteria by hot phenol method. The concentration of LPS in phenolic phase was 435.57 μg/ml while in aqueous phase was 381.76 μg/ml. The LPS molecular weight was estimate which was equivalent to 93325 for phenolic and 71614 Dalton for aqueous phases. The third part of experiment was to study the effect of cytotoxicity in cell line of breast cancer by used different concentrations of lipopolysaccharide. Lipopolysaccharide showed cytotoxicity on the breast cancer cell line mcf-7 in both phenolic and aqueous phases of LPS. The results showed the highest rate of inhibition of breast cancer cells at the concentration of 350 μg/ml by 61.67% in the phenolic phase while the rate of inhibition was 53.33% in the same concentration of the aqueous phase.

Keywords: Lipopolysaccharide, *S. enterica serovar Typhimurium*, MCF-7 cell line, cytotoxicity.

Introduction

Lipopolysaccharides its endotoxins responsible for many of the biological properties of gram negative bacteria particularly (phosphoglycolipid, lipidA) the lipid component¹. These toxins are the most importance among virulence factors for that bacteria and causing the diseases in both animals and human ². There are especially effects for lipopolysaccharide, including lethal toxicity, low blood pressure, fever, and leukocytosis, which has a role in activation of leukocytes and platelets aggregation ³.

The cancer is one of the highest causes of disease and death in the world ⁴. Breast cancer is one of the most common types among women in the world, as it is considered the main cause of the death of women in 15%. Breast cancer accounts for 26% of all cancer cases diagnosed among women worldwide ⁵.

Some bacterial properties have mechanisms that stimulate the immune system to enhance defenses against malignant tumors ⁶. Among the most important of these characteristics is lipopolysaccharide, which is the main component of the outer membrane of the cell wall of the Gram-negative bacteria, that has an assistant effect in stimulating the immune response ⁷.

The LPS compound have cytotoxic effect through its effectiveness of immune cells which are believed to play an important role in the cytotoxicity of gram
negative bacteria through production of biologically active molecules for example: free radicals mediators, prostaglandins, and pro-inflammatory cytokines. So, the LPS compound is not a toxic molecule in itself.

Lipopolysaccharide increases the resistance of bacterial and viral infections by enhancing of B cell response and stimulates interferon production by T lymphocytes. Some researchers have shown that can increased the migration of human esophageal cancer through stimulation of TLR-4 by LPS and it’s can act important role as a catalyst enabled the treatment of gliblastoma multiforme and colorectal cancer.

Because the modicum of available studies in the use of LPS extracted from bacteria in the inhibition and killing of cancer cell line, the study aimed to extract and partially purification the LPS compound from selected isolate of Salmo nella enterica serovar Typhimurium. Cytotoxicity effect of lipopolysaccharide was determined against breast cancer cell line mcf-7.

Materials and Methods

Bacterial isolation:

A total of 302 samples included 201 diarrheic patient samples were collected from of patients at the Fallujah educational hospital and 101 food samples included poultry meat collected from local markets in Fallujah city, and the consulting office at the college of veterinary medicine in university of Fallujah. The specimens were directly inoculated onto MacConkey and Samonella Shigella agar (oxoid) and were incubated at 37°C for 24 hours.

Identification of S. enterica serovar Typhimurium by PCR assay:

Identification of S. enterica serovar Typhimurium was done by using of PCR assay with three primers. The primers were used to amplify the following genes:

1. 617 bp Stn gene
   F-5' TTGTCTCGCTATCACCC 3'
   R-5' ATTCGFAACCCGCTCTGTCC3' 12

   The amplification was done by using 20 μl of reaction mixture with Taq DNA polymerase 1 U/ 20 μl, dNTP mix 250 μM, Primer F 1 μl, Primer R 1μl, MgCl2 1.5μl and Genomic DNA 3 μl. The program amplification of thermal cycler was performed at initial denaturation 94°C for 1min followed by 35 cycle of 94°C for 1 min, 59°C for 1 min, 72°C for 1 min and final extension 72°C for 10 min. Then amplified DNA fragments were examined by utilizing electrophoresis in agarose gel (1.5%). Gels have been stained with ethidium bromide and were photographed by using gel documentation system with UV light.

2. 523 bp of STM4497 gene
   F-5'GGAATCAATGCCCGCCAATG 3'
   R5'CGTGCTTGAATACCGCCTGTC3' 13

   The amplification was carried out using 20 μl reaction mixture containing from Taq DNA polymerase 1 U/ 20 μl, dNTP mix 250 μM, Primer F 1 μl, Primer R 1μl, MgCl2 1.5μl and Genomic DNA 3 μl. Amplification was performed in a programmed thermal cycler were initial denaturation 94°C for 5min followed by 35 cycle of 94°C for 1 min, 68°C for 2min, 72°C for 2min, final extension 72°C for 10 min.

3. 211bp of invA gene.
   F5'ATCAGTGAGCTGGTCTTATCTGAT 3'
   R5'TCTGTTTACCGGGCATACCAT3' 13

   The amplification was carried out using 20 μl reaction mixture containing Taq DNA polymerase 1 U/ 20 μl, dNTP mix 250 μM, Primer F 1 μl, Primer R 01μl, MgCl2 1.5μl and Genomic DNA 3 μl. Amplification was performed in a programmed thermal cycler at initial denaturation 94°C for 5min followed by 35 cycle of 94°C for 1 min, 60°C for 2min, 72°C for 2min and final extension 72°C for 10 min.

Antibiotics susceptibility:

Antimicrobial susceptibility tests using method of by the disc diffusion technique on Muller Hinton agar . The zone diameter of each isolate was compared with National Committee of Clinical Laboratory Standards (NCCLS) 15. Results were recorded as susceptible, intermediate susceptible or resistant, based on the inhibition zone size of each antimicrobial disc used.
Extraction of lipopolysaccharide:

The selected bacterial isolate was cultured under aerobic condition on S.S. and MacConkey agar (Oxoid) and incubated for 24 hours at 37°C. The isolate was harvested using spreader with phosphate buffer saline pH 7 and then washed twice by same buffer. The cells were precipitated using cooling centrifuge at 3000 rpm/min at 4°C for 15 min. The pellet of cells was resuspended in PBS buffer and centrifuged again for 10 min. The cells were dried by cooled acetone (1:10) in ratio 16.

Destruction of bacterial cells:

Depending on the method of 17, destruction of bacterial cells was done by using enzymes as follows: The dried cells were suspended in PBS pH 7 (0.05M EDTA and 0.05 sodium azide) with ratio 1:10. The lysozyme enzyme was added with ratio 0.1 mg / g from weight of bacteria and the suspension was put in the magnetic stirrer in refrigerator for 18 hours, then the suspension was incubated in water bath at 37°C for 20 min and place the suspension in the magnetic stirrer for 3 min. The volume of the strand was then diluted by adding an equal volume of magnesium chloride solution (0.02M), then add DNAase and RNAase enzymes with a final concentration of 1 mg / ml. Finally, the suspension was incubated at 37°C for 10 min and then incubated at 60°C for 10 min.

Extraction of lipopolysaccharide by phenol:

The suspension of bacteria was preheated at 70°C using a water bath and add 90% of phenol solution in equal volume, previously heated at 70°C 18, then the mixture was placed in the magnetic stirrer with a heating unit at 70°C for 15 min. The mixture was put directly in a snow bath to the temperature of 20°C and then centrifuged in capacity of 18000 g and 3000 rpm for 15 min. After the centrifugation, the separation of four phases from top to bottom were observed as follows: aqueous phase, interphase, phenolic phase and sediment. The aqueous and phenolic phases were separated with a Pasteur pipette (both on one side) and then re-extract the remainder by adding three volumes of distilled water and placing the mixture in the magnetic stirrer for 5 min. then the mixture was centrifuged at the same speed above and separate the floating liquid and add to the aqueous phase. Finally, the phases were dialyzed against D.W. for several times and several days to remove phenol’s odor. Partial purification by gel filtration Sephacryl s 200: One hundred and one milliliters of Sephacryl s-200 gel (Pharmacia) were washed with D.W., then were washed by phosphate buffer saline pH 7.2, degassed under vacuum. Subsequently the suspension was poured into a glass column (1.5× 90cm) and allowed the matrix to settle down. The gel was equilibrated with PBS pH 7.2 with flow rate (4ml/7min). LPS sample were added to the column and washed with PBS buffer, the fractions were collected and the absorbance at 280 nm was measured for detecting of contaminating proteins within fractions 19 at 490 nm to estimate the carbohydrate concentration and measuring the absorbance at 260 nm for detecting the nucleic acids 21. Proteins were measured at a wavelength of 595nm whereas the molecular weight of LPS was determined according to standard proteins (Pepsin 34.5KD, GTF from Sterpt. pneumonia 58.2KD, Bovine Serum albumin 67KD, Arginine Deaminase 143.548 KD and Catalase 232 KD) which were added to column and the ratio of Ve/Vₒ was determined to the standard proteins and they were used as molecular weight markers. Blue dextran was also used for the determination of the column void volume (vₒ) and Ve/ Vₒ was measured for LPS of Salmonella typhymurium isolate. The logarithm of the molecular weight of each standard protein was plotted to obtain standard curve.

Determination of molecular weight for Lipopolysaccharide:

Determination the molecular weight of lipopolysaccharide was done by gel filtration chromatography using Sphacryl S – 200. Blue dextran 2000 was used to determine the void volume, which is equal to 43 ml. Molecular weight of LPS was estimated for both phenolic and aqueous phases by using standard protein and drawing the relationship between the logarithm of standard protein molecular weight and the recovery volume/ void volume (Ve/Vₒ).

Cytotoxicity of LPS on cell line of breast cancer mcf-7:

The cytotoxic of lipopolysaccharide on breast cancer cell line (mcf-7) was studied by MTT (3-(4,5-dimethylthiazol-2-yl)23). The cells were plated on 96 wells at 37°C for 24 hrs. at a density of 104 cell per well, then add different concentrations of LPS 0, 100, 150,
250, 350 μg/ml for both phenolic and aqueous phases. After 72 hours at 37°C of incubated, the cells viability was determined. The medium was removed by addition of 28 μg/ml of MTT and the cells were incubated at 37°C for an one hour and a half, then the MTT solution was removed. The remaining crystals in the wells were dissolved by adding 100 mg/ml of DMSO (Dimethle Sulphoxoide) and after that incubated by a shaking incubator for 15 minutes at 37°C. The absorption was determined using the ELISA at a wavelength of 492 nm with three repeats per concentration. The inhibition rate was calculated by the following equation:

\[ \text{Inhibition rate} = \frac{A - B}{A} \times 100 \]

where A= control and B= density of the cells treated with LPS.

**Results and Discussion**

*S. enterica serovar Typhimurium* used in current study was isolated from 302 samples included 201 diarrheic patient samples were collected from patients at the Fallujah educational hospital and 101 food samples included poultry meat collected from local markets in Fallujah city.

The results shown there were 19 (6.29%) isolates of *Salmonella* spp. included 7 (36.84%) isolates diagnosed as *S. enterica serovar Typhimurium* depending on evidences of morphological and biochemical characterizations.

**Antibiotics sensitivity of Salmonella species:**

Antibiotics sensitivity for clinical isolates of *Salmonella* was done against eleven antimicrobial agents. The results showed that all isolates were resistance to Rifampin at 100% followed by the Doxycycline at 94.74% while the average resistance of Cephalaxin, Cefotaxime and Cefixime was 42.1%, 42.1% and 52.63% respectively.

Ciproflaxacin, Aztreonam, Imipenem and Amikacine antibiotics were more effective against *Salmonella* isolates with a sensitivity percentage 94.74%, 94.74%, 100% and 100% respectively (figure 1).

Aslo, the results showed that all *Salmonella* isolates were susceptible to Ciproflaxacin except the isolate S259 which appeared multi-resist against different antibiotics.

**Identification of Salmonella isolates using PCR assay:**

Most ten of *Salmonella* isolates resistance to antibiotics were selected for the diagnosis by PCR assay using of *invA*, *STM4497* and *Stn* genes to detect the strains of *S. enterica serovar Typhimurium*.

An attempt was made to localize the gene responsible for the susceptibility of the *Salmonella* bacteria to tissue invasion.

Accordingly these *invA* gene (211bp) were amplified using specific primers with PCR cycler and optimized specific program. The results showed that all the selected strains contained *invA* gene, the specificity primers were agreement with stated 24, 25.

The results identification of *STM4497* (523bp) gene to detect *S. enterica serovar Typhimurium* showed that seven isolates gave a positive result of the presence. The specificity were reported on earlier study by 25, because isolates gave specific bonds to the gene.

Also the gene *Stn* (617bp) was detected, which is encoded for the production of intestinal toxin of *S. enterica serovar Typhimurium* the results showed that three isolates only possessed this gene, which agree with 26, but differed in proportions from the current study.

Also, the 27 diagnosed *S. enterica serovar Typhimurium* by PCR technique using a *fimC* gene.

According to the previous results, The selected organism which used for the extraction and purification of LPS was the most resistant to antimicrobial agents as well as having the three studied genes.

**Extraction of lipopolysaccharide**

The dry weight of selected *S. enterica serovar Typhimurium* isolate was 10.66 mg as the yield of obtained bacterial growth. The method which used to extracted of LPS by hot phenol was depend on 17. determination the concentration of the lipopolysaccharide was done by using the standard glucose curve. The concentration of LPS in the phenolic phase was estimated at 435.57 μg/ml, while the concentration in the aqueous phase was
estimated at 381.76 μg/ml.

Because the phenolic phase contains a large amount of lipopolysaccharide also due to the structure of the LPS which containing a large amount of N and O-acetylated-6-deoxyhexose in the side chain O which are hydrophobic bonds, some researchers have used that method and therefore accumulate LPS in the phenolic phase. So, The distribution of LPS in both phenolic and aqueous phases depends on the important factor which is hydrophilic bond due to formation of side bond O.

Figure 1: Susceptibility of Salmonella species
Partial purification of lipopolysaccharide:

Partial purification of lipopolysaccharide for both of phenolic and aqueous phases were done by gel filtration chromatography to separate of high molecular weight protein and carbohydrates. The parts were read on the wavelength 600 nm with flow rate was 34 ml/hour and the void volume was equal to 43 ml.

The measuring of protein amount was done by collection of forty-five fractions and assessed for both phenolic and aqueous phases at a wavelength of 289 nm whereas the amount of carbohydrate linked LPS was measured at 490 nm (figures 2 and 3). The results showed that there were two peaks of protein large and small one linked to lipopolysaccharide and difficult to separate whereas phenolic phase there was one peak of carbohydrate. While in aqueous phase there were three peaks of protein: two large and small one linked to the carbohydrate and there was one peak of carbohydrate.

Figure (2): Gel filtration chromatography of *S.*typhimurium (phenolic phase) lipopolysaccharide by using Sphacryl S – 200, the column dimensions was (1.5 x 70 cm) and elution was done with phosphate buffer saline pH 7.2 at flow rate 34 ml/h
Determination of lipopolysaccharide molecular weight:

Results for determinate of lipopolysaccharide molecular weight showed that the molecular weight for LPS in phenolic phase was equal to 93325 Dalton and in aquatic phase was equivalent to 71614 Dalton as shown in figure (4) and table (1). The molecular weight of the lipopolysaccharide is based on its structure, such as its dependence on the oligosaccharide in its molecular weight. In addition, there are two types of oligosaccharid (short or long) 30.

The researcher 31 estimated the molecular weight of Lipopolysaccharide to (70794 Dalton). So, this result was close to the results obtained in this study.

Cytotoxicity of LPS on cell line of breast cancer (mcf-7):

Cytotoxicity of the lipopolysaccharide extracted and partial purified from the local isolate S. enterica serovar Typhimurium S259 was tested in an aquatic phase and phenolic phase which was purified for studying its effect on mcf-7 breast cancer cell line (in vitro).

The results obtained that there was a noticeable toxic effect for different lipopolysaccharide concentrations in phenolic and aqueous phase in the growth of cancerous breast cells mcf-7. That effect starts from the low concentration to toward high concentrations when compared with the control treatment for each phase.

Also the results shown ability of LPS extract for each phases to reduce the density of developing cancer cells. And observed a difference of cytotoxic effect for lipopolysaccharide between the phenolic phase and its cytotoxic effect of aqueous phase.

The statistical analysis results of lipopolysaccharide effect in the phenolic phase showed that there were significant differences between the groups of treatments and the control group. Where the fourth group, represented by concentration 350 µg/ml, recorded maximum of significant differences which was (1700±250) over the other groups comparison with control group (table 2).

As well as the figure (5) shown that the killing rate of cancerous breast cells was 61.67% at the highest concentration of lipopolysaccharide. The figure (6) also shown a gradual variation in the inhibition rates.
of lipopolysaccharide in the phenolic phase, where the inhibition levels in the concentrations 100 μg / ml to 250 μg/ml were as the following: 17%, 30.67%, 46.67%, respectively.

The results also showed significant differences in effect of lipopolysaccharide for both phases on cell line of breast cancer mcf-7, as the results showed the highest significant differences of the phenolic phase than aqueous phase in affectivity on the number and shape of cancer cells line.

The results showed in current study that the cytotoxic effect of lipopolysaccharide was evident in the growth of cancer cells outside the living body during 72 hours of exposure for different concentrations of aqueous and phenolic phases when treated with cancer cell line (mcf-7).

Several studies have accorded to the importance of bacterial toxins in treating various cancer diseases by killing or reducing the growth of cancer cells through changing the cellular processes that control the spread, differentiation and programmed death stages (apoptosis) of living cells.

In several studies have been found that lipopolysaccharide has a toxic effect in reducing the density of developing cancer cells, whether in vitro or in vivo through the introduction of the cancerous cell in the stages of programmed death (apoptosis). The researcher indicated that the lipopolysaccharide enhance the programmed death of breast cancer cells in humans, which inhibits receptors known as TLRs (Toll-like receptors) that have been found to be linked to the development of breast cancer.

Figure (4): Molecular weight of LPS for both aquatic and phenolic phases by using gel filtration chromatography (Sphacryl S – 200) the column dimensions was (1.5 x 70 cm) and elution was done with phosphate buffer saline pH 7.2 at flow rate 34 ml/h

Different letters mean significant differences between groups at a probability level (P <0.05) depending on the X² test.

Figure (5): Cytotoxicity of LPS (phenolic phase) in breast cell line (mcf-7)
Also\(^{(34)}\) found that exposing the pancreatic cancer cell line to lipopolysaccharide reduced its growth by approximately 50\% by stopping the process of DNA replication at the G1 stage during the life cycle of the cell.

Another study indicated that lipopolysaccharide can stimulate killing of cancer cell by enhancing the immune response through stimulating transcription of encoded genes of proteins which responsible for releasing cytokines that are associated with cyclooxygenase-2 cyclooxygenase that have a role in inhibiting cancer cells\(^{(35)}\).

The current study were consistent with\(^{(36)}\), where he found a cytotoxic effect of lipopolysaccharide in the cell line of cervical cancer when used in high concentrations and the rate of killing of cancer cells were depended on the concentration of LPS.

The study also agreed with\(^{(37)}\) who found that a cytotoxic effect of lipopolysaccharide on esophageal cancer and oral cells when used high concentrations of LPS.

The results also were agreement with\(^{(38)}\), who analyzed the cytotoxicity of lipopolysaccharides by treating the lung cancer cell line - NCI - H69 with different concentrations, including: 100, 150, 250 \(\mu\)g/ml. His results showed A gradual reduction in the growth density of lung cancer cells. He also found that the lowest density of the cancer cells was 48.88\% at a concentration of 250 \(\mu\)g/ml of LPS extract, which was closed result to the present study.

Among the total metabolic processes resulting from the transformation of the normal cell into a cancerous cell is the formation of Free radicals in large quantities\(^{(39)}\). It is believed that the interaction of free radicals with DNA can cause genetic mutations that increase the risk of infection of cancer.

Addition to the oxidative stress reduces programmed cell death and increases proliferation, and growth of cancer cells\(^{(40)}\). Therefore, lipopolysaccharide may selectively remove free radicals and thus adversely effect on the growth and proliferation of cancer cells. Also, there are some active factors in cancer cells known as the (nuclear transcription factor) that have a fundamental role in organizing the cell cycle by coding about cytokines and other growth factors which necessary for cell life, as the presence of these factors increases the resistance of the cancer cells to chemotherapy, so inhibiting these factors will lead to an imbalance in increasing the density of the
developing cells and thus entering the cell to the stage of programmed death (apoptosis) and improving the ability to treatment of cancer disease 41.

Also, 42 provided the ability of LPS as potential anticancer agent in breast cancer that ability inducing apoptosis and could be used LPS for wide biomedical applications and could be offer new drug instead of chemotherapy in treatment of various types of cancer disease.

**Conclusion**

We concluded from this study that LPS have an obvious cytotoxic effect on the line of breast cancer cells in different concentrations Also, we concluded that the LPS of *S. enterica* serovar *Typhimurium* has cytotoxic properties which can be used in development of drugs for treatment of cancer disease.

Detection of Antiseptic Resistant Genes in Colistin-Resistant Pseudomonas aeruginosa and MDR Klebsiella pneumoniae

Noor S. Hassan1, Mohamed F. Al-marjani2, Nadema H. Hussain3

1Researcher, 2Professor, 3Assistant Professor, Biology Department, College of Science, Mustansiriyah University, Baghdad, Iraq

Abstract

Objectives: The aim of this study was to detect the existence of developments in resistance to biocide of Pseudomonas aeruginosa resist of colistin and in multi-drug resistance Klebsiella pneumonia in the hospital environment. Materials and Methods: The study included 25 isolates of K. pneumoniae and 30 isolates of P. aeruginosa. Isolated from different clinical and environmental samples in Baghdad hospitals. Antibiotic sensitivity tests and their susceptibility to multiple antibiotic resistance and sensitivity tests were studied for the most commonly used antiseptics at the preventive level (benzalkonium chloride). The test was carried out using the micro dilution broth method, following Institution of Clinical and Laboratory Standards guidelines, PCR was performed for detection of blaTEM, blaSHV, blaCTX-M, qacC/D, qacΔE1 and qacE beta lactamase and antiseptic genes. Results: A high rate of multiple resistance to the most used antibiotics was observed, so the rate of resistance to all antibiotics that was used was 16.0% of P. aeruginosa and 4% of K. pneumoniae possesses comprehensive resistance to all antibiotics that were used and the resist of colistin in P. aeruginosa was 36%. The prevalence of ESBLs was 36.0% and 48.0% of Paeruginosa and K.pneumonia respectively, in addition to their strong ability to form biofilms 80% in Paeruginosa and 94% in k.pneumoniae and their ability to resist Antiseptics. The percentage of resistance to antiseptic benzalkonium chloride showed the highest concentration of Paeruginosa was 33.3% and K. pneumoniae 37.5%. The result of ESBL and antiseptic genes detection clarify, the percent of production genes were (10%), (40%) blaTEM; (6.66%), (56%) blaSHV; (33%), (64%) blaCTX-M; (70%), (44%) qacC/D; (80%), (56%) qacΔE1 in Paeruginosa and K.pneumoniae respectively and no any isolate carried qacE gene. production of extended spectrum β-lactamase genes in addition to their strong ability to form biofilms 80% in p.aeruginosa and 94% in k.pneumoniae and their ability to resist an antiseptics. The percentage of resistance to antiseptic benzalkonium chloride showed the highest concentration of P. aeruginosa was 33.3% and K. pneumoniae 37.5%, the result of beta lactamase and antiseptic genes detection clarify PCR was performed for detection of blaTEM, blaSHV, blaCTX-M, qacC/D, qacΔE1 and qacE beta lactamase and antiseptic genes. Conclusion: Our observations indicate that there is a significant correlation between the ability of bacteria to resist multiple antibiotics in addition to their ability to resist the most commonly used antiseptics, due to their physiological nature and increased virulence factors.

Keywords: Antiseptic, Antibiotic Resistant genes, Pseudomonas aeruginosa, Klebsiella pneumoniae

Introduction

Hospital infection represents one of the most common challenges facing health systems in the developed world such as Health Care - Associated Infection (HCAI) as the number of hospitals which acquired infections (HAI) is increasing dramatically worldwide, especially due to the emergence of multidrug-resistant bacteria (MDR). MDR isolates spread is easily observed in hospitals settings, and are seen specially in a patient while under medical care in a hospital or other healthcare facility. This infection can occur during health care provision for other illnesses and even after patients have discharged the disease, an occupational infection may form among medical personnel. There are two types of bacteria that are common in nosocomial and respiratory infections, Klebsiella pneumoniae and Pseudomonas aeruginosa that most often cause human nosocomial infections.
K. pneumoniae and P. aeruginosa have the ability to form biofilm on medical devices, such as catheters and ventilators. In some cases, pneumonia is excessive and very violent and can spread and affect healthy people, causing life-threatening and often community-transmitted infections, along with pyogenic liver abscess, meningitis, necrotizing fasciitis, endometriosis, and acute pneumonia.

Colistin is a perfect antibiotic against Gram-negative bacteria, the most important of which is Pseudomonas aeruginosa. Where it is effective against the outer membrane of bacteria that are negative for the Gram stain, specifically anionic lipopolysaccharide (LPS). Of concern is the high rate of resistance to Pseudomonas aeruginosa to colistin, as this is explained by the bacteria’s possession of two main mechanisms of resistance to colistin in Gram-negative bacteria, mutation and adaptation, as the resistance resulting from mutations is the increase in gene expression on the reflux pumps, Adaptive is the ionic change of the ions components present in the cell membrane.

Antiseptics and disinfectants are widely used in hospitals and other healthcare settings to prevent infection and reduce the chances of contracting diseases and epidemics, despite the widespread use of disinfectants, a high rate of microbial contamination has recently been observed. This may be due to the development of multiple virulence factors and resistance to both antibiotics and disinfectants due to its ability to adapt to the indiscriminate use of near-lethal concentrations of disinfectants.

K. pneumoniae and P. aeruginosa are dangerous micro-organisms, capable of growing on solid, non-porous surfaces, in addition to their possession of multi virulence factors, the most important of which is their ability to form biofilms. There is a wide range of active chemical agents (or “biocides”) in these products, and many have been used for hundreds of years for sterilization, disinfection and preservation.

Biocides have a wider range of effect compared to antibiotics, as antibiotics have specific intracellular targets in addition to their specialization, while biocides have comprehensive and non-specific effectiveness. Nevertheless, the widespread use of disinfectants has led to pathogens acquiring resistance factors that may be common with antibiotic resistance and what is known as cross resistance. It is important to note that many of these biocides can be used alone or with a variety of products, which differ widely in their activity against microorganisms. Antiseptics differ according to their effectiveness towards the vital cell. Some of them target cell membranes, plasma membranes, nucleic acids, or they may be oxidizing agents. Therefore, hospital disinfection has a major role to play in controlling health care-related. Disinfectants play an essential role in controlling infection and preventing the transmission of infectious pathogens in hospitals. The aim of the study is to detection the antiseptic resistance genes and the extent of their prevalence in multidrug resistant clinical and environmental bacterial isolates in hospital.

Materials and Methods

Samples Collection:

Fifty-five samples were collected from clinical and environmental sources, 30 isolates of Pseudomonas aeruginosa and 25 isolates of Klebsiella pneumoniae, initially diagnosed in hospitals. The samples included swabs for burns, wounds, urine, sputum, and swabs from intensive care rooms, operating rooms, main operating rooms, patient halls, and the children’s protection hall, in addition to swabs for fluid withdrawal devices, endoscopes, surfaces and sinks for preterm infants, which were collected during the period from July to October 2019.

Bacterial Isolates:

Primary diagnosis based on morphological characteristic of the colonies that included colony shape, texture, color and edges dependently on bacterial growth on the MacConky agar and blood agar. All isolates were identified using conventional biochemical tests and vitek 2 system.

Antibiotic Susceptibility Test:

The susceptibility of isolates to different antibiotics was tested using the Kirby-Bauer disk diffusion method following the Clinical and Laboratory Standards Institute guidelines. Using antibacterial agents included: gentamicin (GM), amoxi clav (AUG), amikacin (AK), ceftriaxone (CRO), levofloxacin (LEV), deoxycycline (DXC), piperacillin tazobactam (PTZ), ceftazidime.
(CAZ), cefazolin (KZ), aztreonam (ATM), tetracycline (T), cefepim (EFEP) and colistin (CO). The bacterial culture was carried out using Muller-Hinton agar medium (HiMedia, India) and the bacterial suspension prepared with a dilution standard corresponding to the McFarland standard, after which the cultivated plates were incubated at 35 °C for eighteen hours.

Detection ESβLs by using Vitek-2 system:

Detection Phenotypic of ESβLs producing isolates were also done by Vitek-2 system by using sensitivity of antibiotic test Number (AST-GN69) card according to the manufacturer’s instructions.

Detection of Biofilm formation by Micro titer plate assays:

In this study, isolates of *P. aeruginosa* and *K. pneumoniae* were examined for their ability to form biofilms. A micro titer plate was used according to the method described by 17, 18. Twenty μl of the bacterial suspension was taken from an overnight culture to inoculate the micro titer wells containing 180 μl of Brain Heart Infusion (BHI) broth with 1% sucrose. Thus, the control wells which contained 200 μl of BHI broth with the bacterial suspension. Then the micro titer plate was closed and covered with Para film during incubation at 37 °C for twenty-four hours. Unlinked bacterial cells were surely removed by washing the wells three times with PBS (pH 7.2), then kept at room temperature for fifteen minutes in order to dry, then 200 μl of crystal violet (0.1%) was added to the wells for a period of time. Fifteen minutes. After removing the crystal violet solution, the wells were washed three times with PBS (pH 7.2) to remove the unbounded dye and allowed to dry at room temperature, after which 200 μl of 95% ethanol was used for the purpose of extraction. And in Final, the optical density value of each well is deducted by an ELISA reader at 630 nm absorption degree.

Determination of Minimal Inhibitory Concentration (MIC) for chemical antiseptics:

Fill all wells in a 100 μl micro titer plate of BHB, after that 100 μl of activated isolates suspension after adjusting turbidity to 1 x 10^8 cfu / ml as 0.5 McFarland with normal saline is added to the wells in a micro titer plate. and then the detergent concentration is then diluted using the two-prong dilution method until we obtain a series of dilutions with pre-added BHB from high to low concentration distributed in wells (A to H) in wells (1-10). The row of wells A12- H12 is considered as a positive control. Whereas (A11 - H11) which is a passive control. After incubation for 18 hours at 37 °C, add 60 μl of resazurin sodium to each well in the dish and leave it for (2-4) hours in the incubation to observe the color change 19.

Molecular detection of β-lactamase and antiseptic genes using PCR technique:

All isolates were submitted to PCR technique to detection for ESBLs and antiseptic genes; blaTEM, blaSHV , blaCTX-M , qacC/D, qacΔE1and qacE by using Specific primers (table 1) 20. DNA of isolates were extracted by using a commercial purification system (Genomic DNA Purification Kit) and PCR was used to amplify genes. PCR mixture was set up for each gene alone in a total volume of 25 μl included 12.5μl of Go Taq Green Master Mix, 1.5 μl of each primer (10 picomole/ μl) and 4 μl of template DNA. The volume remaining was completed with sterile nuclease free water PCR products were detected by agarose gel electrophoresis. A DNA marker (Promega/USA) was run with each gel, and the genotype was determined by the size of the amplified produce.

Results and Discussion

In this study 55 samples were collected from clinical and environmental sources. All samples were transferred to the laboratory by transport media, then cultured on MacConkey agar and blood agar and incubated for 18-24 h at 37 °C. Then the isolates were diagnosed and confirmed by using a VITEK-2 pressurized system according to the manufacturer’s instructions (Biomerieux / France). The study included resistance of these isolates to antibiotics and antiseptics in addition to their possession of virulence factors and their ability to form biofilms 21. *Klebsiella pneumoniae* is a type of Gram-negative bacteria and can cause different types of health care-related infections. *Klebsiella* infection usually occurs among patients who are receiving treatment for other conditions. Patients whose care requires devices such as ventilators (ventilators) or intravenous tubes for drugs and urinary catheters 22. Patients who take long courses of some antibiotics are more likely to develop a *Klebsiella* infection 23. Antibiotic susceptibility testing was performed *P. aeruginosa* and *K. pneumoniae isolates*, results showed that isolates (36%) of *P. aeruginosa* were resistant to colistin, all isolates were resistant to amoxiclav, tetracycline and doxycycline (100% each). In addition, 46% of the *P. aeruginosa* isolates were resistant to gentamicin and to tazobactam. In *K. pneumoniae*, the percentage of resistance to gentamycin was 20% and to tazobactam 28%. Cefazolin and aztreonam 90% of *P. aeruginosa* and in *K. pneumoniae* rate of resist to aztreonam was 64% and in Cefazolin was 72% and the same percentage that was in the case of cefazidime. And about the resistance rate in the pseudomonas, it was 50%, for amikacin resistance 40% of *P. aeruginosa* isolates and 16% for *K. pneumoniae* isolates, and for levofloxacin resistance was 53% for the *P. aeruginosa* isolates and 36% for the *K. pneumoniae* isolates, and the cefepime resistance was 46% in all isolates. *K. pneumoniae* showed greater resistance to ciprofloxacin 63% in *P. aeruginosa* and 68% in *K. pneumoniae* as shown in the table 2.

During the past decade, observe increasing in rates of antimicrobial resistance has been recognized worldwide,
and an increased frequency of MDR isolates has also been demonstrated in clinical environment samples. Where the term drug resistance was applied to isolates for which no treatment options were available.

It has been observed during this study that the bacteria communities follow different strategies in antibiotic resistance, which may be physiological or genetic. In terms of clinical isolates, they gain resistance to multiple antibiotics due to patients being exposed to long periods of treatment with these antibiotics, in addition to the irregular use and irregular concentrations of these antibiotics, which led to a gradual adaptation of pathogens to generate defenses against them and one of the most important of these methods is refluxes pumps one of the most important means of multiple antibiotic resistance. While isolates taken from hospital environment and medical devices that indicate contamination of the hospital environment and medical devices with microbes have multiple resistance to antibiotics as their resistance to antibiotics varies according to the source of contamination. If the source of contamination is from the soil, which is the home of bacterial isolates where they acquire self-resistance to antibiotics produced by other bacterial types present in the soil, and the other source is medical waste, which is similar to clinical samples that come from infected patients.

In this study, the bacterial isolates showed their ability to produce extended spectrum beta lactamase included (36.0%) of P.aeruginosa isolates and (48.0%) of K.pneumoniae isolates were ESBLs produced. This is in line with the study where included (42.30%) of P. aeruginosa isolates were positive for ESβLs, and in another study by showed that (46.2%) of K. pneumoniae isolates were positive for ESβLs. This is consistent with what we have reached, and in a comprehensive study made by it was shown that (50%) of Klebsiella sp were positive for ESβLs.

P. aeruginosa and K. pneumoniae were from clinical and environmental sources as MDR and have ability to biofilm form biofilm was assessed by a micro titer plate. The results showed that 80% of P. aeruginosa and 96% of K. pneumoniae were production biofilms, The results were consistent with the results of other studies, in study by results showed (85.63%) of P. aeruginosa producing biofilms. We have shown the similar study reported by Hassan and other K. pneumoniae (64.7%) as high or medium productive biofilms and 40 isolates (35.3%) were identified as poorly produced biofilms. Saifi et al. Reported that the majority of K.pneumoniae (93.6%) were biofilms and only 6.4% were not biofilms. The percentage observed of biofilm formation in clinical samples increased significantly compared to environmental samples. These differences in levels of formation biofilm in clinical samples may be the result of repeated use of drugs, also with high period duration of antibiotic treatment, and excessive use of drugs in the animal and poultry industry that is consumed by humans.

It is worth mentioning that the incorrect use of disinfectants and detergents and the increase of mutagenic bacteria in today’s industrial life. As isolation of clinical source has some selectivity in the formation of biofilms, which is related to the presence of proteins necessary for the growth and biofilms formation associated with the outer membrane, and we note that these membrane proteins need time to adapt to the conditions. It can be seen that the surrounding environment conditions provided in the clinical samples are suitable for them and do not need to be adapted.

Antibiotic resistance and biofilm formation among hospital pathogens is a risk that is difficult to eliminate over time. Producing lactamase and spread among bacterial pathogens adversely affects the possibilities of antibiotic therapy, which is worth noting biocides play an important role in preventing and controlling hospital-acquired infections. The lowest antimicrobial agent for the minimum inhibitor concentration (MIC) is usually tested, and the purpose of this test is to study and find out the sensitivity of bacteria to the antiseptic and to know the lowest concentration that may affect them. The results of the study showed the minimum inhibitory concentration (MICs) for Benzalkonium chloride, were 33.3% of *P. aeruginosa* and 37.5% of *K. pneumoniae* isolates had MIC 40000 µg/ml (4% ), whereas 62.5% of *P.aeruginosa* and 50% *K. pneumoniae* isolates had MIC 20000 µg/ml (2% ), while 66.6% of *P.aeruginosa* and 62.5 % *K. pneumonia* isolates had MIC 10000 µg/ml (1%),fig.1

![Figure (1): Dilution to concentration of Benzalkonium Chlorid](image-url)
The emergence of this resistance is related to the ability of bacteria to adapt to these antiseptics through the acquisition of virulence factors represented in the formation of the cell wall and reflex systems, in addition to their acquisition of antiseptic resistance genes, which may have close relationship with the antibiotic resistance genes, and this resistance has increased specifically in the recent times. by using disinfectants with near-fatal concentrations of the microbe, it gave the opportunity to coexist and develop for resistance and survival.

By using PCR The results of detection of extended spectrum β-lactamase and antiseptic genes showed the presence of qacΔE shows in (80%) of P.aeruginosa and in (56.0%) of K.pneumoniae isolates; qac C/D shows in (70.0%) of P.aeruginosa and in (44.0%) of K.pneumoniae; bla _CTX_ in (33.0%) of P.aeruginosa and in (64.0%) of K.pneumoniae isolates; bla _SHV_ in (6.66%) of P.aeruginosa and in (56.0%) of K.pneumoniae ; bla _TEM_ shows in (10.0%) of P. aeruginosa and in (40.0 %) of K.pneumoniae and no any isolate carried qac E genes, as shown in the table 3.

In a study conducted in Iraq by revealed that all _P. aeruginosa_ isolates (100%) carry bla _CTX_. Bokaeian et al stated that the percentage of bla _TEM_ gene was (100%) in _P.aerugenosa_ Iran . Mohamed et al reported that (90%) of _K.pneumoniae_ isolates carried bla _TEM_ and bla _CTX_ genes respectively in Egypt, and another study was conducted in Egypt, and reported that the percentage of bla _CTX-M_ is (53.3%) in _K. pneumoniae_ isolates in a. The study by found that the percentage of the bla _TEM_ gene is 71.7% and the bla _CTX-M_ gene is 99.2% in _K. pneumoniae_ isolates. Excessive, semi-fatal and intense use led to the emergence of bacterial isolates that are clearly resistant to the dangerous concentrations of disinfectants that are not only resistant to antibiotics. Special genes responsible for host activities such as multiple flow systems and the possibility for these genes to be transmitted between bacterial strains through direct contact or via mobile plasmids.

Hilal et al. revealed that qacEΔ1 and qacE gene replication and their association with antibiotic and biocide resistance in _Pseudomonas aeruginosa_ isolates in Egypt. It was found that the percentage of qacE1 gene was 57.8% in MDR isolates and 13.4% in bacterial isolates. Sensitive to several drugs, while the secreted mucilage was only present among the multidrug-resistant _P. aerugenosa_, while conducted by Amazonian 2014 in a study Maliocytes by , the percentage of quaternary ammonium complex resistance genes (QACs) in _P. aeruginosa_ was (14.28%) Contained the qacC / D gene while the qacEΔ1 gene was 100%

In another study by , the qacEΔ1 gene was detected in 48% of an isolate. Eighty-eight percent of the poly-resistant isolates carried the qacEΔ1 gene, while 35% of the non-resistant isolates were positive for this gene, and multiple resistance was well correlated with its presence.
Among the isolates tested, more than one study has been reported on *K. pneumoniae* by And Abu Zayd and Ames in the UK showed that susceptibility to disinfectants was decreased due to the presence of the *qacΔE1* and *cepA* genes.

**Conclusion**

Our observations indicate a significant correlation between the ability of bacteria to resist many antibiotics in addition to their ability to resist the most common antiseptics due to their physiological nature and increased virulence factors, noting the high incidence of *Pseudomonas aeruginosa* against colistin and the emergence of multiple antibiotic resistance isolates of *Pseudomonas aeruginosa* and *Klebsiella Pneumonia* and high incidence of genes responsible for beta-lactam resistance and antiseptic resistance.

Malaysia

Abstract

In order to achieve phytoremediation during agricultural production, it is essential to identify high genotypes that are able of accumulating many types of heavy metals not in the edible parts which have significant nutritional value but in the non-edible parts. This study conducted to estimate the heavy metal ATPases 5 (HMA5), Phytochelatins synthase (PCs) and metallothionein 2 (MT2) genes expression in plant *Vicia faba* in response to an elevated concentration of copper and zinc in nutrient media. Using Quantitative Real-Time PCR (RT-qPCR) technique, the results of hydroponic culture methods with high concentrations of copper (75 µMol / L) and high concentration of zinc (500 µMol / L) showed high expression level for the three genes of *Vicia faba* plant compared with control. Established that the expression of the genes under the influence of copper ion was higher than the expression under zinc ion influence. Besides that, gene expression increased with increased exposure time to zinc ion, also in the case of copper ion exposure time, all genes expression slightly increases with increased exposure time. In response to excess copper and zinc, an increase in the expression of genes (HMA5, PCs and MT2) involved in plant protection, providing the possibility of its transfer from the cytosol to the apoplast demonstrate that this plant might be useful for phytoremediation of moderately polluted areas with copper or zinc.

Keywords: *Vicia faba*, HMA5, PCs, MT2, copper, zinc, RT-qPCR.

Introduction

Heavy metals can be a major problem for different organisms as may be reactive with several chemicals essential to biological processes. Many chemical and physical methods were used for soil reclamation and remediation, however, these techniques usually required high maintenance costs and may lead to secondary pollution.

Absorption and transportation are crucial mechanisms of plant tolerance to heavy metals which can be performed by heavy metal-associated isoprenylated protein (HMA). The phytochelatins (PCs) are also linked to metalloids with heavy metals to produce PC-metal complexes which are very stable and have less toxicity rather than free metal ions present in the cells. Under natural conditions, PCs are actively involved in the degradation of various glutathione conjugates in comparison to other metalloids. Metallothioneins (MTs) bind to different metal ions due to high affinity of the sulfur molecule in the thiol group of cysteine and exert a major role in the detoxification of heavy metal stress.
In the Mediterranean Basin and Arab countries, Faba bean (Vicia faba) considers as one of the most important legume crops, which is an efficient nitrogen fixer. Faba bean is a plant that had the ability to grow in various climatic zones. Additionally, it can be consumed throughout the year, as it can be utilized in both raw and processed forms. For a human, it is mostly the seed grain that is consumed, whereas the pods are used as animal feed. The plant pods have micro and macro compounds, however, they can a good source of functional phytochemicals. The nutritional importance of Faba bean is lying behind a prominent high protein that offers a valuable amount of energy. This legume plant has also therapeutic potentials as it provides the precursor to a drug used in Parkinson’s disease treatment. Parts of faba bean plants and its processing products such as grains, hulls, and flowers considered as good source of fiber and non-nutrient secondary metabolites which could be salutary to human health. Many reports showed that high protein foods particularly animal-based have a high probability of causing intestinal problems in the long term of use, especially cancer, due to a lack in antioxidant compounds and an abundance in dangerous metabolites. Enhancements of the quantity and quality of food proteins could be done by a combination of legume plants such as faba bean with different plant-based foods. The consumption of faba bean seeds provides some essential amino acids required for normal growth and repair of damaged tissues. Further research that can lead to a reduction in the current extent of yield variability is needed, thus faba bean may prove to be a key component of future arable cropping systems where declining supplies and high prices are likely to constrain the affordability and use of fertilizers. As the development of food production is in continuously processes, and due to environmental and dietary beneficial of faba bean, it could be grown in the market within the next years, and become economical and valuable agricultural products such as soybean.

Recent studies indicated the ability of Vicia faba to tolerate the elevated concentration of heavy metals such as copper. The metal translocation in plants mainly depends on plant species and type of metals. Negative effect of oxidative stress may results either from the increased concentration of essential metals (micronutrients) like Zn, Cu and Ni or nonessentials such as Pb and Cd. Heavy metals are common soil pollutants. Therefore, the effectiveness of plant defense system (antioxidants) in plants should be crucial to clarify the mechanisms of plant tolerance to heavy metals. Production of tress concentration of different metabolites, such as amino acids (prolin, ascorbic acid and histidine) and peptide (e.g., glutathione GSH) or phytochelatins (PC), could be essential for the mechanisms of defense against heavy metals effects. These low molecular weight antioxidants detoxify oxygen free radicals. Also formation of metals nontoxic complexes by binding with nonprotein compound but rich in -SH groups which is an important factor to perform plant’s tolerance to heavy metals ions.

Based on the above and due to the importance of Faba bean in detoxification of heavy metal ions, this work conducted to investigate the expression of HMA5, PCs and MT2 genes in plant Vicia faba.

**Material and Methods**

**Treatment of seeds**

Local Faba bean seeds were disinfected by washing thoroughly with tap water for 15 minutes, sterilized with 2 % v/v sodium hypochlorite (Clorox) for another 15 minutes and then washed extensively with sterilized distilled water.

**Sowing and cultivation the initial stage of seedlings**

Disinfected seeds were sown on the surface of moist perlite in plastic containers (40 cm x x 30 cm x 8 cm) with holes at the bottom, placing the container on a tray. To maintain the desired humidity the top of the container closed with a glass plate and removing it only after sprouting.

**Seedlings replantation in hydroponic system**

At the age of 14 days, the plants removed from the perlite by using a spatula without damaging the roots. Then the roots washed in a small volume of water to remove the perlite particles. The plants are then cultivated in 1-liter pot, at a rate of three plants per pot. Aeration and mixing of the nutrient solution carried out by a continuous and uniform supply of air. In water culture plants grown in a growth chamber at the temperature range of 23-25 / 18-20 °C (day/night), 16:8 h light: dark photoperiod. For growing in hydroponic, an MS
medium was adopted \textsuperscript{29,30} and pH adjusted to 5.8.

Experimental conditions

In the experiments used 5 to 6-week old plants with 3-4 fully developed leaves. Exposure started by the introduction of CuSO\textsubscript{4} to the culture medium at concentrations of 75 µMol \textsuperscript{18} and ZnSO\textsubscript{4} at a concentration of 500 µMol \textsuperscript{31}. Changing the culture medium performed every 5 – 7 days. As a control, plants grown on standard MS medium.

Gene Expression Study

Gene expression for \textit{HMA5}, \textit{PCs} and \textit{MT2} genes were determined using RT qPCR technique by comparative Ct values of specific amplification for each gene to measure the level of gene transcription (mRNA level) \textsuperscript{32}. The Ct of 18srDNA was used as an endogenous control for calibrating the Ct values of other genes \textsuperscript{33}.

RNA Extraction

Total RNA was extracted from the 5gm of fresh leave tissue (after 1 and 2 weeks of exposure to heavy metals) with the use of TRIZOL® reagent (Invitrogen, USA) according to the manufacture’s protocol. For lysis, 1 ml of Trizol solution was added to each sample. For three phases separation, 0.2 ml of chloroform was adding then tubes centrifuge for 10 min at 12000 rpm. RNA samples then concentrated using isopropanol followed washing using 70% ethanol. Finally, RNA pellet diluted using nuclease-free water. Quantus Fluorometer (Promega, USA) was used to determine the concentration of extracted RNA. For 1 µl of RNA, 199 µl of diluted QuanutyFlour dye was mixed. After 5 minutes of incubation at room temperature in a dark place, RNA concentration values were detected.

Quantitative Real-Time PCR (RT–qPCR)

All RT-qPCR studies were designed to comply with the minimum information for publication of quantitative real-time PCR experiments (MIQE) guidelines where applicable or practical. RT-qPCR reactions were carried out with a mic real-time PCR system using GoTaq® 1-Step RT-qPCR System (Promega). Each 10 µl reaction volume contained 1 µl of RNA, 5 µl (2X) GoTaq® 1-Step RT-qPCR, 3 µl dH2O, and 0.5 µl (10 µM) of each primer. The sequences of the selected genes were found in the American National Center for Biotechnology Information (NCBI, www.ncbi.nlm.nih.gov) nucleotide sequence database. The selection of primers for the coding part of the target genes was carried out using the VectorNTI 9.0.0 program. The primer designed to amplify mRNA from:

\textbf{HMA5}, \textit{5-GACAACGACGATTCTCTGAGTAA-3}

\textbf{F:} 5-TAACACAAGCAGCACAAGTCAT-3,

\textbf{PCS}, \textit{F:} 5-ATCAGACCACCATTGACGACTT-3

\textbf{R:} 5- GAACTCACAAGACGAGGAACATCT-3,

\textbf{MT2}, \textit{F:} 5-GTCTTGCTGTGGAGGGAAACTGT-3

\textbf{R:} 5- GGGTTGCACTTGCAGTCCAGAT-3)

\textbf{18s rRNA} gene as endogenous control, \textit{F:} 5-GAGTGATGTGCCAGACCTAGGAATT-3

\textbf{R:} 5- ATGCTGATCCCGGATTACAGC-3.

The reaction conditions included cDNA synthesis step of 37°C for 15 min. followed by an initial denaturation step of 95°C for 30 s, 40 cycles of 95°C/20 s, 60°C/30 s and 72°C/30 s. The dissociation curve was obtained by heating the amplicon from 65 to 95°C. A non-template control was also included for each gene. The primer annealing temperature was calculated using the Vector NTI Suite 9 program \textsuperscript{34}.

Results

The genes expression at the transcription level was evaluated by estimating change in folding level of mRNA transcripts using the RT-qPCR technique (Table 1).

Folding = $2^{-\Delta\Delta Ct}$

$\Delta Ct = Ct (gene) - Ct (control)$,

$Ct = (\text{gene value from RT qPCR}) - (\text{18sRNA value from RT PCR})$.

The expression activity assessed at the level of the total content of individual transcripts at 7 and 14 days of growing plants in MS media with a high concentration of CuSO₄ and ZnSO₄ separately as compare with plants that grow without heavy metal stress as control.

Copper vs. zinc as stress type

Results shown in Fig.1 indicate that HMA5 gene exhibited a constant activity, and its expression was significantly higher in response to copper than zinc ions. On the other hand, PCS and MT2 gene exhibited a varied activity, and its expression was slightly higher under the influence of copper than zinc.

HMA5 vs. PCS and MT2 as the investigated genes

Results shown in Fig.1 indicate that HMA5 gene exhibited a constant activity, and its expression was slightly higher than other two genes (PCS MT2) under influences of copper and zinc at the 1st week and the 2nd week of exposure.

1st vs 2nd week as exposure time.

HMA5 gene exhibited a constant expression enhanced with longer exposure to copper and zinc, that the expression level increased significantly with increased exposure time. While PCS and MT2 genes showes increas in gene expression under influence of copper and zinc comparing with control but there were no significant diffrenece between the level of expression at different exposure time (Fig.1).
Discussion

The resistance of *Vicia faba* plant to the toxic effect of copper and zinc ions could be related to changes in the expression of *HMA5*, *PCs* and *MT2* genes that involved in the regulation of intracellular homeostasis of the plant.

The obtained results showed that in all tested samples, the differences in the expression of the studied genes under the different heavy metals influence are mild. At the same time, manifested activity with an excess of heavy metals in the medium confirms their participation in the protective reactions of the investigated plants. This applies to the participation of membrane transporter gene *HMA5* and the chelation of copper and zinc ions with the participation of phytochelatin synthase gene (*PCs*) and metallothioneins genes (*MT2*) carrying the excess copper and zinc ions from the cell to the extracellular space (apoplast). The activation of expression of these genes encoding a chelation and membrane transporter, transferring excess copper or zinc from the cytosol into the cell wall, where its detoxification is carried out by binding with pectins and hemicellulose. Activation of these genes expression in leaves of *Vicia faba* plants may be one of the reasons for the increased resistance of *Vicia faba* to the toxic effect of excess copper or zinc in the medium. This can serve to protect the plant from the toxic effect of increased content of CuSO₄ in the medium.

Conclusions

The increased activation of *HMA5*, *PCs* and *MT2* genes expression may indicate the formation of stress-protective mechanisms of plants from the toxic effect of high concentrations of copper ions in the environment.

Under the influence of excess copper or zinc, an increase in the expression of genes involved in plant protection was established, providing the possibility of its transfer from the cytosol to the apoplast *HMA5* which exhibit a higher expression level than *MT2* and *PCs* genes.

*Vicia faba* plant is potentially useful for phytoremediation of moderately polluted areas with copper or zinc ions.

Detection of Tn916 Conferring Tetracycline Resistance in Clinical Isolates of *Streptococcus pyogenes*

Hameed M. Jasim¹, Abbas Aboud Farhan², Hanan Raheem Hassooni³, Adil Hassan, Alhusseiny⁴

¹Professor, College of Biotechnology, Al-Nahrain University, Baghdad- Iraq, ²Professor, Faculty of Education for Pure Science, Diyala University, Diyala- Iraq, ³Lecturer (Ph.D), Faculty of Education for Pure Science, Diyala University, Diyala- Iraq, ⁴Professor, Faculty of Medicine, Diyala University, Diyala –Iraq

Abstract

Background: During the past twenty years, tetracycline resistance average has increased in *Streptococcus pyogenes* in many countries. Pneumococcal resistance to erythromycin and tetracycline is associated with the insertion of the *erm*(B) into the transposons of the Tn916 family. To get datum that may be beneficial in resolving the diffusion of antimicrobial resistance, therefore, we can be specified antibiotic resistant genes and their corporation with mobile genetic elements. This study was proceed to explore the genetic regulation of Tn916-carrying *tet*(M) in clinical isolates of *S.pyogenes*. Methods: A twenty two of *S.pyogenes* isolates were assemble from patients suffering from upper respiratory infection, and the susceptibility of these isolates to tetracycline antibiotics was examined. Molecular detection of Tn916 was carried out by employ certain primers to amplify *tet*(M) gene in each isolates.

Results: The results appeared that the resistance of the tetracycline group was 68.1%, 54.5%, 36.3% and 31.8% for minocycline, tetracycline, oxytetracycline and doxycycline, respectively. Genetic analysis showed that Tn916 was detected in eight of the *S.pyogenes* clinical isolates resistant to tetracycline. Conclusions: Our findings suggest that clinical isolates of *S. pyogenes* harboring a copy(s) of Tn916 conferring tetracycline resistance. One possible explanation for resistance to tetracycline in these isolates is due to *tet* gene, which was most likely located on Tn916.

Keywords: Tn916, *S.pyogenes*, Transposable elements, Antibiotic resistance .

Introduction

*Streptococcus pyogenes* is the major human morbid connected with topical or systemic invasion and post-streptococcal immunologic disorders ¹. These bacteria colonize the throat or skin and cause several purulent infections ²,³. In addition, it may be stimulating autoimmune diseases ⁴. Increased levels of antibiotic resistance were reported in *S.pyogenes* in

many countries, particularly among groups includes (MLSB, β-lactams, Aminoglycosides, Tetracyclines and Sulfonamides) causing a problem of treatment failure in patients with these bacteria ⁵. In *S.pyogenes*, the prevalence of *tet*(M) may be dissected by this gene that is carried by “conjugative transposons” like Tn916 or by composite construction like Tn3701, which can in full swing translocate from chromosome to anther ⁶,⁷. Tn916 family, is a prototype of “conjugative transposons” widely dispersed in gram-positive streptococci, Tn916 was first detected in chromosomal DNA of *Enterococcus faecalis* strain DS16 ⁸. All transposable elements relationship to this family include the tetracycline resistance determinant *tet*(M), either solo such as Tn916 and Tn5397, or linked with another genes

such as Tn6002, Tn6003, Tn3872, and Tn1545. Based on the above, to the importance of Tn916 in pervasion tetracycline resistance among bacterial, this study was strived to find the presence of transposable element in S. pyogenes.

Material and Methods:

Bacterial Isolates Identification:

Swab was collected from adults and children complain from upper respiratory infection Diyala, Baghdad and Erbil-Iraq, and Beirut Medical Center in Beirut-Lebanon for the time from January/2018 to April/2019. These samples were cultured on β-Selective Streptococcus agar medium (β-SSA), and the growing colonies were identified later by colonial morphology, gram staining, and biochemical tests (catalase test, blood hemolysis test, and bacitracin sensitivity test), furthermore bacterial isolates suspected to be S. pyogenes were identified by using Vitek-2 system and finally by molecular method.

Susceptibility testing:

Susceptibility of the versus Tetracycline, Minocycline, Doxycycline, and Oxytetracycline was checked, by virtue of to the disk diffusion by the Kirby-Bauer method.

Amplification experiments:

Amplification of tet(M) gene of Tn916 was performed by using specific primer

O6: 5’-GGTACTTGAAAGAACGGGAG-3’  and TETM11: 5’

TTCACCTTAGTATTTTCCACTG-3’

The dehydrated primer was solving in distilled water to reach a concentration of 10 picomole/μl. The amplification conditions began with primary and secondary denaturation at 95 °C, the first continued for 5 minutes, and the second continued for 30 seconds during which 30 cycles of denaturation were made. The other stage of amplification was the annealing process at 61 °C, which took only 30 seconds; the last stage was the initial and final extension process at 72 °C. The first took one minute, and the final one lasted for 7 minutes. Then PCR products were run by use electrophoreses technique.

Results and Discussion

Ninety-three bacterial isolates were obtained from clinical samples collected from pharyngitis, tonsillitis, and otitis cases from patients of different age groups and gender. All samples were cultured on β- selective Streptococcus agar and blood agar base supplemented with 5% of fresh human blood for determining the agricultural characteristics of colonies, then identified by using Vitek-2 system. Results of isolation showed that 93 bacterial isolate were characterized, among them 22 were identified as S. pyogenes. The prevalence of these isolates among clinical isolates is shown in figure (1).

Figure (1): Prevalence of S. pyogenes among clinical sources

Susceptibility of S. pyogenes isolates to tetracycline’s antibiotics was determined.

The results illustrated in figure (2) that resistance in the tetracycline group was 68.1%, 54.5%, 36.3% and 31.8% for minocycline, tetracycline, oxytetracycline and doxycycline, respectively. These resistance is consequent to the presence of tetracycline resistance gene tet(M) carried by Tn916, which mediates tetracycline resistance by the tetracycline-minocycline or tet(M) gene coding for tetracycline inactivating enzyme play a role in bacterial resistance to tetracycline, and that’s explains the tetracycline resistant phenotype in these isolates. However, one isolate symbolized H1 was sensitive to tetracycline, which may refer that this transposon harboring a silent copy of tet (M) as mentioned by Montanari et al., 13. Resistant isolates may presented tet (M) promoter that resulted in an increase
in the gene transcription thus causing a higher level of resistance as mentioned by El Moujaber et al., 14.

Figure (2): Percentage of tetracycline resistance among S.pyogenes isolates

International, many studies have indicated to rise in antibiotic resistance rate between S.pyogenes in tetracycline group 15. It seems clear that resistance significantly varies between geographical regions and time period variation, as well as, the increased use of antimicrobials, especially when misdiagnosing the disease, using unnecessary antimicrobials, or due to the irrational use of antimicrobials, as well as irregular consumption 12, 16.

Detection of Tn916

Tn916 is a conjugative transposon (or integrative conjugative element ICE) which was originally isolated from Enterococcus faecalis DS16 8. All transposable elements relationship to this family include the tetracycline resistance determinant tet(M), either solo such as Tn916 and Tn5397, or linked with another resistance genes such as Tn6002, Tn6003, Tn3872, and Tn1545 9.

In this study, Tn916 was detected in the clinical isolates of S.pyogenes by amplification of genomic DNA using specific primer (O6/TETM11), this primer targeting tet (M) gene carried by Tn916. Results explain in figure (3) appeared that there is an amplified product of 620bp shown the being Tn916 in eight isolates (36.3%) of S.pyogenes. All of these isolates are resistant to tetracycline. These findings are similar to those results detects Tn916 in S.pyogenes using the same primers 17. Resistant isolates may presented tet(M) promoter that resulted in an increase in the gene transcription thus causing a higher level of resistance 14. The results indicated that there was an isolation (symbolized H1) which was sensitive to tetracycline even though it contained a copy of Tn916 which indicates that this copy may be silent.

Moreover, results appeared that there are other eight isolates shown resistant for tetracycline, but they don’t have Tn916 which indicate that may be a chromosomal or plasmid copy of the tetracycline resistance gene, or cause by to another thematic tetracycline gene carried by other form.

Figure (3): Detection of Tn916 conferring tetracycline resistance

Prevalence of Tn916 among clinical isolates of S.pyogenes was illustrated in figure (4). Tn916 was prevalent in 7 out of 8 (87.5%) throat culture isolates and 1of 8 (12.5%) ear isolates. From these data, we conclude that Tn916 represents a specific element, which is more likely to occur in clinical S.pyogenes isolates.
Figure (4): Clinical sources of isolates and percentage of Tn916

Effect of Soft Cheese in Reducing of Lipid Profile and Liver Enzymes for Rats with Fat Disorder

Hiba Sabah Elttayef¹, Mohammed Ahmed Jassim²

¹Post-Graduate, ²Associate Professor  Department of Food Science, College of Agriculture, Tikrit University, Tikrit, Iraq

Abstract

Aim: This study was designed to determine the impact of soft cheese upon total cholesterol (TC), triglycerides (TG), low-density lipoprotein cholesterol (LDL), high-density lipoprotein cholesterol (HDL), very low-density lipoprotein cholesterol (VLDL) and the efficacy of liver enzymes AST, ALT, and ALP in hyperlipidemia experimental Sprague-Dawley rats.

Materials & Methodology: Rats were divided into five groups (six rats each), healthy control group, hyperlipidemia control group, and three hyperlipidemia groups were fed on regular soft cheese (T1), cheese supplementation with probiotics (T2), and cheese supported with Nigella sativa L (T3). Following 28 days, Result: the results revealed a significant decrease (p<0.05) in total cholesterol in groups of rats that were feeding on chees T1, T2 and T3 (179.83, 138.71 and 135.06 mg/dl, respectively) compared to hyperlipidemia control group (250.98 mg/dl), T1, T2 and T3 groups showed a significant decrease in LDL levels (153.45, 104.39, 97.47 mg/dl respectively) compared to hyperlipidemia control groups (246 mg/dl). However, an increase of HDL levels were noticed in the same groups in contrast, T3 group revealed significantly decreased in the liver enzymes (28.45, 67.29, 98.16 IU/L) of ALT, AST and ALP respectively compared to hyperlipidemia control group (41.27, 88.35, 108.72)IU/L respectively.

Key words: soft cheese, probiotics, Nigella sativa L, lipid profile, liver enzymes, hyperlipidemia

Introduction

Cheese has known since prehistoric times, and it is believed, according to some ancient myths and recent archaeological discoveries, that the discovery of cheese occurred by chance by an Arab merchant who was transporting milk in containers made of sheep’s stomachs and crunches in the climatically warm Arab desert, which helped in the occurrence of milk cheese due to the effect of rumen and stomach enzymes, Then the cheese industry was moved from the Arab countries to Europe and various parts of the world¹. In the field of functional cheese production, it has produced many types of therapeutic benefits, as cheese is characterized by being a mild acid product and this accomplishes two purposes. The first is acceptance of acidic products and the second is increasing of the protection for improving micro-revitalization of health that is generated from fermented milk products such as yogurt. Therefore, the attention is drawn to cheese production that contains optimizing microbes². Medicinal plants are importance in many areas, including therapeutic, complementary, preventive and nutritional medicine. They contain many active constituents that are produced by the plant to accomplish many biological functions³. Among these medicinal plants is the Nigella sativa L., which is one of the most important medicinal plants used in direct medication or after extracting of the effective compounds for manufacturing drugs, and has been used to prolong the preservation of soft cheese⁴. Recent studies have pointed the role of probiotics, such as Bifidobacterium, Lactobacillus acidophilus, and Medicinal herbs, especially Nigella sativa L., which have a role in reducing heart disease risk⁵, The role of soft cheese fortified with black seed in reducing lipid profile and liver enzymes, and attributed the reason to that to effective compounds such as thymoquinone in black seed seeds⁶. That the consumption of Probiotic reduces blood fats due to the production of Hydroxy methyl-glutartete by lactic acid bacteria, which inhibits the enzyme glutaryl-CoA-Hydroxy methyl reductase⁷. This study aims to find out the effect of soft black bean-fortified functional cheese or probiotics on lipid profile and some liver enzymes in rats with hyperlipidemia.
Materials & Method

Probiotics: obtained from the Department of Food Sciences - College of Agriculture - the University of Baghdad in the form of a lyophilic in a tightly closed vial and included Lactobacillus acidophilus, Lactobacillus plantarum, and Bifidobacterium infantis.

*Nigella sativa L*: Nigeria Sativa seeds were obtained from the local markets of Samarra and their quality has been confirmed by the faculty members in the Field Crops Department.

Manufacture of cheese: The milk was divided into three groups. The pasteurization process was carried out on the three groups and the cheese was manufactured by following the steps mentioned 8. The following is done by pasteurizing the three groups with a temperature of 65°C for 30 minutes, after which the milk is cooled to a temperature of (45) °C and the thrombus was divided into three sections, the first without any treatment, and cheese was considered a control treatment (T1). As for the second part, it was added to it the black bean powder, and the treatment was considered (T2), and the third section was added to it with biological enhancers, and the third treatment was considered (T3) 9.

Experiment Animals: The experiment was conducted at the animals house of the College of Veterinary Medicine / Tikrit University, where 30 male rats (*Rattus norvegicus*) from the Sprague-Dawley strain at the age of 2-3 months and weights ranged between 205-215g. The experiment conditions were unified for all animals, where the room temperature was set between (23-25)°C by the use of an air conditioner, and the daily light period was 12 hours by the use of two fluorescent lamps, and the humidity rate was about 50%. Food and water were provided daily (*adlibitum*).

Standard meal preparation: The standard meal was prepared according to the 10 to contain (158.5 g casein / kg, 100 g glucose / kg, 50 g cellulose / kg, 100 G / corn oil / kg, 5 g multivitamin mixture / kg, 50 g mineral salts mixture / kg and 536.5 g grown / kg). Distilled water was added to the mixture to make a cohesive dough and to form the appropriate pieces to feed the rats, then placed in flat stainless steel utensils and dried in an oven at a temperature of 50°C through the hot air stream until the completion of drying and then packed in polyethylene bags and stored in the refrigerator when Temperature (2 ± 5) °C.

Preparing a high-calorie diet: The high-calorie diet was prepared using 11. the high-calorie diet of rats was prepared from previously prepared weighted food and then supplemented with fats (20% of hydrogenated fats and 5% of animal fats).

Design of experiment: The experiment animals were randomly divided into five groups, each group consisting of six animals. The animals were fed free for 28 days.

1-First group (negative control): these animals were left intact and fed on a standard diet only while continuing to give water for the duration of the experiment.

2- The second group (positive control): it was fed on a high-calorie diet (a fatty diet) for the duration of the experiment while giving distilled water of the experiment.

3- The third group (T1): It was fed on a fat diet in an amount 50% with soft cheese amount 50% for the duration of the experiment.

4- The Fourth Group (T2): It was fed on a fat diet in an amount 50% with soft cheese supported *Nigella sativa L* of amount 50% for the duration of the experiment.

5- The Fifth Group (T3): It was fed on a fat diet in an amount 50% with soft cheese supported probiotics amount 50% for the duration of the experiment.

Biochemical tests: After the end of the experiment period, the rats were prevented from food for approximately 12 hours Fasting, the animals were then drugged with chloroform, then blood was drawn directly from the heart and placed in test tubes that do not contain the substance (EDTA) and was left for about a quarter of an hour in a water bath at a temperature of 37 °C. Serum was then obtained by Centrifuge at 3000 rpm for 15 minutes and preserved at -20°C. until tests were conducted that included estimating total cholesterol, triglycerides, high-density lipoproteins, low-density lipoproteins, very low-density lipoproteins, enzyme Alanine transaminase (ALT), Aspartate aminotransferase (AST) and alkaline phosphatase (ALP) has been estimated were determined in animal serums only according to the method 13.
Statistical Analysis: The results of the experiments were analyzed using the Linear Model General to study the effect of factors on the complete random design CRD and to determine the significance of the differences between the averages of the factors affecting the characteristics studied at the level of (p≤0.05).

Results and Discussion

The effect of functional soft cheese on the weight of the animal: Table (1) shows the effect of feeding a standard diet, a cholesterol-rich diet by 2%, a cholesterol-rich diet, with rats fed daily with 50% of the T1, T2, and T3 treatments, and a diet rich in cholesterol only, as the effect of different diets is observed on the daily and final weight increase between groups. Rats after 28 days of feeding showed that the daily weight of the rat's group that fed on a standard diet was reached to 0.133 g/day, while the final weight was increased to 3.74 g.

</tbody>
</table>

The numbers in the table express the mean values of the mean standard deviation. Different letters in one column indicate significant differences (p <0.05) between study groups.

The results show that the highest daily increase has appeared in rats feed on a diet rich in cholesterol, with an average daily increase of (0.815)g/day and the final weight increase is (22.83)g, while the average daily weight increase in the members of the rat’s group fed a diet rich in cholesterol and fed by treatment T1 reached (0.268) g/day and the final increase is (7.53) g while in the rats fed a rich diet cholesterol and fed by treatment T2 (0.302)g/day and the final weight increase is (8.48) g/day. The weight increase in the average weight of animals consuming diets rich in cholesterol is the result of the high concentration of both cholesterol and triglycerides as well as the increase in low-density fats. This increase is normal as a result of animal feeding on cholesterol. The increase in treatment T1 is due to the influence of cheese proteins and this is consistent with what found, which indicates that cheese proteins are an important source of amino acids that are of great importance in building protein in the body, in particular the amino acid leucine. It also leads to more muscle adaptation to exercise and contraction for the purpose of bodybuilding. The increase in treatment T2 was due
to the black bean containing carbohydrates, fats, and proteins. The reason for the lower weight of the rats in treatment T3 is the degradation of subcutaneous fat tissue due to the feeding of the rats with vital boosters.

The effect of functional soft cheese on the lipid profile parameters: Table (2) shows the occurrence of significant changes (P ≤ 0.05) in biochemical tests of experimental groups. The total cholesterol level in the affected animal group increased to (250.98) mg/dl compared to that in the healthy control group (108.11) mg/dl, while the treatment with T1, T2, and T3 showed a significant decrease in the cholesterol level (179.83, 138.71 and 135.06) mg/dl, respectively. The results of the biochemical analysis also showed a significant decrease in the level of probability (P ≤ 0.05) in the level of high-density lipoproteins for the affected group to reach (44.16) mg/dl compared to the healthy control group that reached (59.0) mg/dl. While it was observed that HDL-C in groups of infected animals treated with T1, T2, and T3 treatments increased significantly to (52.56, 55.39 and 57.20) mg/dl, respectively. Also, a significant increase in the level of low-density lipoproteins is observed for the group of infected animals, which amounted to (246) mg/dl compared to the healthy control group which reached (64.71) mg/dl. While a significant decrease was observed for the level of LDL-C in the blood serum of animals fed by the three treatments to record (153.45, 104.39, and 97.47) mg/dl, respectively.

This increase may be due to an increase in the cholesterol acyl transferase enzyme activity, which is responsible for absorbing cholesterol that stimulates when insulin deficiency is caused by oxidative stress that affects pancreatic beta cells by the effect of the active oxygen classes, thus increasing the level of cholesterol absorption from before the intestine. The results also showed a significant decrease in the total cholesterol

concentration in the serum of T2 group rats, and these results are consistent with the results of many studies, which indicate that the black seed can be effective in reducing the level of lipid profile. This may be because the essential oils of black seeds that have a great anti-oxidant activity for being contain thymoquinone compound, which is one of the sweeping factors of the free hydroxyl root, preventing lipid peroxidation. These results are consistent with what AL-Jobouri found that the consumption of foods fortified with Probiotic in the form of pharmaceutical products or in the form of ferments for a container structure on the bacteria Lactobacillus and Bifidobacterium, which are among the most important foods that contribute to reducing the level of lipid profile as the boosters work. It is vital to lower cholesterol and thus reduce chronic heart disease. Shown also found that the production of Hydroxymethylglutarate by probiotics inhibits the reductase glutaryl-CoA-Hydroxymethyl enzyme, which is a requirement in the process of cholesterol formation and reduces heart disease rate 2-3%. This is also consistent with what Aktimur et al., mentioned that Probiotic bacteria work to reduce the level of cholesterol in the blood, although this decrease may be affected by other factors such as the bacterial strain or the supports used and others, and the reason for the decrease in blood fat may be that these Biologists produce enzymes that break down fat and some of them destroy cholesterol to make use of it as a carbon source.

The effect of functional soft cheese on some enzymatic parameters: Table (3) shows that ALT level showed the highest concentration in the serum of the infected control rats group (41.27) IU/L, while its concentration in the affected and fed rats group on the T1, T2 and T3 (35.89, 31.19 and 28.45) IU/L, respectively, and compared to the healthy rat’s group, which amounted to (24.71) IU/L. As for the enzyme AST, it was the highest concentration in the serum of the affected control group as it reached (88.35) IU/L and compared to the healthy control group that recorded (63.48) IU/L and it is showing that there are significant differences at the probability level (P≤0.05), either When adding the T1, T2, and T3 coefficients, their value decreased to (76.95, 70.34 and 67.29) IU / L, respectively,

Compared to the affected control group. The highest value of ALP was recorded in the serum of the affected control group as it reached (108.72) IU/L. while its concentration in T1, T2, and T3 coefficients (103.44, 98.39 and 98.16) IU/L, respectively. The level of the enzyme AST and ALT increases during infection with viral hepatitis and other liver diseases accompanied by the occurrence of necrosis in the cells of the liver, as the level of the enzyme increases before the emergence of shows pathological symptoms to the equivalent of (10-100) once more than its normal rate and also increases its activity showily in some Conditions such as acute hepatitis 24. The level of the ALP rises in a variety of conditions, including Cholestasis, Infiltrative liver disease, Partial and Total blockage of the bile duct, Pregnancy, Bone regeneration, Granuloma of the liver and Neoplastic liver disease, on the other hand, the increase in the concentration of basal phosphatase may It is because of the increased efficacy of Lysosomes, which is one of the important pre-cellular changes 25. The results of group T2 indicate a decrease in the concentration of enzymes in the serum of the experiment rats, and the results of the study are consistent with what Mahmoud et al, 26 observed. There was a significant decrease in the concentration of enzymes (AST, ALT) in the serum of the rats fed on soft cheese supported by black seeds. and also with the results Al-Seeni et al, 27, there was a significant decrease in the concentration of liver enzymes in serum rats with hypercholesterolemia and fed on black seed oil. It is also evident from the results that the T3 group had a low enzyme concentration as well due to the decrease in the role of Lactobacillus and Bifidobacterium in improving the metabolic indicators in the liver and then improving its functions through improving the metabolic processes are consistent with what Javadi et al, 28.

Conclusion

Feeding with high-fat diet affected the blood lipid profile if it increased it, while treatment with both functional soft cheese fortified with black seed and probiotics led to a decrease in these indicators. Regarding liver enzymes, feeding on a high-fat diet led to an increase in it, while treatment with functional soft cheese reduced the level of liver enzymes.

Investigation of Lumpy Skin Disease Virus in Baghdad City

Rasha Basim Abdullatif¹, Aida Bara Allawe²

¹Researcher, ²Professor Department of Microbiology, College of Veterinary Medicine, The University of Baghdad, Iraq, ²Department of Microbiology, College of Veterinary Medicine, The University of Baghdad, Iraq

Abstract

In this study, the lumpy skin disease virus was isolated on the lamb testis cell culture for the first time in Iraq. Forty skin nodules were collected from cows suspected with lumpy skin disease (LSD) in Baghdad governorate. Real-time PCR detected LSD virus in 100% of these skin nodules. After that, the lamb testis cell culture was prepared for virus isolation. The prepared samples (0.5 ml) were inoculated into prepared lamb testis cell culture. Cytopathic effects (CPE) of the virus have appeared after 24hr post-inoculation and completed within 72hr. The noticed CPE were cell rounding, aggregation of cells, syncytia formation, and detached of the cells from the cell sheet. Fluids of lamb testis cell culture were examined by the real-time PCR to confirm that the observed CPE was due to the LSD virus. Cell culture fluids were positive by the real-time PCR (100%). Real-time PCR was sensitive for the detection of the LSD virus DNA in skin nodules, and it was a suitable confirmatory diagnosis tool of the virus in the tissue culture fluid. Finally, the locally isolated LSD virus in this study is valuable in future studies for making a vaccine to control the disease.

Keywords: Cattle, Cell culture, Lumpy skin disease, Real-time PCR, Skin nodules

Introduction

Lumpy skin disease (LSD) is a cattle pox illness caused by a virus called the Neethling virus. It mostly affects cattle and zebus but was also seen in giraffes and impalas¹. The disease is characterized by fever, nodules on the skin, internal organs and mucous membranes, swollen lymph nodes, emaciation, skin edema, and occasionally death². Abortion and pneumonia are the most usual sequels to LSD whereas the latter may be potentially fatal³. Lumpy skin disease virus (LSDV) has a double-stranded DNA genome that replicates in host cells cytoplasm⁴. This virus belongs to the Poxviridae family, of the Chordopoxvirinae subfamily, in the Capripoxvirus genus⁵. LSD is the main cattle health issue causing significant economic losses due to decreased milk production, a prolonged weakening of the clinical course, weight gain reduced, sterility in bulls, abortion of pregnant cows and permanent skin damage has a significant effect on the leather industry and this leads to a ban on international livestock trade⁴. Due to its economic effects on the global cattle industry, the World Organization of Animal Health (OIE) has listed the LSD virus as a notifiable disease¹. OIE reported that the latest outbreaks of LSD when to occur in Iraq and Turkey, extending concerns that the disease will persist for spread into Asia and Europe²³.

In Iraq, LSD has occurred since 2013, and LSDV is circulating between Iraqi cows⁶. In autumn 2014, LSDV was detected by the polymerase chain reaction in Babil, Al-Qadysia, and Al-Muthana Governorate⁷, was reported the occurrence of Lumpy skin disease among Iraqi cattle in Wasit province, ⁹, was recorded the LSD in Al-Qadysia province. There are many studies in Iraq were conducted about the detection of LSD virus¹⁰, but the virus did not isolate so it was important to isolate LSD virus on cell culture to aid in the manufacture of a vaccine to control this disease in the future.

The aim of this study was the isolation of lumpy skin disease virus for the first time in Iraq on cell culture then the isolation will confirm by molecular technique.
Materials and Methods

Samples collection

Throughout July to October 2019, forty (40) skin lesions were collected in sterile containers from animals that showed nodules or sitfasts on all the entire body, enlargement of lymph nodes, excessive salivation, mucous membrane ulceration, milk production decrease, anorexia, and pneumonia. These samples (sitfasts and nodules) were collected from five areas in Baghdad city (Abo-Ghraib, Al-Kadhimiya, Al-Wahda, Al-Ridhwania, and Al-Husua).

Extraction and amplification of DNA from collected samples

The collected samples divided into two parts, one part for detection of LSD virus by the real-time PCR, and the other for isolation of the virus on lamb testis cell culture. After sample preparation, the DNA was extracted by an extraction kit (Qiagen, Germany). Then, the extracted DNA was amplified by the real-time PCR kit (Genekam Biotechnology AG, Germany).

Preparation of primary lamb testis cell culture

Lamb testis cell culture Preparation was conducted in the virology laboratory of Baghdad University according to11.

Isolation of LSD virus on lamb testis cell culture

After four days, the cell monolayer growth was completed, and growth media was removed from all flasks. LSD virus was propagated in lamb testis (LT) cell culture by inoculation 0.5 ml of the prepared sample into all flasks (except control flasks). Then, flasks were incubated at 37°C for virus adsorption (1 hour). Thereafter, media (maintenance) was added to all flasks (infected and control), incubated at 37°C, and cells were monitored daily by an inverted microscope for cytopathic effects. After that, flasks were frozen at -20°C (first passage). Flasks of the first passage were thawed to repeat the inoculation of undiluted fluid on new cells (second passage).

Detection of isolated LSD virus in cell culture by real-time PCR

After thawing of all infected flasks (passage 1 and 2), 0.5 ml was taken from each one of these flasks and were subjected to the extraction and amplification of DNA by real-time PCR for confirmation of the isolation of LSD virus in cell culture.

Results and Discussion

Clinical investigation of lumpy skin disease

Animals that used in this study were showed firm, circumscribed, raised and rounded nodules or sitfasts on all the entire body (figure 1), excessive salivation and nasal discharge, mucous membrane ulceration (figure 2), enlargement of lymph nodes, decrease in milk production, anorexia, and pneumonia. These results were compatible with12, 13 and 14.

Detection of LSD virus in the collected samples by using real-time PCR technique

In the current study, skin nodules collected from naturally infected cattle detected by real-time PCR (Figure 3) and were positive (100%). These results revealed that the real-time PCR was sensitive in the detection of LSD virus in skin nodules of naturally infected cattle and indicated the incidence of an outbreak
of lumpy skin disease in Baghdad governorate in 2019. The findings of this study are consistent with those obtained by other researchers who reported that the percentage of positive skin samples was 100%. However, these results are not compatible with, who pointed the detection of the LSD virus in 72% of skin lesions which is probably because of the collection of some samples were in the convalescent stage or due to presence of other diseases that clinically confused with LSD such as pseudo-lumpy skin disease.

![Figure 3: The plot of real-time PCR amplification of positive samples (L406, L403, L401, L408, L410, and L409) from Al-Husua, giving a Ct value of 27, 28, 29, 30, 31, and 33 respectively. +ve: positive control give a Ct value of 28.-ve: negative control (did not give a Ct value).](image)

**Isolation of LSD virus in lamb testis cell culture for the first passage**

The cytopathic effects of the LSD virus were rounding and aggregation of cells noticed after 24 hours post-inoculation. After 48 hours, the number of rounded cells increased, some of them separated from the flask surface, and the cells lost their cellular borders. Within 72 hours post-inoculation, the cytopathic effects were complete by observing the cell clusters detached from the cell sheet leaving empty spots and syncytia formation (Figures 4).

![Figure 4: Cytopathic effects of LSD virus after 72hr post-inoculation (first passage), show syncytia ( ) (100x). Sample no. L379 from Al-Ridhwania.](image)
Isolation of LSD virus in lamb testis cell culture for the second passage

The cytopathic effects of lumpy skin disease virus on lamb testis cell culture in the second passage (Figures 5 and 6) were fast, diffuse, and more evident than the first passage. The type of cytopathic effects was similar (as described in the first passage). In the present study, the primary lamb testis cell cultures were suitable for the cultivation of the virus, and the CPE appeared after 24hr post-inoculation in the first passage while in the second passage the CPE appeared in less than 24hr post-infection. This is similar to the studies of \cite{18} and \cite{22}. However, these findings are contrary to that published by \cite{17} and \cite{19}, who pointed out that the CPE appeared within three days. The CPE of LSD was characterized by cell rounding, cell aggregation, syncytia formation, and detached of the cells from the cell sheet. These findings corresponded with the described results of other authors \cite{17, 18, 19} and \cite{21}. In this study, the cytopathic effects were completed within 72hr which found to coincided with \cite{22} who recorded that the CPE completed in 48 to 72hr but it does not agree with \cite{20} who reported that CPE completed in 9 days. These variations in the time of CPE appearance and completion were probably related to the type of cell culture, the dose of inoculated virus, strain of virus, media, and serum used.

![Figure 5](image5.png)

**Figure 5:** Cytopathic effects of LSD virus after 72hr post-inoculation (second passage), showed cell rounding, aggregation of cells, and empty spots (200x). Sample no. L379 from Al-Ridhwania.

![Figure 6](image6.png)

**Figure 6:** Cytopathic effects of LSD virus after 72hr post-inoculation (second passage), showed rounding of all cells (400x). Sample no. L399 from Al-Kadhimiya.

Detection of isolated LSD virus in cell culture by the real-time PCR technique

All fluids of cell culture (from both passages) were examined by the real-time PCR were positive (100%). This confirmed that the cytopathic effects were due to the LSD virus.

Conclusions

Incidence of infection with LSD virus in Baghdad governorate in 2019 was documented. The real-time PCR was sensitive for the detection of the LSD virus in skin nodules, and it was a suitable confirmatory diagnosis tool of the virus in the tissue culture fluid. It was favorable to collect skin nodules for diagnosis and isolation of the LSD virus. The primary lamb testis cell culture was suitable for lumpy skin disease virus isolation.

Ethical Clearance – This research was carried out under an agreement with the guidelines of the Canadian Council regarding using lab animals and animal care [Olfert] and approved by the office of the agricultural research ethics committee that recently took place in Iraq (approval number 5849/AGRO).

Introduction

Agricultural pest control using fungal pathogens formed during Last five-fifth years fertile ground for scientific research, it has been defined More than 700 species of pest pathogenic ¹. The pest pathogen is undoubtedly an important biological enemy In general, the pathogenic forms reach the host and then spread and penetrate his body, depending on their stock food. Whereas, these spores grow within the host in succession². The form of monocytes or multicellular cells (hence, bud spores Protoplast), taking advantage of the food sources of the overworked host². The pathogen develops and dies, while the fungus results in a number. The infection secures the spread of the fungus A large source of spores Pathogen, or when the fungus resorts to produce a resistant fungal structure that allows for prolongation How long it is without host ³. Insect pathogenic fungi are one of the most common and most distinctive pathogens of insect diseases fungi produce spores that stick to the insect’s body and then germinate when the conditions are right. Therefore, send a tube that produces enzymes that release enzymes at the point of contact with the cuticle of the insect, analyzing the proteins, chitin and lipids involved in the synthesis of cuticle. *P. marneffei* and *V. lecanii* are fungi associated with insects, and are considered insect pathogenic fungi due to their widespread presence in nature ⁴. There are about 35 species of mosquitoes in nature. *Culex pipeins* is one of the most common species in the central and southern regions of Iraq. ⁵ Misleading sites of plants and weeds are more attractive to female mosquitoes ⁶. Eggs from exposed sites, mosquitoes *Cx. pipeines*, one of the most common mosquito species in the world, is a biological vector for many pathogens of humans and animals, including the transmission of filariasis parasite ⁶,⁷. Bio-control using some fungi is currently one of the best ways to control mosquitoes. Through the use of spores containing *Cx.pipeins* ⁸.

**Aims and Objective**

This research aimed to isolate *P. marneffei* and
\textit{V. lacanil} associated with \textit{C. pipeines} mosquitoes and compare the biological efficiency of \textit{P. marneffei} and \textit{V. lecenii} in their biological control second and third instar and adult for the \textit{Cx.pipeins}.

### Materials and Methods

#### Fungi Isolation

\textit{Cx. pipeines} larvae were sterilized by ethyl alcohol 70% For one minute sodium hypochlorite was used for 30 seconds for sterilization and placed on filter paper for disposal of sterile residue. Four replicates were prepared from Potate dextrose agar medium, and five larvae were placed in each repeater. By sterile forceps, the dishes were incubated in a Syrian-made Jard incubator at a temperature of 25 ± 2°C for seven days, a 0.4 cm tablet was taken from the edge of the growing colony around the larvae and placed in a petri dish containing 20 ml of the above food medium and used for this purpose a sterile needle Incubate at 28 ± 2°C for seven days. Multiple ponds were selected at sites in Salheldin province where \textit{C. pipeins} in these ponds because they are rich in organic materials, were collected from different sites for each pond during the march to May 2020 then transferred to the laboratory and emptied in plastic ponds, and the larval food of ground mice, consisting of corn, wheat and protein was added by 1:1:1 by 2 g per basin.

Insect breeding was carried out in the laboratory at a temperature of 25 ± 2°C relative humidity 65 ± 5 light a period of 12 hours / day. \textit{P. Marneffi} and \textit{V. lecenii} isolated from \textit{Cx.pipeins} larvae were diagnosed by fungal growth and caterpillar color by taking a small portion of the fungal growth and placing it on a glass slide with a drop of lcto phenol cotton blue and then cover the slide and examined under a microscope under 40x magnification.

#### Preparing commenter fungi

Glass flakes 250 ml were used for the preparation of the suspension for \textit{P. marneffi} and \textit{V. lecenni} by taking a 0.5 cm diameter tablet from the fungal colony growing on P.D.A. The tablet was placed in 9.5 ml sterile distilled water in the jug above and shaken for five minutes to remove the spores from its spore mounts. Culture was incubated at 25 °C for 7 days, and for the purpose of distributing the fungal growth was shaken daily, a piece of paper was used for filtration and get commenter fugi using a modified erythrocyte slice count to calculate the number of Haemocytometer spores. Following the concentration:

- $2 \times 10^5$ spore / ml
- $2 \times 10^6$ spore / ml
- $2 \times 10^7$ spore / ml

Bioassay in larval stages of \textit{Cx.pipeines} molestes

Four containers/ type of fungus were used, each containing 20 larvae per instars II and III and each concentration of \textit{P. marneffei} and \textit{V. lecenii} tested by using 50 ml distilled water was used to control. The larvae were test left in the plastic pots for 2 minutes. The larvae were then transported by a soft brush to glass jars of 200 ml each distilled water container and the larval food at 10 mg / ml and placed in the incubator at 28 ± 2°C and a light period of 72 hours, the mortality rate was calculated after 48 hours and 72 hours.

Bioassay in adult mosquitoes, \textit{Cx.pipeins} molestes

Numbers of pupae were placed individually in 20 mL tubes and cotton was used for the purpose of closing the nozzle of the tube and waited to become adults. 10 adult males and females were each distributed separately in a 1-liter wide-mouthed pot with three replicates per concentration. In addition to the control Factor, each repeater was sprayed by a fungus at a distance of 5 cm, while the control factor was sprayed with water and placed in the incubator at a temperature of 2±.28 °C and a light period of 12 hours, after which the mortality rate was calculated after 48, 72 hours.

### Statistical Analysis

The results were analyzed based on multiple comparisons between the coefficient rates of the experiment using the complete random design (CRD). The results were analyzed using Duncan Multiple Range Test to find the differences between coefficients according to the significant differences between them and at the level of significance specified for the test (P < 0.05).

### Results and Discussion

The results of the laboratory tests are shown in the table. The fungus \textit{P. marneffei} at concentration 2 ×
6^7 spore /ml gave highest mortality ratio 83.92% for the second larval age after 72 hours while the fungus *P. marneffei*. at concentration 2 × 6^7 spore /ml highest mortality ratio 68.83% for the third larval age after 72 hours of treatment the rate was 0% in the control coefficient, and the relationship between concentration and rate was direct and that this relationship was clear between the duration of exposure and rate. For larval phases II and III where as the proportion of killing increased with increasing concentration due to an increase in the number of developing spores as well as the impact of the immune system, which can not defend the body at high concentrations of the fungus\textsuperscript{11}.

The statistical analysis shows that there are significant differences in the killing rate for the phases at the level of 0.05 and the killing rates decrease with increasing larval age and when exposing the second and third larval phases. The reason is that the immune system of the second larval instar is incomplete and the insect body will be thin.

Table (1) shows larval stages of *Cx. pipeins molestes* affected by various concentrations.

**Bioassay of fungi suspension in adult mosquitoes.**

*Cx.pipeins molestue*

The results of the laboratory tests are shown in the table(2). *P. marneffei*. Against mosquito adults, with the highest homicide Cx. *pipeins molestue* rate was 79.17% for males and 89.42% for females after 72 hours when using $2 \times 10^7$ spore. The mechanism of action of the fungus against male and female adults is the penetration of the thin areas of cuticle after adult spraying with the fungus; the fungus grows and the problem of filamentous growth is multiplied between the tissues of the body of the insect then send the fungus carriers outward and then the death of the insect 12.

**Table (2). Effect of different concentrations of fungi suspensions in the P. marneffei destruction of adult males and female mosquitoes Cx. pipeines molestues.**

* Vertically similar letters and horizontally similar small letters mean no significant differences in Dunkin’s multiple-range test.
The results of the laboratory tests are shown in the table(3) V. lecanii fungi at concentration $2 \times 10^7$ spore / ml highest mortality ratio 89.63% for the second larval age after 72 hours while giving to the fungus V. lecanii at concentration $2 \times 10^7$ spore/ml highest mortality ratio 72.23% for the third larval age after 72 hours of treatment while the rate was 0% in the control coefficient, and the relationship between concentration and rate was direct and that this relationship was clear between the duration of exposure and mortality rate for larval phases II and III, whereas the proportion of killing increased with increasing concentration and exposure period in killing rates increased concentration is due to an increase in the number of developing spores as well as the impact of the immune system, which can defend the body at high concentrations of the fungus Its efficiency $^{13}$. The statistical analysis shows that there are significant differences in the killing rate for the phases at the level of 0.05 and the killing rates decrease with increasing larval age and when exposing the second and third instar.

The reason is that the immune system of the second larval phases is incomplete and the insect body will be thin which is porous by the fungi spores. The findings were consistent with $^{14}$. Describe the relationship between the concentration of spores and the percentage of killing as a direct relationship, where the greater the concentration rate, the greater the proportion of killing This laboratory study converged with the study $^{15}$. Which proved that the biological control using the fungus *Aspergillus niger* at the concentration of $1 \times 10^4$ spore /ml for the larvae of different phases of mosquitoes.

* *Cx..quinquefasciatus* gave a killing rate of 87.68%. Murder The results of the study were similar with $^{16}$ a 90% killing rate when exposure of *Cx.quinquefasciatus* mosquito larvae to *Metarrhizium anisopliae* spores at $2 \times 10^6$ spore / ml. This study is consistent with a study $^{17}$ that demonstrated that the use of different concentrations of fungus

* *Metarhizium brunneum* resulted in 95% killing of the first larval stage of *Cx.pipeins*.

The \textit{P. marneffei} and \textit{V. lecanii} fungus infects mosquito larvae naturally in aquatic environment. Use an insect pathogenic fungus to reduce its spread about pesticide within integrated management programs are an important alternative chemicals that, in many areas, cause the disturbance of the vital balance they led to the emergence of secondary pests as major pests as a result of damaging their vital enemies prevalent in these areas. Especially as many of these pathogenic fungus it is naturally present in many of our arab environments to return pioneering role in limiting the spread of many of the pests throughout our homeland. The study proved that entomopathogenic fungi \textit{P. marneffei} and \textit{V. lecanii} have a significant effect on the life second, third instar and adult of \textit{Cx.pipiens}. It can be introduced into the pest management program using secondary metabolites
in the manufacture of a fungicide for the purpose of controlling Cx.pipiens mosquito.

**Conclusion**

The results of the laboratory tests are shown *V.lecanii* fungi at concentration $2 \times 6^7$ spore / ml highest mortality ratio after 72 hours The study proved that the insect entomopathogenic *P. marneffei* fungi. *V.lecanii* has a significant effect on the life of the larvae of the second and third instar, as well as the adult male and female mosquitoes Cx.pipines, so that a fungicide can be manufactured for the purpose of controlling mosquitoes Cx.pipiens.

Molecular Characterizations of a High Pathogenic Avian Influenza H5N8 in Iraq

Ahmed Neama Mahmood1, Aida Bara Allawe2
1Researcher, 2Professor, Department of Microbiology, College of Veterinary Medicine, University of Baghdad, Iraq

Abstract

High pathogenicity avian influenza subtype H5N8 viruses were detected in different areas in Iraq at the last 2017 and early 2018 and 2019 and the disease was detected clinically. This disease is responsible for high economic losses for poultry industry and threat human health, so that, this study was conducted for molecular detection, characterization and phylogenetic analysis of avian influenza in Iraq. AI subtype H5N8 is an infectious disease primarily in birds and responsible for severe respiratory illness which associated with a high percentage of morbidity and mortality in wild and domestic birds. During this study one hundred fifty different samples including (trachea, larynx and lung) were collected from different areas of broiler chicken from Baghdad and its surrounding regions during winter 2019. Avian influenza virus subtype H5N8 was detected by using real time RT-PCR technique, and specific kits (KyriR Germany) for AIV subtypes H5 and N8 were used respectively. The results revealed that (15) samples out of (150) collected samples were gave positive results for avian influenza H5, these positive samples were prepared for a second step of detection by RT-PCR test specific for N8 subtype the results revealed that only (12) out of (15) tested samples were positive for H5N8 (8%). Genetic sequencing of isolates and phylogenetic analysis of three selected isolates of (H5N8) bellowing to different areas indicate that all strains bellowing to H5 class (2.3.4.4) high pathogenic avian influenza revealed that they are closely related to Egyptian strain (A/duck/Egypt/ F446/2017. H5N8-MH893737.1) (with 97.6% identity). Analysis of the mono-basic amino acid (PQIEPR / GLF) at the hemagglutinin cleavage site revealed there is no deletion of the stalk region with the neuraminidase indicated that the isolates is a typical HPAI strain (A / duck / Egypt / F446/2017). The similarity of the nucleotide sequence analysis of hemagglutinin gene revealed that there was a high homology (97.6%) to that of A/duck/Egypt/F446/2017 H5N8.

Keywords: Avian influenza, Bird flu, Fowl plague, H5N8 avian flu

Introduction

Viruses of avian influenza are single-stranded RNA viruses, negative sense, segmented viruses classified by the Orthomyxoviridae family into groups A, B, C and D based on variations in their matrix proteins, internal nucleoproteins and antigenic characteristics, Influenza type A are only viruses have been known to have the ability to cause natural infections in birds based on their frequency and potential to cause illness in poultry1.

Influenza A / H5N1 was initially isolated from a Chinese goose in 1996. Humans infections were first recorded in Hong Kong in 1997 3. Informally, the avian flu was known as fowl plague or avian influenza and these viruses triggered a variety of influenza that adapted in birds 4. Avian flu is related to dog flu, swine flu, horse flu, and human flu, a disease caused by influenza virus strains that can be adapted in a specific species. Of the four influenza virus types (A, B, C and D), the influenza virus type A is a zoonotic disease and has an almost complete natural reservoir in avian5. Influenza viruses are typically categorized as surface proteins into a broad range of subtypes based

Corresponding author:

aidabaral@yahoo.com
on 18 hemagglutinin HA (from H₁ to H₁₈) and 11 neuraminidase NA (from N₁ to N₁₁), some of which pose a threat to public health⁶.

Numerous specific subtypes 16 hemagglutinin subtypes from H₁ to H₁₆ and Nine neuraminidase subtypes from N₁ to N₉ bellowing to the avian flu viruses, but the H₁₇N₁₀ & H₁₈N₁₁ subtypes which are found in bats only⁷. Broad distribution of avian influenza viruses in different hosts may result in the exchange of their gene or gene fragments, which in turn contributes to highly antigenic variation and potential development of new strains of avian influenza viruses. This can cause significant epidemics and outbreaks, lead to tremendous economic losses in the poultry industry and may also pose a serious threat to human health⁶. The hemagglutinin gene plays a crucial role in the of influenza virus A life cycle, its involvement in recognition of receptor, attachment of virus particles on host cell, e fusion of membrane and entry inside the host cell⁷.

In 2014 the influenza/goose /Guangdong (1/1996) lineage clade (2.3.4.4) H₅N₈ avian influenza viruses with a high pathogenicity were originated in poultry and wild birds throughout Europe, Asia, and North America. At this time, the wild birds in the Netherlands were extensively investigated for HPAI H₅N₈ virus (real-time PCR targeting the M and H₅ genes) and antibody detection (inhibition of hemagglutination and neutral virus)¹¹. The rapid detection by RT-PCR of AIV subtypes H₅ has a crucial role for control of avian influenza disease infection, Pathogenicity of avian influenza infection was varies greatly depending several factor as a host species, virulence of strain, infective doses, and infection routs¹².

In Iraq, according to OIE (H₅N₈) struck again on a commercial farm near the Baghdad metropolitan area and it were killed 13,240 susceptible birds out of 29,000. The survivors were pulled out to control the virus spread, this detection makes Iraq’s sixth (H₅N₈) outbreak during 2018. avian influenza viruses with a high pathogenicity was identified during the last few years in several governorates and the disease was established at 2018 by the organization for animal health in the infected poultry with high sickness and high mortality rate, this reason lead to high economic losses for poultry industry with possible risk for human health¹³. Continuous surveillance of HPAI H₅ in Iraq is necessary to avoid economic losses in poultry industry and detection of outbreak points, so this study is the first to identified high pathogenic avian influenza H₅N₈. And it is aimed for genetic characterization and sequencing and phylogenic analyses of A1 subtype H₅N₈ and study the genetic variation between isolates, for these reasons this study was done.

**Materials and Methods**

Samples collection and screening:-

Between December 2018 and October 2019, 150 samples including (trachea, larynx and lung) were collected from different areas from Baghdad 75 samples, Dialla 42 samples, and Hilla 33 samples) from suspected poultry farm which given symptoms of avian influenza illness. These farms show a different symptom in poultry as ocular and nasal discharge, sneezing, enlarged infra-orbital sinuses. The mortality rate varies from 10% to 65% as well as subcutaneous hemorrhages, petechial hemorrhages on visceral organs and muscles, extreme inflammation, edema and red discoloration of the shanks and feet. Greenish diarrhea was common in badly affected birds, paralysis, and drooping of wings. These samples were collected in sterile container and send to specific diagnostic laboratory for confirmative RT-PCR test.

Samples preparation and RNA extraction:

A part of collected samples were pooled in a sufficient volume of sterile buffer (1 ml of normal saline), another parts were preserved for molecular and histopathological tests. Samples were soak for an adequate period of time and finally wash out the sample by plus vortexing, RNA from samples were extracted from tissues by using kit of the total RNA extraction (Kyli RNA extraction Kit) after extraction the RNA was elute in 60 µL of RNase-free D.D water, then store after adding 20 U of RN as inhibitor at (-80 ºC) until using for Real-Time TR-PCR.

Subtyping of isolates by using Real-Time PCR:

To differentiate influenza isolates from other non-influenza. real-time RT PCR specific for influenza A virus that amplifies the cleavage site of hemagglutinin gene coding sequence which performed using total of 800 bp RNA according the WHO guidelines⁸. Then the
positive isolates for influenza A test were further tested to detect the H₅ by using Real-Time PCR, then using a positive samples for detect the type of N₈ gene according to instruction of manufacturer company (AniCon Labor GmbH) Kit (Germany).

**Sequencing and phylogenetic analysis (incl. comparison to NCBI database):**

A 800 bp fragment containing the cleavage site of the HA gene of Influenza A type H₅N₈ has been sequenced and was phylogenetically analyzed based on comparison to known reference strains by (AniCon Labor. GmbH Emstek, Germany). Influenza viruses were known via a database that was created by downloading influenza virus sequences from the (NCBI) information. Then, tested in the influenza virus database by Basic Local Alignment Analysis Tool for nucleotides (BLASTn).

**Results**

Molecular detection of avian influenza H₅N₈ and Real-Time PCR:-

From about 150 collected samples 15 positive samples that mean an avian influenza virus was present in many area of country in this collection period. In real-Time PCR 15 positive samples of avian influenza A virus and only 12 samples were give a positive result for H₅N₈ (about 8%) by using H₅ kit and N₈ respectively from (KyltR) company for veterinary diagnostic kits.

Based on the amplified sequence of nucleotide coding for the hemagglutinin glycoprotein of Influenza A Virus (type H₅), the RNA extracted from sample numbers A1910987.001, A1910987.002 and A1910987.003 belongs to HPAI-H₅ Clade (2.3.4.4) and is most related to strain A/duck/Egypt/F446/2017(H5N8) (MH893737.1) (each 97.6%).

Figure 2: explain the phylogenetic analysis and sequences hemagglutinin of influenza A virus subtype H5N8 of the detected tissues samples from birds in Iraq. The phylogenetic tree was built using the neighbor-joining method. Within the research was included the representative of viral sequences which were quite close to those recorded in this review. These labels the H5N8 viruses identified in this study. viral sequences are provided. Scale bar indicates estimated genetic distance belongs to HPAI H5 Clade 2.3.4.4 and is most related to strain A/duck/Egypt/F446/2017(H5N8) (MH893737.1) (each 97.6\%).
Discussion

Because of lack of the continuously surveillance of avian influenza subtype H5 in some countries, therefore H5 avian influenza viruses are still circulating in different areas of the world. So that, continuous surveillance of the domestic and wild birds and annually genomic analysis of high and low pathogenic avian influenza viruses by different methods such as next-generation sequencing is recommended due to the high mutation rate of influenza viruses which has been determined by the sequencing. Real time RT-PCR technique was used to detect avian influenza from collected samples by amplification of hemagglutinin gene. The results of sequencing of three selected positive local isolates (A1910987.001, A1910987.002, A1910987.003) for hemagglutinin gene by obtaining a 800 bp fragment containing the cleavage site of the HA gene of Influenza A type H5 was disagree with which was found that H5H8 isolated in this year was bellowing to clade 2.3.4.4 group B and clustered with isolates from Iran and Belgium. The genetic sequences of isolates indicated that there were a similarity between the local isolates and isolate from Egypt and Saudi Arabia. Genetic analysis of AIV H5N8 virus was indicates that the virus probably reach to Iraq by wild birds migration due to the position of Iraq as a road of migratory pathway of birds, other several outbreaks of AIV (H5N8) virus infections was reported in Egypt, Iran and Saudi Arabia at the end of 2017 and 2018 and it cause exponentially increasing of mortality in flocks of birds with high economic losses. The location of isolates at the end of phylogenetic tree is fits with the hypothesis route of (H5N8) virus was introduce into Iraq via the migratory bird but not through the direct contact with infected birds, because the viruses when detected there is no active direct trade and contact with other infected countries and before this time the virus was never been detected in the country. In conclusion the Iraqi HPAI H5N8 isolated detected in this study were belonged to (A/duck/Egypt/F446/2017(H5N8)) with (97.6%) identity and it may contain virulence-enhancing properties to infect the mammalian host as a result of its continuous reassortment of it is genes, for this reasons the identification and monitoring of both low and high pathogenic viral strains is important for the early management and control of avian influenza viruses. Although the AI H5N8 virus was not detected so far in humans, we should remain aware of the potential of this virus to be transmitted from the avian host to the human population.

Ethics Approval and Consent to Participate:-

The study was conducted following the ethical guidelines of the Animal Care and Use Committee at the College of Veterinary Medicine, University of Baghdad, and consent to collect samples from the infected animals was provided by the owner of the farm. After confirmation that influenza infection has spread in the farm.

Abstract

In this study, the prevalence of diverse bovine papilloma viruses in cutaneous lesions was investigated in Iraqi cows. Fourteen specimens were taken from udder growths of Iraqi dairy cows, which demonstrated rice grain-like and small, raised flesh-like appearance. DNA was extracted from the teat wart samples, then was amplified by the polymerase chain reaction (PCR) using primers against BPV-10 (403 bp) and BPV-11 (560 bp). PCR results revealed mixed infections of BPV-10 and BPV -11 in four samples, while the remaining ten samples were infected with BPV-10 only. These findings demonstrate the presence of bovine papillomaviruses 10 and 11 in rice grain-like cutaneous lesions on the teats of cows and multiple elevated growths on udder. The detection and report of the BPV-10 and BPV -11 genotypes in the current study is for first time in Iraq, which are known in the Middle East region, are crucial for disease control measurements.

Keywords: BPV-10, BPV-11, Genotypes, Molecular detection, PCR

Introduction

Cutaneous warts are spread between cattle and originate from the bovine papilloma (BPV) ¹, of which there are multiple strains. The lesion can generally be described as benign, yet may turn malignant ². BPVs exhibit tropism for mesenchymal and mucosal tissue as well as squamous epithelium ³-⁶. Studies have identified fourteen virus genotypes that have been grouped into four genera: Dyoxipapillomavirus, Deltapapillomavirus, Epsilonpapillomavirus, and Xipapillomavirus ⁷-¹⁰. BPV-10 and BPV-11 belong to the Xipapillomavirus family, which contains another type of BPV like viruses ⁵, which are associated with the production of true papillomas ¹¹.

BPV is naked, icosahedral, and possesses double-stranded circular DNA that is 8000 base pairs (bp) containing 5 or 6 open reading frames (ORFs) that are expressed early during infection. Besides two ORFs that are expressed late during infection, the genetic material is organized into three regions: early domain, a long control domain, and a late domain, within which diverse necessary and vital proteins are encoded ¹². With cofactors such as environmental carcinogens present, BPV-induced benign lesions degenerate naturally, but may also develop into cancer ⁴. Clinical, histopathological, and immunohistochemical examinations are all usually used in BPV diagnosis ¹³. Molecular characterization of bovine papillomavirus in Iraqi cattle showed the widespread presence of this oncogenic virus and the contribution it has to the development of skin tumors. BPV1, 2, and 13 affect dairy and beef cattle and induce remarkable commercial losses ¹⁴,¹⁵. This study aims to investigate and identify the etiology of teat and udder warts of Iraqi dairy cattle using molecular and histopathological approaches.
Approaches and protocols

Biopsies

Fourteen teat cutaneous papilloma samples were taken from bovine farms in the Al-Anbar and Baghdad province, including some brought to private clinics between August 2015 to May 2017. The samples that were collected demonstrated a variation in diameter range, about one to three centimeters, and collected from various portions of the teat and udder (Figure 1). For samples that would undergo molecular biology analysis, deep freezing was undertaken, whilst 10% neutral buffered formalin were used to fix samples undergoing histopathological analysis.

Histological study:

Teat and udder specimens were fixed and processed according to routine protocols, as described previously (16). After fixation in 10% NBF, tissue fragments were processed with xylene, dehydrated using ascending concentrations of ethanol (70 to 100%), and set in paraffin, after which they were incised to 5-m pieces, mounted into the slides, and stained by hematoxylin and eosin (H&E) and observed by veterinary pathologist under light microscopic and photographed.

DNA extraction:

Automated DNA extraction system was used to extract genomic DNA (Magnesia, Anatolia Geneworks, Turkey) was utilized in this analysis following the manufacturer’s instructions. The -80 degree freeze samples were processed via an automated Magnesia DNA Extraction machine.

BPV-10 and BPV-11 Primer designing

Primers were designed by aligning the viral genome by the ApE program (http://biologylabs.utah.edu/Jorgensen/wayne/ape): and NCBI Primer-BLAST. These specific primers for genotyping were made by selecting conserved regions for each genotype specifically designed for BPV-10 and BPV-11. Primer sequences are shown in Table 1. The primers were designed to target conserved regions for alignment of BPV-10 (BPV-10, AB331651, and BPV-10 isolate KF017607, MYP55) and BPV-11 complete genome (BPV-11 DNA, AB543507) by the use of the ApE program. The designed primers were tested for inclusivity and exclusivity.

BPV DNA PCR products were identified by a 1.5% agarose gel containing ethidium bromide electrophoresis assay. Gels were put in TBE buffer and ran at a fixed voltage of 100V for thirty-five minutes and visualized via a gel Documentation System (VISION, Scie-Plas, UK). Clinically healthy slaughtered cattle DNA extracted from skin tissues were used as negative control.

**Results**

Clinically diagnosed teat wart cases in the dairy cows, demonstrated a macroscopic appearance as rice grain-like, small, flesh-like growths.

These were generally diffused and enriched with vascularity (see Figure 1A and B). Gross examination revealed that skin warts were exophytic. The histopathological study describes the tumors as cutaneous papillomas (benign squamous cells). Microscopically, all tumor growths showed comparable histological characteristics; according to different degrees of parakeratosis or hyperkeratosis with the presence of papillary-like projections of the squamous epithelium (Figure 2A and B).

In all tumor specimens assessed, most keratinocytes had a clear halo surrounding the nuclei, while others exhibited a pyknotic nucleus that is described as koilocytes (Figure 2C). Presence of koilocytes that have severely condensed pyknotic nucleus with basophilic staining, in addition to multiple degenerated keratinocytes (Figure 2D).

Figure-2. Histopathological characterization of teat and udder warts in a cow. A) Presence of papillary-like projections of the squamous epithelium. Stratum corneum showed a hyperkeratosis (black arrow), H&E, 40x. B) The proliferation of the squamous epithelium that has koilocytes can be observed H&E 100x. C) Hyperkeratosis and presence of clear halo surrounding the nuclei of most keratinocytes H&E 400x. D) Presence of koilocytes that have severely condensed pyknotic nucleus with basophilic-staining. In addition to multiple degenerated keratinocytes (black arrow). (H&E, 400x).

Bovine papillomavirus type 10 (BPV-10) DNA was discovered exclusively in ten (71.42%) of the fourteen teat and udder wart samples (Figure 3, Table 1), whilst four samples (28.58%) showed mixed infections with BPV-10 and BPV-11 (Figure 4, Table 1) which belong to Xipapillomavirus family (8). These BPV-10 and BPV-11-positive samples yielded two DNA fragments of 403bp and 560bp, respectively, in length for E2, E5, and L2 genes. The PCR produced another DNA fragment of 556 bp, of BPV_11 gene in 4 udder teats samples that were amplified utilizing specific gene primers.

Figure-4, PCR products for BPV-11 genotypes visualized in an ethidium bromide-stained 1.5% agarose gel following electrophoreses in TBE buffer. M: 100–10,000 bp marker; lanes: 1–4 BPV-11 positive samples (udder and teat wart samples) with bands at 560 bp.
It is clear from the above that PCR experiments ultimately showed mixed infections of viral DNA of BPV-10 and BPV -11 in four samples, and ten teat samples showed BPV-10 only (Table 2).

**Discussion**

Figures 1 and 2 show the distinct appearance of benign skin tumor and multiple stages of hyperkeratinization in addition to other tumor related microscopic and gross changes in cutaneous layers. Previous studies by our team for different types of BPV (type 1, 2 and 13) showed that tumor samples were cutaneous fibropapillomas, which demonstrated the main features of papillomatosis (14,15). PCR products for BPV-10 genotypes Fig.3 were detected with band sat 403 bp in agreement with 17 while PCR products demonstrated BPV-11 genotypes with band sat 560 bp (Fig. 4) in agreement with (18). To summarize, PCR results identified either BPV-10 alone or BPV-10&BPV-11 (Table 2), with ten samples showing exclusivity to BPV-10 whilst four demonstrated a mixed infection of both BPV-10 and BPV-11. In brief, clinically diagnosed cases of the teat and bovine udder papillomatosis were studied to recognize BPV-10 and BPV-11 genotypes, which were prevalent mostly in the Middle part of Iraq that is the primary site for large cattle-raising farms. The detection and identification of BPV-10 and BPV-11 genotypes in this geographic area are crucial in effective disease control. In conclusion, Bovine papillomatosis of teat and udder were confirmed in this study to be initiated by BPV-10 and BPV-11 genotypes in the Middle regions of Iraq, where cattle farms are spread, which will ease the control requirements of the disease in the area.

**Ethical Approval**

Consent was obtained from the owner of farm animals from which samples were gathered. Approval was obtained from the scientific committee at The Biotechnology and environment research center, University of Fallujah, Al-Anbar, Iraq. The experimental in vitro part was accomplished at the department of Experimental Therapy, Iraqi Center for Cancer and Medical Genetic Research, Mustansiriyah University, Baghdad, Iraq

**Acknowledgment:** The authors thank Dr Emyr Bakker and Dr Israa N. A. Al-Ibadi for their assistant in the English editing and improving the manuscript language. We would like to thank the support of Mustansiriyah University, Iraqi Center for Cancer and Medical Genetic Research, Baghdad, Iraq.

**Abstract**

Ligase enzymes were discovered as a member of the nucleotidyl transferase family. Here in this paper, DNA Ligase is extracted from *S. aureus* works with the cofactor NAD⁺ to make a phosphodiester bond and reform between the 3’hydroxyl and 5’phosphate DNA end. *Staphylococcus aureus*-DNA Ligases Enzyme type A (SLE-A) contains two essential domains; NTase and OB- fold domain, which are the most essential domains for the enzyme function. The main aim of the study is to investigate the activity of SLE-A in the presence of magnesium ion (Mg²⁺) by evaluating several kinetic parameters on a time course. The result showed that SLE-A has optimal activity at 500 µM of Mg²⁺. Furthermore, the low number of Equilibrium Association Constant (Kₘ value) explains the binding affinity between DNA ligase of *Staphylococcus aureus* SLE-A enzyme and Mg²⁺ ion was very high and sold.

**Keywords:** DNA ligases, Magnesium ion, Staphylococcus aureus, Michaelis-Menten equation.

**Introduction**

**Background of DNA ligase.**

Fifty years ago, Lehman and other groups discovered the DNA ligases and was a turning point event in molecular biology (1-4). Other DNA ligases had been lighted on since and they are presented in all domains of life (5). The DNA ligase enzyme is an important component in the Ligation reaction, which also called DNA seals, DNA joins and/or DNA fixing enzyme (6). All types of DNA Ligases which have the same protein fold are considered as part of nucleotidyltransferase family. For example, DNA ligases and RNA ligases (7), they participated in multi processes for instance DNA repair, recombination and replication (8). DNA ligase enzyme plays an important role during DNA replication: Firstly, joins Okazaki fragments, in addition it carry out a several DNA repairs like base excision, nucleotide excision, single and double-stranded repairs (9). The lake or mutation of SLE-A (referees to LigA gene), resulted the loss of the ability to ligate Okazaki fragments during the replication steps (10). DNA Ligases are very potent chemical material in the development of biotechnology, bimolecular and genetic engineering (11). Another important implication, is that NAD⁺-dependent ligases not present in mammalian cells as well as they are involved in developing antibacterial drugs “A requirement for an antibacterial enzyme target is that it should be essential for the organism and not present in the host (12). The formation of a phosphodiester bond between adjacent 5 phosphate and 3’ hydroxyl DNA termini is catalyzed by Ligases which known to fix several substrates.

**Indeed, ligases are participated in the base**

Excision DNA repair, culminating step of nucleotide and the ligation of Okazaki fragments during cell replication (13-14). Importantly, NAD⁺ ligases play an important role in cell survival for prokaryotes (15). The main characteristics of DNA ligase in prokaryotic is to present into all bacteria and all bacterial species contain
LigA protein\(^{(16)}\). Kaczmarek announced in 2001, that the deletion or mutation of the LigA gene in *Staphylococcus aureus* (represent to SLE-A) lead to loss the complete growth in the bacteria \(^{(17)}\). The *S. aureus*-DNA ligase enzyme A (LigA) is formed of 666 signal amino acid and consist of 6 main domains with 74,993 Da molecular weight. The tertiary structure of *Staphylococcus aureus* of LigA (SLE-A) protein consists of two main domains called nuclotidyltransferase/NTase domain and an Oligomer Binding (OB domain), which are considered as a catalytic core for all domains of life \(^{(18-19)}\).

**Magnesium Ion in DNA Ligase.**

One of the most important cofactor in the ligation or the mechanism process of DNA ligases enzymes is MgCl\(_2\) Ion. It considers a second cofactor in the reaction of ligase. Mg\(^{2+}\) is a co-factors that allows the ligase enzymes to join and shut a nick at the backbone of Deoxyribonucleic acid. Furthermore, LigA DNA ligase needs Mg\(^{2+}\) to draw the AMP groups that is very necessary during the mechanism of ligase and attaches with the active site of amino acid called lysine to do its work. The AMP groups comes when the ligase enzyme touches with cofactor ATP or NAD+ to form a phosphoamide-linked AMP and without the NAD\(^+\) or ATP the reaction of ligation will be stopped completely \(^{(9)}\).

**Materials and Methods**

**The Cloning of *Staphylococcus aureus* DNA Ligase.**

The published open-reading frames of *S. aureus*-DNA Ligase enzyme A (SLE-A) (belongs to LigA) was retrieved from the NCBI-PubMed database using Gene ID 45575143 and the gene size is 2004 base pair for *S. aureus* LigA. Gene was synthesised (GeneArt, ThermoFisher, UK) with a 20 bp flanking sequence containing an Ndel site and cloned into the Ndel site of pET29c. Kanamycin-resistant transformants of *S. aureus* LigA were screened by colony PCR and those showing the requisite sizes were sequenced in full on both strands (Genewiz, UK). Figure 1 is shown a sample of *S. aureus* (SLE-A) gene was run on a 1% agarose gel. Large-scale preparations of each plasmid were made (Qiagen, UK) and stored at \(-20^\circ\)C in 50 µl aliquots. DNA primer sequences are as follow as (green colour refers to the NdeI site of pET29c and black colour refers to the forward and reverse primers of *S. aureus*-DNA ligase enzyme type A gene.):

\[

\text{CATATGCTAACTATTTAATTTCATTTT}
\]

![Figure 1: Cloning of *S. aureus*-DNA ligase enzyme type A.](image-url)
1% of agarose gel showing the PCR cloning from *S. aureus*-DNA enzyme type A as follows: Lane M – 1 kbp DNA ladder (NEB), showing sizes of DNA between 500 bp to 10,000 bp. Lane 1 is a colony PCR products of SLE-A gene, the length of *S. aureus* SLE-A (LigA) is 2004 bp depending on the GeneBank plus the sequencing of plasmid.

The expression and purification of *Staphylococcus aureus* DNA Ligase.

For *S. aureus* LigA (SLE-A) expression, competent *E. coli* BL21 (DE3) cells was transformed with 0.5 µg plasmid (pLigA) and grown overnight at 37°C on LB-agar containing 50 µg/ml kanamycin. A single colony was picked and grown overnight in an orbital shaker at 37°C in 5 mL LB media. A 1 mL aliquot of this starter culture was added to 500 mL fresh LB broth and grown under the same conditions until an OD$_{600}$ of 0.6 was reached. Protein expression was induced with 1 mM isopropyl B-D-thiogalactoside (IPTG) and the culture incubated at 37°C for 2 hours (LigA) until an OD$_{600}$ ~2.0 was reached. Bacterial cultures were harvested by centrifugation at 6000 rpm for 20 minutes at 4°C and the media discarded. The cell pellet was re-suspended in 15 ml Lysis buffer (10 mM sodium phosphate, pH 7.0, containing benzamidine and PMSF protease inhibitor cocktail (Sigma-Aldrich, UK) was sonicated on ice in 10 second pulses over 3 minutes and spun at 18000 rpm for 20 minutes at 4°C to separate supernatant and cell debris. Ligase A was subsequently purified from the supernatant using a two-step method; all steps were at 4°C. In the first step, NaCl was adjusted to 1M in order to disrupt protein-nucleic acid interactions and ammonium sulphate then added slowly over two hours to a final concentration of 35% (w/v) in order to precipitate the enzyme. Following centrifugation at 18000 rpm for 20 minutes, the pellet was resuspended in an appropriate volume of Buffer A (10 mM sodium phosphate, pH 7.0). Salt was removed by membrane dialysis overnight in Buffer A. In the second stage, enzymes were injected onto a Hi-Trap heparin anion-exchange column (GE Healthcare, UK) in Buffer A and eluted in the same buffer with NaCl gradient to 1 M. Fractions eluting from the column were analysed by SDS-PAGE to confirm the presence and purity of the protein. Fractions containing purified LigA was pooled and dialysed into Buffer A. Ligase activity assays were then used to check for correctly-folded, functional ligase. LigA was further purified using size-exclusion chromatography (GE Healthcare, UK).

Fractions containing purified LigA were pooled and concentrated using spin column to ~ 1 ml. *S. aureus* LigA was finally dialysed into 1×Ligase storage buffer (30 mM Tris-HCl, pH 7.2, 1 mM DTT and 50 µg/ml BSA and 30% (v/v) glycerol). Aliquots of 50 µl were stored at -20°C and used fresh for subsequent kinetic and binding assays.
**Figure 2** is shown the large scale of expression of DNA ligase (LigA) and the final purification of the *S. aureus* SLE-A protein.

![Image of SDS PAGE gel](image)

10% SDS PAGE gel shows the large induction of *S. aureus* SLE-A enzyme in *E. coli* BL21 (DE3) as follow: Lane M shows an NEB protein marker indicated by sizes (in kDa) pointed to the left of the gel. Lanes 1 and 2 shows the total post-induction of expressed SLE-A. Lane 3 shows the corresponding samples of *S. aureus* LigA protein that pooled from heparin column with molecular weight (size) 74,993 Da. Lane 4 shows the final purification of pure protein via using size exclusion column.

**Ligase activity and timecourse assays.**

Three HPLC-purified oligonucleotides (Fisher Scientific, UK) were used:

- **20Top** 5’-HEX-ATCTCGCGTATGGGCCTTCG-3’
- **30Top** 5’-P-CTGCTCACAGGACACCTGGTATACGTAATG-3’
- **50Bot** 5’-CATTACGTATACCAGGTGTCCTGTGAGCAGCGAAGGCCCATACGCGAGAT-3’
These were mixed in a ratio of 1:1:1 at a concentration of 10 µM in 50 µl of 1×Ligase reaction buffer (30 mM Tris-HCl, pH 7.5, 1 mM DTT and 50 µg/ml BSA) and annealed by cooling in a PCR machine from 100°C to 4°C at 0.1°C/min. The resulting 50mer oligoduplex contained a single off-centre nick between the 20Top and 30Top strands with a phosphoryl group on the 5’-side of the nick; a hexachlorofluorescein (HEX) group at the 5-end of the 20Top strand permitted the DNA to be quantitated. Kinetic assays on LigA was carried out in 1× ligase reaction buffer. The concentration of nicked oligoduplex was 1000 nM in most experiments. Each timecourse (50 µl) contained nicked oligoduplex, 1×Ligase buffer, the requisite cofactor(s) and 40 nM of LigA. Each reaction of time course was containing a single nick of six MgCl₂ samples ranging from (0.1, 1, 10, 50, 100, and 500 μM) on a denaturing PAGE 15%. All the samples were incubated at 16 °C. The time points were prepared for 5 times as follow (0 time, 3 mins, 5 mins, 10 mins, 20 mins and 60 mins) and all the tubes were heated at 100 °C for 2 mins. Shortly, the intensity of the 50TOP bands were measured by using computer software ImageGauge. The data were plotted with % intensity against time revealing the initial rate.

**Data Analysis.**

Products of timecourse reactions were run on 40 cm long, 0.4 mm thick 15% (w/v) denaturing polyacrylamide gels containing 1×TBE (89 mM Tris-borate, 2 mM EDTA) and 40% urea. Gels were pre-run at 60 W for 30 minutes until warm. Samples (10 µl) were heated at 90°C for 2 minutes, loaded and run at 50 W for ~90 minutes. The HEX-labelled DNA strands were visualised by excitation at 600 nm using a fluorescence imager (FLA-5000, Fuji, Japan). The digitised images were quantified using ImageJ (imagej.nih.gov) by firstly removing background (50-pixel ‘rolling-ball’ average) and then integrating the area under each peak. These data were used to calculate the fraction of counts distributed between the 20mer substrate and 50mer product bands in each lane; these were multiplied by the DNA concentration to give the amount of each in nM. Initial rates (V₀) were determined by the gradient of the first 20% of the reaction. Rate data were fit to the Michaelis-Menten equation (Grafit v5, Erithacus Software, UK) and Vₘₐₓ and Kᵣ parameters were elucidated by plotting their V₀ values for each timecourse and fitting them by using Michaelis- Menten equation as follow: \[ V₀ = V_{max} + \frac{[S]}{K_m + [S]} \]

The definition of Kₐ is the concentration of substrate that gives half maximum rate. It was obtained from the Michaelis- Menten equation fit above as well.

**Results**

**Nick-joining ligation activity.**

All proteins purified in this study have been proved to join nicks in double stranded nucleic acid in different conditions and terms. The purified of LigA protein of *E. coli* DNA ligase have been confirmed to join nicks in double stranded nucleic acids with varying efficiencies in presence of NAD⁺. In order to achieve the ligation experiment and how the ligation was affected by varying concentrations of Mg²⁺, a double-stranded DNA substrate (dsDNA) was synthetised from Fisher Scientific, UK with a single nick on the top strand. Three HPLC purification of oligonucleotides were synthetised as follow: the length of first top oligonucleotide was 50 bases contains from two top strands (20 and 30 bases) and both of them are complementary to adjacent the 50 base bottom strand. The 20 top single strand attached fluorescent HEX group and the nick was made on the top strand between 30 top and 20 top. The complementarity in the bottom and top strands location, the two top strands (30 and 20) was adjacent to each other. The nick on the top strand (50 oligonucleotide) was at 3’-hydroxyl group of the 20 base strand and 5’-phosphate group of the 30 base strand.

When the buffer has the nicked DNA substrate and SLE-A (LigA) protein of the appropriate concentration and conditions, the nick on the top strand will be sealed by the proteins.

The samples were taken at specific time points and transferred to the stop buffer to stop the ligase protein its work. During electrophoresis, the denaturing gel separate the double stranded structure (50 base top and bottom) and causes to unfold the dsDNA into the linear chain. The dsDNA substrates will be migrated through the gel as single stranded. Therefore, the size of DNA ligation is easy to distinguish as the distance migrated by the DNA. Once the products sDNA of 20 and 30 base strands ligated will be migrated less position on the
denaturing gel, comparing to only the 20 base strand, which will be stayed at the bottom of the gel. The visible light to the ligated products in the denaturing gel was easy to follow due to the attached of fluorescent HEX group at 20 top strand.

The Effect of Mg$^{2+}$ ion on the S. aureus DNA ligase.

To assess whether ligation of such nucleic acids may be a substantial value of these enzymes, at least in biochemical condition, all these experiments have been characterized the ligation of the dsDNA with different protein of S. aureus SLE-A (LigA) across a range of independent variable of Mg$^{2+}$ ion. All the experiments were carried out at 16 °C (except temperature) and 1 µM of oligonucleotide substrate in total volume of 50 µl of 1X DNA ligase buffer and the mixture of reaction were completed with free water. The concentration of enzymes that used in all these experiments was 40 nM. To check how was influenced by different Mg$^{2+}$ ion concentrations; the process of ligation was performed in the existence of Mg$^{2+}$ concentrations from 0.1, 1, 10, 50, 100, and 500 µM. At low of Mg$^{2+}$ ion, initial average increases slowly till over 10 µM (does not show), where is initial rate rises rapidly around 50 µM and the loop of curve begins to rise until 500 µM. The value for $V_{\text{max}}$ gained by organized initial average in front of Mg$^{2+}$ ion concentrations. The $V_{\text{max}}$ obtained by Mg$^{2+}$ ion concentrations which was µM/min and the $K_m$ (the $[\text{MgCl}_2]$ that given half $V_{\text{max}}$ rate) was as well in µM. To examine the $V_{\text{max}}$ and $K_m$ (shown as $K_d$ at the figure) for Mg$^{2+}$, using six Mg$^{2+}$ concentrations, these initial rate values (in % per minute) were calculated against the concentration of Mg$^{2+}$ in each experiment and fit the curve to a Michaelis-Menten equation by using the software Grafit. The initial rate and the measurement of the intensity were explained by details in the data analysis in the Material and Method above. Figures 3 is an example of gels showing the ligation of DNA ligase of S. aureus SLE-A with different concentration of Mg$^{2+}$ that appeared by bands of DNA in the denaturing gel. The plot for the MgCl$_2$ ion shows below in Figure 4. The $V_{\text{max}}$ (capacity) of Mg$^{2+}$ ion was 3.9 %/min where is the $K_m$ (is shown as $K_d$ ) was 5.2 µM.

![Denaturing PAGE gel](image)

**Figure 3** is the denaturing PAGE gel of three of the six MgCl$_2$ Ion concentrations tested.

Denaturing PAGE gel that was got from this study is labelled as following lanes: 1-6 which is corresponded to the following time points 3,5,10,20 and 60 minutes, at 500 µM of Mg+$^{2+}$ ion as an example of this gel, at the top of gel are 50 mer (50 Top) and the bottom of gel are 20 mer (20 Top). The Bromophenol blue is the colour which is used to check the bands on the denaturing gel.
Discussion

Because of the NAD\(^+\)-dependent DNA ligase is very essential enzyme for DNA replication and repair, it had been reported as a prospective broad-spectrum antibacterial target, since there are a high conserved phylogenetic and distinctly different from the Eukaryotic DNA ligases \(^{20-22}\). Thus, prokaryotic NAD\(^+\)-dependent ligases is present as a promising drug target for antimicrobial therapy comparing to ATP-dependent in human \(^{23-24}\). In 1973s, Modrich and Lehman were referred that magnesium ion increase the activity of ligase protein. Magnesium ion is very important component in the step1 and step2 of the ligation mechanism of ligases enzyme in general. Moreover, in the same study showed that the magnesium ion is being involved to increase the rate of phosphodiester synthesis and DNA adenylation in the system of mechanism of ligases enzymes \(^{25}\). The obtained results in this paper from the investigation the effect of Mg\(^{2+}\) ion on Staphylococcus aureus-DNA Ligases enzyme type A (SLE-A) activity showed that 500 µM of Mg\(^{2+}\) ion had the best on ligases’s activity for fixing the nick in the DNA between the 20 mer and 30 mer, and transfer them to 50 mer. Comparing this result with different study by using ammonium sulphate ion to determine how much this ion affected to the E. coli DNA Ligase activity (LigA), and the result was showed that the best concentration of ammonium sulphate was as well 500 µM, which is indicated the similarity between these ions activity on different enzymes \(^{26}\). Moreover, the results can be concluded that DNA ligases of E. coli and Staphylococcus aureus are structurally similar. The \(K_m\) value (equilibrium association constant) in this study was 5.2 µM, which is explained the binding affinity between DNA ligase of Staphylococcus aureus SLE-A and MgCl\(_2\) ion was slightly similar to the \(K_m\) value for NAD\(^+\) cofactor for S. aureus LigA (2.75 µM) that found by Gul et al, 2004 \(^{27}\). However, different result by Sriskanda & Shuman 2001 who obtained the \(K_m\) value for E. coli DNA ligase enzyme LigA for singly-nicked DNA substrate and was 12.2 nM, which is completely different comparing with this study \(^{7}\). Generally, it was mentioned above in the discussion that the main objective in the biology and medical sciences is to find a target in the bacteria to be as novel drug target for antimicrobial therapy, and DNA ligase is one of them since there are no similarity to the eukaryotic DNA ligases. However, magnesium ions here did not inhibit the activity of Staphylococcus aureus-DNA Ligases enzyme type A (SLE-A), but increase the rat of reaction. Therefore, Due to the importance of the DNA ligase enzyme, further study would be involved to identify more compounds that would be able to inhibit the activity of DNA ligase (SEL-A) but not inhibit the activity of eukaryotic DNA ligases by blocking the communication sites between the
magnesium ions (Mg$^{2+}$) and the ligase of bacteria, and eventually control the growth of them.

Study of Bacterial Contaminants and some Chemical Elements of the Euphrates River and Al-Fallujah City Drainage

Shaimaa M. Dawd
Lecturer, University of Anbar – Education Collage for Women

Abstract
This article included bacteriological and some chemical elements study of pollution from Euphrates river and Al-Flaloha city drainage. The study of four selected sites which are Euphrates river (T), Al-Falahat (F) drainage, Al-Ne'emya (N) drainage, and Al-Bo Alwan (B) drainage in the period 11-13/December/2016. Bacteria were isolated and diagnosed in water samples depending on their cultural, microscopic biochemical tests. Results showed that the water samples were polluted with bacteria produced by human and animal wastes, 7 out 20 isolates were selected and diagnosed. The study included counting the concentration of some chemical ions such as Sodium, Potassium using a flame photometer, the highest concentration of Sodium was in station F and the highest concentration of Potassium was at the station B, concentrations of carbonates and bicarbonates were measured using titration method, the highest concentration of bicarbonates ion was at station T, it also showed no carbonates in a water sample.

Keywords: Bacterial pollutants, Chemical elements, Euphrates, bacteriological, Bacterial isolates

Introduction
The considerable prevalence of salts in the agricultural lands located between the Dijla and Euphrates rivers in the plain sedimentary region led to the necessity of establishing a main network of puncture for the country’s need for fertile agricultural lands. Still the problem of biological pollution that is caused by sewage water is one of the most critical problems that have been aggravated by the political conditions, it went through such as wars, blockades and others that have increased water treatment problems. The current reality of treatment stations is one of the most important environmental problems that will undoubtedly lead to pollution of wastes, and of drains and hence the pollution of water bodies. The severity of water pollution is closely related to the source of pollution, and factory water and wastes constitute (60%) of all water pollutants, most of these pollutants are emitted from factories and their chemical waste, containing chemical elements pollution water. This makes this water a source of pathogenic bacteria such as Faecal Coliform Bacteria, Enterococcus and Pseudomonas Bacteria, which are evidence of stool water pollution.

In light of this: We use this study to detect the degree of pollution present in the studied water stations. As well as the diagnosis of bacteria resulting from pollutants and wastewater using microscopic and chemical analyzes.

Materials and Methods
The Study Area
Samples were collected from the study sites by one sample from each region during a season in addition to the sample taken from the Euphrates River using containers of polyethylene (1 liter) as shown in Table 1.
Identification of isolates

Microscopic and biochemical tests were performed using the scientific sources used in the diagnosis of bacteria. Diagnostic steps included cultural properties, Microscopic tests, and motility tests. As for biochemical tests, they included conducting the Oxidase test, the Catalase test, and the Citrate utilization test, Voges-Proskauer test, Methyl red test and Indole production test.

Determination of chemical elements in water samples

Determine the potassium $K^+$ and sodium $Na^+$ elements by flame atomic emission using a flame photometer and prepare a standard curve for the potassium element from KCl and a standard sodium curve from NaCl, the carbonate ions ($CO_3^{2-}$) and the bicarbonate ($HCO_3^{-}$) were measured by solution ($0.01 n H_2SO_4$).

Results and Discussion

The diagnosis was performed on (20) isolates obtained from the water samples of the studied sites according Bacterial Density, by (3 isolates at site T, 4 isolates at site F, 9 isolates at site N and 4 isolates at site B).

Micro and agricultural characteristics

Microscopic examination showed that the isolates that we obtained were (17) isolates in single or bilateral bacilli and (3) isolates in the form of staphylococci. As for the dye of gram, there was (15) negative isolation of gram. And (5) isolation is positive for gram. As for its ability to move, there are (14) of them grown on the medium semi-solid agar and (6) non-move isolates. Most bacteria isolates showed that ability to grow at a temperature of (28$^\circ$) and (38$^\circ$), as shown in Table No. (1).

Biochemical tests

The results of the biochemical tests showed that the isolated isolates were tested for the tests (catalyze and oxidase enzyme production, indole production, red methyl test, fox proscur and the consumption of $Citrate$) as follows:

The catalase enzyme test

The catalase enzyme test showed that for all isolates there are 17 positive isolates of this test, that is, they have the ability to produce the catalase enzyme, and 3 negative isolates for this test that is, they cannot produce the catalase enzyme.

Oxidase test

The test showed that for all isolates there are 3 positive isolates that have the ability to excrete the oxidase and 17 negative isolates for this test, they do not have the ability to excrete the oxidase.

Indole production test

The indole production test for all isolates showed that there are 7 isolates on the ability to produce indole from the amino acid Tryptophan by enzyme Tryptophanase and 13 isolates that do not have the ability to produce indole.

Red Excitation Test

For all isolates, a red methylation test showed that 13 isolates showed red color. This indicates the
efficiency of isolated bacteria on analyzing glucose sugar altogether and produced amino mixed acid fermentation. And 7 isolates in which a yellow color was observed, this indicates the negativity of these isolates for this test, that is, they do not have the ability to thorough analyze glucose and produce this Mixed Acid Fermentation completely).

**Fox Proscower Test**

The results of the Fox Proscur test showed that for all isolates, there are 9 isolates that showed a red color, and this indicates the ability of bacteria to partially analyze glucose sugar and the formation of an intermediate compound is Acetyl-Methylcarbinol and 11 isolates in which a yellow color remains, and it has no ability to partially analyze glucose and form the intermediate Acetyl-Methylcarbinol.

**Citrate Utilization Test**

The test showed the utilization of *citrate* for all isolates that 9 isolates are changing the color The proof blue bromothaimol from green to blue this is evidence of the ability of bacteria in these isolates to use the *citrate* as a single source of carbon and the presence of the enzyme Citatelyase and 11 isolates where it was observed that the color of the green medium was not changed, evidence for this indicates that this isolation is negative for this test.

**Spread Bacteria in the studied areas:**

The areas that were studied trocar showed that there are a large number of different pollutants in them, especially their pollution sewage, agricultural wastes and animal waste, in addition to their pollution with factory waste, which caused an increase in the number of bacteria in those areas, as shown in Table (2) as follows:

</table>
We notice from the results in Table that the *E. coli* bacteria have the largest number of bacterial isolates diagnosed by seven isolates and at a rate of (35%), as station N recorded the highest number of isolates for this bacterium by six isolates followed by station B with only one isolate. The reason for its spread in these areas may be due to the large pollution of these trocars with heavy water resulting from the disposal of wastewater, as well as throwing agricultural and animal wastes directly into the trocars, especially site N, as it is considered an agricultural area there is also a lot of animal husbandry in this region, as the high number of colon bacteria in the water is considered evidence of pollution of water with stool, which may be caused by drainage of wastewater into surface waters such as rivers, streams, etc. In addition to throwing agricultural wastes and animal waste in this water, which provides a fertile environment for the growth of this type of bacteria.

As for *P. aeruginosa* and *E. faecalis*, it was 15% each, and by one or two isolates of the station, the presence of these two types of bacteria is also an important indicator of bacteriological pollution of water resulting from human excrement and excreta in addition to other wastes. While bacterial species *Pr. mirabilis*, *K. pneumonia* and *Enterobactrum* are 10% each, and the presence of these bacterial species in the water is considered a danger to human health if this water is used for drinking, as *Klebsiella Pneumonia* is one of the causes of bowel disorders and pharyngitis, as well as urinary tract infection that may cause it. Also, *Enterobactum bacteria*

As for the bacteria *Citrobacter freundii*, the lowest percentage of bacterial isolates (5%) was recorded with only one isolate at station T, as this station has the advantage of being the lowest number of bacterial isolates diagnosed in it because the river water is running water and heavy elements are deposited as well as the discharge of pollutants.

Content of some chemical elements in water samples:

Positive ions:

Sodium ion:

Sodium (Na) concentrations in water samples have been reported between 215.6 mg.l⁻¹ at site B and 762.5 mg.l⁻¹ at site F and 443.1 mg.l⁻¹ at site N, while its concentration in the Euphrates River (T) was 104.9 mg.l⁻¹ as shown in Table (3). When comparing the results of sodium concentration, it appears to us that the highest value of the Na concentration was at site F, This may be due to the drainage of agricultural lands on both sides of the trocar, as the Al-Falahat suburb is considered an agricultural area containing many palm groves and other trees, where the process of trocars and evaporation in summer causes an increase in the percentage of salts in the water, including sodium salts. Whereas, the lowest value of the sodium concentration was recorded in the site T, because the river water is running water in which the concentration of chemical elements decreases in general, and also because of the growth of algae, and living organisms that consumer these nutrients.

Potassium ion:

The results of the study showed that the highest value of potassium ion concentration was for site B 16.7 mg / l, followed by site F 8 mg / l, then site N 4.8 mg / l. As it is noticed the low potassium concentration in the water compared to the sodium ion, This is due to the element potassium that is included in the composition of clay minerals during weathering and the other reason is that potassium minerals are more resistant to weathering compared to sodium minerals. While the lowest value of the Euphrates River T was recorded at 4.4 mg.l⁻¹, because the river water is considered running water and the consumption of the elements by the aquatic organisms that are present in it occurs a lot compared to other stations (Table No. 3).

Negative ions:

Carbonate ion, CO₃⁻ and bicarbonate, HCO₃⁻:

The results showed that the highest concentration of the bicarbonate ion was in the water of the river and this is consistent with the study carried out by, which also showed an increase in the concentration of bicarbonate ion in the Euphrates River for the city of Fallujah. The high concentration of these ions in the water of the river is due to the availability of dissolved non-organic carbon in addition to the heavy rains falling on the soil rich in carbon dioxide whose waters descend into the river, which is one of the main reasons leading to an
increase in the value of the bicarbonate ion \(^1\). As for other sites, we note that the site N is 6 mg.l\(^{-1}\), followed by the Euphrates River, followed by the site F 2 mg.l\(^{-1}\), then the site B is 0.9 mg.l\(^{-1}\). This is proportional to the number of diagnosed bacteria in these sites that rely on citrate as a carbon source, where it was observed that the concentration of the bicarbonate ion increased with the increase in the number of diagnosed bacteria in that water except for the Euphrates River water T 28 mg.l\(^{-1}\) where the concentration of the bicarbonate ion increased for the reasons mentioned above (Table No. 3). It is clear to us through the above results that there is an increase in the concentration of the chemical elements studied in the water stations included in the study, Explain \(^2\) indicated that sanitary and industrial wastewater always leads to a large increase in the concentration of chemical elements in the water.

Conclusions

Through the results of this study it was found that studied water suffers from the pollution that reached a degree that negatively affected its use; Hence, it became unsuitable for drinking and industrial home use, which affects public health. There was also a relationship between the pollution of this water and the increased prevalence of pathogenic bacteria in the areas under study. It also increases the concentration of elements in water samples due to their pollution with wastewater.

Study of some Immunological Variables Resulted from Balb/c Mice Injection with Hydatid Cysts Protoscolex Antigens

A. O. Humide¹, Abbdalwahab Hussain², Ezeddin A. Albayyar³
¹Lecturer, ²Prof., University of Fallujah, College of Applied Science, ³Assist. Prof., University of Anbar, College of Science

Abstract

Human cyst disease is a common epidemic disease between humans. The current study was carried out to study some of immunological parameters (the immunoglobins IgG, IgA, the complement proteins C3, C4, the MIF of PMNs cells, the reducing of NBT and the phagocytosis of Candida albicans) in the Balb/c mice injected with antigen of protoscolex. By using (15) BALb/c mice and the antibodies IgG, IgA in addition to the complements (C3, C4) that were measured as well as the Migration Inhibition Factor (MIF). The results showed that there were significant differences in IgG (13458) mg/dl. IgA (4773) mg/dl, C3 (359.7) mg/dl, C4 (90.80) mg/dl levels with injection of 0.5 ml in muscle and the MIF levels (1.49) with injection of (0.75) ml. so between the test and the control up (p≤0.05). This might be a good candidate for immunization and diagnosis of Hydatid cysts in the intermediate host of E. granulosus.

Keywords: Complement, Echinococcus granulosus, Hydatid cysts, Immunoglobulins, Protoscolex antigen

Introduction

Human cyst disease is a common epidemic disease between humans and animals since ancient times; this disease was caused by the larval stage of granular cestodes of the genus E. granulosus ¹⁻⁵. The lifecycle of this parasite requires two hosts, the final host, such as dogs, which carry adult worms, and the central host, such as humans, who infected with the larval phase that cause water cyst disease. The disease is endemic in southern America, northern Canada, Western Europe, the Mediterranean basin and the Asia center, and in Australia ⁶⁻⁸. The Hydatid cysts infect the organs and tissues of the body ⁹⁻¹¹ and liver infection represent more than half of the organs’ infections¹². While spinal cord and brain injuries are very rare¹³, the bone injury was first described by Didlon in 1870. ¹⁴ The survival of the parasite in the body may extend for 53 years ¹⁵ and this long survival may explain its ability to regulate the immunological response ¹⁶.

Therefore, current studies have focused on knowing how to stimulate the immune system in the central host and the possibility of using its Antigens of whole-numerical components. Therefore, the present study focused on the possibility of preparing antigens from protoscolex proteins and using different concentrations of these antigens in order to stimulate the immune response in laboratory animals by immunization of the mice with protoscolex antigens using two concentrations intramuscular.

Material and Methods

Experimental design :

1. The experiment dealt with 15 white mice distributed into three groups of 5 mice each.

2. The first group was injected with a concentration of 0.5 ml of protoscolex antigen I/M. The second group was injected at a concentration of 0.75 ml of the same antigen. The third group injected at a concentration of 0.1 ml PBS solution as a control group at the same location.

3. Measurement the level of serum IgG, IgA in immunized mice using single radial immunodiffusion
Measurement of neutrophil PMNs and Testing the Phagocytosis of *Candida albicans* by dye exclusion method according to 17.

4. Measurement of NBT dye reductively according to 18.

5. Measurement Coefficient of inhibition of cell migration and Complement measurement using proliferation of a single immune protein in solid pits.

Statistical analysis: mean and standard deviation calculated using SPSS program.

Results and Discussion

The results of the study revealed a significant increase in IgG and IgA antibody production levels in the plentiful serum of mice. The highest concentration of IgG and IgA were recorded respectively (4773) and (3458) mg / 100 ml at antigen concentration 0.5 ml compared to control.

Protoscolex antigens are highly effective in stimulating and activating the immune system, especially in non-lethal doses so that non-expansion of both liver and spleen resulted from the determination of the disease by the immune response of the host, where the spleen is the most resistant organ because it is an immune organ that includes cells that regulate the immune response. The immune response against cystic adenocarcinoma involves the production of fixed levels of antibodies, but these levels are rapidly reduced after removal of the cyst and its organs. IgG levels rise within 2 to 11 weeks of infection. Where the antibodies act in killing the protoscolex of E. granulosus worms in the chronic stages of infection, mainly IgG, IgM IgA, antibodies. These levels begin to decline in the chronic stages of the infection but start to rise in the later stages. Where levels of IgG1, IgG3 significantly increased during the eighth week after the challenge dose and subsequent periods. The immune response mediated by complement and gastric proteins by bodies Antibiotics can be generated by administering two doses of the vaccine within a month and lasting up to 13 months. There is evidence that a significant increasing in PMNs and macrophage and eosinophils. Some cytokines that are secreted by lymphocytes type - T2 cells can inhibit the effectiveness of the influencing factors despite the stimulation of large numbers of immune cells.

The production of IFN gamma, IFN alpha, interleukins when stimulating cells with antigens plays an important role in the secondary response. Those materials work in inducing T-independent antigens, which in turn stimulate the production of antibodies type IgG3 IgM as there is a clear link between the production of antibodies and the production of cytokines in the chronic stages of infection in humans in IgG4 and IgE types. This binding is necessary to determine the growth of the parasite and prevent the destruction of the organ in the host. The ability of cells to phagocyte germs and antigens depends on their ability to produce super oxide ion, which plays a key role in the mechanism of cell killing, gobbling and destroying antigens when assembling H₂O₂, O₂. However, they do not stimulate lymphocytes qualitatively, but they do not produce sufficient amounts of MIF.

Conclusions

Finding of this research support involvement of immune system competent in mice vaccinate with E. granulosus antigens, and in the sequential promotion of the immune cell responses and a modulate immunity in infective animals to moderate vaccines.

Study of the Biochemical Markers of Liver and Renal Function in Moderate -To- Heavy Cigarette Smokers’ Men in Mosul City

Enaam Ahmed Hamza Al-Dagestani
Lecturer, Department of Biophysics, College of Science ,University of Mosul

Abstract

Smoking has been associated with adverse health effects on body organs. The effect of smoking on the liver’s enzymes and kidney’s parameters, and their relationships with some blood parameters need more evaluation. This study aimed to investigate the association of cigarette smoking to liver and kidney functions in 68 males, all of them not suffer from chronic disease and their ages were between (25-45) years, by estimating the levels of alanine aminotransferase (ALT), aspartate aminotransferase (AST) and alkaline phosphatase (ALP) as liver enzymes as well as estimating of creatinine, urea, and uric acid in the serum of smokers comparing with non-smokers groups (control). Also, this work aimed to study the effects of smoking on some blood profiles, white blood cell counts (WBC), red blood counts (RBC), hemoglobin (HB), mean corpuscular volume (MCV), and platelet (PLT). The results showed a significant increase in (ALT), (AST), (ALP) enzymes, urea, creatinine (WBC), (RBC), (HB) and (MCV), the result also showed a significant decrease in uric acid while no significant decrease in (PLT) in smokers comparing to non-smokers’ group. In conclusion a cigarette smoking negatively affected in biochemical markers of liver and kidney function.

Keywords: Non-smokers, biochemical markers, liver, renal.

Introduction

Smoking is one of the main causes of disability, illness and early death 1. The use of tobacco is widely spreading throughout the world and was listed as one of the risk factors for the majority of the disorders. Different diseases are caused or gotten worse by cigarette smoking that leads to death which is appearing every year all over the world 2. Recent investigation by Gue 3 suggests that active smoking is significantly related to the risks of the severe cases of COVID-19. The death that is caused by heart disease was strongly related to the lower levels of education 4. However, alcohol, smoking, body mass index, and physical inactivity were considered as most of the risk factors of atherosclerosis and cardiovascular disease, and the biggest share was accounted for smoking 4, 5. The good news by Babb et al. was 68% of cigarette smokers want completely to quit smoking 6.

The best define of moderate-to-heavy smokers is the persons who are smoking at least 11 cigarettes per day 7. Cigarette Smoking induces major adverse effects and exposes the body to many different harmful compounds such as toxins, free radicals, and carcinogenic 7. These compounds have numerous impacts on diverse body organs starting with the primary contact of cigarette poisons to the lung and other organs 8. Although cigarette smoking is the main risk for cardiovascular diseases, its relationship with hypertension remains unclear 9.

Smoking is one of the poor living behavior in our life, that may elevate the risk for liver disease such as cirrhosis and fibrosis that associated with chronic hepatitis B infection 10, 11. Azzalini et al. have mentioned a relationship between the seriousness of the liver infection and cigarette smoking in patients with liver disease 12. The liver is the important organs that is negatively affected by smoking. The liver plays the main role of metabolism, storing the Glycogen, and eliminating the harmful and toxic compounds from the body 13.

In addition, the kidneys control the consistency of the inner environment, valuable materials are rapidly recycled but undesirable ingredients are effectively eliminated through urine 14. A positive relationship
between smoking and chronic kidney disease (CKD) has been mentioned. Since there is a correlation between the function of the liver and the kidney, it is possible that liver disease in more than one way affects the functioning of the kidney and increases the rates of microbial infections. Also, the decrease in blood pressure resulting from a defect in the function of the liver leads to a decrease in blood flow that reaches the kidneys and it becomes unable to perform its function in eliminating toxins from the body, which causes an increase in the level of creatinine and urea in the blood.

More clarification might be required about the effect of smoking on liver and kidney functions. This study aimed to investigate the effect of cigarette smoking on liver function, kidney function, and blood profile. In addition, this study interested in evaluating the possible associations between the liver’s enzymes and parameters studied such as urea, creatinine, uric acid, and some of the blood parameters. Experimental section:

**Materials and Methods**

A total of (68) Iraqi males in Mosul city were separated into two groups: (34) smoker and (34) non-smokers (control), their ages were between 25-45 years. All participants did not suffer from any chronic diseases and did not take drugs. Each person included in this study was asked about the duration of smoking and also the number of cigarettes consumed per day.

A blood sample was collected from the vein, a small amount of each sample was separated in the test tube that contains anticoagulant with gentle mixing for the use in CBC test, and the rest was left to clot in Serum Separation Gel Tubes, sera were stored in labeled Eppendorf tubes at -20°C until they were used for the biochemical test.

Body mass index (BMI) value was estimated by the weight in kg per the body height square in meters (kg m−2). (ALT), (AST) and (ALP) activities in serum were estimated by using the Kits from Biolabo-amazing Company, made in France. Urea concentrations in sera were estimated by using Kits from BioSystems company, made in Spain. Serum creatinine and uric acid concentrations were estimated by using Kits from Biolabo-maize-France.

**Statistical measurements:**

By using SPSS (Statistical Package for the Social Sciences) software program version 26, data of this study were analyzed. The normality of data was tested by Kolmogorov-Smirnov test. Independent-Sample T-test was performed for the comparisons between two groups (Smokers and control). Bivariate Analysis (person correlation for normal distribution data and Spearman correlation for abnormal distribution data) was performed to find possible associations between liver enzymes and the selected parameters in the smokers group. P-value ≤0.05 is considered significant.

**Results and Discussion**

The effects of Smoking depend on the duration of smoking and how much the individual smokes per day. Early smoking increases the risk factor of linked diseases. The characteristics of the subjects that included Ages, BMI, and duration of smoking in both non-smokers (control) and smokers’ group were shown in Table 1.

The liver is an active organ with various functions, such as regulating glycogen storage, production of plasma protein, and detoxification. The results showed that enzyme activity of ALT, AST, and ALP in serum increased significantly in cigarette smokers in comparison with non-smokers as seen in Table 2. This may be indicating the negative effect of smoking on the performance of the hepatocyte. These results were similar to the results of Gordon. Numerous studies suggest that AST, ALT enzymes can be used as markers for any disorder related to the function of the liver, and as indicators of clinical results for the patients and healthy groups. The high levels of liver enzymes ALT, AST, and ALP in the smokers’ men may be due to the release of more than normal levels of the cellular oxidative radicals. This effect may be because there are many different types of components in cigarette smoke able to disrupt the balance of oxidants and antioxidants in all tissues and blood. Cigarette smoke influenced liver function by harmful and toxic compounds on hepatocyte, that lead to secrete enzymes from the cells of the liver through inflammatory pathways, and that increases the chronic inflammation. There is a multivariable that affects the serum levels of ALT and AST such as BMI, age, gender, daily current smoking, and lifetime of smoking.

This study also showed the alterations in the levels of creatinine, urea, and uric acid in the smokers’ group in comparison with the control that obviously appears the negative effect of smoking on kidney function. Table 2 shows significantly elevated levels of serum urea and creatinine in smokers than in the control. These findings have similarity with the outcomes of another investigation by El Sayed et al. The cause of these changes might be due to a rise in resistance in renal vascular, leading to lowering in the rate of glomerular filtration, a decrease in the rate flow of distal renal tubular, and a fall of urea reabsorption. The result also showed a significant decrease in serum uric acid concentration in smokers in compression with nonsmokers’ groups. This result matches with other reports by Gorica and Skibska, that indicated low serum uric acid in the smokers’ groups. The decline or destruction of the antioxidants levels, indicating that the oxidative stress is increased with every cigarette smoked as demonstrated. Cigarette smoking influences numerous organs of human body. It causes vasoconstriction due to stimulation of the nervous system (sympathetic) which leads to the rise of blood pressure and reduction in glomerular filtration rate. Also increases the risk of microalbuminuria.
Moderate-to-heavy daily cigarette smokers showed a significant increase in WBC compared with the control who had normal value for the above parameters as seen in Table 3. This result is similar to the results of Freedman et al. 28.

WBC; white blood cell, RBC; red blood cell, HB, hemoglobin, MCV; Mean corpuscular volume,

PLT; platelet blood count. * Significant at p-value ≤0.05

It is known that the high levels of leukocytosis in smokers’ blood could be a marker of the injury or inflammation in the tissues due to high level of free radicals as oxidants in cigarette smoke 29. In addition, smoking leads to an increase in the WBC level by 30% in comparison with non-smokers. Glycoprotein as ingredients of tobacco leaf might play a role as a stimulator for the lymphocyte to activate proliferation and differentiation through its interaction with membrane components, inducing response such as the response that occurs with antigen. This mechanism could be one of the possible mechanisms that may cause the elevation in the WBC account as demonstrated 28. RBC, HB and MCV also increased significantly in the smokers’ group compared with control, as shown in table 3, this elevation because of the presence of Carbon monoxide, one of the chemical compounds recognized in tobacco that may be lead to hypoxia and then the body increases the number of erythrocytes due to hypoxia 30. This situation of polycythemia creates an oxy-carbon poisoning, so more oxygen is required and the generation of RBC cells is increased 31,32. MCV is one index of the RBC that help to measure the HB composition and average size of the RBC. The result showed no significant decrease in platelet (PLT) count in the smokers’ group compared with the control as seen in table 3. The current study were slightly showed in agreement with another study that found that there was no significant change between male smokers and nonsmokers in the levels of the platelet counts 33. Another study by Suwansaksri and Wiwanitkit observed there was no difference in platelet levels in male smokers and control 34. However, the effect of smoking on the amounts of platelets might be another contributing factor and it is still controversial. A higher level of hemoglobin as a result of decreasing the proportion of oxygenated blood and increasing the carboxyhemoglobin level in the blood leaves no place on the hemoglobin in the RBC to carry oxygen. Hypoxia induces the secretion of the erythropoietin hormone from the kidneys which activates the bone marrow to increase red blood cells’ production in order to overcome this deficiency. In addition, smoking causes lipoprotein abnormalities that have been detected in active smokers. As a symptom of these changes, the smoker feels tired when he is doing the simplest physical activities as demonstrated by Gossett and his workers 35. Bivariate analysis was performed to find possibly related between the liver’s enzymes and the selected parameters in the smokers’ groups. The results showed there is no correlation with ALT enzyme and other
selected parameters as shown in Table 4. A negatively significant correlation between AST enzyme and ALP enzyme and a significant positive correlation between AST enzyme and uric acid showed in Table 5. However, there is no correlation between the ALP enzyme and the parameters studied as shown in Table 6. The elevation in ALP concentration is related to liver dysfunction and it is caused by some destruction of hepatic cell membranes such as intrahepatic or extrahepatic cholestasis. Rising cholestasis accelerates more production of ALP by the bile ductules cell producing an additional level of ALP which ends up entering circulating. ALP enzyme is present in the liver and bones, a high level of ALP in the blood without any increase in the liver enzymes may be good markers of a specific injury in the gall bladder tracts. Nyblom et al. found significant elevations of AST and plasma uric acid in patients with cirrhosis of the liver, viral hepatitis. The increase in serum uric acid concentration with the elevations in the liver enzymes levels might be accounted as a risk factor that related to chronic liver diseases.

Conclusions

Smoking is one of the great health risks that negatively affect the markers of liver and kidney functions and causes a significant increase in ALT, AST, ALP enzymes, urea, creatinine, WBC, RBC, HB, MCV and no significant decrease in PLT. Cigarette smoking significantly lower of uric acid. Decreasing serum uric acid significantly in smokers indicates that one or more of the cigarette smoking components might be useful for making this effect, but these compounds and the mechanism need to be clarifying by additional work.

The Effect of Dual-Species Biofilms, Monosaccharide and D-Amino Acids on Pseudomonal Biofilm

Al-Moghira Khairi Al-Qaysi¹; Safaa Abed Latef Al-Meani²; Mushtak T.S. Al-Ouqaili³

¹Assistant lecture, University of Anbar, College of Education for Pure Sciences, Department of Biology, ²Assistant Professor, University of Anbar, College of Science, Department of Biotechnology, ³Professor, University of Anbar, College of Medicine, Department of Microbiology

Abstract

Background: The major therapeutic failure in clinical settings is due to problematic biofilm-producing bacteria like Pseudomonas aeruginosa. This study aims to investigate the effect of dual-species biofilms, monosaccharide, and D-amino acids on pseudomonal biofilm.

Methodology: A total of 130 patients with catheter-associated urinary tract and wound infections were involved in this study. Quantitative biofilm assay by alginate beads was performed. The dual-species biofilms have been done, and the effect of ciprofloxacin, monosaccharides, and D-amino acids on sessile cells was detected.

Conclusion: This study suggested that the combined action of both monosaccharides (glucose and galactose) and the combination of each one with ciprofloxacin is the enhancing of P. aeruginosa biofilm and increases survival strategy against ciprofloxacin. In contrast, a noticeable biofilm reduction and marked synergistic action for ciprofloxacin have been determined in the combination of the two D-amino acid, alanine, and glycine in comparison to the effect of each one alone. Furthermore, the dual biofilm of P. aeruginosa with each of K. pneumonia and E. coli, markedly reduced pseudomonal biofilm, while co-culture with S. aureus revealed strong support of pseudomonal pathogenicity and increased its biofilm production.

Keywords: Biofilm, monosaccharide, D-amino acids

Introduction

Pseudomonas aeruginosa, a Gram-negative bacillus widely found in nature, is an opportunistic pathogen that can cause disease in immunosuppressed patients.¹ The organism is known to produce biofilm and cause severe infections.² A biofilm is generally considered to be a community of microbes enmeshed in an extracellular matrix (often a polysaccharide), typically attached to surfaces, that displays characteristics different from their planktonic counterparts. These unique properties of biofilms complicate their eradication and may contribute to the development of chronic disease.³ Additionally, naturally occurring biofilms typically involve multiple species of bacteria. Polymicrobial growth necessitates interspecies interactions that involve some degree of intercellular communication and metabolic cooperation. The interactions within mixed-species biofilms have been characterized as cooperative, competitive, or neutral, nature based on the genetic background of the involved species.⁴

P. aeruginosa produces at least three extracellular polysaccharides with different chemical structures, functions, and biosynthetic pathways: alginate, Psl, and Pel. Pel is a glucose-rich structure and Psl consists of repeating D-glucose units. Some P. aeruginosa strains predominantly produce Psl, which is associated with matrix stability.⁵ Factors that can trigger biofilm dissolution of the biofilm are D-amino acids, which are naturally produced by late stationary phase cultures. Incorporating D-amino acids within the cell wall modulates peptidoglycan synthesis and inhibits attachment to the biofilm matrix proteins. Thus, these amino acids may reduce intercellular adhesion,
negatively affecting biofilm stability. Therefore, one of the aims of this study was to investigate the effect of monosaccharides and D-amino acids on pseudomonal biofilms, including their effects on biofilm inhibitory concentrations (BICs). Another aim of the study was to gain insights into inter-species interactions in dual species biofilms, such as survival strategies in the presence of antibiotics.

**Patients and Methods**

A total of 130 clinical specimens were obtained from patients with catheter-associated urinary tract and wound infections. The patients attended the Ramadi (Iraq) Teaching Hospital or private clinics in Ramadi between October 2019 and February 2020.

**Microbiological diagnosis of study isolates**

*P. aeruginosa* isolates were recovered following growth on selective media (2.2% nalidixic acid with cetrimide agar). All study isolates of *P. aeruginosa*, *S. aureus*, *K. pneumonia*, and *E. coli* were identified using the Vitek system (BioMérieux, Marcy-l’Etoile, France) and confirmed using biochemical tests.

**Detection of biofilm production**

Bacterial biofilms were produced on alginate beads, following the method of Vásquez-Ponce et al., Briefly, this method entails by cultured bacteria overnight in BHI broth, and added (600 µL) to the wells of a 48-well culture plate. Prepared alginate beads had been added to the wells and the plates were incubated overnight. The cultured beads were transferred to triplicate fresh wells containing BHI broth (600 µL) and the desired antibiotic, and the plates were incubated overnight, and then calculating by Mils Misra method.

Production was included in this study using alginate beads. It includes preparation of alginate beads, biofilm set up and formation on it, dislodging of sessile cells from beads and then counting bacteria by Miles Misra method the isolates’ ability to form biofilms was first determined by a qualitative microtiter plate assay. This test involved the inoculation in the wells of a 96-well microtiter plate of a standardized bacterial inoculum. The methanol was added to each well for 15 minutes after overnight incubation and then the plate was drained, allowing dry air to be allowed. Before the well was rinsed out, crystal violet for 5 min was added to each well. In each well, acetic acid (160 µl) was added and an optical density at 570 and 630 nm for each well was read. Optical (OD) density was used to classify the isolate’s capability to make a biofilm into weak (OD < 1.078), intermediate (OD = 1.078–2.156), or strong (OD > 2.156).

**Biofilm susceptibility test**

Susceptibility testing was performed according to the Clinical Laboratory Standard Institute (CLSI) method. Briefly, 600 µl of brain heart infusion (BHI) containing approximately 10⁴ colony forming units (CFU)/mL was pipetted into each well of a 48-well plate. Alginate beads, prepared as described by Allison et al., were also added (600 µL) to each well, and the plate was incubated (37°C, 150 rpm) overnight. Following the incubation, the media and non-adherent bacteria were removed and fresh media was added. In experiments investigating the effects of ciprofloxacin, the antibiotic was added to the media. For the experiments investigating the effects of added monosaccharides, the BHI broth was supplemented with glucose, fructose, or galactose at 20 µg/dL, or with combinations of glucose/fructose, glucose/galactose, or fructose/galactose, each at 10 µg/dL. For experiments involving D-amino acids (alanine or glycine), the BHI was supplemented with either amino acid (500 mM) The plates were incubated for 24 h (37°C, 150 rpm). Triplicate wells of beads were collected following 2, 4, 6, 8, 12, 12, and 24 h of incubation. Following this incubation, the samples were washed in distilled water and placed into a tube containing 2 mL of dissolving solution (5.3 g NaCO₃ and 5.2 g citric acid in 100 ml). The beads were homogenized, and samples were diluted and the bacterial numbers determined by plating on BHI agar and determining the numbers of viable bacteria recovered. These tests were made according to the criteria mentioned by the Clinical Laboratory Standard Institute (CLSI). They were checked with the determination of the stability of growth in terms of CFU with the presence and absence of ciprofloxacin.

**Effects of ciprofloxacin, monosaccharides, and D-amino acids**

In some experiments the antimicrobial action of ciprofloxacin (MHOX; Prepared Media Laboratories, Tualatin, Oreg) was investigated against two *P.
**P. aeruginosa** isolates. One isolate (#1) was challenged with 900 µg/mL of the antibiotic; the second isolate (#2) was challenged with 800 µg/mL.

Similarly, the effects of adding remint. Glucose, galactose, and fructose [BDH, England] were investigated. 12

The effects of D-amino acids were also explored using 500 mM D-alanine and D-glycine, alone or in combination, on sessile and planktonic cells.

**Dual-species biofilms**

*P. aeruginosa* was cultured with isolates of *Staphylococcus aureus*, *Klebsiella pneumoniae*, and *Escherichia coli*. Overnight cultures of the target bacterial species were re-suspended in BHI broth (1 mL) to a density of approximately 10⁸ CFU/mL; 300 µl of two cultures 1 total bacterial cell volume from both bacteria in 1:1 ratio, then it was vortexing. *P. aeruginosa* was vortexing with *S. aureus*, *K. pneumonia* and *E. coli* (independently). Using 48 wells plate, 600 µl BHI broth containing 1/10 000 from co-culture was pipetting 600 µl into each well. Alginate beads were inserting to the wells after washing them in SDW using flamed wire and pliers. The plate was incubating overnight at 37°C and 150 rpm. Triplicate beads were used for each mixed culture. Media and non-adherent cells were discarded after incubation. They were putting by the experiment in a new medium with ciprofloxacin and without ciprofloxacin. Then Incubate overnight at 37°C, 150 rpm. The beads were collecting at 2, 4, 6, 8, 12, and 24 h; and washed in 600 µl dH₂O in a 48 well plate before dissolving in a 15 ml falcon tube in two ml dissolving solution, the beads were smashing with a sterile loop stick. In order to differentiate between bacteria in the Miles Misra technique, biofilm production was estimated for each bacterium (alone and together), using selective media and antibiotics.

In dual-species biofilms between the studies isolate no. 2 and *S. aureus*, *P. aeruginosa* was inhibited by adding four µg/ml of amikacin to the culture media. Also, the isolate no. 2 was inhibited by exposing to 4 µg/ml of ceftazidime when it is co-cultured with *K. pneumonia*. Further, in dual culture with *E. coli*, the isolate no. 2 was inhibited by two µg/ml of gentamicin. The calculation of CFU for all isolates which were co-cultured with isolate no. 1 was done according to the following equation: CFU of dual-species biofilms culture minus CFU of isolate no. 1. All other above bacteria were inhibiting by cetrimide agar contains naldixic acid. 13

Data analyses were performed using the SPSS-23 (SPSS, Chicago, IL, USA) statistical package. Data are presented as simple measures of frequency, percentages, means, standard deviations, and ranges (minimum-maximum values). For quantitative data, differences between means were examined using t-tests for independent means or paired t-tests for differences between paired observations. An analysis of variance (ANOVA) was used to examine differences between more than two independent means. For qualitative data, the chi-square test was used to examine differences between percentages. P-values ≤ 0.05 were considered significant.

**Results**

The increase in the number of *P. aeruginosa* cells (isolates 1 and 2) attached to the alginate beads, under control conditions (BHI only, no additional antimicrobial or other additive) is shown in Figure 1. There was complete inhibition of growth when cultivating sessile cells of *P. aeruginosa* overnight on alginate beads when the BHI broth either 800 or 900 µg/mL ciprofloxacin for isolates no. 2 and 1, respectively (Figure 1). However, when the sessile cells are actively growing on the alginate beads and producing the biofilms, there is low-level resistance, and after four hours incubation, the ciprofloxacin concentration has a negligible effect on the sessile cells. The development of survival strategy against the selected ciprofloxacin concentration with both isolates only occurs between 4 and 8 hours growth. However, the survival of sessile cells decreased sharply and by 12 hours to isolate no. 2 and 24 hours to isolate no. 1 (figure 1).
The number of cells that adhered to the alginate beads was dependent on both concentrations of the supplements added and the bacterial isolate. The sessile *P. aeruginosa* cells exhibited copious growth when glucose or galactose was added to the media, although much more growth was discernible in the presence of glucose (Figures 2). Glucose supplementation resulted in more adherent cells than either fructose or galactose, and both isolates responded similarly to the added sugar (Figures 2). Both study isolates were yielded, enhancing biofilm production with the addition of glucose (P<0.05). Significant differences were detected in the biofilm production for both isolates with the presence of galactose (P<0.05) with one log increase, compared to sessile cells without any addition. No significant differences observed in the biofilm production with fructose supplementation compared to sessile cells without any addition (Figure 2).

In planktonic stage, the results obtained by adding monosaccharides to the culture medium indicated that the number of free swimming pseudomonal cells increased in two log with the addition of glucose, but with galactose and fructose the increase was negligible. Further, when ciprofloxacin was added the values of MICs were decreased (resistance decrease) with the addition of glucose, while the effect with the presence of galactose and fructose is negligible.
Figure 2. Development of biofilms on alginate beads of two isolates no. 2 and 1, with the addition of different monosaccharides to the culture media using logarithmic panel. Cultures were set up from overnight cultures as described in Materials and Methods, with triplicate beads or wells and sampled at the indicated time points. Beads were washed, dissolved, serially diluted and plated for CFU/ml counts. Mean CFU/ml counts are plotted against time of growth with error bars. Dashed line indicates the detection inhibit sessile cells A: glucose supplement, and glucose with ciprofloxacin supplements, B: fructose supplement, and fructose with ciprofloxacin supplements, C: galactose supplement, and galactose with ciprofloxacin supplements.
The combined form of fructose with each glucose and galactose were supplementing to the culture media to determine the biofilm for producer isolates of *P. aeruginosa* during 24 h and compared with sessile cells of *P. aeruginosa* without any addition. The results revealed no significant differences for both isolates. The combined form of glucose and galactose was adding to media, which contains alginate beads to estimate the effect of combined action of glucose and galactose on the activity of sessile cells. They were showing significant differences (P<0.05) with one log increase in comparison with sessile cells of bacteria without addition (figure 3).

**Figure 3.** Development of biofilms on alginate beads of two isolates no. 2 and 1, with the addition of a different combined form of monosaccharides to the culture media. Cultures were set up from overnight cultures as described in materials and methods, with triplicate beads or wells and sampled at the indicated time points. Beads were washed, dissolved, serially diluted and plated for CFU/ml counts. Mean CFU/ml counts are plotted against time of growth with error bars. The dashed line indicates the detection inhibit sessile cells. A: glucose with fructose supplements, and glucose, fructose and ciprofloxacin supplements, B: glucose with galactose supplements, and glucose, galactose and ciprofloxacin supplements, C: galactose with fructose supplements, and galactose, fructose and ciprofloxacin supplements.
Ciprofloxacin was added to the media, which contains glucose, fructose, and galactose, the combined form of glucose with each fructose and galactose, and combined form of fructose with galactose. For the study, isolates no. 1 and 2, there were significant differences (P˂0.05) when ciprofloxacin added to culture media containing glucose. The effect of ciprofloxacin on the sessile cells in the presence of glucose is limited and it will become more effective and reduced sharply when the glucose is absent (in absence of glucose) (figure 1); ciprofloxacin did not eradicate the sessile cells with glucose presence. Furthermore, galactose enhanced survival of sessile cells with ciprofloxacin presence, but less than that occurred with glucose addition, as well as with the combined form of glucose and galactose addition with one log increase (P<0.05) compared with BIC of ciprofloxacin in the same time. Other additions when compared with BIC of ciprofloxacin statistically showing no significant differences when added ciprofloxacin to the culture media that containing fructose or combined form of fructose with each glucose and galactose during 24 h, which means that there was no noticeable increase or reduce in P. aeruginosa sessile cells (figure 4).

Figure 4. Development of biofilms on alginate beads of isolate no.2 without any addition, with adding glucose and with adding glucose with the ciprofloxacin. Cultures were set up from overnight cultures as described in Materials and Methods, with triplicate beads or wells and sampled at the indicated time points. Beads were washed, dissolved, serially diluted and plated for CFU/ml counts. Mean CFU/ml counts are plotted against time of growth with error bars.

Our initial experiments showed that D-gly, D-ala, and combined form of this amino acids, decreased biofilms formed by P. aeruginosa. However, the inhibitory action of the combined form of D-gly and D-ala was significantly (P<0.05) higher than D-gly and D-ala alone, while D-ala did not affect on sessile cells of isolate no.1. Hence, these amino acids were employed in experiments on account of its efficacy in combined action with ciprofloxacin. A positive correlation between these amino acids and ciprofloxacin was obtained from CFU count for both isolates. From the correlation lines, the number of adherent cells was calculated in the presence of D-gly, D-ala, and combined form of these D-amino acids supplementary. Rates of biofilm formation were obtained from the slopes of regression lines. Our results showed that a marked decrease in sessile cells when adding ciprofloxacin to the media containing D-amino acids. At 12 h, the BIC was observed with synergistic action between D-gly and ciprofloxacin for both isolates, and it was more potent with isolate no. 2. Also, the synergistic action between ciprofloxacin and combined form of D-gly with D-ala was observed. Synergistic
action also observed between D-ala and ciprofloxacin against isolate no. 2 (figure 5). The planktonic cells affected on amino acids. Planktonic cells showed a marked decrease in number with the addition of combined form of D-gly and D-ala, in comparison with D-gly alone. No observed effect appeared with the addition of the D-ala. Further, when adding the ciprofloxacin, the results showed synergistic reaction with the amino acids.

Figure 5. Development of biofilms on alginate beads for isolate no.2 versus addition some D-amino acids and ciprofloxacin to the media. Cultures were set up from overnight cultures as described in Materials and Methods, with triplicate beads or wells and sampled at the indicated time points. Beads were washed, dissolved, serially diluted and plated for CFU/ml counts. Mean CFU/ml counts are plotted against time of growth with error bars. The dashed line indicates the detection inhibit of sessile cells A: Sessile cells level without additions, and sessile cells level with added D-amino acids, B: Sessile cells level without any addition, D-amino acids, and ciprofloxacin addition.
Dual-species biofilms occur via a combination of bacterial auto/co-aggregation and attachment to a substratum. As dual-species biofilms under laboratory conditions, two isolates of *P. aeruginosa* with *S. aureus*, *K. pneumonia*, and *E. coli* were cultured for 24 h. They observed in 2, 4, 6, 8, 12, and 24 h. When estimated, the sessile cells compared to the single-species biofilm of *P. aeruginosa* and *S. aureus*, for the same sessile cells number of time. *P. aeruginosa* was increased of sessile cells in co-culture with *S. aureus*, while gave decreased in number in co-culture with *K. Pneumonia* and *E. coli*. However, changes were calculated relative to single-species biofilms for each bacterium. Dual-species biofilm composition analysis of sessile cells and calculation of competitive relative indicated that *S. aureus* reduced at each time point with less competitive relative indices than *P. aeruginosa*. The relative competitors are derived from sessile cell number and more significant competitive indexes, therefore mean higher bacterial numbers. This suggests that it was advantageous for *P. aeruginosa* to be part of a dual-species biofilm in terms of synergistic growth with *S. aureus*. The reduction of sessile cells of *S. aureus* after co-culture was significant differences (P<0.05) with one log increase (figure 6).

![Figure 6](image)

**Figure 6.** Development of biofilms on alginate beads for two isolates no.1 and 2 when co-cultured with *S. aureus*. Cultures were set up from overnight cultures as described in Materials and Methods, with triplicate beads or wells and sampled at the indicated time points. Beads were washed, dissolved, serially diluted and plated for CFU/ml counts. Mean CFU/ml counts are plotted against time of growth with error bars. A: isolate no. 1, B: isolate no.2.
Conversely, sessile cells of *P. aeruginosa* were observed when co-incubated with *K. pneumonia* and *E. coli*. Sessile cells of both isolates no. 1 and 2, which were one log reduce (P<0.05) compared to the sessile cells alone, while sessile cells of *K. pneumonia* with both isolates of *P. aeruginosa* no. 1 and 2 were one log increase (P<0.05) compared to sessile cells of *K. pneumonia* alone. Statistically, *E. coli* gave no significant differences compared to *E. coli* alone (figure 7).

Figure 7. Development of biofilms on alginate beads for two isolates no.1 and 2 when co-cultured with *K. pneumonia*. Cultures were set up from overnight cultures as described in Materials and Methods, with triplicate beads or wells and sampled at the indicated time points. Beads were washed, dissolved, serially diluted and plated for CFU/ml counts. Mean CFU/ml counts are plotted against time of growth with error bars. , A: isolate no. 1, B: isolate no.2. A: isolate no. 2, B: isolate no. 1.
P. aeruginosa was cultured in the presence of S. aureus, K. pneumonia, and E. coli when grown on alginate beads. We were hypothesizing that exposure of P. aeruginosa to S. aureus, K. pneumonia, and E. coli might alter the BIC of P. aeruginosa to ciprofloxacin. To test this hypothesis, it was selecting a methicillin-resistance S. aureus, K. pneumonia, and E. coli. BIC was determined in 24 h for both isolates of P. aeruginosa with S. aureus. It was 900 µg/ml ciprofloxacin for isolates no. 1, and 800 µg/ml ciprofloxacin for isolate no. 2. After dual-species biofilms culture, they were become 800 µg/ml to isolate no. 1, whilst isolate no. 2 still 800 µg/ml. S. aureus with isolate no.1 before and after dual-species biofilms. BIC was still 1000 µg/ml. S. aureus with isolate no.2 before dual-species biofilms, BIC was 1000 µg/ml, while after dual-species biofilms culture, BIC has become 800 µg/ml (figure 6).

Dual species biofilms with ciprofloxacin addition, P. aeruginosa with K. pneumonia when had co-cultured on alginate beads, BIC was 900 µg/ml ciprofloxacin for isolate no. 1, while BIC of P. aeruginosa isolate no. 2 was 800 µg/ml. After co-incubation with K. pneumonia on alginate beads, BIC becomes 100 µg/ml at four hours of isolate no. 2. Isolate no. 1 becomes 200 µg/ml at the same time. K. pneumonia before co-cultured, BIC was 100 µg/ml, while after co-cultured, it becomes 700 µg/ml with isolate no. 2. With isolate no. 1 BIC of K. pneumonia becomes 300 µg/ml (figure 7).

P. aeruginosa biofilm cell viability increased in 24 h when these microbes were co-culture with E. coli on alginate beads. With ciprofloxacin addition, BIC of P. aeruginosa isolates no. 2 becomes 500 µg/ml. Before co-cultured, BIC was 800 µg/ml. Isolate no. 1, BIC was 900 µg/ml, after co-cultured with E. coli BIC becomes 700 µg/ml. BIC of E. coli was describing before and after co-culture. It was 100 µg/ml ciprofloxacin before dual-species biofilms culture. E. coli when co-cultured with isolate no. 1; BIC becomes 200 µg/ml, while when co-cultured with isolate no. 2; BIC becomes 600 µg/ml (figure 8).

![Figure 8. Development of biofilms on alginate beads for two isolates no.1 and 2 when co-cultured with E. coli. Cultures were set up from overnight cultures as described in Materials and Methods, with triplicate beads or wells and sampled at the indicated time points. Beads were washed, dissolved, serially diluted and plated for CFU/ml counts. Mean CFU/ml counts are plotted against time of growth with error bars. , A: isolate no. 1, B: isolate no.2.](image-url)
Discussion

The impact of sugars and other factors on biofilm formation can vary depending on the type of bacteria present. Up to our simple knowledge, this study has been done for the 1st time in our country. Our research suggested that the fructose and combined form of fructose with each glucose and galactose were at least stop the effect of these two types of sugars when this combined form tested with ciprofloxacin against pseudomonal biofilm. Further, this research suggested that the glucose and galactose affect markedly on sessile cells of P. aeruginosa, and it is in agreement with those observed by Rasamiravaka. who concluded that the glucose could influence growth of biofilm. Geerlings and associates, going to that the urine samples with glucose concentrations between 100 and 1000 mg/dL, were responsible for enhancing bacterial growth, while Khangholi and Jamalli, revealed that the bacterial biofilm was not influenced with the presence of sugar. The interpretation of the above statements is may be due to that the P. aeruginosa had generated at least three polysaccharides (alginate, pel, and psl), which are essential for biofilm structure stability and the qualitative composition in the biofilm matrix of their polysaccharides, primarily alginate, Psl, and Pel, varies in the P. aeruginosa. The Pel polysaccharide is predominantly a glucose-rich matrix, whereas the Psl consists of D-mannose, L-rhamnose, glucose, and repeated pentasaccharides. In the early stages of biofilm formation, Pel and Psl may serve as a primary structure ground for biofilm development. This may also be interpreted as what’s has happened in diabetic patients in vivo who were more likely to get an infection from the urinary tract due to elevated levels of blood sugar, the high concentration of sugar provides to pathogenic bacteria a suitable growth environment.

Our findings showed that the galactose enhancing biofilm formation after 24 hours. This result is in line with Khangholi et al., who showed that galactose enhances biofilm formation. This may be due to the PSL production provides a benefit at the group level to cells growing in biofilms, and Psl is a galactose-rich exopolysaccharide. The study results revealed that the glucose and galactose and combined form with each other, influencing survival strategy against ciprofloxacin. This result is in line with Allison et al., who concluded that after the addition of particular carbon metabolites to persister cells, the cells return into a state in contradiction of which antibiotics. In contrast, Flume et al., reported that adjunctive sugar therapy might be particularly useful in treating P. aeruginosa pulmonary infections with increased intrinsic resistance to antibiotic and multidrug-resistant isolates. This interpretation may be due to that the sugars in the early stage can promote the interaction of a wide range of bacterial adhesions to form bacterial clusters, such as type IV pilis. The sugars can help to bind or absorb antibiotics. Eventually, in clusters, sugar can alt the metabolic status of bacteria without raising the proliferation of bacteria, making them more antibiotic susceptibility.

The free swimming pseudomonal cells increased with the addition of glucose. Further, when ciprofloxacin was added the values of MICs were decreased with the addition of glucose. Our results were in line with Paranjape and Shashidhar, who concluded that the glucose increases the respiration which in turn increases the metabolism and cell division rate. Furthermore, the addition of glucose could increase the susceptibility of persister cells to ciprofloxacin only. In general, the bacterial susceptibility can be increased by combining the antibiotics with glucose.

The planktonic cells affected on amino acids. Planktonic cells showed a marked decrease in number with the addition of combined form of D-gly and D-ala, in comparison with D-gly alone. Our initial experiments showed that D-gly, D-ala, and combined form of these amino acids, reduced biofilms formed by P. aeruginosa, relative to control. The combined form of D-gly and D-ala was more potent against biofilm production than those of control. These results are in agreement with Hammes et al., who suggested that the amount of incorporated D-gly or D-ala can decrease sessile cells of bacteria. This interpreted may be due to D-gly, which is integrated into peptidoglycan. D-gly could replace L-alanine in position one and D-ala residues in positions 4 and 5 of the peptide subunit. The Replacing of L-ala in position one with UDP-MurNAc: l-Ala ligases, which suggest a ligase inhibition of peptides with uridine diphosphate-muramic acid accumulation. Modified peptidoglycan precursors are indicated to be produced by weak substrates of some of the enzymes in peptidoglycan synthesis, D-gly effect on sessile cells CFU/ml. Their investigations had shown
that D-gly interferes with several steps of peptidoglycan synthesis. Kao et al., 24 reported that the D-ala did not deter the development of \( P. \) \( aeruginosa \) biofilm, but delaying in biofilm formation.

In order to gain a better understanding of the interactions between different microbial species in this complex environment, the analysis of these various communities is crucial. Recognizing these relationships will lead to the detection of unique goals and therapeutics that were likely to be missed otherwise. \( P. \) \( aeruginosa \) biofilm monospecies inoculated with \( S. \) \( aureus \), \( K. \) \( Pneumoniae \), and \( E. \) \( coli \) as a secondary colonizer showed significant increases and decreases in the number of sessile cells in contrast with single species \( P. \) \( aeruginosa \) biofilm. We hypothesized that the dual culture between \( P. \) \( aeruginosa \) and \( S. \) \( aureus \) exhibits an increase of sessile cells of \( P. \) \( aeruginosa \). Alves et al., 25 showed that the biomass rises detected between \( P. \) \( aeruginosa \) monospecies and dual-species biofilm relative to single-species \( P. \) \( aeruginosa \) biofilms at the same period. Our findings showed a huge, statistically significant difference (\( P \leq 0.05 \)) between \( P. \) \( aeruginosa \) monospecies and dual-species \( S. \) \( aureus \) Biofilm. \( S. \) \( aureus \) was using in biofilm growth tests as a promoter colonizer and improved \( P. \) \( aeruginosa \) attachment. \( S. \) \( aureus \) contributes to the \( P. \) \( aeruginosa \) biofilms formed for 24 h has a secondary colonizer and results in a decrease in the total biofilm biomass of \( S. \) \( aureus \); this effect is not reciprocal. Somehow disrupts by \( S. \) \( aureus \) for \( P. \) \( aeruginosa \) biofilm, perhaps by dispersion or direct bactericidal action. Also, secreted components extracted from \( S. \) \( aureus \) biofilm repeated this effect, which indicates that the dispersal of biofilm is dependent on a secreted element. \( S. \) \( aureus \) is known to create nucleases that prevent or interfere with the production of biofilm in several bacteria pathogens, including \( P. \) \( aeruginosa \). The results of this study were showing clear interactions between \( S. \) \( aureus \) and \( P. \) \( aeruginosa \) that are both competitive and reciprocal in pathogenicity and colonization for each organism.

The interpretation of bacterial-bacterial interactions may be due to an association between the SpA factor and \( P. \) \( aeruginosa \) Psl, the \( S. \) \( aureus \) element (\( S. \) \( aureus \)-specific staphylococcal protein A) SpA, had shown to inhibit the formation of biofilm as measured. Their inability to add SpA to type 4 pili in the case of \( P. \) \( aeruginosa \) was attributed when Psl was not present, and therefore their attachment was reduced. 26 Our finding revealed that the co-incubation between \( P. \) \( aeruginosa \) and \( S. \) \( aureus \) did not change survival against ciprofloxacin, while Orazi and O’Toole, 27 had shown that interspecies bacterial interactions alter antibiotic tolerance in unpredictable ways. Specifically, they found that \( P. \) \( aeruginosa \) protects biofilm and planktonic populations of \( S. \) \( aureus \) from an antibiotic. This interpretation may be due to the high-affinity quinone oxidation of \( P. \) \( aeruginosa \) inhibitor and siderophores, which is defending \( S. \) \( aureus \) biofilms from antibiotic therapy.

Natural biofilms had often were found within both the ecosystem and the host as multi-species populations that differ significantly from monospecies biofilm systems in their composition, structure, and survival strategies against antimicrobial resistance. \( K. \) \( pneumoniae \) and \( P. \) \( aeruginosa \) were two bacteria that were often found together within biofilm-mediated chronic wound infections. The two species that are active in biofilms that are often found together, \( P. \) \( aeruginosa \) and the \( K. \) \( pneumoniae \). 28 In our results, \( P. \) \( aeruginosa \) showed one log reduction of sessile cells when co-cultured with \( K. \) \( pneumoniae \), while Goncalves et al., 29 showed that the anti-biofilm activity of \( K. \) \( pneumoniae \) supernatant against pseudomonal biofilm was indicated no significant effect on biofilm production. The interpretation may be due to The capsular polysaccharide of \( K. \) \( pneumoniae \) is implied in surface adhesion, spacing and order of bacteria in the initial step of biofilm formation, and is required for late biofilm maturation step. Though the initial adhesion of bacteria on the surface constitutes a crucial step in the formation of biofilm, the spread of bacteria on the surface is also another essential factor in the formation of a biofilm, especially in a multispecies highly competitive environment. Some Gram-negative rods such as the highly motile \( P. \) \( aeruginosa \) produce exopolysaccharides that promote their own surface movement during the early stages of biofilm formation. \( K. \) \( pneumoniae \) is a nonmotile Gram-negative rod and may have developed different social strategies leading to surface exclusion of competitors by large capsular polysaccharide production and therefore allowing successful surface colonization. 30

When \( P. \) \( aeruginosa \) co-cultured with \( E. \) \( coli \) as it was occurred in our research, in addition to \( K. \) \( pneumoniae \), \( P. \)
aeruginosa sessile cells were reduced in number. This result is compatible with those observed by Culotti and Packman, who highlighted the relationship between P. aeruginosa and E. coli. P. aeruginosa introduction triggered a growth response that allowed E. coli to develop biofilm. E. coli was continuously deposited in pre-established P. aeruginosa biofilms and also in nutrient agar reduced colonized the interiors of P. aeruginosa clusters. P. aeruginosa grew significantly lower under the same nutritional and flight conditions in mixed cultivations than in monocultures. In contrast, following the introduction of E. coli, P. aeruginosa biofilm biomass decreased. E. coli’s strong antagonism to P. aeruginosa is suggested by the reduction of P. aeruginosa biomass in dual biofilms. Extracellular indole accumulation had already documented in order to reduce the development of E. coli biofilm by impairing cell motility. Indole, which is an E. coli metabolite formed by tryptophanase from the amino acid breaks down by P aeruginosa, and can probably improve E. coli biofilms through the elimination of the growth inhibition induced by extracellular indole. E. coli strains that were indole-producing and indole-deficient, however, similarly increased in biofilms. The indole-deficient E. coli grew poorly in monoculture, but after the introduction of P. aeruginosa was able to form extensive biofilms. The studies with the indole producing strains E. coli observed similar growth patterns. This suggests that indole can play a significant role in E. coli–P. aeruginosa biofilm’s growth behavior.

Conclusion

The study suggested that the findings concerning the impact of monosaccharide and D-amino acids on P. aeruginosa biofilm. There were significant differences between the numbers of sessile cells before and after adding monosaccharide as well as in amino acids (with and without ciprofloxacin), glucose and galactose, and the combination of each one with ciprofloxacin is the enhancing of P. aeruginosa biofilm and increases survival strategy against ciprofloxacin. In contrast, a noticeable biofilm reduction and marked synergistic action for ciprofloxacin have been determined in the combination of the two D-amino acid, alanine, and glycine in comparison to the effect of each one alone. Furthermore, pseudomonal dual-species biofilms culture with S. aureus gave a raised number of sessile cells with the reduction of BIC. In co-culture with K. pneumonia and E. coli, sessile cells of P. aeruginosa were reduced in number and made Pseudomonal biofilm less resistant to ciprofloxacin.

Isolation and Analysis of Nucleotide Sequences of the 16S rRNA Gene of *Pseudomonas aeruginosa* Isolated from Clinical Samples

Atheer Abdulameer Raheem1, Hasanain Khaleel Shareef1
1College of Science for Women, University of Babylon/Iraq

Abstract

*Pseudomonas aeruginosa* consider one of the opportunistic pathogens is able to infection almost all body tissue as a result of having it a variety of virulence factors that contribute greatly to pathogenic events in the host this bacterium has been responsible for 30% of pneumonia, 19% of urinary tract infections and 10% of bloodstream infections. And leads to nosocomial pathogens causing infections that usually develop late during hospital stay. Consequently the aim of this research was to classify and characterize *P. aeruginosa* isolated from various clinical samples from Iraqi patients by sequencing the 16S rRNA gene.

**Keywords:** Health; Clinical samples; RNA genes; toxicity; *Pseudomonas aeruginosa*

Introduction

*Pseudomonas aeruginosa* is a Gram-negative bacteria belong to the family Pseudomonaceae, motile with a polar flagellum, non-spore forming, obligate aerobes that grows in a wide range of temperatures (10-44 °C) and the optimum thermal temperature is 35°C, widespread in nature, this bacterium causing acute and chronic infections in patients who are in hospital, especially in patients with burns, its grows well when cultured on simple media, It has the ability to produce two kinds of pigment green-blue (pyocyanin) and yellowish green pigment (pyoverdin) [1-3].

This bacterium is a naturally common among humans [4]. It has a relatively large genome, which is likely to promote survival in various environments, with a variety of gene-regulatory activities to facilitate adaptation to new environmental conditions [5]. Therefore, despite the development of new and improved antibiotics is still one of the key causes of death in critically impaired patients with immune systems [6]. 16S rRNA sequencing has been instrumental in the successful detection of bacterial isolates and in the discovery of new isolates in diagnostic laboratories. this gene is especially important for bacterial detection with unique phenotypic profiles, rare bacteria, slow growing bacteria, uncultivable bacteria and culture-negative infections, it isn’t only did it give information into the etiology of an infectious disease, it also allows physicians to pick antibiotics and assess the length of care and infection prevention procedures. [7] 16S rRNA sequencing has provided important and valuable knowledge worldwide.

Materials and Methods

One hundred of specimens were collected (46 males and 54 females) from five hospitals in Baghdad, including: ghazi Al-hareri Hospital, Wound and Burn Hospital, Baghdad Medical City Hospital, Child Teaching Hospital, and Ibn Al-baladi Hospital, from September to December 2019. Collected from patients with various infections such as UTIs, burns, wounds, pus swab from ear infection and sputum. All specimens were cultured on MacConkey agar (selective and differential medium). Then used the biochemical tests for identify and recognize Gram negative bacteria, Also GN24 Kit had used to detect Pseudomonas species.

DNA Extraction

For 16S rRNA sequencing analysis, genomic
DNA has been extracted for (38) isolates belong to *P. aeruginosa* using ABIOpure Extraction Kit (USA). Then use Quantus Florometer to measure the concentration of collected DNA to measure the sampling goodness for downstream applications. All bacterial DNA has been used as a template for conventional PCR amplification bacterial 16S rRNA gene were amplified by tow universal primers 27F (5’ AGAGTTTGATCCTGGCTCAG-3’) and 1492R (5’TACGGTTACCTTGTTACGACTT-3’) for forward and reverse primers (Macrogen, South Korea). Thermal cycling conditions were as follows: 5 min of 95 °C for initial denaturation (30 cycles of denaturation) annealing (60°C for 30 sec), extension (72°C for 30 sec); Final extension at 72 for 7 min (1 cycle). PCR was carried out on a (Bio-Rad, USA) Automatic Cycler Thermal. Duplicate PCR was performed for replication of each sample [9]. After amplification with PCR, the agarose gel electrophoresis was followed to validate the amplification existence.

**Bacterial 16S rRNA sequences analysis**

16S rRNA gene were amplified by using universal primers and the PCR product undergo for sequence analysis in Macrogen Lab. (south Korea) the sequences were identified by alignment and comparing them with sequences deposited in genbank through the NCBI site.

**Phylogenetic analysis**

The sequences of 16s rRNA compared with those in deposited in genbank database (https://www.ncbi.nlm.nih.gov/blast) to find related species and creation Phylogenetic trees using geneious software version 11.1 [10]

**Results and Discussion**

One hundred (100) clinical samples were collected from different infections include (wounds, burns, urine, ear infections and sputum), 38 (38%) isolates belonging to *P. aeruginosa*, whereas the remaining 62 (62%) isolates belonged to other bacteria species as seen in the table (1).

Thirty eight (38) isolates from the total clinical isolate were classified by traditional methods (characteristics, morphology) as *P. aeruginosa*. In addition to use Identification system for Gram negative bacteria (GN24 Kit) the results are shown in figure (1,2):
Kit GN 24 consists of 24 wells Microtitration plate strip in the classic 96 well format containing dehydrated substrates. Reconstitution of substrates is performed by bacterial suspension inoculation. During incubation, color changes occur in wells due to microorganisms ‘ metabolic activity. Test results may be measured either by automated readers or visually depending on the color scheme, or by the color definition displayed in the flyer. The results of recognition can be collected from the evaluation table or by using evaluation tools located at (www.diagnostics.sk/idmicro).

Conventional polymerase chain reaction PCR

The results of Conventional polymerase chain reaction followed electrophoresis to detect of *P. aeruginosa* using 16S rRNA that previously identification by GN24 Kit showed all isolates were *P. aeruginosa* and gave a good confirmative identification as shown in the figure (3). That gives the band size (1500 bp) which was the product size of primers used for identification.

![Image of 16S rRNA gel electrophoresis](image3.jpg)

Figure (3) Results of the amplification of 16S rRNA gene of *Pseudomonas aeruginosa* samples fractionated on 1% agaros gel electrophoresis stained by Eth.Br. Lane1:100bp DNA marker.
16S rRNA gene sequences contain hyper variable regions with high conservation which have potential to identify species-specific signature sequences that are helpful to the classification of bacteria \[11,12\]. Analysis sequencing of this gene consider as an important method to assess the phylogenetic relationship between strains. The properties of this molecular target make it important and beneficial for the detection and diagnosis of bacteria in the clinical laboratory.

**Bioinformatics analysis**

The 16S rRNA nucleotide sequences scanned for similarity sequences using online BLASTn. And use geneious software version 11.1. To create phylogenetic tree for 12 isolates selected randomly, the result tend to have a strong identical between them and identical with those strains deposited in genbank under accession numbers China KF894970; Iran MG016493; China MK825339; Bangladesh MN256396; India K675975; India KX268504; China KT759043. The phylogenetic tree for this gene appears all of the isolates have a common ancestor. (Figure 4)

![Figure 4: Construction of phylogeny tree for twelve isolates of *P. aeruginosa* using geneious software, appear all of the isolates has a common ancestor.](image)

16S rRNA sequence has long been used as a “gold standard” taxonomy in the determination of the phylogeny of bacterial species. In the last decade, the *Pseudomonas* classification has gained further attention and has been reclassified by Brosch *et al* 1996, Kersters *et al* 1996, Palleroni 1992. \[13-15\]. Identification of *Pseudomonas* is causing a lot of difficulties \[16, 17\]. Morphologically related organisms have a like biochemical properties. Sequence of highly conserved gene area 16S rRNA data allows us to predict accurate taxonomy. Our present research was performed on the 16S rRNA sequence based on PCR amplification for recognition and genetic level identification of *Pseudomonas aeruginosa*.

**Conclusion**

In conclusion, PCR assay based on 16S rRNA sequencing is highly precise, responsive and useful in the detection of bacteria. And use for recognition of
those closely connected ones genotypical species of Pseudomonas. DNA sequencing of the 16S rRNA gene was used as an important method for studying Bacterial phylogeny and taxonomy relationships between strains.

The Effects of Different Intensive Physical Performances by athletes on Selected Hematological Parameters

Shumoos H Alwaid
Lecturer, Department of Medical Laboratory Technique, Collage of Medical and Technique, Islamic University, Najaf, Iraq

Abstract
The aim of this review study is to compare the effects of different intensive physical performances and competitions from several studies include (football, basketball, 24h marathon race and cycling) games on hematological parameters of males players. And to find the one with strongest effect on those parameters among the performances. The Hematological parameter include white blood cell count (WBC) , red blood cell count (RBC) count , hemoglobin (HGB), haematocrit (HCT), mean cell volume (MCV) , mean corpuscular hemoglobin (MCH), mean corpuscular hemoglobin concentration (MCHC) and platelet count (PLT). Iron and Feritten level also estimated in one study. When comparing the blood values for all the players before and after the competitions period, there were significant differences in prevalence of most of blood parameters in all studies but the most impact was in 24 h marathon performance of 11 male runners who raced for 24 hours around a 400 m oval track, covering at least 100 km of distance. The runners changed course every 4 hours and were allowed to rest and freely consume food and water. The blood samples were obtained from subject in 2 and 9 days prior to competition and after competition. The result was showing that the runners suffering from distinguish blood anemia appear after competition in 2 day. The findings show that the hematological parameters could be affected by endurance of performance depending on competition time period and intensity of physical performance.

Keyword: physical performances, hematological parameters , WBC , RBC, HGB, HCT, MCV, MCHC, PLT, anemia.

Introduction
Physical and physiological changes in virtually all organs and structures within the human body can occur during physical activity. Changes that occur in the organism can be observed by using the right experimental techniques, and what needs to be done in this direction can be determined. It is possible to achieve physiological adaptation to the different athlete training environments in the context of the data decided on the basis of the research (1). In the relatively stable population, hematological parameters are determined by many factors. Those factors include education, age , sex, ethnicity, diet, and altitude (2). Each or all of these factors may affect hematocrit (Hct), hemoglobin (Hb), and red blood cell (RBC) counts positively or negatively. In particular, the resistance training often decreases all three (3).

To our knowledge, Longitudinal studies are lacking in highly trained adolescent athletes evaluating the intensity of hematological, hormonal and enzymatic behavior over an annual training period. Training may have positive or negative effects on development, metabolites, enzymes and haematological variables depending on the training load, specificity of the training, age and initial training level (4). Hematological and biochemical parameters can differ by type, intensity, exercise duration, feeding status, and supplementation (5). The hemoglobin and hematocrit values of athletes undergoing intense exercise program
decrease characteristically and this status is considered to be anemia among sportsmen (6). The energy consumption and metabolism arising from long term workouts and competitions expand in the body. Increased metabolites cause a gradual decline in muscle and nervous system function that leads to exhausting chemical, physiological, psychological and environmental factors in this exhaustion. The produced blood metabolites are lactic and pyruvic acid arising from the digestion of carbohydrates, urea, uric acid, phosphates, creatinine and creatinine as a result of the metabolism of proteins, acetone and ketone bodies as a consequence of fat metabolism. Besides, the chemical causes of fatigue are decrease in blood sugar, hypoglycemia and decrease in the amount of oxygen (7).

Although vigorous exercise in the athletes is causing exhaustion, the organism recovers with sufficient rest. Afterwards the individual’s physical ability increases. Unless the rest time after intense workouts is inadequate for rehabilitation, due to the prolongation of fatigue life, the physical capacity is degraded (8). The hematocrit, hemoglobin, Fe, ferritin, calcium, magnesium, urea, uric acid, creatine, creatine kinase, CPK (creatine phosphokinase), and total protein should be measured to assess the overtraining, which is a loss of efficiency due to physical and mental exhaustion (9).

The aim of this study is to compare the changes that may occur in the blood values before and after intensive exercise in different physical performances in different player groups in several studies and to find which performance has more effective influence on hematology parameters.

Methodology

The methodology of this study will review the method and results of four different studies with varies physical performances include football, basketball, 24 h marathon and cycling.

Study by Ayhan et al., (2017) on 28 soccers athletes two-stage tests were performed pre-competition and post-competition test (90 minutes official competition) the pre-competition test was on rest day no competition and training. To assess the subjects metabolic, biochemical, and haematological values. In field conditions (natural grass surface football field) post-competition experiments were carried out. The intergroup pre- and post-test variables of the teams were determined using independent t test. Study of Pearson correlation has been used for the relationship between variables within each team. If P < 0.05, a statistically relevant result will be acknowledged (10). Study by Gencer et al., (2018) was performed on 10 volunteer basketball players with an average age of 22.80 ±3.20 years and average height of 185.83 ±7.57 cm. Teams without health issues were university graduates. Before and after competitions (24 hours) with potassium-edged tubes for hemogram 5 ml of blood samples were taken by venous pathway. The model CELL-DYN-3500 R automated blood counting system was used for laboratory research. The SPSS package software was applied to descriptive statistics data and the two sample experiments carried out by Wilcoxon were used to compare values before and after competition (11).

Study by Wu et al., (2004) In this research 11 runners had previously given their informed consent. The runners raced for 24 hours around a 400 m oval track, covering at least 100 km of distance. Each 4 hours the runners changed course. 24 hours before the run, directly after the race, two days after the race and nine days after the race, blood samples were obtained from the antecubital vein. The blood was tested within 1 h with an autoanalyzer ABBOTT CELL DYN 3 000 (Abbott Diagnostics, Mountain View, CA., USA) and HITACHI 7150 (Hitachi High Techotologies, Tokyo, Japan).

The statistical significance of paired variations in mean and standard deviations of the associated hematological and biochemical changes between pre-race, immediate post-race, two days post-race and nine days post-race values were determined using ANOVA analyzes of one type. The significance level was set to P<0.05 (12). A total of 272 cyclists male subjects were contribute in the study by Schumacher et a., (2002). Under standardized conditions, blood sampling took place in a supine position on an empty stomach before race and after 9 days of race in the morning. Blood was drawn into a 4-mL K-EDTA coated vacutainer device from a cubital vein. The following variables were evaluated within 3 h of the prelevation in the EDTA samples by an automated cell counter (Serono-Baker Diagnostics, Allentown, PA; Model 9000 Diff): Hb, Hct (percent), and red blood cell count (106·mm 3) (13).
Results and Discussion

Study by Ayhan et al., (2017) result were Red Blood Cell RBC, Hemoglobin HGB, Hematocrit HCT, Mean Erythrocyte Volume MCV, Mean Hemoglobin MCH, Erythrocyte Hemoglobin Concentration MCHC, Trbomocyte PLT and statistically significant values (p>0.05). (Tab. 1). White Blood Cell WBC values were found to be statistically significant (p < 0.05) in athletes category after performance compared to before performance (10). Bezci et al found that athletes had a significant increase in WBC rates in their country, European and Turkey youth categories research on athletes (14).

There is a significant increase in the prevalence of, MCH, MCHC values before and after the competition, as shown in the Gencer et al (2018) Table 1 report. The HCT and MPV values decreased significantly (P<0.05). The findings show that intensive competitions may have affected the physiological characteristics of the basketball players. TABLE 1. Hematological variables of various sporting categories in different studies before and after performance
in the literature on the acute impact of exercise on blood parameters. Significant increases were found at WBC, values (15). Chronic effects of exercise on blood parameters have been documented in some other research. Hematocritic and hemoglobin levels have been shown to be in activation (16). There are, however, not enough research on the impact of prolonged duration of competition on blood parameters. (17) analyzed the blood parameters of soccer players during the 10-day intense competition period and found a significant impact on the values of RBC (Erythrocyte), PLT (Platelet) and HGB (Hemoglobin) (p<0.05) and statistically insignificant effect on the values of WBC (Leukocyte) (p>0.05). Fewer blood parameters were analyzed in this analysis, and blood samples were taken 2 hours after the conclusion of the vigorous competition. Blood samples were taken the day after the research to rule out the acute impact of vigorous exercise (11). Study by Wu et al (2004) on 24-hour marathon runners shows a substantial decrease in red cell count, Hb and Hct rates by day two after race (Table-1). The mean concentration of cell Hb on day two was slightly lower than before the race. Mean cell Hb and the red cell distribution width remained constant at all times. Red cell count, Hb and Hct, three anemia markers, had been normal prior to the race. Consistent with RBC’s rapid deterioration of endurance athletes, substantial declines were noticed by day two (18). Among days two and nine the three factors remained reduced; so-called sports anemia. The results and observations of vigorous training on athlete safety can be used to support athletes in future competitions. Is caused not only by hemolysis due to mechanical trauma but also by red cell oxidizing injuries (19). Red cells with a mean life of 120 d are renewed at approximately 1 per cent daily under normal conditions. However, as demonstrated in the participants in this study, this turnover rate increases after the endurance training. The increased turnover rate is beneficial for athletes because young red cells can be more effective in carrying oxygen than older cells (19). The mean volume of cells, the mean concentration of cell hemoglobin and the mean concentration of cell hemoglobin all remained normal. Transient sports anemia has been caused by reduced red cell numbers, rather than red cell size or Hb volume (20). The adjustment to the number of platelets was inconsistent with previous studies. At the end of the race the platelet count was higher than on day nine, but stayed within the normal range, and no coagulopathy was observed. The number of white cells increased markedly and decreased thereafter (12).

Study by Schumacher et al (2002) on 272 Cyclists before and after performance showed that a significant decrease in iron levels and a significant decrease in ferritin levels Iron and especially ferritin, the iron storage protein, was shown to be reduced in athletes due to higher iron turnover and increased synthesis of iron-containing proteins combined with altered intestinal absorption and an increase in iron-containing proteins. The results from the study highlights these findings for athletes as there is a substantial decrease in ferritin relative to sedentary citizens. Hemolysis caused by exercise, frequently discussed as a cause for decreased levels of iron and ferritin, or even anemias (13).

Conclusions

This study conclude that the hematological parameters could be affected by endurance of performance depending on competition time period and intensity of physical performance. The most affected players were the 24h marathon runners due to the long period and intensity of exercise. A better understanding of these factors will help event organizers and coaches in the planning of competitions and will make it easier for the sportsmen to prepare for their protection for these intense competitions.

Role of CoQ10 and IGFBP-1 in Obese Male Patients with Diabetic Mellitus Type II

Dina A. M. Al-Khafajy1, Maysaa J. Majeed2, Omar F. Al-Azzawi3; Ayad Ismael Khaleel4

1Researcher, 2Prof., 3Associate. Prof., University of Baghdad, Medicine Faculty, Baghdad, Iraq, 4Lecturer, Qasim Green University, Agriculture Faculty, Department of Horticulture, Babylon, Iraq

Abstract

Study the role of CoQ10 and IGFBP-1 in obese male patients with diabetic mellitus type 2. ELISA method was used to assay Serum CoQ10 and IGFBP-1. Blood was taken with drawn sample from 30 obese normal patients with age range (40-60) years, 30 diabetic patients with age range (40-60) years at duration of disease (1-5) years and 30 normal healthy patients. The mean difference between T2DM according to CoQ10 (12.5±1.1) was decreased than the mean of IFG (21.8±3.2) (P 0.002) and the mean difference between T2DM according to IGFBPs (0.65±0.06) was decreased than the mean of IFG (3.2±0.3) (P 0.000). While no significant difference between mean age of DM2 patients (55.5±1.06), and IFG (55.6±0.9) (p 0.90), no significant difference between mean BMI of DM2 patients (27.7±0.8), and IFG (27.8±0.5) (p 0.94). were significant differences in DM and IFG obese groups (G1 and G2) according to age (51.66 ±2.10, 51.80±1.16) P (0.02), however, there were significant differences between DM and IFG in Normal weight groups (G5 and G6) according to age (59.93±0.94, 51.13±1.80) P (0.00), while no significant differences between DM and IFG in Over weight groups (G3 and G4) according to age (54.93±1.17, 58.00±1.73) P(0.21), there were significant differences between DM2 and IFG in obese groups (G1 and G2) according to BMI (33.70±1.20, 31.1±0.37) P (0.01), no significant difference between overweight (G3 and G4) according to BMI (27.72±0.30, 27.52±0.34) P(0.66), and no significant difference between normal weight (G5 and G6) according to BMI (21.84±0.45, 21.53±0.50) P(0.65). There were significant differences between DM and IFG in obese groups (G1 and G2) according to CoQ10 (7.2±0.4, 4.9±0.4) P (0.002), and IGFBP (0.3±0.02, 1.2±0.19) P (0.005).

Keywords: CoQ10, Obese patients, Diabetic Mellitus Type 2, IFG.

Introduction

Diabetes mellitus (DM) is a chronic disease described by elevated of blood glucose. The raised concentration of blood glucose result from the insufficient production of insulin or an imperviousness to the impacts of insulin, a hormone framed by the pancreas (1). It is becoming one of the main chronic non-contagious diseases threatening the health of human around the world (2). T2DM accounts for between 90% and 95% of diabetes, with highest proportions in low- and middle income countries (2). It is a common and serious global health problem that has evolved in association with rapid cultural, economic and social changes, ageing populations, increasing and unplanned urbanization, dietary changes such as increased consumption of highly processed foods and sugar sweetened beverages, obesity, reduced physical activity, unhealthy lifestyle and behavioural patterns, fetal malnutrition, and increasing fetal exposure to hyperglycemia during pregnancy (3). T2DM is most common in adults, but an increasing number of children and adolescents are also affected (4). Obesity is a disorder characterized by an unequal increase in body weight in relation to height, mainly due to the accumulation of fat. Obesity is considered a pandemic of the present century by the World Health Organization (WHO) and other international organization (5). Obesity is associated with the development of important non-
communicable chronic diseases, namely, hypertension, metabolic syndrome, type 2 diabetes mellitus (T2DM), cardiovascular diseases (CVD), obstructive sleeping apnea, osteoarthropathies and cancer. Insulin-like growth factor 1 (IGF-1) is a 70-aminoacid polypeptide hormone with endocrine, paracrine, and autocrine effects, which shares structural homology (>60 %) with IGF-2 and proinsulin. It is mainly produced by the liver (accounting for ≈75 % of circulating IGF-1) secondary to growth hormone (GH) and insulin endocrine stimulation in the liver. Conversely, IGF-1 acts to provide an inhibitory feedback signal on GH secretion in the hypothalamus by stimulating somatostatin production in the pituitary. IGF-1 is also produced locally in all bodily tissues. IGF-1 availability is tightly regulated by the so-called insulin-like growth factor binding proteins (IGFBPs), which may act by increasing IGF-1 half-life, from minutes to hours (most commonly by forming a tertiary complex with Acid-Labile Subunit and IGFBP3), however blocking its binding to the insulin-like growth factor 1 receptor (IGF-1R).

Materials and Methods

This study performed during period from September 2019 to December 2019 the subject were selected from Teaching Hospital/Medical City. Questionnaires were filled by participants and to get the agreement to participants in this study to collect the information of control and patients group. Blood samples were collected from control and patients group. The sample was drawn from the vein and stored by using (5mL) disposable syringe, all samples were collected in fasting status. The sample was keep into dispensable tubes containing a gel which facilitate the separation processes of serum and allowed to clot at 37°C approximately at ten-fifteen min and then centrifuged at 2000 Xg for ten-fifteen min then the serum was stored at (-20°C) until analysis (CoQ10 and insulin-like growth Factor Binding Protein -1).

Subjects (patients and control groups):

Subject were enrolled in this study First group: patients 30 normal obese male with age range (40-60) years. Second group: DM type 2 (30) male with age range (40-60) years the duration of disease (1-5) years. Third group: 30 normal healthy male documented by physician or lab investigation matched in their age in both obese group.

Measurement of Human CoQ10.

1. Standard wells, a volume of 50μl of the standard solutions were added to the standard wells. Then a volume of 10μl of the sample was added followed by 40μl of sample diluent was added to the testing sample well, in blank nothing to add. Afterword, a volume of 100μl of HRP-conjugate reagent was added to each well and then covered by used adhesive strip followed by incubation for sixty min at 37°C. Next ,the cover on a plate was removed and starting to wash process, the wash process was repeated for four times using 400μl of Wash Solution each time by an auto washer. After that, a volume of 50μl of chromogen solution (A) and (B) was added to each well and mixed gently and followed by incubation period at 37°C for 15 min. This addition should be protected from light. Then, a volume of 50μl Stop Solution was added to each well. The color in the wells converts from blue color to yellow color. If the color in the wells become green or the color change does not appear uniform, the plate should gently covered to ensure good mixing. Later a microtiter plate reader was used to read the absorption within 15 min at 450 nm. A dose response standard curve was used to evaluate the concentration of CoQ10 in serum.

Measurement of Human Insulin-like growth Factor Binding Protein -1.

Standard wells, a volume of 50μl of the standard solutions were added to the standard wells. Then a volume of 10μl of the sample was added followed by 40μl of sample diluent was added to the testing sample well, in blank nothing to add. Next, a volume of 100μl of HRP-conjugate reagent was added to each well and then covered by used adhesive strip followed by incubation for sixty min at 37°C. The cover on a plate was removed and starting to wash process, the wash process was repeated for four times using 400μl of Wash Solution each time by an auto washer. After that, a volume of 50μl of chromogen solution (A) and (B) was added to each well and mixed gently and followed by incubation period at 37°C for 15 min. This addition should be protected from light. After , a volume of 50μl Stop Solution was added to each well. The color in the wells converts from blue color to yellow color. If the color in the wells become green or the color change does not appear uniform, the plate should gently covered.
to ensure good mixing. Later, a microtiter plate reader was used to read the absorption within 15 min at 450 nm. A dose response standard curve was used to evaluate the concentration of (IGFBP-1) in serum.

Statistical Analysis

The version twenty of SPSS was used to complete Statistical analysis. (Means ± SD) were used to represent the variables. The comparison between patients group and control group was done by use student t-test; with a p-value of ≤ 0.001 was considered a significant. The method that used to find the relationship between two continuous variables was correlation coefficient (r).

Results

The result showed as in Table (1) and the mean difference between T2DM according to CoQ10 (12.5±1.1) was decreased than the mean of IFG (21.8±3.2) (P 0.002) and the mean difference between T2DM according to IGFBPs (0.65±0.06) was decreased than the mean of IFG (3.2±0.3) (P 0.000). While no significant difference between mean age of DM2 patients (55.5±1.06), and IFG (55.6±0.9) (p 0.90), no significant difference between mean BMI of DM2 patients (27.7±0.8), and IFG (27.8±0.5) (p 0.94).

Discussions

These results were agreement with results obtained by Alehagen et al.\(^{(12)}\) who found that, there were significant differences between T2DM and IFG according to CoQ10 (\(P < 0.001\)). Dulskas et al.\(^{(13)}\) found that, there were no significant difference between T2DM and IFG according to age (\(P 0.89\)), BMI (\(P 0.74\)), this result was agreement with results in this study. A study of\(^{(14)}\) found that, there were significant differences IGFBP in patients with T2DM. The clinical parameters were studied by\(^{(15)}\)found that age and BMI, were no significant differences in T2DM patients, so, these results were agreement with results obtained by\(^{(15)}\) who found that, there were significant differences between IFG and CoQ10 (\(P < 0.005\)). Wei et al.,\(^{(16)}\) found that, there were no significant difference between IFG and age, BMI P (0.55), while the results in this study were disagreement with study of\(^{(17)}\) who found that, there was a statistically significant interaction was found between T2DM and BMI (\(p<0.0001\)). The results of\(^{(18)}\) found that, the diabetic patients were not associated with obesity (\(p=0.020\)) and were independent of age. These results were agreement with results obtained by\(^{(19)}\) who found that More than 90% of patients with type 2 diabetes have a BMI ≥25.0 kg/m2. In adult patients with type 2 diabetes, some studies have shown that individuals who lost 9–13 kg had a 25% reduction in all-cause mortality compared to weight-neutral patients. The results were agreement with results obtained by\(^{(18)}\) who found that, increased BMI was associated with increased prevalence of diabetes mellitus (\(p < 0.001\)). In addition to that\(^{(20)}\) found more than 75% of patients had BMI ≥ 25 kg/m2 estimated that prevalence of diabetes mellitus.

Histological and Morphological Study of Carcinoma Breast of Women

Aaya Hamid Al-Hakeem¹, Marwa Ahmed Meri¹

¹Assist. Lect., Department of Medical Laboratory Techniques, Faculty of Medical and Health Techniques, University of AlKafeel, Najaf, Iraq

Abstract

Previous studies have referred that the breast cancer, with particular histological traits, can be affected by the reproductive factors. In the current study, we employed 30 breast cancer cases for women in age (15-55 years) to study how factors such as microscopic screening, gross examination, as well as the age, can impact on histological type and grade of tumor. After the organ eradication from the patients, the tissue samples were picked, as fast as possible, and placed in 10% formalin directly. In such a way, we maintained the cells and cellular components in a situation that can be described as similar as possible to the living cells and preserved the antigenicity in order to be processed without any modification. Samples were divided depending on various factors, such as anatomical location, the nodal status, and tumor relationship to surgical margin, weight, size, and age. Each sample was sectioned and fixed onto a private embedding cassette to keep the tissue treatment. The histochemical stains, which is include the eosin and hematoxylin, had utilized to afford a disparity to tissue sections. We found that the majority of the 30 women with breast cancer were at age (31-40 years) and that 12 patients of them were involved left breast, while the other 18 patients included right breast. In agreement with previous studies that have investigated the level of risk of histological subgroups, our study concludes that the link between breast cancer risks and reproductive factors is vary depending on the histological structure of the tumor.

Keywords: Breast carcinoma; breast neoplasms; cancer measurement; cancer staging

Introduction

One of the most important indicators for survival percentage for women with breast cancer is the tumor size and its correlation with lymph node developments (¹). Depending on the cancer staging manual AJCC/UICC (American Joint Committee on Cancer/Union for International Cancer Control), the size of the tumor can be determined (²). Among the different types of cancer that may occur in women around the world generally, breast cancer can be considered as one of the most popular, and it can be diagnosed in one of three women with cancer. After age 40, the percentage of the incidence of breast cancer will increase, while after age 50, the percentage of the incidence will be the highest and reach about 80% of invasive cases. For the cancer diagnosis, the pathologists implement several procedures including the estimating of breast cancer tumor morphology, where it will subject to the screening by the optical microscope, and the degree of differentiation, where it will point the similarity between the breast cancer tumor morphology and the extent of its identity with the other healthy tissue of the organ. The outcomes of such steps will definitely lead to the breast cancer diagnosis (³). Nevertheless, the tumor stage is deal with as an uncertain indicator because of its low level reproducibility (⁴). Furthermore, the bad inter- and intra-observer approval, can affect the optical specific morphology, which leads to non-utilize the grade as an essential indicator for the results. During the specific tumor determination, the pathologist may determine various grades to the same tumor after repeat the assessment for other times (⁵).

Risk factors for Breast Cancer:

In wealthy societies with the western lifestyle, where people obtain diets that rich-fat and protein, and high caloric, concurrently with the absence of physical exercise, breast cancer can exist in high percentage. The affluent societies like Europe, North America, and Australia, with such a kind of lifestyle, have reached the top of the incidence percentage with (70-90) newly cases for every 100,000 people per year. On the other hand, societies, which have become rich and industrialized recently, have shown a significant increase in disease incidence rates and mortality. However, the main risk factors that have determined involve the dietary and obesity, hereditary, gynecological, age, lifestyle which include the smoking, alcohol and also exercise, oxygen reactive types, as well as the radiation dose and the factors of the environmental pollutants. While breast cancer incidence increases obviously up to the age (50 years), the incidence rate tends to raise in slow level after the age (50 years) (6). Further, the smoker women might reach menopause early compared with nonsmoker women (7), while the percentage of alcoholic women, whose have the risk of evolving breast cancer, might reach to 15% (8).

In general, there is a link between the breast cancer and the level of endogenous estrogen. When the level of estrogen in the serum or urine is high, and the level of SHBG (sex hormone binding protein) is low, this can lead to high abundance of free estradiol. In turn, such a bioavailability leads to increasing the risk of breast cancer caused by endogenous and exogenous estrogens (9). Specific pollutants called xeno-estrogens, which involve the food preservatives, dyes, pesticides, and other, can play an important role in the causes of breast cancer, as long as they intervene with factors like the action of endogenous estrogens (10), the benign of breast cancer history (6), and the Ionizing radiation (11).

Materials and Methods

Our study population was included 30 female, at age (15-55 years), had diagnosed with breast cancer. Factors such as the family history with breast cancer, age, as well as other immunology disease, had been employed for current study. Such a research can lead to a great prospective study about the cancer risks and reproductive factors (12). The survey about the medical family history was based on whether the mother or sisters has diagnosed with a breast cancer, and the existence or lack of cancer (13). After the organ eradication from the patients, the tissue samples were picked, as fast as possible, and for the fixation, it placed in 10% formalin directly. After the fixation step, samples were trimmed by utilizing special scalpel to make them suitable for the labelled tissue cassette. For removing the fixation, and also the water, from the tissues, samples were passed through alcohols with graded concentrations (70 - 95 - 100%). Then, the paraffin block that contain the tissue was trimmed to reveal the interest tissue, and cut into fine sections with about 5 micrometers diameter by microtome machine. Both types of the histochemical stains, the eosin and hematoxylin, were typically used for the tissue sections contrast, to improve the tissue structures and make it clearer and easy to estimate.

Results and Discussion

![Figure - 1: Age Distribution of Breast Cancer (Female No.)](image-url)
Age Distribution of breast cancer (female %)

In the current study, the majority of the 30 women with breast cancer were at age (31-40 years) (Figure 2). The mean age was about (35.26) years, and about 12 patients of them were involved left breast, while the other 18 patients included right breast.

One of the most widespread cancer that involves the female’s population around the world is the breast cancer. In developing countries, its incidence percentage has raised at rate 3-4%, and generally diagnosed at final stages (9). In Nepal, a previous study had been indicated that among the reproductive cancers, breast cancer had the highest prevalence, and the female age category that most exposed was (30-40 years) (15). Our results proved that the female age category (15-50 years) had the highest rate of breast cancer in compared with other age categories. In contrast, previous study had shown that the most popular age category in diagnosis the breast cancer was (41-55 years) (16).

Histological and morphological change of female patient of breast cancer

Fig3: Location of Biopsy: right breast nodule. Age of female 35 years. Gross examination: Multiple pieces of tissue measure (5x4) cm, brown in color, and firm in consistency, cut section reveal white homogeneous area, multiple pieces taken in five cassettes. Microscopic examination: Section revealed hyalinized stroma in broad papillary fibro vascular cores with presence of two cell types epithelial and myoepithelial with normochromic often-oval epithelial cell nuclei and scant mitotic activity Picture of intraductal papilloma.
Fig 4: Site of biopsy: Right breast. Age 18 years. Gross examination: Single piece of tissue measure (4x2x1.5 cm), white in color, and firm in consistency, cut section revealed homogenous, white surface, multiple pieces taken in three cassettes. Microscopic examination: Section revealed pieces of breast tissue showing dilated small duct with intact epithelial lining surrounded by mild fibrosis with area of fibro-adenomatous changes.

Picture of fibrocystic disease with fibro-adenomatous changes.

Fig 5: Site of biopsy: right breast lump. Age 55 years. Gross examination: Four core of tissue measure (1x0.5x0.2) cm, all taken (each two cores) in one cassette. Microscopic examination: Section reveal four core of breast tissue showing increase proliferation of atypical pleomorphic ductal cell, arranged in a ducts, cords and single cells, on a background of desmoplastic stroma, associated with focal area of lymphocyte infiltration. Picture of invasive ductal carcinoma.
Fig6: Site of biopsy: left breast mass. Age 35 years. Gross examination: Multiple piece of tissue measure (1x1) cm, all taken in one cassette. Microscopic examination: Section reveal marked infiltration malignant neoplastic cell showed marked necrosis and stromal invasion, few cluster showed marked stromal invasion. Picture of non-differentiated invasive ductal carcinoma grade 2.

Depending on (modified Scarff-Bloom-Richardson grade), which is basically grading system, parameters such as the nuclear size and pleomorphism, the level of tubule formation, and mitotic rate had been measured. Each factor was specified with a score (1-3), however, the final grade was determined from the total of every single scores. Regardes to the differentiation degree, (grade I) is a well differentiated with scores (3-5), (grade II) is a moderately differentiated with scores (6-7), and (grade III) is a poorly differentiated with scores (8-9) (17).

Conclusion

Our results showed that the link between the risk of breast cancer and the reproductive factors is vary depending on the histological pattern of the tumor.

Although not included it in staging guidelines because of the nature of the assessment procedure, the histological grade of breast cancer considers as a substantial prognostic factor.

Despite the fact that the highest frequency of medullary tumors is existed among multiparous women, it’s considered as not preferred factor effect for pregnancy on the histological type of breast cancer

Isolation and Molecular Identification of *proteus mirabilis*
Isolated from Hospitals in the Capital *Baghdad*

Mohammed Kaittan Abed¹, Hasanain Khaleel Shareef²

¹Post graduate, Prof., College of Science for Women / University of Babylon, Iraq

Abstract

*Proteus mirabilis* a Gram-negative bacteria belonging the *Enterobacteriaceae* family and that causes several infections to patients such as urinary tract infections, middle ear infections, wounds and burns, in addition to other infections. This study aimed to isolate and diagnose *Proteus mirabilis* bacteria collected from different samples of infection sources from patients present in many hospitals using traditional diagnostic like morphological and biochemical tests as well as molecular methods. The Identification system for Gram negative bacteria GN24 KIT had used to detect *Proteus mirabilis* species . The results of using this kit were confirmed by the molecular diagnosis of bacteria through the PCR technique of the 16S rRNA gene, where the confirmation rate was 100%. The PCR sample was analyzed in Macrogen Corporation–Korea for Sanger sequencing using ABI3730XL, an automated DNA sequences. the findings were obtained and analyzed via genius software in order to Synthesis of the phylogenetic tree of the isolated strains that resulted from the discovery of a new global strain of *Proteus mirabilis* bacteria and was recorded in NCBI genebank with accession number (MN 700085) and name (M.K.84 ).

**Keywords:** Health; Genebank; toxicity; sequencing; *proteus mirabilis*

Introduction

*Proteus* spp . considered one of Gram-negative bacteria and they are members of the family *Enterobacteriaceae*, as well as belong to gastrointestinal microorganisms [1]. *Proteus mirabilis* is a rod formed bacteria, it is commonly documented by its urease generation and recognizable capability to differentiate to elongated swarm cells and the distinctive bull-eye style of motility on agar media plates [2]: *P. mirabilis* return to the Gammaproteobacteria class, and had been for a long time regarded as an individual of the *Enterobacteriales* Order, *Enterobacteriaceae* family, Besides that, lately, one group suggested re-classification of the *Enterobacteriales* order to put *Proteus* in a new position within the *Morganellaceae* family based on the recreating phylogenetic tree depending on four multilocus sequence analysis proteins, ribosomal proteins , shared core proteins [3]. *Proteus mirabilis* was of medicinal significance and is typically responsible for most serious bacterial infections in hospitals including such urinary tract infections, wound, ear infections and other infections [4]. In healthy hosts *P. mirabilis* is not considered a major cause of urinary tract infection , on the contrary , *P. mirabilis* is detected in complicated UTIs comparatively repeatedly like Patients with functional or physiological disorders, in particular patients with urolithiasis or chronic urinary catheter [5]. *Proteus mirabilis* ureolytic activity in the catheterized urinary tract results in ammonia production and an elevation of urinary pH. Under these alkaline environment, magnesium ammonium phosphate (struvite) and calcium phosphate (hydroxyapatite) crystals are usually begin to form by normally soluble urine constituents precipitation [6].

16S rRNA genes encoding a small subunit of rRNA in prokaryotes have been widely used in taxonomic classification and determination of phylogenetic relationships. The 16S rRNA gene sequence is used to detect bacterial species in natural specimens and to
establish phylogenetic relationships between them. This is made possible by the fact that all bacterial species contain the 16S rRNA gene, which has highly conserved regions on which to design universal primers, as well as hypervariable regions that are useful in distinguishing species. The 16S rRNA gene has hypervariable regions which are an indication of divergence over evolutionary time[7]. For addition reasons the use of 16S rRNA gene sequences to study bacterial phylogeny and taxonomy was by far the most common genetic marker used, these reasons include (i) its existence in almost all bacteria, often identified as a multigene family or operons; (ii) the function of the 16S rRNA gene has not changed over time, indicating that alterations in the sequence are a more accurate measure and (iii) the 16S rRNA gene (1500 bp) is fairly large for informatics purposes[8].

Genotypic bacterial analysis starts with the PCR product’s nucleotide sequence analysis of the respective gene(s) followed by a comparison of such sequences with the identified sequences in the database [9].

**Materials and Methods**

One hundred and fifty swab samples were collected from different sources of infections (urinary tract infections, Otitis media swab, Stool , Wound swab, Vaginal swab) that were taken from patients suffering from various diseases, which were eighty samples from females and seventy samples of males (With age range from six months to seventy years) present to the several Iraqi capital Baghdad hospitals for the period from the first of September 2019 to January 2020 . Each specimen is immediately inoculated onto the MacConkey’s agar plates where it is considered a selective and differentiation agar which develops only gram-negative bacterial organisms; it could also distinguish gram-negative species on the basis of the lactose fermentation , the selective and differentiating property of MacConkey agar that allows use in both scientific and clinical applications [10]. On the other hand, to see the phenomenon of swarming more clearly , samples were cultured on blood agar plates which was the enriched product often used for cultivating fastidious microbes and the differentiation of bacteria depending on their hemolytic effects [11].

**Identification system for Gram negative bacteria GN24 KIT**

GN 24 is a standard recognition method for Gram negative bacteria common species . The test is dependent on 24-29 miniaturized biochemical tests and on the Internet database. Kit GN 24 consists of 24 wells microtiteration plate strip in the classic 96 well format containing dehydrated substrates Reconstitution of substrates is performed by bacterial suspension inoculation. During incubation, color changes occur in wells due to microorganisms ' metabolic activity. Test results may be measured either by automated readers or visually depending on the color scheme, or by the color definition displayed in the flyer. The results of recognition can be collected from the evaluation table or by using evaluation tools located at (www.diagnostics. sk/idmicro).

**DNA Extraction from Gram Negative bacteria**

According to the ABIOpure (USA) Extraction method , genomic DNA was extracted from bacterial growth.

**Quantitation of DNA**

Quantus Florometer (Promega, USA) has been used to measure the concentration of sample DNA collected for downstream applications.

**Detection of 16S rRNA Genes by Polymerase Chain Reaction (PCR)**

Bacterial 16S rRNA had amplified via specific primer pair designed in Macrogen Company ( Korea ). ( F: 5' - AGAGTTTGATCCTGGCTCAG-3') and ( R: 5'- TACGGTTACCTTGTTACGACTT-3') The PCR condition was: Initial denaturation at 95°C for 5 min , followed by 30 cycles of denaturation at 95 °C for 30s, annealing at 60 °C for 30s and extinction at 72 °C for 1min. Final extension at 72 °C for 7 min , finally hold at 10 °C for 10 min.

**Standard Sequencing**

The PCR amplicon samples was analyzed in Macrogen Corporation laboraty–Korea for Sanger sequencing using ABI3730XL, an automated DNA sequences . the findings were obtained and analysed Using genious software .
Results and Discussion

Of the 150 clinical samples, 110 gives positive results, including 19 (12.7%) isolates belonging to *Proteus mirabilis*, whereas the remaining 91 (60.7%) isolates belonged to other bacteria species as seen in the table (1).

The outcome of the present study matched Abbas et al 2015 that found the *P. mirabilis* rate (12.6%) of one hundred and thirty-five specimens from patients with various clinical cases[12]. EL-Baghdady et al. (2009) got the results comparable to the present study, which had obtain to isolate *P. mirabilis* at rate reaching to (10%) [13]. Mishra et al. (2001) isolated *P. mirabilis* from different sources of infections at a percentage of 78.3%[14]. Furthermore, AL-Jumaa (2011) isolated just (7%) of *P. mirabilis* from the total of 100 samples obtained from various clinical samples of urine, blood, otitis media, burn, wound and perianus [15].

### Proteus mirabilis Identification

*Proteus mirabilis* identification was carried out according to [16] based on the Colonial morphology (Shape, swarming, odor on MacConkey) and Microscopic analysis involving bacterial cell morphology was examined by Gram-Stain to determine the shape, cell arrangement, and form of Gram-Stain reaction. After staining, different biochemical tests are carried out for each isolate includes Catalase (+ ve) and Oxidase (-ve) In addition to use Identification system for Gram negative bacteria (GN24 KIT) which used as previously mentioned. Its results are shown in Figure (1) below.

![Figure 1. Diagnostic Results to one of *Proteus mirabilis* isolates Using GN24 kit Software.](image-url)
PCR identification

The results of PCR identification of (15 Isolates) *P. mirabilis* using 16S rRNA showed all isolates were *P. mirabilis* and gave a good confirmative identification as shown in the figure (2). All *P. mirabilis* isolates yielded the same band size (1500 bp) which was the product size of primers used for identification.

![Image of PCR results](image)

**Figure 2.** Results of the amplification of 16S rRNA gene of *Proteus mirabilis* samples were fractionated on 1% agarose gel electrophoresis stained with Eth.Br. Lane1:100bp DNA marker.

The present research showed that 16S rRNA was a strong selective power to determine isolated *P. mirabilis*, which was compatible with the Saleh et al. (2019) 16S rRNA test to recognize *Proteus* spp. isolated from urinary tract infection patients and the Mukhtar et al. (2018) finding the 16s rRNA gene used to identify *Proteus mirabilis* on banknotes, the two above research have been reported to be a strongly selective force for *Proteus* spp recognition by 16S rRNA [9,17].

The 16S rRNA gene, which has a length of 1.5 kilobase (kb), has proved to be a valuable molecular target because it is found in all bacteria, whether as a single copy or in multiple copies, and is strongly conserved in a species over time.[18] [19].

**Sequencing and Phylogenetic of 16S rRNA gene**

The results of the analysis of gene sequence of the present study showed a match in the sequence of the nitrogenous bases of the 16S rRNA gene of *P. mirabilis* local isolates with *P. mirabilis* global isolates which saved in (NCBI-Genebank), Where the proportion of identical of fourteen isolates were (100%) and the identical ratio of last isolate was (99.63%) , as the result of the current study was close to what Jian-ke et al.,(2015) reached where he was found that the 16S rRNA gene for the diagnosis of *P.mirabilis* bacteria is more than (99%) identical when analyzed at (NCBI-BLAST) site . The same researcher also found that the Phylogenetic tree analysis for 16S rRNA gene of 20 global *P.mirabilis* strains had very high identical ratio in the gene-bank and the match rate was (98.9-99.7%) this ratio was Close to the result of the phylogenetic tree analysis for the current study for the 16S rRNA gene as shown in figure 3 below . Where the results showed in the current study that there was a group of strains that were 100% identical with each other, and these are the following samples (10-14-16-27-29-30-33) these strains differ with some strains in the gene bank in the rate of (6*10^-5) . The other group includes a group of strains that are 100% identical with each other, as well as other strains in the genebank at 100%. an example of this was
the numbered strain (AOUC-001) which matching with samples (20-21-23-28-32), While the sample No. (17) was identical to the gene bank sample (TL14(1)) at the rate of (100%) and differs from the other local and global strains above in ratio about (1.84*10^{-4} 10^{-4}) also, the sample (31) was 100% identical to the sample (ALK042) on the other hand, it differs from the first group strains above by (6*10^{-5} 10^{-5}). Finally, with regard to sample No. (7), it did not match with any other strain (100%), whether they were local or global strains, and the percentage of difference with all strains mentioned previously was (0.002). It will be discussed more broadly in the next topic.

Figure 3. The Phylogenetic tree of 16S rRNA gene for fifteen strains of P. mirabilis bacteria included in the current study in addition to a number of strains of the same species of bacteria from the strains stored in the gene-bank database of NCBI.

**Detect novel strain**

After the 16S rRNA nucleotide sequences were scanned for similarity sequences using online NCBI-BLAST analysis one of the isolates, was discovered which did not match any strain, at 100% of the strains stored in a NCBI-Genebank. The above-mentioned isolation registration was approved by the (NCBI-Genebank) as a new global strain and it was given an accession number (MN 700085). The 16S rRNA nucleotide sequences of new strain were scanned for similarity sequences using
online BLAST to create phylogenetic tree as appear in figure (4). All isolates retrieved from the NCBI GenBank subjected to the analysis of multiple sequence alignment using genius software.

Figure 4. phylogenetic tree of 16S rRNA nucleotide sequences of new strain *Proteus mirabilis* strain M.K.84 accession number (MN 700085).

Through the phylogenetic tree shown in the figure above, we divide the strains into two groups for the purpose of comparison among them in the first group the results show that the numbered strain (EF091150) was matching with strain (CP048787). The two strains differ with the strain that had accession number (LC382139) in a ratio (5.93 × 10⁻⁴). In the second group the strain which had accession number (CP029133) was matching with strain (AM942759). The two strains also differ with the strain that had accession number (CP042907) in a ratio (5.93 × 10⁻⁴). The rate of difference between the strains of the first group and the second group was (0.0016). The end result of the new strain (MN 700085) was It differs with the strain of both groups in ratio (0.0022). The nucleotides substitutions that appeared in the new strain (MN 700085) was shown in Figure. 5.
Figures 5. Consensus identity of new strain (MN 700085) sequence after analyzing it in genius software.

During the analysis of the sequence of the new strain in the genius program, the result was a match with the strain of accession number (CP042907) at (99.63%) and by five nucleotides in the form of substitutions at the sequences (88-186-245-919-945) (C-T: C-G: T-G: C-T: T-G).

Acknowledgments

We gratefully thank University of Babylon, Science college for girls for assistance and permitting to performed this work in (microbiology Lab), Advance Scientific Office molecular lab (ASCO.Lab) and the following institutions crew (Al Kindy Teaching Hospital, Central Teaching Hospital of Pediatrics, Ghazi al-Hariri hospital for surgery specialist, Al- Sader Hospital, Teaching Laboratories Institute) for supporting and supplying the clinical samples for this study.

Abstract

Diabetes is the greatest public condition among patients with coronavirus disease and has been found to affect prognosis worldwide. It is revealed that hyperglycemia is one of the elements that elevates the risk of consequences in these persons. This study designed to analysis the overall features of the novel coronavirus and provide an understanding of the coronavirus disease in diabetic patients, and its treatment.

These patients are usually treated with various medications and this review clarify the role of metformin and dipeptidyl peptidase 4 inhibitors as helpful factors in these patients. Recommendations are made on the probable pathophysiological mechanisms of the association between coronavirus and diabetes, and its management. Additional study about this association and its clinical managing is necessary.

Keywords: Diabetes mellitus, Coronavirus disease, Severe acute respiratory syndrome-coronavirus-2, Metformin, Dipeptidyl peptidase 4 inhibitors.

Introduction

Diabetes mellitus (DM) is a main cause of morbidity and mortality through the world. It is related with various micro- and macrovascular complications, that eventually influence the general patient’s endurance (¹).

An association between infection and diabetes has long been clinically known (²). Current epidemiological data of the Italian reported as the risk of mortality in coronavirus (COVID-19) patients progressively increases with the numbers of the comorbidities (³).

Coronavirus belong to the Coronaviridae, the members of which infect a wide-ranging range of hosts, generating symptoms and diseases ranging from a common cold to severe and eventually fatal diseases as severe acute respiratory syndrome (SARS), Middle-East Respiratory Syndrome (MERS), and as of present COVID-19 (Figure 1) (⁴).

Differential Diagnosis of COVID-19:

The symptoms of the primary phases of the disease are non-specific. Differential diagnosis must contain the probability of a varied types of respiratory disorders.

- Influenza
- Parainfluenza
- Rhinovirus (common cold)
- Adenovirus
- Human metapneumovirus (HmPV)
- Respiratory syncytial virus (RSV)

Demography and Clinical Characteristics:

Although all age groups have been exaggerated by COVID-19, the middle age seems between 47–59 years, and commonly greater among severe cases and non-survivors. Signs and symptoms of COVID-19 are illustrated in table 1. It has been shown that males would be poorer exaggerated than females, with a male majority in recent researches. Less cases have been recognized among children and infants, while older COVID-19 cases were noticed to have a poor prognosis (5). Additionally, metabolic syndrome found to be related with a worse scenario in COVID-19 persons. Hypertension is related with worse consequences. These primary clinical explanations that cases with severe COVID-19 are: elderly persons, male, hypertensive, with higher blood glucose concentrations and abnormal liver blood examinations increase the prospect that insulin resistance (IR) might show a significant role in intermediating disease severity. Recent documents from China expected mortality rates near 10% in DM, from a model of 72,314 established cases (6).

Table 1. Signs and symptoms of COVID-19

| Fever       | cough | fatigue | sputum production | shortness of breath |

Review has been documented a considerable correlation between DM and COVID-19 severity (OR 2.67, 95% CI 1.91–3.74). Diabetes and race both seem to be further risk elements emerging in the clinical consequences of the COVID-19 pandemic. Within the hospital population COVID-19, infected persons with DM is overrepresented. (7).

Criteria for Suspicion and Testing:

The diagnosis of COVID-19 is approved by microbiologic analysis. Patients who undergo coronavirus according to WHO criteria must be testing for SARS-CoV-2, also testing for additional respiratory pathogens (e.g., influenza, respiratory syncytial virus, etc) (8).

Glycemic Control and COVID-19:

Limited data are concerning glucose metabolism and progress of acute complications of DM in COVID-19
Patients with infection of severe acute respiratory syndrome-coronavirus-2 (SARS-CoV-2) and DM probably initiate higher stress circumstances, with higher release of hyperglycemic hormones levels as catecholamines and glucocorticoids, leading to elevated blood glucose concentrations (9).

Glycated hemoglobin (HbA1c) is considered for estimating blood glucose concentration within 120 days before the test, and higher HbA1c value is associated with the complications risk among diabetics (10). Patients with COVID-19 who has higher HbA1c value may reveal moderately greater level of severity. Moreover, the infection may leading to a rise in HbA1c value (11).

**Inflammatory Markers and COVID-19:**

It was reported that inflammatory markers such as C-reactive protein (CRP) level, serum ferritin level, erythrocyte sedimentation rate (ESR) and clotting factors were positively associated with HbA1c value in cases of COVID-19. Previous data have showed that DM not only leads to dysfunction of the epithelium in the pulmonary cilia and improves the permeability of the vascular system, but also donates dysregulated immune system function (12, 13).

The potential mechanisms of COVID-19 affecting glucose metabolism comprise β-cell damage and IR. Preceding data have documented that certain viruses can cause pancreatic β-cell damage directly (14, 15), and angiotensin converting enzyme 2 (ACE2) as a SARS-CoV-2 receptor has greater expression in pancreatic endocrine tissues than in exocrine tissues (16).

Hyperglycemia and IR lead to improved synthesis of pro-inflammatory cytokines, oxidative stress (OS), and advanced glycation end products (AGEs) as well as stimulating the production of adhesion molecules, (Table 2) that mediate tissue inflammation (17).

| Table 2. Factors that affecting on some process in human (17) |
|---------------------------------|-----------------|
| Factors                        | Effects         |
| - Hyperglycemia                | Pro-inflammatory cytokines |
| - IR                           | AGEs            |
|                                | OS              |
|                                | Production of adhesion molecules |

This inflammatory process may initiate the primary mechanism that leads to a greater tendency to infections, with poor consequences in diabetics. Autopsy revealed that though some of pancreatic cells were deteriorated in pancreatic tissue, whereas immunohistochemical examination and polymerase chain reaction (PCR) tests did not identify the occurrence of SARS-CoV-2 in pancreatic cells (18). COVID-19 patients frequently show on admission lymphocytopenia, and to a reduced extent thrombocytopenia and leukopenia, which are more noticeable in cases with severe disease (19).

A further mechanisms, independent of ACE2 expression, are possible to donate to the additional severe phenotype related with DM in COVID-19. A cytokine storm has been concerned in the multi-organ failure related with COVID-19 and there is good indication from animal models of MERS that DM modifies the cytokine profile and augments a dysregulated immune response which aggravates lung pathology. Hence, higher levels of proinflammatory cytokines, including interleukin-6 (IL-6) and CRP, in addition to higher coagulation activity factor, (Figure 2) noticeable by elevated levels of d-dimer, were also related with severity (20).

The concentrations of these elements can be diminished by lifestyle-related variations. There is rare documents on diabetic ketoacidosis (DKA) with COVID-19 infection. It has been reported cases of DKA precipitated by COVID-19 in a newly diagnosed patient with DM. The diabetic ketoacidosis occurs as
a consequence of insulin insufficiency and improved regulatory responses, which favor the production of ketones (21).

The relationship between SARS-CoV-2 and the reninangiotensin-aldosterone system (RAAS) might reveal additional mechanism in the pathophysiology of DKA. Moreover, in T2DM an inequity between coagulation and fibrinolysis happens, with higher concentrations of clotting factors and inhibition of the fibrinolytic system. These irregularities favor the progress of a hypercoagulable pro-thrombotic state (22).

Figure 2. COVID-19 in diabetic patients (22)

It has been thought that the measure of clinical (skin tags, acanthosis nigricans, body weight, body mass index, waist/hip ratio) and biochemical (fasting glucose, insulin, leptin, adiponectin, leptin/adiponectin ratio) parameters related with IR, to conclude if they were related with COVID-19 severity. Consequently, large cohorts of prospectively genotyped cases might recognize genetic polymorphisms related with COVID-19 occurrence or severity that would improve the understanding of the mechanistic basis for the difference in severity of the infection.

The record current publication, encompassing 7336 patients, revealed the risk of fatal result from COVID-19 was up to 50% greater in diabetic patients. Additionally, well regulated blood glucose was related with lesser hospital mortality than uncontrolled glucose (hazard ratio 0.14) (23).

Renin Angiotensin System and COVID-19:

The ACE2 is a carboxypeptidase that is mainly located in the membrane. It is homologous to ACE (24). The ACE2 down-regulates the RAAS and acts as an inhibitor of angiotensin II (AngII), an active peptide causing pro-inflammation action, vasoconstriction, profibrosis, stimulating aldosterone secretion by binding to the AT1 receptor, converting it into Ang-(1-7), an active peptide with opposite possessions to AngII. It has been revealed that Ang-(1-7), by binding to the Mas
receptor, tempted vasodilatation and revealed anti-fibrosis and anti-inflammatory properties (25) (Figure 3). Also, AngII is inhibited by an aminopeptidase which converts AngII into AngIII, which prompts vasodilatation and elevates natriuresis. ACE2 then converts AngI into Ang-(1-9), which is also converted into Ang-(1-7) by ACE1 (26).

Additionally, SARS-CoV-2 binds to ACE2 which is largely expressed by the intestine, lung, and epithelial cells of blood vessels. The RAAS activity is elevated in the lung and is a major source of circulating AngII due to increased expression of ACE. Lung ACE2 regulates the RAAS activation balance by regulating the AngII / Ang1-7 ratio. AngII pulmonary AngII exacerbates vascular permeability, initiating pulmonary edema (27).

Metformin in COVID-19: A Possible Role

Metformin is deliberated one of the safest oral hypoglycemic agents. It lessens IR, but does not promote insulin secretion from β-cells, and so it is not related with increased risk of hypoglycemia (28).

It has recommended that metformin be used as a medication to combat the virus. Also, women who are taking metformin may be at lesser risk for serious COVID-19. In 6,200 diabetic adults or obese who were hospitalized with COVID-19, there were less deaths among women who had filled their 90-day metformin drugs than among those not taking it. This association was not shown in men. So, it is known that metformin has diverse influences between men and women (29). Metformin prompts AMP-activated protein kinase (AMPK) in hepatocytes by causing its phosphorylation.

This is the primary mechanism by which metformin is responsible for positive effects on glucose and lipid metabolism (30). Since metformin works by activating AMPK, which leads to ACE2 phosphorylation, it can be studied that this hypothetical addition of phosphate group would lead to conformational and functional alterations in the ACE2 receptor (31). This may reduce the binding to the receptor binding domain (RBD) of the SARS-CoV-2 protein (SARS-CoV-2 RBD) due to inactivation by adding bulk PO4-3 molecule. However, when it enters the virus, there is a decrease in the
regulation of ACE2 receptors. This leads to asymmetry of the RAAS which supports the harmful properties of its pro-inflammatory and anti-fibrotic arm, leading to potentially fatal cardiopulmonary consequences. By regulating ACE2, the defect in RAAS can be prevented. Therefore, metformin will not only block SARS-CoV-2 entry but also prevent harmful supplementation by activating ACE2 through AMPK signaling

Conclusions

Present review illustrated that DM is related with severity of the disease and poorer short term consequences comprising death. Stronger individual strategies are advised for diabetics, and more serious investigation and management should be deliberated when they are infected with SARS-CoV-2. It is probable that SARS-CoV-2 may deteriorate pancreatic β-cell function and formation of DKA. High blood glucose and HbA1c level are related with inflammation and hypercoagulability. Though DPP4i have been described to be useful for the long term management in diabetic patients where in DPP4 enzyme is blocked, there is no actual data confirmed on the influence on the prognosis of COVID-19 infection.

The Effect of Training with Rubber Ropes and Controlling the Resistance Arm on the Response Time and some Biomechanical Variables for the Skill of Sending for Wheelchair Tennis Players

Maytham Hadi Mahdi
Assist.Lect. Ministry of Education / General Directorate of Holy Karbala Education / Iraq

Abstract

Training with rubber ropes is one of the modern training methods that help to develop the absolute strength of specific parts of the body and according to the skill performance, especially when training with different muscle moments that cause the movement of those limbs according to variable resistances, especially for wheelchair tennis players, so the research was applied to a sample of tennis players with chairs. Using these exercises to find out their effect on the serve skill mechanism, this exercises were applied for a period of (10) weeks, on (6) players who are the best players in this competition, and the researcher used foreign and Arab sources and the international information network, observation, experimentation, tests and measurements as means of collecting information.

A video camera for filming and using kinematic analysis to extract the mechanical variables, and the researcher came up with several conclusions, including that training according to the results of the analysis and using the change of resistance arms when training with rubber ropes was effective in developing the speed of the centers of the striking arm parts of the research sample. The exercises led to an improvement in the technical performance interdependence (the research sample), which inevitably affected the achievement of good achievement, as well as in improving the response time of the research sample.

Keywords: Resistance arm, response time and control.

Introduction

Training with rubber ropes is one of the modern training methods that help to develop the absolute strength of specific parts of the body and according to the skill performance, in order to develop the forces that cause the movements of those parts for the various sporting activities whose performance is related to the movements of the upper extremity, such as the skill of ground tennis, including wheelchair tennis. And since the movements of the upper limbs of the body of a disabled person in the game of ground tennis are relied upon in the application of basic skills in this game, which are often rotational movements, the muscular work will be related to the action of the various muscle moments that cause the movement of those limbs, and when the force is exerted by the muscles, this force will work to rotate the associated parts around the joints of the body and whenever the level of muscle strength is large, the movement of these limbs will be as fast as possible, and thus the speed achieved in the limbs will contribute to the overall linear velocity of the body when performing the front and back blow or the serve with tennis, which requires the development of strength by controlling the resistance arm when it is shot on the arm and at different distances from the arm in order to develop the torque of force and develop the speed gain for it, given that the parts of the body contributing to the performance are levers whose movement is related to the presence of force and joints around which these parts must be used in

the service of the skillful performance for this activity, which requires a careful study of the motor performance And the consequent conditions and biomechanical laws in order to reach the correct technical position to achieve the best achievement, so the importance of research came to focus On the strength training exercises for rubber ropes for wheelchair tennis players, which are related to exercises based on the principle of moments, and to determine the importance of the work of these moments in the development of some biomechanical variables and the speed of response to them.

The types of resistance forces have varied as training momentum, which “are of unequal magnitudes and opposite directions or in one direction in the end that support each other in order for the body to move accordingly and change its speed and direction of movement”, which is imposed on the body simultaneously as (the moments of the force of gravity And resistance force moments when training with added weights, body weight, or rubber ropes ) During skill performance, most coaches and players were interested in strength training with various resistances, which are known as “sports movements that are similar in composition in terms of the combination of kinetic performance of strength and speed”, through the use of the best training methods that play a role in influencing the development of strength, including training rubber ropes of various lengths and resistances in various forms, as well as methods of training this regular force, and special strength according to the principle of moments as one of the effective training methods in this field Which is believed to be in addition to its effectiveness in developing muscle strength and ability when performing arm and trunk angle movements in accordance with the mechanical conditions accompanying performance, it can improve performance. The interest of coaches and players in most developed countries of the world has increased in resistance power training according to the Karbala governorate team, and their number was (6) players. They are the best players in this competition and who are preparing to participate in the Iraq Championship 2020. For their lengths (1.76) with a standard deviation (± 0.05).The researcher used foreign and Arab sources and the international information network. Observation, experimentation, tests and measurements as means of collecting information, as well as using a (2) Japanese-origin Casio video camera with a speed of (120) r / s and a computer Automated (laptop Lap top) Lenovo type, and a height and weight measuring device. And rubber bands of different resistors and lengths.

**Research Methodology**

The use of the experimental approach to suit the nature of the research. The sample of his research consisted of elite wheelchair tennis players from the Karbala governorate team, and their number was (6) players. They are the best players in this competition and who are preparing to participate in the Iraq Championship 2020. For their lengths (1.76) with a standard deviation (± 0.05).The researcher used foreign and Arab sources and the international information network. Observation, experimentation, tests and measurements as means of collecting information, as well as using a (2) Japanese-origin Casio video camera with a speed of (120) r / s and a computer.

Automated (laptop Lap top) Lenovo type, and a height and weight measuring device. And rubber bands of different resistors and lengths.

**Tests and measurements**

**A test of the skill performance of the serve and the pre-filming**

The serve skill test of the search sample was conducted
in accordance with the rules of the International Tennis Federation with the conduct of videography, using a video camera at a speed of 120 p/s, for the purpose of analyzing and extracting the variables for the search, and this camera was placed so that the player’s movement is photographed from the weighted moment to receive the ball (as a preparatory position) For the purpose of hitting the transmitter skill, the camera was 7 m away from the midpoint of the path, to ensure the player’s movement was followed, and the height of the camera lens was (1.55 m) perpendicular to the ground.

Bio-mechanical variables

The following biomechanical variables were measured through direct sample imaging and kinematic analysis during pre and posttests, and they are:

velocity variables

1. The speed of the center of the shoulder, elbow and hand of the striking arm according to the following law:

\[
\text{Angular velocity} = \frac{\text{angular velocity (for the forearm or upper arm)}}{\text{time}}, \text{ then extract the circumferential velocity of the hand and shoulder according to the equation (peripheral velocity) = } \frac{\text{angular velocity (in sector / s)}}{N}
\]

The variables of the two equations were extracted through video kinematic analysis of the forehand and serve skills.

- The ball’s launch velocity was extracted from kinetic analysis.
- Response time: measured with the Nelson Kinetic Response Test.

The Nelson Test for Selective Kinetic Response.

The purpose of the test: to measure the ability to respond and move quickly according to the stimulus test.

Necessary tools

- The tennis court: a flat area free of obstructions with a length of (20 m) and a width of (2 m) within which there are three lines of distance between the line and the other (6.40 m), and the length of the line in the middle (1 m).

An electronic stopwatch, a tape measure-recorder/that calls the names first and records the time of performing the test second. Timer/give start signal with timing.

Performance specifications

The player stands at one end of the middle line facing the timer who is standing at the end of the other end of the line and the player takes the standby position so that the middle line is between the feet, then the player prepares with his chair, and the timer holds the stopwatch with one of his hands and raises it to the top and then quickly moves his arm to the left or the right and at the same time he turns on the clock and when the player responds to the start signal, he tries to move with his chair as quickly as possible in the specified direction to reach the side line that is 6.40 m away from the center line, and when the player crosses the right side line, the timer stops the clock.

Test Instructions

- If a player starts in the wrong direction, the timer continues to run the clock until the player changes direction and reaches the right side line.
- The player is given (6) consecutive attempts between each attempt and the other (20) seconds of rest, with (3) attempts on each side.
- The attempts on each side are randomly selected and sequenced.
- The timer must train the start signal in order to be able to give this signal by the arm and operate the watch at the same time.
- The player must not know the number of attempts required of him to perform in order to reduce the player’s expectation.
- The test should start with the timer displaying the (prepare - start) indication for all attempts.

Recording method: The time for each attempt is calculated to the nearest 1/100 second.

Lab score is the average of the six attempts (total score = total attempts ÷ 6 = 0.00 s).
Pilot study

The researcher conducted an exploratory experiment on (10/12/2019) on the sample members in order to adjust the performance of the devices used and to establish the location of the cameras and their preparation completely and the clarity of the images in them. And to identify the obstacles and errors that accompany the research procedures.

Pre-test and videography

The researcher conducted the pre-test and videotaping on (12/12/2019) at the specialized center of the Sports Talent Center for Tennis in Karbala, the researcher conducted performance tests and videotaping and took the test in accordance with international law.

Exercises applied

Restricted strength training (with rubber bands) was applied at the rate of (3) training units per week for a period of (10) weeks and at (30) units by using rubber ropes, which could contribute to the development of the strength level of the sample members according to mechanical conditions, and the exercises focused on special strength according to The theory of force moment (strength x length of the part of the movement), whether the arm or the torso part, and it was given (3) types of exercises in one training unit and these form types of exercises related to skill, movement of the body and the performance of movements that rise with the presence of resistances, as the intensity of these exercises Ranging from (85-95%) of the maximum intensity of the player according to the type of work performed, and a rest period was given according to the working time to rest between repetitions and (2) two minutes between one group and another, and it was carried out by the method of repetitive and interval training with high intensity and the training time was part of the main section within the training unit ranges between (30-40) minutes and the corrugation was (3: 1). The group was subjected to the direct supervision of the researcher with the help of specialized trainers.

The exercises started on 12/18/2019 and ended on 2/10/2020 ,the researcher conducted the test and videotaping on (2/13/2020) at the Sports Talent Center in Karbala, taking care to provide all the same conditions for the two tests.

*Significance at ≤ 0.05 significance level.
The aim of the research was to study the effect of strength training with rubber ropes with changing arms of resistance in the development of some biomechanical variables for the skill of sending for tennis wheelchair players. There was an evolution in the values of this velocity for the sample members in the dimensional tests, as the development of velocity, whether for the center of gravity of the body or the centers of the joints of the body, is a result of exerting force and its development, because the speed and its development are related to the speed of body parts (such as the speed of the hip, the speed of the elbow and the hand) with the development of force, The more force there was, the more speed, and this is what appeared to the group members during the post tests in each of the hip velocity, the center of the shoulder axis, the elbow and the hand as well as the speed of the head of the racquet, as the researcher used rubber bands according to the skillful performance to develop the muscle groups working on these joints As well as the development of velocity values for these centers.9

The important factor that helps to achieve the fastest possible speed, both when performing the skill of sending and beyond, is the increase in muscle effectiveness and its ability to effectively extend the working joints, which has been emphasized during exercises in which resistances are used as momentum (resistance) during skill performance, as the extension is often used The complete shoulder joint, the elbow joint and the hip joint while maintaining a high position for (the center of gravity of the body) during the final hitting stage, and the player must issue a large central force to maintain the speed achieved in the racket and the continuation of the speed of the center of gravity of the body and the rest of the body at the speed of the possibility of performing the skill of serving.10 All this helped make the change in the velocity of the body parts accused of performance, which is related to the amount of mass of this body or the mass of the body part and its speed between the grooming and hitting phases, which has to do with the form of pushing the instantaneous force exerted, as the momentary force is the reason for the change in the amount of movement of the body Always.11

Some researchers pointed out that training according to the moment of resistance and the absolute and relative muscle moments it encounters enhances the physical and mental ability of the player to visualize the required movement paths, which focus on taking appropriate positions that increase the angular and linear velocity of his body parts by reducing the radii during the performance to which he is exposed. Each repetition ,12 and these repetitions worked to increase the absolute muscle strength of the muscles working in the performance of these stages and increase the efficiency of their neuromuscular compatibility and at appropriate times between repetitions, and all these exercises led to an improvement in the movement paths, especially at the moment of linking the preparation to strike The performance of the strike in the serving skill influences the correlation of the technical performance of the service, which inevitably affects the achievement of good performance, and there had to be iterations to train these parts of the basic skill in order to achieve the special speed and increase the feeling of effective hitting in order to develop the special mechanical variables for these stages which are linked Certainly of the previous stages, to ensure the achievement of the required speed for the body and the racket after launch. As some studies indicate that there is an effect of training using assistive devices in improving efficiency on mastering skills and achieving movement paths for the center of gravity of the body in varying proportions to achieve the goal of training, in addition to that these methods give a positive opportunity to understand the components of skill performance and the possibility of applying it in practice and thus gives an effective effect on Raising the level of motor performance of skills.13

Some studies have indicated that all the characteristics of strength, speed, thrust and direction that a tennis player needs must be in harmony with the goal of performance and the final hitting stage, as the player can take the appropriate technical and mechanical positions due to its association with compound movements and exert the required force with the trunk and arms in a sequential and smooth manner.14

*Significance at ≤ 0.05 significance level.

The researcher attributes the reason for the development of the response time to that the exercises in which the sample members used resistors bound by rubber ropes along with the skillful performance and the use of the accompanying corrective feedback contributed to enhancing the attention to the visual stimulus (temporary arm movement), which contributed to the development of the sense of the field of travel distance of the body, the wheelchair, and parts The other body and I helped the players to achieve them in the appropriate manner for good technical performance in order to achieve the best movement response. The researcher was keen to train the members of the sample to perform training while achieving the best angles in the parts of the body and developing the strengths of them in order to economize the momentary muscle strength and in the shortest possible time according to the skillful performance, which facilitated the application of the instantaneous force correctly, especially when starting the movement of the chair according to the correct direction to achieve the correct response that helps In taking the right and appropriate angles to continue this speed.

The application of a good technique of forces to the parts of the body contributing to performance must be done with a balanced kinematic compatibility and high control, especially when extending the striking arm forward at the start of the serve, which comes simultaneously with the swinging arm backward. This means obtaining the mechanical mode that qualifies the player to perform better and good service. Therefore, the researcher was keen to train the members of the sample and train the working muscles of the parts of the body in order to enhance the instantaneous muscle strength in the least possible time according to the skill performance, which facilitated the correct application of the instantaneous force according to the specificity of the skill performance that expresses the final speed that the player reaches.

The results indicated that the exercises that aimed to deepen the foundations of applying the correct movements and according to its technical path by using the development of muscle strengths in the joints (working) in the shoulders, hips and torso were for the development of the instantaneous rotational force of the shoulders, trunk and arms as they are responsible for the performance of the skill of sending and according to the angles The body and its change in the stages of the serve performance, as it appears that the exercises with ropes according to the change of the arms of the resistance have led to the understanding and assimilation of the research sample the technical matters of the performance stages at the moment of hitting through the apparent improvement in the speed of the centers of the parts of this arm, and this improvement is a result of the strength and torque training of the arms and the torso This helped to overcome the mass of the body and the chair during the performance and what follows it from other technical stages, reaching the final stage of striking properly without a technical error, as the use of resistors with less than the maximum intensity when training leads to an increase in the momentary force and the emphasis on changing the tool blocks gives Positive in the acceleration of body parts and device development. Therefore, all exercises aimed at developing muscle strength and momentum with the technical performance required and appropriate for it. This was also emphasized and followed up through the use of exercises using various training methods, and the correction of these values through training to identify possible errors and prepare the exercises according to the requirements of the results of the analysis.
Conclusions

1. Training according to the results of the analysis and by using the change of resistance arms when training with rubber ropes was influential in developing the speed of the striking arm parts centers of the research sample.

2. The exercises led to an improvement in the technical performance coherence (the research sample), which inevitably affects the achievement of a good achievement.

3. The special exercises affected the improvement in the response time of the research sample.

Antioxidant Activity and Phytominerals Study of Some Asteraceae Species Growth in Western of Iraq

Ashwaq Talib Hameed¹, Nbaa Mutea Abid Al-alh², Asmaa Wajeh Jumaa²

¹Assistant prof., ²Lecturer, College of Education for women, University of Anbar, Iraq

Abstract

The antioxidant efficacy of aqueous extracts of twelve plants of the Asteraceae family, which is from natural flora, was investigated by the method of scavenging free radicals of the compound Diphenylpicrylhydrazyl (DPPH) namely Aster subulatus, Calendula officinalis, Carduus pycnocephalus, Carthamus Oxantea, and Carthamus Oxantea linearis, Launaea nudicaulis, Sonchus maritimus and Sonchus oleraceus, this activity is compared to an inhibition ratio (IC50) half of the maximum inhibitor concentration of 50 of the standard ascorbic acid (vitamin C) antioxidant. the most effective of which was Carthamus oxyacantha, which reached 68.430% and Centaurea pallescens 66.432%, and the lowest effectiveness in, Launaea nudicaulis was 40.430% and Koelpinia linearis was 43.816%. The mineral elements were analyzed in the aerial part of plants: (K, Na, Mg, Ca, and P) using Atomic absorption (Spectrophotometer apparatus 5000 (Atomic) - the results showed that plants contain very good ratios of elements as the best plant in terms of content was Carduus pycnocephalus and Carthamus oxykontha.

Keywords: phytominerals, Asteraceae species; toxicity; biological changes.

Introduction

Antioxidants are chemical compounds that can bind to free radicals without turning into a free root, provided that they are not harmful to the body and are subject to excretion, that is, the body can get rid of them, they work to provide the free electron that binds with the other free electron resulting from the oxidation process, thus reaching The state of stability (1) and with this mechanism, the antioxidants maintain the cell and not change the chemical composition of the basic components of the cell, such as fats, proteins, genetics, etc. They are oxidized, and thus you can delay or prevent the emergence of oxidation significantly and with multiple mechanisms, some of which exist naturally in the body, that is, they are self-forming, and the body of the organism manufactures them in order to protect itself from the impact of oxidation of enzymes and vitamins, such as vitamin A, C, E Secondary metabolites in plants (5) which are found in fruits, vegetables and herbs, examples of which are carotenoids, rotenoids, phenolic compounds and flavonoids that trap free radicals and are more effective than vitamins. Antioxidants are also added to foods to help prevent spoilage, Exposure to oxygen and sunlight are the main factors causing food oxidation. (6) The Asteraceae family is one of the largest families in vascular plants at all, and the majority of this family is either in the form of trees, shrubs or herbs, and it is one of the richest plant families in the world as it has about 1600-1700 genera and 24000 species, Monoecious, leaves alternate or opposite, flowers bisexual, the female radial of various shapes, and the corolla is either ligulate in the tubular flowers in the discus flowers, and the fruit Achenes. This family have an anti-oxidative potential (2) and against pathogenic bacteria and infections (3) and also for cancers, and wild plants possess a good content of mineral elements. (4) The aim of the research is study the antioxidant activity in some wild plants of Asteraceae family and know their content of the main nutrient minerals

Materials and Methods

Plants collection

Corresponding author:
Ashwaq Talib Hameed

The plants were collected during flowering from separate areas in Anbar Governorate, from March to mid-August of 2018, after cleaning the plants, they were naturally dried in shade, taking into account the constant stirring, then they were milled using an electric grinder, and then packed with clean and sterile glass containers.

And sterilized

Measurement of oxidative efficacy

the DPPH method, according to what was stated in. (8)250 mg of aqueous leaf extract (5 mg of crude extract / ml of water) was dissolved, and the volume was supplemented to 10 ml of methanol, to a final concentration of 0.5 mg / ml. Standard solutions were prepared by dissolving 250 mg of Ascorbic acid in 25 ml of distilled water, so that the final concentration was 10 mg / ml, and the latter was considered a storage solution of which four concentrations were prepared from which four concentrations of 0.4, 0.3, 0.2, 0.1 (mg / ml) were considered as a control sample and placed in Tubes with plant solutions one by one. 3 ml of DPPH root was added to all tubes and shaken well in the Voretx apparatus. The tubes were placed in the dark for half an hour. After this period, the absorbance of the solutions was measured at a wavelength of 517 nm compared to the control sample DPPH.

Determination of mineral elements

The concentrations of mineral nutrients (K, Na, Mn, Mg, Ca, and P) were measured using an atomic absorption device (Atomic absorption Spectrophotometer 5000, by weighing 1g samples of the plant powder for the studied species and cooled down, dissolve the ashes in 5 ml of hydrochloric acid (20%), then filter the solution using filter paper, and complete the volume to (50) ml using distilled water.

Results and discussion

Oxidative Activity:

The ability of the aqueous extracts of the studied plants to scavenge free radicals was tested using the compound diphenyl-1-picrylhydrazyl-2,2 DPPH, which was transformed into 1,1-diphenyl-2-picrylhydrazine in a reduced form DPPH –H, where it gave an antioxidant such as ascorbic acid. The hydrogen root of the DPPH reagent leading to a change in coloration. (10) the results of the antioxidant reaction of plants showed that the best DPPH was for Carthamus oxyacantha which reached 68.430%, followed by the value of Centaurea pallescens 66.432%. Comparing this effectiveness with the IC value of ascorbic acid which inhibits 50%, we find that these plants greatly surpassed it, which are among the plants of dry areas, and the lowest value of root scavenging was in Launaea nudicaulis, which amounted to 40.816%, and Table (1) shows the e percentage of antioxidant efficacy of plants compared to ascorbic acid.

The results obtained from the antioxidant reaction of the aqueous extracts of the studied plants showed high efficacy and great ability to displace free roots, and this is confirmed by the studies on both wild plants having a high ability to heal and increase the body’s immunity, especially the species of the Asteraceae family. These plants possess significant amounts of phenolic acids, as well as flavonoids, tannins and fatty acids, as such compounds are widely distributed in the plant kingdom, especially this family, which are distinguished by their effective properties as antioxidants, as the plant components are the most displacement of the roots. This has been confirmed in many studies. Moreover, the efficacy of plant extracts is relatively related to the content of the active chemical compounds they contain, and this was very clear for each of the plant regions which classified as xerophyte plant.

Figure (1): Standard curve for ascorbic acid to find the inhibitory concentration of the oxidative half-activity of the DPPH root.

The content of mineral elements shows Table (2,3,4,5) the content of the studied plants of mineral nutrients. The results showed a high percentage of potassium, sodium and manganese, which work to protect the body from osteoporosis and paralysis, and works to increase fertility, and is useful in treating muscle spasm and that its severe deficiency leads to stop the heart muscle in the state of diastole, as it is useful in cases of mental deficiency and has importance in regulating blood pressure and heartbeat and activating all excretory systems in the body such as the kidneys and colon by exchanging ions with potassium, as well as its importance in excreting CO2 from the body and without it to accumulate CO2 in the blood has become acidic, thus preventing the occurrence of cancer diseases, and
this element has an important role in the representation and transport of sugars inside the plant. (16) and the table shows the presence of phosphorus, as its presence in the plant occurs naturally as a result of its absorption from the soil and is important in Water balance within cells, and it is important for neuromuscular stimulation as it is excreted from the body through the kidneys (14) Calcium has a benefit in preventing osteoporosis and joint pain, and it also has an important role in the blood clotting process as its ions are naturally present in the blood, factor (4) that is involved in the formation of the enzyme that helps convert prothrombin in to thrombin, and the presence of this The element explains the indications for using the plant as a tonic and tonic for the heart muscle (15) And the presence of magnesium, calcium and phosphorous in wild plants, which gives them a role in treatments for morbidity and bone formation, and is useful for muscle contraction, hypertonia, reducing and treating nausea, and gastrointestinal disorders, and this explains the importance of the plant in the treatment of general weakness of the body and anemia to produce Hemoclopin, which increases the body’s resistance, supports the immune system, as well as increases energy production, which the body needs greatly, especially in women and children (6) As for manganese, their percentage was weakness, anemia, and skin pimples as well as being an antioxidant and that these elements have a role in increasing the oxidative activity of plants (4).

The Influence of Cement Spacer Thickness on Retentive Strength of Monolithic Zirconia Crowns Cemented with Different Luting Agents (A Comparative in-vitro Study)

Reyam H. Ali1, Mohammed Kassim2

1B.D.S, Ministry of Health; Post Graduate / Department of Conservative Dentistry, College of Dentistry, Mustansiriyah University, Baghdad, Iraq, 2B.D.S M.Sc. Ph.D, Assist. Prof./ Department of Conservative Dentistry, College of Dentistry, Mustansiriyah University, Baghdad, Iraq

Abstract

Aims of Study: to evaluate and compare the retentive strength and the failure-modes of monolithic zirconia crowns with different cement spacer thickness, cemented with two different types of luting agents.

Materials and Methods: Forty sound maxillary first premolar teeth were divided into two main groups (n=20): Group A: cement spacer thickness of 80μm; Group B: cement spacer thickness of 120μm. The groups were further subdivided into two subgroups (n=10): (A1, B1) cemented with Panavia F2.0 resin-cement; (A2, B2) cemented with Riva luting plus RMGIC. All the teeth were prepared to receive monolithic zirconia crowns with the following features: (6° convergence angle, 0.8mm deep chamfer finishing line, 4mm axial wall height with planar occlusal reduction). Afterwards, the teeth were scanned and the crowns were fabricated and cemented. Zirconia crowns were pulled-out along its path of insertion using universal testing machine. Failure stresses were calculated in MPa. Failure-modes was assessed using magnifying-lens (2.5X).

Results: The highest mean retentive values (in Mpa) was recorded by subgroup B1 (8.651); followed by subgroup B2 (7.765); subgroup A1 (7.309) and subgroup A2 (6.875). Independent t-test showed a statistically significant difference between A1 and B1 subgroups. Concerning the failure-mode, the majority of samples revealed adhesive failure between teeth and cement.

Conclusion: All the tested crowns have mean retentive values within the clinically acceptable limit, increasing cement space resulted in a significant increase in the retention when Panavia F2.0 used as a luting agent, while, it has no significant effect on the retention when RIVA luting plus was used.

Keywords: cement space, monolithic zirconia, resin-cement, retentive strength, RMGIC.

Introduction

Over the past few years, there has been a remarkable shift towards high-strength, all-ceramic restorations; In-particular those fabricated from zirconium-oxide (ZrO2) ceramics, because of their esthetic, biocompatibility and mechanical properties 1. A common cause of failure of crowns and bridges was reported as a loss of retention 2. Retention form could be defined as the quality of the preparation that prevents the restoration from being dislodged by such forces parallel to its insertion pathway. Retention is dependent on several factors such as form of prepared teeth, roughness of the intaglio surface of the crown restorations, type of cement and its film thickness 3. Furthermore, fitness of crown restorations plays a substantial role in their retention 4. Previously, researchers theorized that better retention could be attained with the frictional fit between the intaglio surface of the restoration and the tooth preparation 5. However,
this theory has been rejected because a perfect fit could not be attained during the cementation, due to the lack of space for the cement. Many researchers have agreed that final fitness of the restoration after cementation would be improved by providing cement spacing during crown fabrication. Consequently, the retention of the cemented crown could also be improved. Cement spacer permits increased space for the luting agent thus reducing stress formed during cementation, resulting in improved fitness and retention of the restoration. Conversely, if the cement space was exceedingly wide, the seated crown will be loose on the preparation; the probability of crown loosening during function would considerably increase, compromising its longevity.

Definitive cementation represents an essential step through the restorative procedure. The precise selection of luting agent and standardized application of cementation protocol are crucial for proper retention and sufficient marginal sealing of the restoration in time.

The objectives of this study were to evaluate and compare the influence of difference in cement spacer thickness on the retentive strength of monolithic zirconia crowns cemented with two different types of luting agents (adhesive resin-cement and resin-modified glass-ionomer cement) and to evaluate the failure-modes of tested crowns.

**Materials and Methods**

Forty sound human maxillary first premolar teeth extracted for orthodontic purpose from patients with the age of 18-23 years had been used in this study, only teeth with two-separated roots were selected to withstand removal from the imbedding-resin during testing, the teeth were cleaned and then disinfected in 1% thymol solution for 48 hours to avoid fungal and bacterial growth. U-shaped notches were made on each root to act as a mechanical mean for retention, each tooth was embedded in specially-fabricated cylindrical rubber-mold containing cold-cure acrylic (Veracril, New Stetic, Colombia) parallel to the long axis to within 2mm apical to the CEJ to simulate the biologic width with the aid of dental surveyor (Paraline, Dentaurum, Germany).

Teeth were randomly divided into two groups (n=20), according to the cement spacer thickness used as: Group A (80μm) and Group B (120μm). They were further subdivided into two subgroups (n=10) according to the type of luting agents: subgroup (A1, B1) cemented with adhesive resin-cement (Panavia F2.0, Kuraray, Japan) and subgroup (A2, B2) cemented with resin-modified glass-ionomer luting cement (RIVA luting plus, SDI, Australia).

Teeth samples were prepared to receive monolithic zirconia crowns (Katana zirconia ML A light, Kuraray, Japan) according to the following criteria: 6-degree total convergence angle, a planar occlusal reduction, 0.8mm deep chamfer finishing line and 4mm axial height from the finishing line to the occlusal level buccally and palatally (Figure 1).

![Figure (1): Finished prepared tooth](image)

A: Occlusal view, B Lateral view.

Samples scanning was performed using powder-free digital scanner (in-Eos X5 in-lab scanner, Sirona, Germany). Measurement of the surface area for the scanned preparation was performed using AutoCAD architecture software. During designing procedure, the zirconia crowns were deliberately received four macro-retention bars to help removal of the crown after cementation, 5-axis milling machine (In-Lab MC X5 milling machine, Sirona, Germany) was used to produce the zirconia crowns.
After completion of sintering procedure, the intaglio surface of each crown was air-abraded with 50μm aluminum-oxide for 15 seconds using 4-bar pressure at 10mm distance and 45° angle (Pneumatic sandblasting unit, Renfert, Germany). Afterwards, the crowns were cleaned in an ultrasonic cleaner for 5 minutes to remove any residue of blasting agent.

For Panavia F2.0 resin-cement subgroups, two coats of zirconia primer (Z-PRIME Plus, Bisco, USA) were applied to the intaglio surface of the restoration and then lightly air-dried for 5 seconds according to manufacturer’s instruction. Equal amounts of primer (ED primer II A and B, Kuraray, Japan) were mixed for 5 seconds and applied to the tooth surface, left for 30 seconds and lightly air-dried for 5 seconds. Equal amounts of the two pastes (one complete turn for each paste) were mixed for 20 seconds according to manufacturer’s instruction, the cement was evenly distributed on the intaglio surface with a pen brush.

For resin-modified glass-ionomer cementation, 37% phosphoric acid gel (Super Etch, SDI, Australia) was applied to the prepared tooth for 5 seconds then rinsed with water and air-dried according to their manufacturer’s instructions. Riva luting plus capsules were mixed for 10 seconds then the cement was injected into the crown.

The cementation procedure for all subgroups was performed using a modified dental surveyor under a constant load of 5-Kg for 5 minutes. The excess cement was removed with a microbrush followed by curing for 20 seconds per surface for resin-cement subgroups according to the manufacturer’s instructions. Thereafter, the samples were stored in deionized water at room temperature for 7 days.

Before the tensile-test, each crown was embedded in a clear cold-cure acrylic-resin (Duracryl® Plus, Kerr, Crech) using a second cylindrical rubber-mold. A stainless-steel screw was incorporated at the top parallel to the long axis of the tooth with the aid of an adapted surveyor. The upper mold was separated from the lower one by 3mm thick sheet of rubber.

After 24 hours, the entire apparatus was mounted in (computer-controlled universal testing machine, Laryee, China) and pulled along the path of insertion in a crosshead speed of 0.5mm/min until failure. The dislodgment force was recorded in (N), divided by the surface area of each preparation in (mm²) to yield the retentive stress in (MPa).

After completion of the test, all samples were examined using a magnifying-lens (2.5X) to assess the failure-modes, according to the classification by Gundogdu and Aladag in 2018 (Table 1).

**Discussion**

Retention is considered as one of the essential elements which determine the long-term clinical-success of dental prosthesis. There is no single factor on which retention is entirely dependent. In-fact, retention involves a list of factors, all of which have to be taken into account during all stages starting from teeth preparation to the final cementation. Even if a single factor is accidentally neglected it can affect the retention of the crown restorations which further has a direct impact on the longevity of the restoration. Monolithic zirconia crowns were selected for this study due to its superior physical properties that were pliable to the tensile pull-off test.

A total convergence angle of 6-degree was used in this study because it is considered as an ideal convergence angle that improves retention of crown restoration. A planar occlusal reduction was performed because tooth should be prepared in accordance with a clinical simulation. Furthermore, greater surface area would be achieved (when compared to a flat occlusal reduction) thereby increasing its retention.

Because of high flexural strength, zirconia crowns can be cemented either non-adhesively using conventional cements or adhesively with the resin-cement. Therefore, RIVA luting plus RMGIC and Panavia F2.0 resin-cement were selected to represent two distinct groups of luting agents.

The results of this study have been showed that all the tested crowns have mean retentive values exceeding the clinically acceptable limit required to retain crown successfully according to Palacios et al. (2006). In this study we found that 120μm cement spacer thickness has significantly higher mean retentive values than 80μm cement spacer thickness for resin-cement subgroups. It might be explained as when ideal convergence angle would be used for the preparation (6-degree), the expression of the excess cement through this angle would be difficult, this will lead to filtration process causes the cement to separate into particles and liquid phase, allowing the passage of liquid phase while solid particles gathering occlusally which leads to the development of hydrostatic pressure under the crown that increases until it matches the seating force and causes further seating impossible. Increasing space between the prepared tooth surface and the intaglio surface of the restoration, reducing stress areas formed during cementation, and thereby resulting in better fitness and retention of the definitive restoration. This was in accordance with previous studies concerning the increase in the cement spacer thickness.

The results found in this study were inconsistent with that reported by Mehl et al. (2013). However, the different materials of the aforementioned study (titanium implant's abutments, cobalt-chromium crowns and different cementing systems) could be the reason for
Another finding of this study concerning the type of luting agents used, when cement space thickness remains constant, the results showed non-significant difference in the mean retentive stresses for RIVA luting plus RMGIC when compared to resin-cement. This might be due to the chemical adhesion to dentin, improving the retention of RIVA luting plus RMGIC. In addition, the use of phosphoric acid-etching enhanced the micromechanical retention of Riva luting plus RMGIC. Furthermore, the grain particle size of Panavia F2.0 resin-cement (0.04-19μm) is relatively similar to the particle size of the resin-modified glass-ionomer luting cements (≈15μm) which might lead to a relatively similar entanglement or hooking of filler particles to the dentin surface. However, in spite of the non-significant difference, a higher mean retentive values were recorded with Panavia F2.0 resin-cement subgroups than those of RIVA luting plus RMGIC subgroups. The findings of the present study are in agreement with the study by Ernst et al. (2005) and Palacios et al. (2006).

Concerning the failure-modes, the majority of samples for all subgroups showed an adhesive failure (type II and type IV) (52.5% and 25%) respectively. This suggests that the mechanical interlock to air-abraded roughened zirconia surface was greater than mechanical interlock to the tooth and might be also attributed to the application of Z-prime plus which enhances the bond strength of the resin-cement to zirconia crowns. A number of studies had been performed to evaluate the influence of cement space on the retention of cemented crowns, their data produced inconsistent results. A clearly established experimental protocol is not evident from those studies rendering the comparison of results so difficult. Further research is needed to examine the effect of cement spacer thickness on crown retention, various crown material types, different surface treatments, different luting cements, long-term storage, thermocycling.

Conclusions

Within the limitations of this study, the following conclusions were drawn:

1. All the tested crowns have mean retentive values within the clinically acceptable limit required to retain crown successfully.

2. Increasing cement space thickness to 120μm would result in a significant increase in the retention values of zirconia crown restorations when Panavia F2.0 used as a luting agent. While it has no significant effect on the retention of crown restoration when RIVA luting plus was used as a luting agent.

3. The results for characterization of failure-modes were generally adhesive in nature.

HIV/AIDS Status in Baghdad/ Iraq Over Ten Years (2010-2019)

Jalil Ibrahim Saleh¹, Haitham Numan², Nawar Sahib Khalil³

¹Al-Iraqia University/ College of Medicine/ Department of Family and Community Medicine, ²Anbar University/ College of Medicine/ Department of Medicine, ³National HIV Center/ Ministry of Health/Baghdad-Iraq

Abstract

Background: Human immunodeficiency Virus and/or Acquired immunodeficiency Syndrome (HIV/AIDS) hitherto represents a serious global health problem.

Objective: To disclose the status and trend of HIV/AIDS in Baghdad/ Capital of Iraq throughout the last ten years (2010 -2019).

Materials and Methods: A retrospective study of the available data on new HIV cases for the last ten years was conducted in Baghdad/ Capital of Iraq from August 2018 to December 2019. The data included age, sex, annual number of new HIV cases, AIDS-related deaths, years of diagnosis, and risk factors associated-HIV transmission. All suspected HIV/AIDS cases were examined clinically and tested initially for anti-HIV antibodies by ELISA and confirmed by western blot technique.

Results: A cumulative annual number of new HIV cases registered for the last ten years was 287. The trend of number of new HIV cases increased gradually and steadily over successive ten years 2010-2019. The majority of them were males (79.1 %) and adults (≥15 years old) (98.2%). Sexual transmission had a higher rate of new HIV infection (81.9%) mainly through heterosexuals (79.2 %).

Conclusion: Although the trend of the annual number of HIV cases increased with time, Baghdad remains within the area of low HIV prevalence, and there is a potential risk for exposure to an outbreak or epidemic/endemic if no implementation of proper and effective national strategy plans on HIV/AIDS in place. Adult males play a role in rising the risk of illness. Sexual practices mainly through heterosexuals was the major route of HIV transmission.

Keywords: HIV, Status, trend, Toxicity; Baghdad; Sexual transmission

Introduction

HIV/AIDS endures the leading cause of morbidity and mortality throughout the world with a large socio-economic impact. [1]

In 2019, around 38.0 million people in universe living with HIV, with 1.7 million became newly HIV infected , and 700 000 were died from AIDS related illnesses [2-3]. An estimated that 0.7% of the world were infected with new HIV infections, the Middle East region reported the lowest HIV prevalence (<0.1%) while WHO Africa region reported the highest prevalence of HIV (3.7%)[1-4].

Baghdad City is the capital of Iraq with a population of seven million people, of which about four millions are living in Resafa sector and three millions living in Karkh sector. [5]

In Iraq, no information are available on status of HIV/AIDS except one study published in 2007 [6], because of governmental restriction.

Therefore such information are needed to highlight the status and trend of the new HIV cases registered in Baghdad Province/ Capital of Iraq for the period extending from 2010 to 2019.
Materials and methods

This an observational, retrospective study carried out on data of new HIV cases records for Baghdad at National HIV program Center, during 2010-2019. It was conducted in Baghdad City from August 2018 to December 2019. All the cases were referred from doctors working in governmental and private clinics and detected in Central Public Health Laboratory (CPHL)/Baghdad, using ELISA as screening test for HIV and confirmed by Western blot testing. All positive cases are confirmed also by Polymerase Chain Reaction (PCR) and follow up periodically to ensure the effectiveness of anti-retroviral therapy (ARTs) which is free of charge in Iraq.

The detection of the HIV cases is mandatory by Iraqi government for specific groups of people having potential risk for exposure to HIV, such as, suspected HIV patients with their contacts, blood donors, pre-surgical operations, pre-marriage, pre-natal care program.

The data were collected from records and categorized into the years of diagnosis age, sex, and possible routes of HIV transmission.

Ethical approval and permissions were obtained from Ethical Approval Committee of Al-Anbar University in 23/February/2018,N0.24 in coordination with HIV/AIDS Medical Center/MOH.

Data were processed using computer software program of Statistical Package for Social Sciences (SPSS), version 26. For the analysis Chi-square and Yate’s correction test were used, P-value of <0.05 was considered statistically significant.

Results

A cumulative annual number of 287 newly HIV cases were recorded for Baghdad from 2010 - 2019. Their age ranged between 4 - 65 years old. There were 227 males (79.1%) and 60 females (20.9%), giving a male to female ratio of 4.85:1.

Figure 1 shows an increased in the trend of annual number of new HIV cases in Baghdad for both sexes during the period from 2010-2019 with a significantly higher annual number in males than in females (P<0.0001).

Figure 2 shows that the trend of annual number new HIV cases is increased year by year; it was five cases (1.7%) in 2010, reaching to 16 cases (5.6%) for 2015 and 80 cases (27.9%) for 2019, giving grew rate of 6.8% per year. Although there is gradual increasing in the annual number of the cases with time, Baghdad City remained within an area of low prevalence (<0.1%) and the overall annual incidence of HIV infections was <4/100,000. The trend of annual number of alive cases was parallel to the cumulative annual number of new HIV cases with duration of diagnosis while the annual number of HIV-related deaths does not show any clear trend; it remained relatively stable (static) (Figure 2).

Table 1 shows increasing in the annual number of new HIV cases in both sectors of Baghdad City between 2010-2019, with a non-significantly higher percent in Resafa sector (59.9%) compared to Karkh sector (40.1%) (P<0.7091).

Of the total new HIV cases, males (238) were affected more than females (49) (P<0.0001); majority of the males (81.9%) and females (75%) were at age group of ≥25 years old; 17.3% and 21.6% of the males and females, respectively, were aged 15-24 years old. This difference was statistically of significant (P<0.0028).

The distribution of new HIV cases had an upward trend among across all age groups with the least cases recorded among those aged <15 years old (P<0.0027) (Table 2).

Table 3 shows that the possible routes of HIV transmission. It was found that sexual practices was responsible for 81.9% of the cases, blood transfusion for 4.2%, perinatal transmission for 0.35%, using illegal drug in 0.35%, while 13.2% of the new HIV cases denied any risk behavior (no specify or unknown cause). This difference was of highly significant (p-value <0.0001).

Within sexual activity, heterosexual contact constituted 79.2% of the cases followed by bisexual contact at 13.6%, and homosexual contact at 7.2 %. This difference was also statistically of significant (p< 0.01145)

**Discussion**

In this study, although the curve of new HIV diagnosed cases and alive cases shows clear rising with time from 2010 to 2019, with annual growth rate of 6.8%, and stability (static) of HIV-related deaths, Baghdad is still remaining among the areas with low HIV prevalence (<0.1%), but this may lead to a potential risk for an outbreak or epidemic/endemic of the illness. In comparison, world estimates show that by the end of 2019, the global prevalence of HIV infection was 0.8%, and there was declining in the number of new HIV infection by 23% and AIDS-related deaths by 39% between 2010 and 2019.\,[2,7-8]

Our finding is in the line to that was reported in many countries of Middle East and North of Africa (MENA) region which has the lowest prevalence of HIV globally (<0.1%), increasing in the number of new HIV infections from 2010 to 2019, while HIV-related deaths remained stable and in contrast to Sub-Saharan Africa region which has the highest HIV prevalence of all regions (6.7%)\,[9-11]

In this study, increasing in the new HIV infections with time may be due to increasing in the identification of HIV through an increasing in HIV testing and counselling services, increasing awareness of people about the illness, increasing access for diagnosis and for seeking ART which is free in our country. Besides that, more travel, rapid changes in socio-cultural and religious values. All these factors, collectively may contribute to a heightened the risk of HIV. The trend of HIV-related deaths was stabilize (static) with years of diagnosis and the death cases are less than alive. Stability of annual HIV-related deaths in Baghdad, reflects in part to the effectiveness of the national HIV program for diagnosis through availability of HIV testing and the success of ART programme increasing survival among people living with HIV.

In this study, both sectors of Baghdad show rising in the annual number of the new HIV cases with years of diagnosis with a higher percent in Reasfa sector. This finding may be related to a higher population density in Resafa than in Karkh sector; and over the past few
years, the presence of massage parlors in Baghdad has significantly increased especially in Resafa sector, raising concerns among authorities in Iraq’s capital that sexually transmitted diseases could spread in salons that secretly provide sexual services may participate in the rising of new HIV cases although the health care services regarding HIV screening, diagnosis, treatment, and prevention are equally distributed in both sectors; in addition to that both sectors sharing the same socio demographic characteristics, religion, cultural behavior.

Regarding to age and sex, the vast majority of the cases were adult males (≥15 years old). This finding was consistent with UNAIDS / WHO.\cite{3} estimate in 2019, that out of 38 million people living with HIV worldwide, 36.2 million people (95%) were adult (≥15 years old) and the remainder (5%) were children (<15 years old), and globally, new IV infections among adult females declined by 17% compared with 9% among adult males. While new HIV cases among children (<15 years old) decreased by 41% \cite{3}. Our results are consistent to Iraqi study published previously by El-Ebadi et al \cite{6} who found that the bulk of HIV cases were males (86.2%) and adults (>20 years old) and also consistent to other studies conducted in Oman \cite{13} and Qatar.\cite{14}

Our findings may be related to the fact that the adult males in Baghdad community are more liberal in movement, travel widely outside the country, more illegal sex practice, and get the infection from his wife. Besides that, as Baghdadi community are more conservative society, social stigma restricted mainly to female HIV infected people with risky behaviors from seeking HIV testing and counseling services made them under estimated.

Epidemiology of HIV transmission is known to be changed over time from one region to another and from one country to another within the same region\cite{15}. In the present study, sexual behavior mainly through heterosexuals, represents the main route of HIV transmission. Previously, from 1986-2005, El-Ebadi et al, found that 84.5% of new HIV Iraqi cases were transmitted by parenteral route mainly through blood donation, while sexual practice is responsible for 11.3% of the cases.\cite{6}

Our finding is consistent to many studies conducted in different Arabian countries of Middle East region where heterosexuals was the most common mode of HIV transmission as in Kuwait, Qatar, UAE, Bahrain, Oman \cite{13}, Syria, Jordan, Egypt, \cite{4} and Palestine \cite{17} and inconsistent to that reported in Iran and Libya , where the main route of transmission was injecting drug use \cite{4}. Our finding is related to the fact that sexual behavior are associated with decreasing religious values, rapid socio-cultural changes, increasing international travel, unemployment , inter-personal factors, increasing costs of marriage. All these factors collectively may participate in increasing the possibility of sexual practices to become the main route of HIV transmission\cite{17}.

During 1986 and 2005, blood donation and perinatal routes were shown to be responsible for 84.6% and 4% of HIV infections in Iraq, respectively \cite{6}; while in our study, blood transfusion is responsible for 4.3% and perinatal for 0.35% of all new HIV cases, this may reflect the effectiveness of blood screening program for blood-borne viral infections since 2010 and indicate that prevention of perinatal transmission of HIV through ante-natal care program had been more effective. In the present study, only one case (0.35%) reported illegal drug injection. This finding doesn’t reflect the actual number because drug addict phenomenon is prohibited in our country and considered as social stigma. However, this leads to increase the percentage of none specify to 13.2% of the cases as unknown cause of HIV transmission.

**Limitations**

Overall, these study findings are important. However, as in all studies, several limitations warrant mentioning. The cumulative annual number of new HIV cases doesn’t reflect the actual number because there are many new HIV cases not registered in the HIV/AIDS program center and are treated out the governmental health settings whether out-side the country or in private clinics. The second limitation is the information biases resulting from incorrect information given to the health authorities especially points regarding routes of sexual transmission especially homosexuals, illegal drug injection, and others) because they are more sensitive in a conservative country like Iraq, so many cases may report none specify (unknown cause) for HIV transmission.
Conclusion

Although there was gradual increasing in the trend of the annual number of HIV cases with time, Baghdad City remains within the area of low HIV prevalence (<0.1%), and there is a potential risk for exposure to an outbreak or epidemic/endemic if no implementation of proper and effective national strategy plans on HIV/AIDS in place. Adult males have a potential risk for acquiring HIV infection. Sexual behavior mainly through heterosexuals was the most common route of HIV transmission.

Molecular Detection of nan, tly and dsA gene of Propionibacterium acnes Isolated from acne vulgaris in Babylon Province

Rabab J H AL-Hasseny1, Lamees A. Abdul-Lateef 2, Hussein Abbas AL-Sultany3
1Assist. Lect. Microbiology / College of Food Science /AL-Qasim Green University, Iraq, 2Prof, Department of Microbiology, College of Medicine, University of Babylon, Iraq, 3Prof. Venereology and Dermatology, College of Medicine, University of Babylon, Iraq

Abstract
Propionibacterium acnes virulence factors can be divided into chromosomal, plasmid and bacteriophages encoded virulence factors. Many of the Propionibacterium acnes virulence factors, are camp5, gehA, tly, sialidases, neuraminidases, endoglycoceramidases, lipases, and hemolysins genes are clustered in certain areas of the chromosome. A total of 200 clinical acne samples were collected during this study which obtained from patient Suffering from acne vulgaris who to the out-patient clinics and delivery dermatology unite of acne, in hospitals of Babylon Province: AL-Hashmeia general Hospital and Marjan hospital, during the period from April to November 2019. Out of 200 specimens 14 (7.7%) were detected by culture and vitek2 compact9 (64.3%) of them were confirmed by PCR using target gene of Propionibacterium acnes. PCR was conducted to determine the some virulence genes of the isolates by using primers nan, tly and dsA gene. The PCR amplification products were visualized by electrophoresis on 1% agarose gels for 35min at 70v. The sizes of the amplicons were determined by comparison to the 200 bp allelic ladder. Among isolates studies it was found that nan gene present in 6/9(66.7%). isolates, dsA gene it was found in only 3isolates (33.4%) while tly gene it was found in all isolates(100%).

Keywords: Propionibacterium, camp5, gehA, tly, PCR, Isolate.

Introduction
Propionibacterium acnes is a nonspore- forming, gram- positive, anaerobic, pleomorphic rod whose end products of fermentation include propionic acid (1). P.acnes is considered an opportunistic pathogen, causing a range of infections as well as being associated with a number of inflammatory conditions. Its primarily recognized for its role in acne vulgaris where it is thought to contribute to the inflammatory phase of the condition (2).

Propionibacterium acnes, which are a normal inhabitant of the skin, produce fatty acids that inhibit the growth of fungi on the skin. (3). However, when it becomes trapped inside the hair follicle, it may grow and cause inflammation and acne infection (4).

The virulence genes involved in the pathogenesis of acne are camp5, gehA, tly, sialidases, neuraminidases, endoglycoceramidases, lipases, and hemolysins . The lipoglycan-based cell envelope and their extracellular secreted lipase, particularly triacylglycerol lipase, encoded by the gehA gene assists in the adherence and the colonization of the bacterium to the sebaceous follicle. The other product which aids in the acne process by destroying the host tissue includes porphyrins, hyaluronate lyase, endoglycoceramidase, sialidases/ neuramidase, cardiolipin synthetase, and calcineurin like phosphoesterase (5).

Materials and Methods

Samples Collection:
The study involved (200) patients were subjected for sampling which include both skin sites (comedon and pustule) for the sampling were forehead, cheek, forearm, axilla, sole from both sexes and the age of patients ranged from 13 to 30 years. These patients
were diagnosed by dermatology physician, according to the signs and symptoms, in addition to having risk factors that were determined by the information about patients. In this study, patients with recent usage of local antibiotic treatment and usage cosmetic material were excluded from sampling.

**Culturing of Samples:**

Spread a 10 μl (loop full) from the inoculated and incubate thioglygoloy agar and blood agar plates after adding 0.01 ml from Tween-80 and incubate at 37°C at 4-7 days and read plates of *Propionibacterium acnes* suspect colonies thioglygoloy agar and blood agar onto non-selective media, (nutrient agar) plates for morphology and biochemical confirmation of *Propionibacterium acnes*. After culturing of sample used vitek 2 compact system to detection of *Propionibacterium acnes*.

**DNA Extraction for Gram POSITIVE Bacteria**

DNA extraction was carried out according to the genomic DNA purification kit supplemented by manufactured company (Gene aid, UK).

**Confirmed Detection Propionibacterium acnes by PCR using Specific Primer**

The one aim of this study was to develop a rapid molecular diagnostic test to identify and purity of *P. acnes* isolates based on the specific primer (par gene). The primer flanking portion length 1202bp were selected.

**Molecular Detection of Salmonella Typhimurium and Salmonella Enteritidis Group using Multiplex PCR**

PCR mixture was prepared by adding 25 μl of Green master mix (2x) promaga, 8 μl template DNA, 3 μl from forward primer and 3 μl from each four revers primer, final volume was completed to 50 μl by adding nucleuse free water.

**Detection of Some Virulence Gene Markers by PCR**

The primers and PCR conditions used to amplify genes encoding virulence factors with PCR are listed in Table (2). The primer includes *tly* gene, *dsA* gene and *nan* gene. Each 25μl of PCR reaction contained 5μl of each upstream and downstream primer, 5 μl of free nuclease water, 2.5μl of DNA extraction and 12.5 μl of master mix. The PCR amplification products were visualized by electrophoresis on 1% agarose ladder (promega, USA).

### Results and Discussion

The one aim of this study was to develop a rapid molecular diagnostic test to identify and purity of *P. acnes* isolates based on the specific primer (par gene). The primer flanking portion length 1202bp were selected. The result was 9 (64.3%) isolation from *P. acnes* as the following Figure (1).

![Image](image.png)

Figure (1): 1% Agarose gel electrophoresis at 70 volt for 50 min for par gene PCR products visualized under U.V light at 280 nm after staining with ethidium bromide. L50:1500bp ladder; lane (1-9) were positive for this gene, the size of product is 1202bp.
Propionibacterium acnes on the other hand were considered as normal flora in the skin, however their role in acne is still vague. So this study may concern on this bacteria because there is no molecular studies performed on Propionibacterium acnes, also there is no molecular research in Iraq which covered the importance and pathogenesis of this through its ability to produce and detection certain virulence factor.

N-acetylurnamendas gene (nan gene) was investigated by PCR technique using specific primers for this gene. The result of this experiment indicate for positive amplification as shown in figure (2). Not all samples were gave positive results for nan gene. the size of this genes of product is 196 bp. It was found that nan marker was observed in 6/9 isolates of Propionibacterium acnes (66.7%).

![Figure (2): Agarose gel electrophoresis at 82 volt for 30 min for par gene PCR products visualized under U.V light at 280 nm after staining with ethidium bromide L100- 3000 bP ladder(abm); lane [1, 2, 3, 5, 6 and 8] were positive for this genes nan gene the size of product is 196bp.](image)

The nanA gene was found to be conserved and sialidase activity was found in P.acnes isolated over a period of 50 years from various geographical locations. The analyzed the sialidase activity of the NanA protein of P.acnes and cloned the sialidase gene nanA. Sialidase is encoded as a precursor protein of 722 amino acids with a 26 amino acid signal peptide. The mature sialidase has a calculated molecular mass of 81 kDa and contains the carbohydrate binding module 32. Sialidase activity does not require the CBM32 domain. The NanA protein is secreted by P.acnes as a dimer.

Molecular studies of dsA gene were done for all Propionibacterium acnes isolates by using specific PCR markers. But in present study not all samples were gave positive results for dsA gene. 3 (33.4%) samples were positive for the dsA genes the size of product is 325bp as shown in figure(3).
Figure (3): Agarose gel electrophoresis at 82 volt for 30 min for par gene PCR products visualized under U.V light at 280 nm after staining with ethidium bromide L50 - 1500 bP ladder (abm); lane [1, 6, 7] dermatan sulphate-binding adhesins (dsA) gene the size of product is 325bp.

This result was agreement with (8) who detected same strains of Propionibacterium acnes identified two dermatan-sulphate-binding proteins (DsA1& DsA2) with putative phase/antigenic variation signatures and the expression of these proteins by type IA organisms contributes to their role in the pathophysiology of acne and helps explain the recurrent nature of the disease.

Potential Effect of the DsA protein in Propionibacterium acnes are Colonization, adhesion, Fibrinogen-binding and inflammation (4)

The notable virulence gene involved in the pathogenesis of acne was tly gene responsible of damage the blood cells. So, this gene was very important virulence factor for bacteria associated with acne vulgaris. The molecular detection of tly gene was done by using specific primer. It was found that tly gene detected 9 (100%) isolates of Propionibacterium acnes isolates with long length 909 bp as shown in figure (4).

Figure (4): Agarose gel electrophoresis at 82 volt for 30 min for par gene PCR products visualized under U.V light at 280 nm after staining with ethidium bromide L50 - 1500 bP ladder(abm); lane all P.acnes isolates were positive for this genes Tly gene the size of product is 909bp.
The result correlated with (9) who was showed a basically clonal population structure correlated with allelic variation in the virulence gene tly.

The result correlated with (10) who reporters the 98% identity sequenced of the tly gene from a further 19 P.acnes strains isolated from different sources and selected to represent types I and II. he showed that the differences between type I and II were based on type-specific polymorphisms in tly gene

Abstract

This study aimed to show the impact of cinnamon mouth gargle on Aphtous ulcer and there role on recovery process of this ulcer.

This take a look at became carried-out on one hundred sufferers affected by Aphtous ulcer that typically visitor clinics.

The sufferers have been divided into groups, Cinnamon dealt with institution: Their wide variety 50 affected person, the aphthus ulcer dealt with Cinnamon gurgle wash 3-instances every day and Placebo dealt with institution. The affected person wide variety became 50 affected person suffered from aphthus ulcer and dealt with placebo 3-instances every day.

Prior to the take a look at, all assigned clinicians from the exclusive medical facilities have been skilled with the aid of using the most important examiner for the same old working way that covered the measurement of ulcers, undertaking the visible analog scale (VAS),and record it.

This study concluded that, the maximum of the sufferers that suffered from Aphtous ulcer typically arise at (30– 40) day of age. Also, the occurrence of Aphtous ulcer decreased in the institution dealt with with Cinnamon also, the ache of Aphthus ulcer decreased with Cinnamon mouth gargle wash.

Keywords: Cinnamon, Gargel, Healing, Aphthous, Ulcer, Oral.

Introduction

With the converting traits and life-style the techniques of oral hygiene status have affected. industrial merchandise of oral health, crafted from artificial products, are favored over herbal re-assets and are being usually used, possibly due to clean availability and on the spot results. But those cleaning and whitening merchandise like toothpaste and mouthwash are being drastically criticized due to their unfavourable results on enamel, gum, mucous membrane.\footnote{1}

for long period many beneficial component that recognized and made from flowers ,may be introduced as protecting material (anti mutagen) to the goods of oral health to keep away from its terrible results on human health. As herbal merchandise, the crucial oils were suggested owning good applications\footnote{2}.

Aphtous stomatitis with recurrent painful aphthous ulcers at the non-keratinized oral mucous membranes.\footnote{3,4}

Chronic recurrent ulcers have 3 type of medical morphology and with distinct time courses. Less than 1 cm minor-type (normally 2–five mm) and then cure without treatment in 4–14 days. These are forming 80–90% from all type of recurrent ulcers\footnote{5}.

Scarring takes place in round 8% of cases of ulcers\footnote{6}. Major ulcers are normally 1–three cm, deep indurated and may remaining from 10 days- six weeks on occasion longer\footnote{7}. They are 10% of recurrent ulcers of oral area. About 64% of these ulcers heal with scarring. Herpetiform aphthous oral ulcers are 1 to 2 mm in

\textcopyright{} Indian Journal of Forensic Medicine & Toxicology. January-March 2021, Vol. 15, No. 1

DOI Number: 10.37506/ijfmt.v15i1.13740
diameter \(^{(8)}\). They account for round five% of recurrent oral aphthous ulcers, are extraordinarily painful, remain for seven to ten days. Herprtiform aphthous appears one hundred ulcers; there will aggregate forming large erosive area, approximately 32% scar forming. \(^{(9)}\).

The efficiency of the oil of cinnamon in DNA molecule was examined and the result then summarized. It changed into located that plant extracts blanketed the DNA from the mutagenic impact of mouth wash and the DNA bands remained intact and have been much like the band of DNA of control. The wells of gel are sparkling due to the presence of crucialoils of remedy because the DNA changed into loaded without delay after remedy to keep away from any impact of purifying answers on DNA structure.

Jayaprakasha et al. \(^{(1)}\) located anti mutagenic pastime of water extract of cinnamon. Also, Hamssa et al. \(^{(10)}\) located black peppers and bell pepper having anti-mutagenic effects. They in addition said that each are succesful of inhibiting carcinogen activation, enhancing the cleansing of carcinogens through scavenging the reactive dealers that harm DNA.

Jayaprakasha et al. \(^{(1)}\) indicated that under-applied and unconventional a part of cinnamon is a great supply of antioxidant and antimutagenic phenolics.

U.S. Department of Agriculture provide that a teaspoon of cinnamon weighing 2.6 g have 6.42 calories of energy; 2.1 g of carbohydrates, 26.1 milligrams (mg) of calcium, 0.21 mg of iron; magnesium: 1.50 six mg, phosphorus: 1.60 six mg, 11.2 mg of potassium and vitamin A: 0.39micrograms. It additionally includes strains of nutrients beta-carotene, alpha-carotene, lycopene, the antioxidants choline, lutein, zeaxanthin and beta-cryptoxanthin, .

Oxidative stress may be decreased by Antioxidants and can decrease the occurrence of cancer, kind 2 diabetes, and plenty of different status. People usually used cinnamon in small amount in food. Therefore, the vitamins it includes will be benefit inside the diet. \(^{(11)}\).

The extract of Cinnamomumzeylanicum includes antioxidant products with the action of hydroxyl radicals and anions from scavenging superoxide. \(^{(12)}\). Inhibiting factor of zeylanicum crucial oil and oxidation factor merchandise formation in mustard oil on the awareness of 0.02% \(^{(11)}\).

Borneolum is acrystal steam distilled product of Cinnamomum camphora \(^{(13)}\). It is for external use in ulceration and sore mouth \(^{(14)}\) and confirmed anti-inflammatory and antioxidant molecular protecting results through reducing inflammatory factor iNOS expression, and NO, release, in addition to NF-κB translocation and associated apoptosis in an ischemic/reperfusion neuron model \(^{(15)}\). Gallachinensis in TCM concept astringes, promotes wound recuperation and is used for ulcers and edema \(^{(16)}\).

This study aimed to examine the impact of cenimon mouth gargle on Aphthous ulcer and there results on recuperation process of this ulcer.

**Patient and methods**

1-Patients:

Patients came to privet clinic how an aphthus ulcers have.

2-Cinnamoon gargle preparation:

The cinnamon spice had been used as a powder mixed with water in appropriate ratio as in hot drink of cinnamon and use as mouthwash treatments.

3-Grouping and statistical design:

Both test and placebo gargle wash (1:1 allocation ratio) had been randomized the usage of a computer-primarily based totally random variety generator and allotted to the centers.

4-The patients had been categorized into:

1-Cinnamon handled organization: Their variety 50, the aphthus ulcer handled with Cinnamon gargle wash 3-instances daily.

2-Placebo handled organization: The affected person variety changed into 50 affected person suffered from aphthus ulcer and handled with placebo 3-instances daily.

5- Study Intervention

The ulcer length and ache level had been examine,
measured and documented on the clinics on 1st, 3, and five day via way of means of assigned unbiased scientific investigators. In addition to pulse, body temperature and blood pressure, had been taken in all visits. When the ulcer heal in the five-day examine period, the cinnamon and/or placebo agent changed into gathered. measured the ulcers dimention, carrying out the visible analog scale (VAS).

6. Clinical notes:

These parkling ulcers, as defined as advanced inside seventy two hrs of onset and actually seen then documented. The assessment of the floor place of the ulcer ,changed appear in cm and mm via way of means of a dental probe (Shanghai,Dental Instrument Factory- China).ulcer diameter usually measured and documented. Pain depth changed into measured the usage of a VAS, in which the amountof ache ranged 0 (no ache) to 10 (insufferable ache). Pain changed into assessed via way of means of annoying the ulcer with the periodontal probe. The values had been gathered via way of means of the assigned investigators.

7-Statistical evaluation:

Statistical evaluation changed into made the usage of SPSSPC + Computer program - Version 25, via the usage of t-check for evaluating among the 2 businesses (Cinnamon handled organization and Placebo handled organization) in ulcer sized development. Also, Chi²-check for evaluating the% of development of in Ulcer length and ulcer ache some of the businesses below the examine.

Results

The baseline demography data of the patients.

Our results observed in Table (1) on the characters of the patients cleared that, the age, of the patients that suffered from Aphtous ulcer not differ significantly among the patients under the studied groups (P > 0.05), the experimental group its age level reached to (32.34 year) and in placebo treated group it reached to (33.17 year).

The results cleared that, the incidences of Aphtous ulcer in experimental group 11 (22 %) lower than its incidences in the placebo treated group in male patients 16 (32 %), while, in female patients in experimental group its incidences reached to 45 (90 %) and in placebo treated group it reached to 35 (70 %).

Also the duration of the previous ulcer not differ significantly among experimental and placebo treated groups as its duration reached to 12 and 11.42 day for Aphtous ulcer in experimental and placebo treated group.

The results cleared that, the experimental group that treated with Cinnamon gurgle wash its average ulcer size reached to 4.51 mm² while, in placebo treated group its size reached to 5.14 mm².

The results observed in Table (1) cleared that the ulcer pain (VAS) in Cinnamon treated group is lower than its level in the placebo treated group.

| Table (1): distribution data of the patients. |
|-----------------|-----------------|--------|
|                  | cinnamon group (n =50) | Placebo group (n =50) | P   |
| (Age per year) (mean ± SD)* | 32.34 ± 10.12 | 33.17 ± 11.9 | 0.77 |
| Gender**                |                  |                    |
| Male,                   | 11 (22%)         | 16 (32%)          | 0.016 |
| Female,                 | 45 (90 %□)       | 35 (70%)          |      |
| Duration of previous ulcer (day)* | 12 ± 3.96 | 11.42 ± 4.16 | 0.95 |
Our results on the improvement of the ulcer size among patients treated with Cinnamon gurgling wash and placebo wash:

The results observed in Table (2), cleared that, the experimental group that treated with Cinnamon mouth gurgling have lower size of ulcer than the placebo treated group as its size reached to 3.2 mm² in cinnamon treated group, and reached to 4.3 mm² in placebo treated group at 3 days of treatment, while, at 5-days post-treatment its size reached to 2.1 for Cinnamon treated group and 3.7 mm² in placebo mouth wash treated group, respectively.

Also, the improvement % at 3 and 5-days post treatment improved in Cinnamon using group than the placebo group for improvement % in Cinnamon at day 3 was 14 (28 %) and in placebo treated group it was 9 (18 %). While, at 5-day post-treatment the improvement % reached to 35 (70 %) in Cinnamon treated group, while, in placebo treated group it reached to 28 (56 %).

The effective indices for significant improvement cleared that the Cinnamoen is more efficient in treatment of Aphthus ulcer than the placebo treatment at 3 and 5 days of experiment. While, the non-significant improvement showed a higher results in placebo than the Cinnamon treatment of Aphthus ulcers.

EI = Effective indices

Our results on the improvement of the ulcer pain among patients treated with Cinnamon gurgle wash and placebo wash:

The VAS was used to measure the level of pain for both groups. The results observed in Table (3), cleared that, the improvement % of pain at 3 and 5 days post treatment improved in Cinnamon group than the placebo treated group as the improvement % in Cinnamon at day 3 was 14 (28%) and in placebo treated group it was 9 (18%). While, at 5-day post-treatment the pain improvement % reached to 36 (72.00 %) in Cinnamon treated group, while, in placebo treated group it reached to 29 (58.0 %).

The effective pain indices for significant improvement cleared that the Cinnamoen is more efficient in treatment of Aphthus ulcer than the placebo in reducing the pain at 3 and 5 days of experiment.

While, the non-significant improvement showed a higher results in placebo than the Cinnamon treatment of Aphthus ulcers.

EI = Effective indices

**Discussion**

25% is the percentage of the prevalence of Recurrent aphthous stomatitis (RAS) (17), which occur on oral mucosa which is non keratinized. There are 3 main type of oral ulcers major, minor also, herpetiform (18), 80–85% of RAS, with 3–10mm ulcers usually painful and appears on groups greater than 5 lesions heal between 10 days to two week (18),there are no specific treatments for RAS depending on the etiology, but we must work to decrease the pain and the duration of ulcers by prevent the secondary infection and suppress the local immune factors (17).

Our results on this study: cleared that, the most of the patients that suffered from Aphthous ulcer commonly occur at (30 – 40) day of age and in female higher than male.

This results attributed Recurrent Aphthous ulcers (RAS) is common manifestation that related to group of health problems with multiple causes (19). The development of ulcers depending on the local Immune factors, which was supported by the histological infiltration of plasma cells, lymphocytes, and neutrophils of oral mucosa (20). There are many types of cytokines played a role on the pathogenicity of ulcers (21), in RAS lesions the IL-10 concentration decreased, while IL-2, IFN-γ, and TNF-α were elevated (22,23).

The results cleared that, the incidences of Aphabetous ulcer reduced in the group treated with Cinnamon.

The present of ulcers in recurrent aphthus stomatitis
patients were usually exposed to huge number of microorganisms, then lead to inflammatory reaction. The healing of ulcers depends on the protection against microbes. Although the antimicrobial activity of Cinnamon on inflammatory disease was denied by Li et al. because there is no reported effects on *E. coli* growth (24).

This results agreed with those of (1,25) where they reported that, cinnamon water extract have anti-mutagenic activity and it preserve the health condition of the cells and help in regeneration of the cells and treat the ulcer with reduction of its size.

Also the pain reduced in the group treated with Cinnamone, this results attributed to with the healing of many ulcers, the pain of ulcers will be disappeared. The activity of Cinnamon gurgle wash on pain, explain in this study on day 5, may be due to healing of ulcers, and not belong to the analgesic effect of cinnamon.

This results agreed with those of (18) where they reported that by using some herbs as Cinnamon can treat the unclear etiology of the ulcer, by decrease the pain and the duration of ulcers via prevent the secondary infection and suppress the local immune factors.

The active effect of cinnamon mouth wash in treatment of aphthus ulcer attributed to the Cinnamon contain Cinnamaldehyde (CM) which is the active component of the spice cinnamon (*Cinnamomum zeylanicum*). It had anti-microbial, anti-inflammatory, anti-tumor, anti-oxidant, cholesterol lowering and immunomodulatory properties (26). Cinnamon consider as anti-inflammatory such as in gastric inflammation by decrease the activation of NF-κB (27). Cinnamon effects on regulatory T-cells which lead to decrease allergic encephalomyelitis in vivo (28). Cinnamon consider as anti-rheumatic agent due to their action on reduce the inflammation in arthritis in vivo by decrease the effect of cytokines such as interferon γ (IFNγ) and, IL-2, IL-4, (29). Cinnamon is effective in the treatment of degenerative disease of neurological origins as in AD (30, 31).

Our results concluded that, the most of the patients that suffered from Aphhtous ulcer commonly occur at (30 – 40) day of age. Also, the incidences of Aphhtous ulcer reduced in the group treated with Cinnamon also, the pain of aphthus ulcer reduced with Cinnamon mouth gurgle wash.

GC-Mass Spectrometry Analysis of Iraqi *Moringa Oleifera* Seeds Extract

Fiham Jassim AL-Obaidi¹, Abid A. Thaker²,  Asmiet Ramizy³

¹ MSc. Student, ²Prof. Department of Biology, college of Science. University of Anbar, ³Prof., Department of Physics, college of Science, University of Anbar

Abstract

*Moringa oleifera* is an important traditional medicinal plant used for the treatment of many health problems. It is widely cultivated across the world but it has not well known or well-studied in Iraq. Therefore, the aim of this study is to identify the bioactive compounds present in acetone:methanol (1:1) seeds extract of Iraqi *Moringa oleifera* by using GC-Mass Spectrophotometry.

The results of this analysis revealed 41 compounds which include, terpenes (cis-beta-Ocimene 0.97%, Cedrene 0.20%, Cedrenol 1.40%, Verrucarol 0.29%, Dehydroxy-isocalamendiol 0.09%, beta-Myrcene 0.14%, 3-Thujene 0.06%, Ocimene 0.72%, Sabinene 0.37%, Aromadendrene 1.54% ), phenols (0.34%, Eugenol 0.49%, cis-Isoeugenol 1.21%, Methoxyeugenol 0.26%, Ferrocene 0.57%, Phenol, 2-methoxy-4-(1-propenyl)-, (Z) 0.34, Oxabicyclo[3.3.0]octan-2-one -7-neopentylidene) 0.61% ), fatty acid methyl esters (n-Tridecanoic acid 0.15%, Undecanoic acid 0.09%, Pentadecanoic acid 34.43%, 4-Hexadienal 1.52%, Dodecanoic acid 11.02%, cis-Vaccenic acid 21.39%, Hexadecenoic acid 0.15%, Eicosanoic acid 0.03%), acid (myristicin, 7.8%), Phenyl propanoid (Asarone, 4.99%), Antioxidant (tert-Butyl-4-hydroxyanisole, 1.38%), Drug (Berbine, 2,3,9,10-tetramethoxy, 0.73%), Drug (Thiazolo, 0.63%), aldehyde (Trimethylsilyl vanillin, 0.61%), hormone (Octenoic acid, 0.46%), Amine (ethyl ester, 0.42%), Carboxylic acid (Dimethylandrost5-en-3-one, 0.28%), Terpenoid (Lavandulol, 0.19%), Heterocyclic compound (Buten-3-one, 1-(2-carboxy-4,4-dimethylcyclobutenyl, 0.18%), Volatile oil (Butanoic acid, 0.16%), Fatty alcohol (1-Heptatriacontanol, 0.12%), Hydroxy carbon-alkene-(Carene, 0.11%).

It can be concluded from this study that the seeds are considered a rich source of bioactive compounds.

**Keywords:** GC-MS analysis, Bioactive compounds, Methanol:Acetone Extract, Iraqi *Moringa oleifera*.

Introduction

Medical plants are commonly used as a source of medicinal products or against the toxicity of xenobiotics. World Health Organization reports that 4 billion people (80 percent of the world’s population) use herbal medicinal goods for most of the primary health care.

*Moringa oleifera* is among 13 species of Moringa trees that grow in different countries around the world.

Seeds of *M. oleifera* tree are useful for medicinal, practical food preparations, water purification, and biodiesel production. *M. oleifera* seeds are a good source of proteins, lipids, vitamins, minerals, micronutrients, and bioactive phytochemicals. The aqueous seeds extract of *M. oleifera* inhibit bacterial and fungal growth. The methanol: acetone seed extract of Iraqi *M. oleifera* is found to reduce the toxicity of nanoparticles of lead in the rat (Unpublished results).

This study aims to estimate the compounds found in methanol: acetone seeds extract of Iraq *M. oleifera* by using GC mass spectroscopy.
Material and Methods

Plant collection

The ripe dried pods of *M. oleifera* were collected from the trees planted in National Iraqi herbarium (in Baghdad), Iraq, and was identified by a taxonomist in the Desert center, University of Anbar, Iraq.

Preparation of samples

The seeds were removed from dried pods, dehusked, kept at shade ambient temperature (45°C) to remove any possible moisture. The seeds were later milled to obtain seed powder using a blender and stored it in the refrigerator in airtight containers for analysis.

Preparation of extract

The dried powdered seeds (300gms) were extracted using Soxhlet and thimble with 1000 ml of solvent (methanol: Acetone 1:1) for 48 hours. The extract was then evaporated with a rotary evaporator. The dried extract was stored at 4°C in a sterile container.

GC-MS analysis

The chromatograph used was Shimadzu GC-2010 plus-Japan in the Iraqi ministry of sciences and technology; Column: ZB-5MS Capillary Column (30 m x 0.25 mm, I.D. 0.25 μm), Carrier Gas: UHP Helium, Injection Temperature: 280.00°C, Detector Temperature: 280.00 °C, Injection Mode: Split, Flow Control Mode: Pressure, Injector Pressure: 100.0 kPa, Total Flow: 47.3 μl/min, Column Flow: 1.43 μl/min, Linear Velocity: 44.1 cm/min, Injection Volume: 1 μL, Run Time: 35 minutes. A freshly prepared sample (10mg/ml) was used.

Results and Discussion

GC-MS is an important device used for the analysis of bioactive chemical constituents according to their mass to charge ratio.

Forty one bioactive compounds were identified in seeds extract (methanol:acetone 1:1) of Iraqi *M. oleifera* by GC-MS analysis and detailed in Figure 1., the compounds included terpenes (cis-beta-Ocimene 0.97%, Cedrene 0.20%, Cedrenol 1.40%, Verrucarol 0.29%, Dehydroxy-isocalamendiol 0.09%, beta-Myrcene 0.14%, 3-Thujene 0.06%, Ocimene 0.72%, Sabinene 0.37% Aromadendrene 1.54%) , phenols (0.34%, Eugenol 0.49%, cis-Isoeugenol 1.21%, Methoxyeugenol 0.26%, Ferrocene 0.57%, Phenol, 2-methoxy-4-(1-propenyl)-, (Z) 0.34 , Oxabicyclo[3.3.0]octan-2-one -7-neopentyldiene) 0.61% ), fatty acid methyl esters ( n-Tridecanoic acid 0.15%, Undecanoic acid 0.09%, Pentadecanoic acid 34.43%, 4-Hexadienal 1.52%, Dodecanoic acid 11.02%, cis-Vaccenic acid 21.39%, Hexadecenoic acid 0.15%, Eicosanoic acid 0.03%), acid (myristicin, 7.8%), Phenyl propanoid (Asarone, 4.99%), Antioxidant (-tert-Butyl-4-hydroxyanisole, 1.38%), Drug (Berbine, 2,3,9,10-tetramethoxy, 0.73%), Drug (Thiazolo, 0.63%), aldehyde (Trimethylsilyl vanillin, 0.61%), hormone (Octenoic acid, 0.46%), Amine (ethyl ester, 0.42%), Carboxylic acid (Dimethyleneostrost-5-en-3-one, 0.28%), Terpenoid (Lavandulol, 0.19%), Heterocyclic compound (Buten-3-one, 1-(2-carboxy-4,4-dimethylcyclobutenyl, 0.18%), Volatile oil (Butanoic acid, 0.16%), Fatty alcohol (1-Heptatriacontanol, 0.12%), Hydroxy carbon-alkene-(Carene, 0.11%).

The following examples revealed the biological activity of each of the above compounds. Myristicin was found to act as prophylactic effects against colitis in mice, the myristicin treatment before the induction of colitis significantly changed the colonic oxidative stress by elevating the antioxidant enzymatic activities, and reducing the lipid peroxidation (11).

Asarone may be developed to a therapeutic agent to manage cognitive weakening related to conditions such as Alzheimer (12) and increase of chemosensitivity by preventing tumor glycolysis in gastric cancer (13).

Methoxyeugenol has anticancer activity and antimicrobial activity (14). Pentadecanoic acid, suppresses the stemness of mcf-7/sc human breast cancer stem-like cells through JAK2/STAT3 signaling (15). Dodecanoic acid, may elicit apoptosis in certain cancer cells (16) and exerted antiproliferative activity in diverse types of tumor cells (17). When fed vaccenic acid over 16 weeks, rats exhibited lowered total cholesterol, lowered LDL cholesterol, and lower triglycerides levels (18).

The crude seeds extract of *M. oleifera* was also found to have protective effects against the toxicity of lead nanoparticles in rats (Unpublished results), oxidative DNA damage (19), and against bacterial growth (20).
Conclusions

The result of a GC-mass analysis of Iraqi *M. oleifera* was valuable. The number and quality of the compounds manufactured and stored in the seeds of *M. oleifera* reveal the nutritional and/or medicinal importance of these phytochemicals. The compounds, pentadecanoic acid, Cis-Vaccenic acid, dodecanoic acid, and myristicin constitute about 74.64% of the total contents of extraction.

Correlation Between Serum Ferritin And Liver Function in Thalassemia Patients

Zainab Qasim Muhammad Al-Yasiri
Assistant Lect., Biology Department / College of Education for Girls / Dhi Qar University / Iraq

Abstract

Thalassemia, is one of the most important hemolytic genetic, diseases that break down red blood cells, Children with thalassemia cannot produce enough hemoglobin because; the bone marrow cannot produce enough red blood cells to meet their needs and the red blood cells produced, by them are almost devoid of hemoglobin, and the disease is divided into alpha, and Beta thalassemia.

The current study was designed with the aim of investigating the relationship between serum ferritin and hepatic enzymes in thalassemia patients. Iron is stored primarily in the form of ferritin in liver cells. The study included 60 patients with thalassemia in; Dhi Qar governorate, distributed between the two gender during the research period, their ages ranged between (2-26) years old, blood samples were taken in order to testing of, hemoglobin, ferritin, and liver enzymes (ATP, GOT, GPT), and the same, tests were performed on healthy people 40 person; as they are a control group.

The results recorded; a high percentage of thalassemia incidence in males and a decrease in females. The study also showed; that the incidence of thalassemia reached its peak in the age. group (2-6) years and decreased with age, as it reached its lowest levels in the age, group (22-26) years.

The study revealed; a significant decrease (0.05 > P) in hemoglobin concentration in thalassemia patients compared with the control group, and the results recorded a significant; increase (0.05 P <) in the concentration of ferritin in thalassemia patients compared with the control group.

The current study; also showed a significant increase (P <0.05) in GPT enzyme concentration in thalassemia patients compared with the control group. There was a significant increase (P <0.05) of GOT enzyme concentration in patients compared to the control group.

The results indicated; that there was a significant increase (P <0.05) in the concentration of the ALP enzyme in the patients compared with the control group.

Keywords: thalassemia, ferritin, liver

Introduction

Thalassemia: It is one of the most important hereditary hemolytic diseases and the most prevalent in the world, Thalassemia is a Greek word in origin that means anemia in the Mediterranean region. The disease is widely known in this region and is also known as Mediterranean anemia. In the United States of America, it was known as Cooley’s anemia, due to the disease’s discoverer who discovered it in 1925 (1)
Thalassemia is often diagnosed in the first six months of a newborn’s life, and it may be fatal if the patient does not receive appropriate treatment. Children with thalassemia need a blood transfusion every 3-4 weeks, depending on the patient’s age and the degree of hemoglobin deficiency in the blood in order to be able to survive.

Thalassemia major disease does not affect the fetus in the uterus, because fetuses have a special type of hemoglobin called fetal hemoglobin and differs from adult hemoglobin, and when a fetus is born most of the hemoglobin in its body remains the hemoglobin of fetuses in the first six months of life, but the problem of thalassemia lies in the inability of children to generate sufficient amounts of hemoglobin, so thalassemia, major symptoms begin to appear in children in the first year of life.

The lifespan of red blood cells in thalassemia patients is very short, so these pellets are gradually eaten, causing severe anemia, and so patients undergo periodic blood transfusions to keep the red blood cells close to the required level, which improves, the patient’s condition and ensures the transfer of oxygen to the tissues and the normal growth of the body. Anemia worsens and the child’s growth stops. As a result, the shape of the child’s forehead and bones changes.

Types of Thalassemia:

1- Alpha-thalassemia:

It is uncommon and has been found periodically in different parts of the world. There are four alpha globin genes, so the disease symptoms appear according to the number of defective genes:

- Silent alpha thalassemia:
  It occurs if the mutation affects only one gene, then the person does not have any health problem.

- Alpha thalassemia trait carrier:
  If the mutation affects only two of the genes and it does not accompany any health problem, but children may be born to him with health problems in hemoglobin if his wife is a carrier of the same trait.

1- Beta-thalassemia:

It is the most common genetic disorder worldwide, there are two beta globin genes, so the symptoms of the disease appear according to the number of defective genes:

- Thalassemia minor (carriers of the disease):
  When there is a defect in one of the beta globin genes, this condition is called a carrier of the disease, and does not suffer from any health problem, except from a slight anemia that does not require a blood transfusion, he is able to transmit the disease to his children.

- Medium thalassemia:
  It occurs when there is a defect (mutation) in both of the beta globin genes, resulting in a moderate decrease in the amount of beta globin produced in the body, leading to a moderately severe decrease in the hemoglobin level in the blood, and the patient does not need a periodic transfusion.

- Thalassemia major:
  It occurs when there is a defect (mutation) in both of the beta globin genes, but the type of damage in the beta gene this time is more severe. This results in a severe decrease in the proportion of beta-globin, thus reducing hemoglobin as a result of breaking down the abnormal red blood cells before the end of their life span, The patient needs periodic blood transfusions every 3-4 weeks to maintain a high level of Hb in order for the
body, to grow healthy (11).

Aim of Study:

In light of the foregoing, the present study suggested in order to investigate the effect of thalassemia infection on liver function by studying the following criteria:

1- Measuring the levels of liver enzymes represented by GOT, GPT and ALT.

2- Measurement of serum ferritin level (iron-storing protein).

3- Measurement of hemoglobin level in the blood.

4- To identify the largest infection rate among different age groups.

5- Comparing the infection rate between the two gender and, investigating the causes.

Materials and methods:

1-Blood samples:

Blood samples were drawn from thalassemia patients during their visit to the General Al-Habobi Hospital / Genetic Hematology Center in order to receive treatment and care, (60) samples were obtained from these patients distributed between of either gender. during the research period, their ages ranged between (2-20) years, and examinations were performed in hematology and biochemistry laboratories.

For the period from December / 2018 to July / 2019, 5 ml of blood was taken for each patient and a hemoglobin,(Hb) test was performed in the blood laboratory, the blood serum was obtained by placing samples in clean and dry test tubes then placed in a centrifuge At a speed of ;4000 r / min for five minutes and the serum was separated from the thrombus by a micro pipette, the serum was placed in labeled Eppendorf tubes for the examination of ferritin and liver enzymes (GPT, GOT, ALT).The same amount of blood was drawn from healthy people (40) samples and they underwent the same tests for comparison purposes as control samples.

2- Hemoglobin measurement:

Hemoglobin was measured using the Coulter Horiba blood tester of French origin Emerald. company.

3- Liver enzymes measurement:

3-1- Measurement of Aspartate transaminase (AST) GOT:

This enzyme; was measured by using a kit of the type. bio Merieux- French, and the, activity of this enzyme was measured by color methods by using the method of .(Gella F.J. et al., 1985), according to the following reaction equation:

$$\text{Aspartate} + \alpha \text{Ketoglutarate} \leftrightarrow \text{Oxaloacetate} + \text{glutamate}$$

The formed oxaloacetate is measured by color methods through, its interaction with 2,4-. dinitrophenylhydrazine.-.to form the hydrozone derivative. This derivative; is measured through a spectrophotometer .with a wave length of 505nm, the .intensity of absorption will be proportional. to the activity of this enzyme.

3-2- Measurement of Alanine transaminase (ALT) GPT:

The effectiveness, of this enzyme was measured using a bio Merieux- French kit, and GPT (Glutamic pyruvic transaminase) ,was measured by color methods which described .by (Lustig V. et al., 1988) according to the following. reaction:

$$\text{GPT}$$

$$\text{Alanine} + \alpha\text{-Ketoglutarate} \rightarrow \text{Pyruvate} + \text{Glutamate}$$

The liberated pyruvate is. measured by the presence of the compound 2- 4- di-nitrophenyl hydrazine .to form the ,hydrazone ,derivative, and this compound is measured by a spectrophotometer; with a wave length of 505nm. The. intensity of absorbance, will be proportional. to the activity of this enzyme.

3-3- Measurement of Alkaline, phosphatase (ALP):

This enzyme was; measured by several bio Merieux- france kit, and the basis of this method depends on the. activity of this enzyme in the basic medium by using the. method described by Tietz , et al. (12) according to the
following equation:

\[
\text{Alkaline Phosphatase} \\
\text{Phenylphosphate} \xrightarrow{\text{Phosphate}} \text{Phenol} \\
\text{PH} 10
\]

The released phenol is measured by the presence of the 4-aminoantipyren compound, and the potassium, Ferro cyanide. The presence of sodium arsenate is to stop the enzyme activity. Then the solution is measured over a wavelength of 510 nm. The amount of absorption is proportional to the amount of phenol released; and this depends on the activity of the enzyme.

**4- Measuring the level of ferritin:**

The method for quantifying protein storage, ziron (Ferritin) is based on the immunoassay using the method which described by Gomez et al (13). The antibody is used for a specific type of mice and is surrounded by a layer of magnetic atoms, which represent, the solid phase, and another antibody for a type of rat linked to derivatives of Isoluminol. The work steps were carried out according to the instructions of the Italian company DiaSorin, and equipped with the equipment needed to measure the concentration of Ferritin.

**5- Determining the incidence of thalassemia among males and females:**

\[
\text{Class number) Percentage of thalassemia, incidence)%} \\
\text{=} \frac{\text{__________}}{\text{the total number}} \times 100
\]

**6- Divide thalassemia patients into five age groups:**

- The first age group. (2-6) years.
- The second age group. (7-11) years.
- The third age group. (12-16) years.
- The fourth age group. (17-21) years.
- The Fifth age group. (22-26) years.

**7- Statistical analysis:**

The results were analyzed by using the SPSS 17 statistical program to determine the mean, standard deviation, and other variables. The differences in the case of the probability \( p < 0.05 \) were considered statistically significant.

**Results**

**1 - Thalassemia relationship with gender:**

The current study, indicated that there, was a high percentage of thalassemia in males, which was 61.70%, while in females it decreased to 38.30%.
2 - Thalassemia relationship with age:

The current study showed that the incidence of thalassemia reached its peak in the first age group (2-6) years, so the percentage was (37.26%), then the infection rate decreases, as the age progresses until the ratio gradually decreases to the lowest level in the, fifth age group (22-26 years), so it was (3.14%).

![Figure 2: Distribution of age groups in thalassemia patients.](image)

3 - Thalassemia effect on concentration of hemoglobin and Serum ferritin:

The results of the current study showed a significant decrease (P <0.05) in the hemoglobin Hb concentration in Thalassemia patients group (2) with a concentration of (7.76 ± 0.58 g / dL) compared to the control group (1) it was (13.40 ± 0.92) g / dL.

The results recorded, a significant increase (P<0.05) in the concentration of ferritin in thalassemia, patients, group (2), it reached (3841.79 ± 942 μg / L) compared to the control .group (1) as it was (150.69 ± 44.72 /g / L) as shown In Table (1).

4 - Effect of Thalassemia on liver enzymes levels:

The results of the current study showed a significant increase (P < 0.05) with GPT enzyme concentration in Thalassemia patients (Group 2), it was (29.74 ± 5.40 U/ml) compared to the control group (Group 1) which reached (17.04 ± 2.07 U/ml).

The results also recorded a significant increase (P < 0.05) with a concentration of GOT enzyme in group (2) reached (30.02 ± 7.23 U/ml) compared to control group (1) was (13.87 ± 0.70 U/ml).

The results indicated a significant increase (P < 0.05) with the concentration of ALP enzyme in group (2), it was (166.23 ± 8.45 U/ml) compared to the control group (1) that recorded (81.06 ± 26.79 U/ml).

Discussion

1 - Thalassemia relationship with gender:

It is clear from Figure No. 1 that the males are more infected than females. The percentage, of thalassemia in males was 61.70%, while in females it decreased to 38.30%. There is no clear explanation for this, although it is consistent with previous studies (4), but the reason may be attributed to the possibility of a genetic association, with gender, as it may reflect the reality of the areas where the disease is spreading where increased attention to males compared to females, in addition to the reluctance; of some families to visit hospitals when; the disease is present in females.

2 - Thalassemia relationship with age:

The current study showed in Figure (2) that the incidence of thalassemia reached its peak in the first age group (2-6) years, ;so the ratio was (37.26%), and the incidence rate gradually decreased with age, until it reached the lowest level in the fifth, age group (22-26) year, it was (3.14%), and the reason for this may be an increase, in deaths of children with thalassemia, as the age progresses, either due to the cost of treatment, which is offset by the poor physical condition of the patients, the reason may be the delayed of disease diagnosis to advanced stages, when the treatment may be not benefit with it, or the cause may be attributed to the patient’s poor health condition and suffering from severe complications of the disease that may eventually lead to death (3).

3 - Thalassemia effect on concentration of hemoglobin and Serum ferritin:

It was noted through the results of the current study in Table (1) that there was a significant decrease (P < 0.05) in the hemoglobin, concentration in thalassemia patients, as its concentration (7.76 ± 0.58 g / dL) compared to the control group was (13.40 ± 0.92 g
Indian Journal of Forensic Medicine & Toxicology, January-March 2021, Vol. 15, No. 1

(μg/L), and the reason for this may be attributed to the genetic mutation occurring in both genes of beta-globin, resulting in a severe decrease in the ratio of beta-globin, thus a decrease in hemoglobin, as a result of the breakage of abnormal erythrocytes before the end of their shelf life 120 days (11). The Erythropoiesis process is ineffective and manifests itself through the apoptosis of erythrocytes as a result of obstructing the manufacture of heme units, as hemoglobin is mainly composed of two parts, heme and globin protein, so the resulting red blood cells are in small size, small numbers and low hemoglobin, and that high fracture due to the decrease severe hemoglobin concentration, and the results of the current study are consistent with what it reached (14), and this condition occurs when two of the damaged gene carriers of beta thalassemia decide marriage and childbearing, as a result of which the patient will need to periodically blood transfer every 3-4 weeks to maintain a high rate of Hb to allow the body to grow in a healthy way (4).

Because thalassemia is the most common genetic defect in humans, around the world (15), genetic blood disorders are characterized by a low level of hemoglobin (Hb) in red blood cells (RBC) and a very low production of red blood cells (6), and although this disease is characterized by a number of signs and symptoms, severe anemia is the only crucial thing (10).

The results recorded a significant increase (P <0.05) in the concentration of ferritin in thalassemia patients, as it reached (3841.79 ± 942 μg/L) compared to the control group, as it was 150.69 ± 44.72 μg/L, and the reason for this may be periodic blood transfusions every 3-4 weeks to maintain a high rate of Hb to allow the body to grow in a healthy way (4).

Because thalassemia is the most common genetic defect in humans, around the world (15), genetic blood disorders are characterized by a low level of hemoglobin (Hb) in red blood cells (RBC) and a very low production of red blood cells (6), and although this disease is characterized by a number of signs and symptoms, severe anemia is the only crucial thing (10).

The results recorded a significant increase (P <0.05) in the concentration of ferritin in thalassemia patients, as it reached (3841.79 ± 942 μg/L) compared to the control group, as it was 150.69 ± 44.72 μg/L, and the reason for this may be periodic blood transfusions every 3-4 weeks, as multiple blood transfusions lead to increased iron loading, which increases its sedimentation in the body, which in turn leads to an increase in ferritin levels. Thus, iron levels in the blood serum of patients. Thus, iron levels in the blood serum increase as they increase, and repeat blood transfusions (5). Iron is stored primarily in the liver at 70%, and the remainder is stored in the spleen and bone marrow in the form of ferritin in addition to the presence of additional amounts of it in the blood (3).

When conducting blood transfusions to thalassemia patients, the percentage of iron will increase, which leads to the inability of the ferritin to absorb it. Ultimately, free iron is deposited in the blood and tissues (16). This iron burden is usually reflected by increasing serum ferritin levels and controlling it on Long-term correlation with survival, estimating the concentration of ferritin in the blood is an indicator for measuring total iron in the body (15).

4 - Effect of Thalassemia on liver enzymes levels:

Table 2 shows a significant increase (P <0.05) in GPT enzyme concentration in Thalassemia patients, as it was 29.74 ± 5.40 U/ml compared to the control group that reached (U/ml 17.04 ± 2.07). The results also recorded a significant increase (P <0.05) in a concentration of GOT enzyme in Thalassemia patients, as it reached (30.02 ± 7.23 U/ml) compared to the control group that was (U/ml) 13.87 ± 0.70. The results indicated a significant increase (P <0.05) in the ALP enzyme concentration of thalassemia patients it was (166.23 ± 8.45 U/ml) compared to the control group that, recorded (81.06 ± 26.79 U/ml), may be the reason for the high concentrations of liver enzymes due to very high levels of ferritin that collects primarily in the liver shows its negative effects on the liver, enzymes clearly (4,17).

A slight positive relationship has been observed between serum ferritin with hepatic enzymes and hemoglobin in thalassemia patients, as high levels of hepatic enzymes are related to some extent to the concentration of ferritin in the serum, or because of the need to build peptide chains through the effectiveness of this enzyme in the formation of amino acids required for construction (16).

The GOT enzyme is more effective than the GPT enzyme. The first enzyme is more common in the tissue of the heart, liver, and skeletal muscles as well as the kidneys, while the liver contains large amounts of the GPT enzyme, and other tissues such as the kidneys, heart, and skeletal muscles contain abundant amounts of this enzyme, possibly due to the amounts of iron present in patients’ serum, which is deposited in these organs, which results, in the breakdown of the fat of some cells of these organs (3).

As for the ALP enzyme, the research results showed a significant increase in the activity of this enzyme compared to the enzyme activity in the healthy serum.
The reason for this may be due to; the fact that most of the activity of this enzyme comes from bone tissue and, since thalassemia patients suffer from the dissolution of this tissue, this leads to the leakage, of this enzyme into the blood circulation, and then an increase in the effectiveness of this enzyme (15).

Iron is one of the essential minerals that the body needs to complete the formation of erythrocytes, oxidative metabolism, and cellular immune response, and plays, an essential role in many body functions. Iron is the site of oxygen binding in Heme-containing proteins such as, hemoglobin and myoglobin, (18). Iron is absorbed by the gut and transported to the blood by a special protein called Transferrin, as the receptors for this carrier protein are found on; bone marrow cells and some other cells of the body, and the ability of this protein to bind to iron increases, in the event of high iron consumption by the body (15).

Iron deposition in the liver, spleen and bones resulting from the blood transfusion, process may cause distortions in the shape of the body and its deposition in the organs that we have mentioned, which leads to their enlargement (5). Therefore, this requires working to displace iron to reduce complications, by giving the patient medications to remove iron from the body and other drugs such as folic acid, Vitamin C, including desiferal injections, is injected under the skin for five days a week, in addition to another treatment, Exjade pills, given daily once, according to the child’s weight, given, his dose of (15 mg per kilo - 40 mg per kilo) depending on the patient’s weight and, high iron content. In His Blood (19,20).

Conclusions and recommendations:

Conclusion

We conclude from this study:

1. The higher incidence of thalassemia in males than in females

2. The incidence of infection decreased, with age, and it peaked in the age group (2-6) years and decreased to the lowest, levels in the age group (22-26) years.

3. There is a decrease in hemoglobin concentration and high serum ferritin concentration in people with thalassemia, compared with healthy people.

4. There was an increase in the levels of hepatic enzymes (GPT, GOT, ALP) in patients, compared to healthy levels.

5. Deposition, of iron in patients’ bodies adversely affects liver function.

6. There is a positive correlation between serum ferritin and liver enzymes in thalassemia patients.

Recommendations

1. Intensifying awareness campaigns through various media such as newspapers, magazines, television and lectures and publishing, brochures on thalassemia as it is a genetic disease that may be limited by proper planning and avoiding marriage of relatives as much as possible in families with a history of the disease.

2. Specialized, centers shall be determined to work on finding a formula for recording the numbers, of the injured, their addresses and the sick, history of the family, from grandparents to parents. And the establishment of centers specialized in bone marrow transplantation as part of the, treatment requirements for thalassemia.

3. Emphasis on conducting a pre-marriage screening test for thalassemia, and adding it to the list of examinations, conducted for this purpose may help with medical advice, before marriage.

4. Emphasis on prenatal diagnosis, especially in families where the disease appears frequently.

5. Urging families with a history of thalassemia to determine childbearing in order to reduce the frequency of infection, in the same family.

Abstract

In the present study, the histo-morphometric comparison study of small intestine in hamsters and rabbit was aimed. Ten of clinically healthy animals of both sexes were collected by Al-Simawa city, age ranged between 6 month to 1 year, which was estimated according to the dental equation of the animals. The small intestine was cut and stained alternatively with Hematoxylin and Eosin (H & E) and (Lilles Alchrome stain).

The current study aims to discover the structures and measurement of small intestine belonging to these animals specifically their histo-morphometric textures. The anatomical studies revealed that small intestine of both animals consists of: duodenum, jejunum and ileum. Histological exam was showed that the wall of small intestine composed of four layers including: mucosa, submucosa, muscularis and serosa and adventitia.

Key words: histology, small intestine, rats, duodenum, epithelium.

Introduction

The small intestine was observed to be divided into (duodenum, jejunum and ileum). The duodenum was long and started at the pylorus region close to the stomach. The jejunum appeared to be convoluted or coiled, very long and occupied the abdominal floor between the stomach urinary bladder. The ileum was short and followed the jejunum and marked the end of the small intestine. The distal end of the ileum had a thick walled enlargement, Sacculus rotundus which mark the junction between the ileum, cecum and colon (1,2).

The major functions of the small intestine are digestion, secretion, and absorption. The small intestinal mucosa has several anatomic adaptations that serve to create an immense surface area with which to digest and absorb nutrients. These include the plicae circulares (intestinal folds), villi, and microvilli. The small intestinal mucosa is characterized by numerous, regularly distributed luminal papillary projections called villi. Villi are lined by columnar epithelial cells, enterocytes. Enterocytes have apical microvilli (brush border) (3).

The chyme passes into the small intestine from the stomach. Flow into the small intestine is regulated by the pyloric sphincter. The small intestine is the place where the majority of digestion and absorption of nutrients occurs. The small intestine can be divided into three sections – duodenum, jejunum, and ileum (4).

The duodenum is the first section and is the site of most digestion. Buffers are secreted from the pancreas into the small intestine to increase the pH to a more neutral level, as the stomach acids would make the digested food have a low pH level. In addition, a variety of enzymes are secreted by and into the small intestine to break down the food. These include proteolytic, lipolytic (fat digesting), and amylolytic (starch digesting) enzymes (5,6).

The jejunum is the middle section of the small intestine. Many nutrients, such as amino acids, fatty
acids, and glucose, are absorbed here. The last section of the small intestine is the ileum. In the ileum, the remaining digested nutrients are absorbed, as well as the B vitamins (7).

The ileum is mainly to absorb vitamin B\textsubscript{12} and bile salts and whatever products of digestion were not absorbed by the jejunum. The wall itself is made up of folds, each of which has many tiny finger-like projections known as villi on its surface. In turn, the epithelial cells that line these villi possess even larger numbers of microvilli. Therefore, the ileum has an extremely large surface area both for the adsorption (attachment) of enzyme molecules and for the absorption of products of digestion (8).

### Materials and Methods

#### Animal source

A total of ten mature animals of both sexes (5 hamsters and 5 rabbits) were used for this study. They were purchased from local market of Al-Samawaa city, Al Muthanaa government, Iraq. The animals were transported using laboratory hamsters cages to the department of veterinary anatomy laboratory, University Al-Muthanaa, Iraq.

The animals were acclimatized for three days prior to the research and had free access to elephant grass, commercial feed supplement and water. The animals were observed to be in good nutritional status on physical examination before euthanasia. They were all sedated using gaseous chloroform in a confined container and later sacrificed.

#### Gross anatomy

For each animal, an incision was made on the ventral midline immediately after sacrifice and the abdominal cavity was exposed. The small intestines were dissected from the mesenteric and spread in a straight line. The gross anatomical structures of the entire intestine were observed.

Photomacrographs were taken using a digital camera. Tissue samples were collected from the segments of the small intestine (Duodenum, Jejunum and Ileum) and fixed 10% in buffered formalin for histology.

#### Histology

The fixed tissues (duodenum, jejunum and ileum) were cut into blocks and identified. They were then dehydrated through a series of graded alcohols (70%, 80%, 90%, 95% and 100%). The blocks were cleared in xylene and then infiltrated with molten paraffin wax. Sections (6 \mu m) microns thick were cut from embedded tissue using (Jung Rotary Microtome (model 42339)) (9).

The tissues were then mounted on grease free clean glass slides. The slides were prepared at room temperature stained alternatively with Hematoxylin and Eosin (H & E) and (Lilles Alchrome stain). The prepared slides were studied using light microscope (Olympus binocular microscope). Photomicrographs of the prepared slides mounted on the binocular microscope were taken using a digital microscopic objective. These pictures were then transferred to a computer and detailed studies were carried out (10).

### Results & Discussion

#### Morphological aspect: The small intestine of animal studies were distinctly divided into three segments, namely the duodenum, jejunum and ileum. The three grossly divided parts of small intestine in the current studied animals were similarly observed in other studies such as (11–13).

The duodenum consisted of descending and ascending limbs forming U-shaped tube called duodenal loop. The pancreas observed between these limbs. The U-shape of duodenum in the current animals was commonly observed in the other (this result disagreement with other studies such as Agur et al (14) those said the duodenum it was found to form an “S” shaped curve and also the (15,16) mention the duodenum it found is a C-shaped or horseshoe-shaped structure.

The jejunum of the animals was organized grossly in the form of cone-shaped of spiral coils. The cone had centripetal coils, a sigmoid flexure and centrifugal coils. This jejunum shape was similar to other studies in squirre (17).

The third segment of the small intestine of the animals was the ileum which appeared the shortest part of the small intestine. It joined the jejunum cranially and extended caudally to join the cecum these result
agreement with other studies such as (14,17).

**Histological aspect**

The small intestine appeared long convoluted tube, extends from the junction with stomach to joining point with the large intestine. Three segments were found in the small intestine of the studied animals, namely duodenum, jejunum and ileum these result agreement with other studies such as (15,17).

**Duodenum:** The organ showed microscopically the four classic known layers of a tube organ: mucosa, submucosa, muscularis and serosa (Fig.1). These four layers appeared in the duodenum and other parts of the small intestine in all such as (18,19).

**Tunicae mucosa:** The duodenal mucous membrane in the animals showed three different parts (Fig.2), that were lining epithelium (simple columnar cells) (Fig. 2), lamina propria (loose connective tissue with the presence of mucosal glands) (Fig.2,1 ) and muscularis mucosa (two thick layers of smooth muscle arranged into inner circular and outer longitudinal bundles). The presence of two layers of muscularis mucosa in the duodenal mucosae of animals was similar to the findings observed in (20). The mean thickness of this tunica in hamster was 2131.2mm, whereas, in the rabbit was 2410.1 mm.

**Duodenal villi:** They were finger-shaped mucosal projections which constructed from the lamina propria, smooth muscle fibers as well as the lacteal. The latter was blind ended lymphatic capillary that is lined by simple columnar epithelium in studied animals (Fig.1,a) these result agreement with other studies such as (2,21).

The lining epithelium of the villi was similar to those observed previously in the same organ these similarity with study (3). The irregularity that observed in the mucosal surface could be due to the presence of duodenal villi intervening between the bases crypts of Lieberkühn. The mean length of villi in hamster was 7251.3mm, whereas, in rabbit about 9764.7 mm.

**Duodenal Crypts of Lieberkühn:** These were simple tubular glands called intestinal glands that were extended from the muscularis mucosa till the bases of the villi. They were lined by a simple columnar epithelium similar to the lining epithelium of the duodenal lumen (Fig.2,a ). The mean diameter of gland in hamsters was 3228 mm and in rabbit 5783.1mm.

**Tunicae Submucosa:** It was formed irregular dense connective tissue situated, beneath the muscularis mucosa, and the layer composed of large blood, lymphatic vessels. The Brunner glands that found in submucosa in mammals concert. The mean thickness of this tunica in hamster was 1877.3mm, whereas, in the rabbit was 2124.1 mm.

**Tunicae Muscularis Externia:** Underneath submucosa the muscular coat consists of the smooth muscles fibers arranged into two layers, the inner circular and the outer longitudinal layers in the studied animals(Fig.1,a). Evenly the inner layer was thicker than the longitudinal layer over all parts of the duodenum. This finding was agreed with studies (16) in wistar rats. The mean thickness of this tunica in hamster was 4342mm, whereas, in the rabbit was 5117 mm.

**Serosa and adventitia:** The layer appeared thin in thickness constructed by loose connective tissue covered by a layer of mesothelial cells (Fig.1,a ). The serosa lined externally the muscularis. These findings were similarly recorded in other result disagreement with (4) in wistar rats. The adventitia or outer layer consists of a serous membrane composed of connective tissue covered the free part of organ. The mean thickness of this tunica in hamster was 200mm, whereas, in the rabbit was 240 mm.

**Jejunum:** The microscopic examination of jejunum’s wall showed similar histological layers of a tube organ (Fig.3,b ).

**Tunicae mucosa:** The mucous membrane was thrown into large numerous long leaf-shaped villi that were arranged in a finger like projections in animals. The epithelial lining represented by single layer of tall columnar cells of both villi and crypts in the studied animals (Fig.3,b ) which was in a good agreements with what was recorded by other result such as (4) in wistar rats. The mean length of villi in hamster was 7640mm, whereas, in rabbit about 8951mm. The crypts of Lieberkühn were short and simple tubular ducts opened at the bases of villi occupying most of the thickness of the lamina propria till the muscularis mucosa (Fig. 3,b). The mean diameter of gland in hamster was 2879mm and in rabbit was 2276mm. The lamina propria consists
of loosely packed connective tissue containing blood vessels and muscle fibers (Fig.3,b) and such finding was comparable with that observed by other studies (4) in wistar rats.

The muscularis mucosa in the animals was poorly developed and composed of only a few bundles of circular muscle fibers (Fig. 1,b). The mean thickness of this tunica in hamster was 2621 mm, whereas, in the rabbit was 2791 mm.

**Tunicae Submucosa**: The submucosa was a thicker layer of loose connective tissue possessed many blood vessels (Fig. 1,b). The mean thickness of this tunica in hamster was 1372 mm, whereas, in the rabbit was 1912 mm.

**Tunicae Muscularis Externa**: This layer was constructed of a thin outer longitudinal and a thick inner circular layers in the studied animals. Between these muscle bundles, fine dispersed narrow connective tissue layer containing many large blood vessels (Fig. 1,b). The presence of two muscular layers in the present animals was similarly recorded in other studies such as (15). The mean thickness of this tunica in hamster was 4320 mm, whereas, in the rabbit was 4771 mm.

**Tunicae Serosa**: It was formed by layer of simple squamous epithelium under which was a thin layer of loose connective tissue (Fig. 1,b). The mean thickness of this tunica in hamster was 180 mm, whereas, in the rabbit was 200 mm.

**Ileum**: Similar to the previous tube like organs the microscopic examination of ileum’s wall showed the four layers: mucosa, submucosa, muscularis and serosa (Fig.4).

**Tunicae mucosa**: The villi appeared small leaf-shaped arranged in a zig-zag pattern (Fig. 4,c). Each villus was lined by an epithelium while its center contained connective tissue core and such construction was agreed with results of studies (4) in wistar rats. The villi were short and less numerous compared to those found previously in the jejunum and duodenum of the same investigated animals. The lining epithelium was simple columnar (Fig. 1,c). The epithelium showed obviously higher number of goblet cells compared to those observed in both duodenum and jejunum. The mean length of villi in hamster was 3481 mm, whereas, in rabbit about 3632.1 mm. Loose connective tissue observed in the propria just beneath the epithelial lining (Fig. 1,c) which was similar to (17) in rats when a simple columnar epithelium supported by underlying connective tissue propria.

The muscularis mucosa was made of a thin outer longitudinal and a thick inner circular layers of smooth muscle fibers (4) in wistar rats. The mean thickness of this tunica in hamster was 1815 mm, whereas, in the rabbit was 2126 mm.

**Tunicae submucosa**: This layer was formed of loose connective tissue with blood vessels and these findings agreed with that recorded in (4) in wistar rats. The mean thickness of this tunica in hamsters was 1311 mm, whereas, in the rabbit was 1521 mm.

**Tunicae Muscularis Externa**: The layer muscularis was made up of an inner circularly and an outer longitudinally arranged layers of smooth muscles bundles (Fig. 1,c). This muscular arrangement was similar to that in (17) in rats. The mean thickness of this tunica in hamsters was 2321 mm, whereas, in the rabbit was 2853.4 mm.

**Tunicae Serosa**: Layers serosa was a thin layer of loose connective tissue. Its external surface was lined by simple squamous epithelium (Fig. 4,c). The mean thickness of this tunica in hamster was 160 mm, whereas, in the rabbit was 180 mm.
The dimensions of duodenum, Ilium nad Jejunum in hamsters and rabbit (µm) (Mean ± SE).

Fig. 1. Cross section of the small intestine wall of Rabbit showed mucosa (A), Submucosa (B), Muscularis (C), and serosa (D), muscularis mucosa (E), (a) duodenum, (b) jejunum, (c) ileum H & E, X100 (a) and (b), (c) X200

Fig. 2. Cross section of the small intestine wall of Rabbit showed: Crypts of Lieberkuhn (A), Brunner’s glands (B) connective tissue (green), (a) duodenum, (b) jejunum, (c) ileum.

Awareness of Health Workers in Premature Units At Kirkuk City Hospitals Concerning Neonatal Jaundice

Wijdan Abdullameer Kamel1, Chateen Jihad Rauf2
1MSc. Environmental Chemistry. Assistant Lecturer, Department of Basic Sciences, Kirkuk University, College of Nursing, Kirkuk, Iraq, 2MSc. Industrial Chemistry. Assistant Lecturer, Kirkuk Education Directorate, Kirkuk, Iraq

Abstract

Objective: this study aimed to assess the awareness of the health workers in premature units regarding neonatal jaundice at Kirkuk city hospitals, as well as to find out the socio demographic characteristics of the study sample.

Methodology: A descriptive study was carried out at premature units of Azadi Teaching Hospital, Kirkuk General Hospital and Pediatric Hospital of Kirkuk city, for a period from the 1st February and up to the 15th of May, 2019 and to achieve the objectives of the study. A non-probability (purposive) sample of (62) health workers working at premature unit were recruited. Developed questionnaire was constructed for the purpose of the study which consisted of two parts: the demographic characteristics; awareness part (knowledge and practices). The data were collected through the use of self- administered technique. They were analyzed through the application of descriptive statistical analysis (Frequency, Percentage % and mean score) data analysis.

Results: The findings of the study indicated that (45.2%) of the staff were from pediatric hospital. (40.3%) were graduated from Nursing Institute, (43.5%) had experience from 1<5 years and (74.2%) had participated in a training course mostly inside the country. The total grand mean score for the staff awareness (knowledge and practices) were adequate (1.73).

Conclusions and Recommendations: Assessment for the study sample awareness was adequate. Educational programs should be designed to increase the health workers awareness working at pediatric departments regarding management of neonatal jaundice especially those with less than 5 years’ experience.

Keywords: Neonatal jaundice, hyperbilirubinemia, health workers, Kirkuk.

Introduction

Neonatal jaundice (NNJ) is the yellowish shading of the skin and sclera of babies because of expanded degree of bilirubin in the body. It is the most widely recognized neonatal issue requiring clinical assessment and the executives everywhere on over the world. Neonatal jaundice consider one of the most well-known discernible physical signs during neonatal period. (1)

The most cases of neonatal jaundice are physiological jaundice, which occurs in 36 hours after birth, and the baby usually in good condition and the total serum bilirubin will not be too high 12mg/dl in a full term baby. (2)

Physiological jaundice in newborn can be due to, massive erythrocyte destruction, decrease in conjugation rate and poor transformation of bilirubin. (3)

The other type of neonatal jaundice is the pathological jaundice which occurs in the first 24 hours after birth and there will be rapid elevated of total serum bilirubin 5mg/dl/day. (4) The main causes for pathological jaundice, direct bilirubin is sepsis, congenital infections and liver diseases such as hepatitis and biliary atresia, while the indirect bilirubin is hemolytic disease and hypothyroidism. (1)
The early identification of newborns who are at a greater risk of enhancing severe neonatal hyperbilirubinemia is of paramount importance to preventing damage of brain. (3) In any case, bilirubin is venomous to synapses. In the event that infant be experiencing intense jaundice, there’s a hazard of passing bilirubin to cerebrum, this condition is called extreme bilirubin encephalopathy.

Neonatal jaundice (NNJ) influences up to 84% of term infants and is the most inescapable reason for emergency clinic readmission in the neonatal stage. (7) In child, jaundice will in general create as a result of two factors, the breakdown of fetal hemoglobin and the moderately youthful hepatic metabolic way ways which can’t form thus emission of bilirubin is as fast as a grown-up, this explanation an aggregation of bilirubin in the blood prompting the indication of jaundice. (8)

The known risk factors for the occurrence of infant jaundice incorporate an ABO or Rh factor contradiction among mother and infant, a newborn child of a diabetic mother, premature liver functioning, Glucose 6 Phosphate dehydrogenase deficiencies and incorrect latch of newborn to breast during breastfeeding. (9)

According to a report by Global Burden of Disease GBD in 2016, insufficiency of offices for fast, routine bilirubin assurance or imperfect irradiance (<8–10 μW/cm²/nm) from ineffectively kept up phototherapy apparatuses are levels of deferral for powerful mediation that bring about higher midpoints of avoidable and conceivably destructive trade bonding likewise bilirubin instigated mortality in creating nations. It likewise watches home conveyances do assume a part in late location and treatment of neonatal jaundice. (10) It is known United Nations Children’s Fund (UNICEF) intents to decrease in death rates occurring at neonatal age, Global Burden of Disease (GBD) indicates that first trial to estimate the burden of severe NNJ assessed to influence 481,000 late-preterm and term children yearly, with 114, 000 biting the dust and >63, 000 getting by with moderate or extreme long-haul neurologic weaknesses. (10, 11) That’s why we need to further research and interventions to put the alarming problem under monitoring.

This investigation was directed to distinguish the information and practices of the nursing staff who are working in the premature unit in three hospitals in Kirkuk city regarding the neonatal jaundice.

**Methodology**

**Design and setting of the Study:** An engaging report was done from February, 1st, 2019 to May, 15th, 2019 so as to accomplish the targets of the current examination. The examination was directed in untimely units of three medical clinics (Pediatric Hospital, Azadi Teaching Hospital and Kirkuk General Hospital) in Kirkuk city.

**Test of the examination:** Non - Probability inspecting approach (purposive example) comprises of 62 health workers working at premature units of the three hospitals.

**Inclusion Criteria:** Only health workers who were working at premature units of the three hospitals.

**Instrument Construction:** For the purpose of the present study, a questionnaire format was constructed to assess the health workers awareness (knowledge and practices) regarding neonatal jaundice. The poll design depended on the audit of writing and related past investigations. Formal consent was obtained from the nursing staff who agreed to participate in the study, the questionnaire was self-administer and took 10-15 minutes to be complete. The investigation instrument included three sections, which was comprised of the accompanying factors: The investigation instrument included three sections, which was comprised of the accompanying factors:

1. **Part One/Socio-segment qualities:** which includes: Type of hospital, Sex, Educational level, marital status, residence, Socio-economic status, years of experience in premature unit, participation in a training course, period of the training course and the place of the training.

2. **Part Two/ Assessment of awareness (knowledge part):** Include 15 items regarding knowledge of the sample. It has been consist of two scales as two (2) for ‘‘Yes’’ and one (1) for ‘‘No’’.

3. **Part Three/ Assessment of awareness (practice part):** Include 7 items regarding practices of the study sample.
Legitimacy of the examination scale: To guarantee the legitimacy of the scale, technique and system were proposed to be done during the investigation. Nine specialists of various fortes identified with the field of the current investigation were picked to survey face and substance legitimacy. They were approached to audit the scale design for lucidity and ampleness so as to accomplish the current examination goals. Certain changes were utilized dependent on the specialists’ proposals and recommendations.

Pilot study: The pilot study was completed for the period from February, 15th, 2019 to February, 30th, 2019. A pilot study was conducted before starting actual data collection, time need to complete each questionnaire and self-administered ranged approximately (10-15) minutes. Selected 4 staff from pediatric Hospital, 3 from Azadi Teaching hospital and 3 staff from Kirkuk general hospital. The sample of the pilot study were excluded from original sample of the study. The purpose from the pilot study was to recognize the obstructions that might be experienced during information assortment, gauge the time required for information assortment and to make certain of the precision of the scales.

Strategy for Data Collection: Data were gathered through self-administered technique. The examiner had exhibited targets and the centrality of examination and the advantage of the investigation to the member. Verbal consent obtained from premature unit nursing staff. Each nurse spends approximately (10-15min) to respond to the questionnaire.

Period of Information Collection: Data assortment has been directed during a time of two months stretching out from February 15th, 2019 to April 15th, 2019.

Statistical analysis: Data were analyzed in several steps. First, descriptive statistics, which includes frequency and percentages, and Mean score. Data were arranged, composed and went into the PC record; Statistical Package for Social Science (SPSS) (20 rendition) is utilized for information examination at (P. esteem ≤ 0.05). Information were analyzed through the application of two approaches:

Descriptive statistical data analysis: This approach is employed through:

- Frequency distribution
- Percentage (%)

\[
\%	ext{ } = \frac{\text{Frequencies}}{\text{sample size}} \times 100
\]

- Mean of Scores

This calculation is applied for the assurance of thing’s centrality of the evaluation apparatus comparative with every angle. Cut-off points are used for this determination low-significant, moderate significant, and highly significant.

\[
M . S = \frac{f_1 \times \text{score}_1}{n_1} + \frac{f_2 \times \text{score}_2}{n_2}
\]

It is computed as follows:

\[
M . S = \text{Mean of score}
\]

\[
f = \text{Frequency}
\]

\[
n = \text{Number of cases}
\]

So the cutoff point was calculated according to the following formula

\[
\frac{1+2}{2} = 1.5
\]

A mean of score of (1- less than 1.5) was considerate inadequate and from (1.5 - 2) was considerate adequate

Rating and scoring of the scale: The mindfulness (information and practices) poll things were appraised and scored to things as, (2) for Yes, and (1) for No. Data of the study were ordinal according to two levels scale of (Yes, No) which were scored as (2, 1) for each level respectively.

Ethical approval: Ethical approval were obtained from Kirkuk Directorate of Health as well as from the moral council in the school of nursing, Kirkuk University.

Results

The present study sample were distributed to the three hospitals as follows, (45.2%) of them were from Pediatric Hospital, (32.3%) were from Kirkuk General
Hospital, while (22.6%) of the participants were from Azadi Teaching Hospital. (figure 1)

Figure 1: Distribution of the study sample

Regarding to sex, (79%) of the participants were female, while only (21%) were male, according to the educational level (40.3%) of the participants were graduated from nursing institute, while (11.3%) of them had graduated from nursing college.

According to marital status, (50%) of study sample were married, while (6.5%) were divorced and widow. While to residence, (82.3%) were from urban and (17.7%) were from rural. socio-economic status, (58.1%) had barely sufficient economic status and (27.4%) had sufficient economic status.

Regarding to years of experience in pre mature unit (43.5%) of participants had (1<5) years’ experience, while (1.6%) of them had (15<10) years of experience, while according to participation in a training course (74.2%) of them answered yes, while (25.8%) answered No, and those who participate in a training course less than one week were (46.8%), while (24.2%) had from (1week<11month) training course, and (71%) of these training courses were inside Iraq.

While table 3 shows the total GMS for the study sample knowledge and practices, the result found that the knowledge and practices of our study sample were adequate.

Discussion

The finding of the current examination showed that most of the investigation test (79.0%) was female. The current study is in agreement with a study by Khudhair S, (2016) (12) of effectiveness of health educational program upon nurses practices toward care of newborn regarding neonatal jaundice, which found that the majority of the study sample were female, and this can be explained as the majority of females had cozy toward care baby so they like to work in pediatric medical clinics. Moreover, most of the sample graduated from the institute of nursing. Our result was in agreement with a study by Khudhair S, (2016) (12) who referenced that the majority of the investigation test were moved on from the clinical foundation in his examination about adequacy an instructive program upon medical attendants rehearse toward care of infant with respect to neonatal jaundice. In the current investigation around two third of health workers live in metropolitan zone and half of the nurses were married, while (37.1%) of them were single. The results were in the same line with Ahmed et al (2017) (13) who observed that most of them were married. Comparable to the attendants’ long stretches of encounters in the neonatal emergency unit more noteworthy level of them had 1<5 years’ understanding and accounted (43.5%) while only (1.6%), (6.5%) of them had experience from 15 to more than 20 years. Regarding to participation in a training courses, around three quarters of the sample have involved in a training course of being less than one-week period the majority (46.8%) and most of the training courses was inside the country. This finding is upheld by Watson(2011)(14) who referenced that all members the length of administration extended from 1 to 5 years. The result by Khudhair S, (2016) (11) also disagree with the current study as the medical attendants’ long stretches of encounters in the neonatal emergency unit more prominent level of them had 12-16 years’ understanding and accounted (36.7%) and (40.0%) of them had over 17 years of encounters in nursing. The attendant assumes fundamental function to guarantee the norm of care for all babies so as to restrain intense bilirubin encephalopathy and kernicterus and the medical caretakers should fill in as a crew to guarantee that all newborn children are screened for of danger raised bilirubin levels (hyperbilirubinemia) preceding clearing from the emergency clinic. Awhonn S.et.al. (2009) (15). As regard to the knowledge of the health workers in premature unit of the three hospitals, the current study found that the assessment for the participant’s knowledge regarding neonatal jaundice was adequate knowledge for all items with grand mean score (1.72). This result was in agreement with the result of Adebami, (2015) (16) who found that there was significantly better understanding of neonatal jaundice causes such as blood group incompatibility, G6PD deficiency, low birth weight and infection among optional medical services laborers than essential consideration laborers (p < 0.007). Similarly, secondary health care workers were
better informed on appropriate approach to management of neonatal jaundice like the need for referral, laboratory tests to determine the causes and severity, possible treatment options like phototherapy and/or exchange blood transfusion when severe (p=0.000). Regarding the health workers practices in premature unit of three hospitals, the result showed that the participants practice were adequate, except in item (1) which was “Most of neonatal jaundice does not need treatment” and item (2) which was “Follow the baby without admission” were inadequate (MS: 1.4) respectively. The total grand mean score for the practice part was (1.74). A study by Abai G.et al.(2011) (17) has found that intercessions taken assisted with advancing the information and practice of prescribed measures to unveil neonatal jaundice early. More grounded accentuation must be put on utilizing the new revealing strategies and new nursing sheets. Offices of vehicles for all bustling maternal and kid wellbeing centers for home nursing consideration is enthusiastically suggested.

Conclusions and Recommendations: Assessment for the study sample awareness was adequate. Educational programs should be designed to increase the health workers awareness working at pediatric departments regarding management of neonatal jaundice especially those with less than 5 years’ experience.

Study of Some Immunity Characters Results of Injection antigenic *Staphylococcus sp.* in Local Rabbits

Roua Jamal AbdulKhaliq¹, Hiba M. AlKhateeb², Abdulwahab Bdewi Hussain³, A. O. Humide³

¹Lect. Department of Pathological Analysis, Applied Science Collage, University of Fallujah, ²Lect. Department of Dentistry, Al-Esraa University collage, ³Lect., Department of Pathological Analysis, Applied Science Collage, University of Fallujah

Abstract

This study was conducted to identify some immune manifestations resulting from the injection of staphylococcal bacterium antigens Heat-killing with a concentration of 0.75 ml in muscle and concentration 0.5 ml subcutaneous in local rabbits to see how immune response of these antigens achieve. Tests were carried out (late hypersensitivity, phagocytosis of candida albicans, and NBT dye reduction).

The results showed that the highest level of skin thickness was 9.50 ml compared to control 1.48 ml after 24 hours of antigen injection. The results also showed that the highest level of candida yeast is 81.30% when injecting concentration 0.5 ml under the skin compared to control 79.33%. As for the reduction of NBT dye, the highest level of dye reduction was 14.70% when the concentration was injected 0.75 ml with the muscle compared to 10.63% control.

We conclude that the injection of staphylococcus antigens (killed by heat) has the potential to induce immune response in local rabbits

Keywords: *Staphylococcus*, Immunity, Rabbits

Introduction

*Staphylococcus* is considered a cluster bacterium for its non-moving cluster shape and discolored according to gram, an anaerobic bacterium optional with the exception of sheep’s Staph. *Aureus*. which is obligatory anaerobic (¹). It currently has approximately 20 or more types of skin injuries such as daisies and lobes and has a high pathogenic characteristic and contains an important pathogenic factor, coagulase. Bacteria are considered one of the most famous factors that cause the infection because of its wide spread spectrum, because of the range of infection from simple to serious, as these bacteria have the potential to spread the infection widely and its toxic effect(²–⁴).

The aim of the research is to determine the extent of the immune response against staphylococcus antigens in local rabbits.

Material & Methods

Sampling and bacterial isolation:

Swab samples were collected from inflamed wounds in animals and then grown on three culture transplant and it’s:

- Nutrient Agar
- Blood Agar
- MacConky Agar

Then placed in the incubator for 24 hours with a temperature of 37.2 c0 and then observed the growth of bacterial colonies on the implant circles, the eye was taken from the colonies and dyed with gram stain and upon examination it was found positive for this dye and it is a cluster bacteria (cocci).

To find out the sex of these bacteria, he took his eye and grew up on another medium, Mannitol Salt Agar, a
special medium for the growth of Staphylococcus, placed in the incubator with a temperature of 37.5 °C for 24-48 hours observed the growth of bacterial colonies. He then attended a liquid transplant, Brain Heart Infusion Broth, for mitigation purposes. After preparing the medium we planted in one of the tubes bacteria Staphylococcus and then put in the incubator and after 24 hours observed the change of the middle from net to turbidity indicating the growth of bacteria then attended 6 tubes of the liquid implant center in each tube 9 ml to perform the mitigation process. He took 1 ml of the tube containing on a bacterium and then put in the tube number 1 and then 1 ml of tube 1 and put in the tube number 2 and then 1 ml of number 2 and put in number 3…. Etc. To tube 6 where we took 1 ml and we neglected it. Then he took from each of the tubes (4-5-6) one ml (1 ml) and the other 0.1 ml and put in the dishes of the implant and then poured the center of the implant on top of it and then we moved each dish 25 turns clockwise and 25 cycle counterclockwise for the purpose of mixing bacteria with the culture media. Incubated the dishes were heated at a temperature of 37.5 °C and for 24-48 hours after which we found the growth of bacteria in the implant editing circles where the growth in the two concentrations for tubes 4-5 was very dense (colonies cannot be counted) as well as for the concentration of 1 ml for tube 6. As for the concentration of 0.1 ml for tube 6, the number of colonies was 242 colonies by a growing bacteriological on the plate (the colonies were calculated by the colony counting device), by equation. (Number of colonies * inverted dilution * solution size).

When calculating concentration at 1 ml, it was found to be =242*10^7 colony by bacteria colony/ml. Then killed the bacteria by putting them in a water bath temperature of 100 °C for half an hour, then they took sample and grew on the culture media to make sure that the bacteria were killed and after the incubation for 24 hours /37.5 °C did not grow the bacteria(5).

2- Injection of dead bacteria into rabbits:

After killing the bacteria, take three groups of local rabbits in the animal field of the Faculty college of Veterinary Medicine in Fallujah university, took each group of three rabbits that injected the first group with a concentration of 0.5 ml subcutaneous, and injected the second group with a concentration 0.75 ml with the muscle and left the third group for control. After 14 days of the first injection, it was injected with the same concentrations again and a week later the blood was drawn for work immunological experiments.

3- Immunological tests

A- Hypersensitivity Test

Two groups of local rabbits belonging to the Faculty of Veterinary Medicine in Fallujah took each group of thirteen rabbits injected the first group with staphylococcus bacterium antigens killed by heat with a concentration of 0.1 ml inside the skin, and left the second group to control. The thickness of the skin and the diameter of the red circle were measured in the infected group and in the control group after 24-48-72 hours of injection.

B- Isolation of polymorph nuclear neutrophils cell from the blood.

Blood was drawn from the group of infected people and from the control group from the heart by a wine syringe and placed in sterile plastic tubes and sealed container on heparin with a concentration of 500 global units to prevent coagulation and dextran solution to degenerative red blood cells and then gently blended the contents of the tube. The tubes were then placed in the incubator warmly 37 °C for 45 minutes, after which the plasma layer containing the white blood cells was withdrawn and transferred to another sterile plastic tube. White blood cells were washed with hanks local balanced solution twice by discarding them at 1500 rpm to remove plasma and heparin. The cells were then suspended in the same solution, with a concentration of 1*10^6 cells/ml(6).

A- The effect of staphylococcus on the reduction of Nitroblue tetrazolium stain (NBT for PMNs cells).

Put 0.75 ml of PMNs cell stuck in silicone-coated glass tubes and then add 0.75 ml of NBT dye prepared according to the method(7) the tubes calmly spin the hand to mix the contents of the tube with the provisions of the provisions placed the pipes then in the incubator temperature 37°C for 25 minutes. After the end of the incubation period he took 20 microliters from each tube to a glass slide and spread gently and then left to dry and fixed with methanol and then dyed your dye as a
muzzle prepared according to the method of Allen and his group\(^{(8)}\) for 15 minutes after which 200 cells under the optical microscope 100 X were calculated for the purpose of extracting the percentage of cells that were able to produce superoxide ion and thus reduce the yellow dye NBT to the blue furor granules that deposit in the eye-cell\(^{(7)}\). After the end of the incubation period he took 20 microliters from each tube to a glass slide and spread gently and then left to dry and fixed with methanol and then dyed by Geimsa stain prepared according to the method of Allen and his group\(^{(8)}\) for 15 minutes after which 200 cells under the optical microscope 100 X were calculated for the purpose of extracting the percentage of cells that were able to produce superoxide ion and thus reduce the yellow dye NBT to the blue furor granules that deposit in the eye-cell\(^{(7)}\).

A- The effect of Staphylococcus infection on the heat-dead candida yeast:

· Preparation of AB blood group

Pull 10 ml of the blood of a healthy people AB and put it in a sterile plastic tube and leave at room temperature for 30 minutes and then centrifuge quickly 2000 cycle/minute for 15 minutes, pull the top layer containing the required material (antibodies and complement), and save at a temperature \(-20^\circ\)C until use.

· Phagocytic examination

Placed in sterile plastic tubes 0.25 ml of PMNs cell that concentration \(1\times10^6\) cells/ml added 0.25ml of heat-killed yeast cells prepared by method (Wilkinson, (1977), by 1 cell PBNs: 4 killed yeast cells It was added 0.25ml of AB human blood group, after which the tubes were incubated at a temperature of 5-10% Co2 for periods (30-60-90-120) minutes where they prepare a tube for all time and for all trials (Harry etal., 2014). Then I made four slides for each tube left to dry and fix methanol for two minutes and then dyed with a pigment giemza for 15 minutes calculate 200 phagocytic cells and not phagocytic cells using optical microscope zoom 100 X to calculate the pharynx coefficient =

\[
\text{Pharyngeal coefficient =number of pharyngeal cells/total pharyngeal cell number (phagocytic cells + not phagocytic cells) x 100}^{(6)}
\]

Results

Table 1 shows late hypersensitivity reactions when staphylococcus antigens are injected into the skin and have the highest value for skin foldfish when heat-killing antigens are injected at 0.1 ml in the skin 9.50 mm at a time of 48 hours compared to control 1.48 mm, and the highest red diameter rate was 3.54 mm at a time of 24 hours compared to control (zero).

**Discussion**

The results of the study showed that the highest diameter of the redness circuit was 3.54 mm while the highest rate of skin fold thickness was 9.5 mm when injecting 0.1 ml of staphylococcus spp antigens. In the skin at the time 24 and 48 hours in respectively and then start the area of the irritated area and the thickness of the skin folds gradually decreased and there were significances differences between the transactions and its control. These results are consistent with his findings(9) When injecting antigens of the weakened pseudomonas aeruginosa bacteria as well as consistent with the study(9) On the heat-weakening E. coli bacteria, they found that the injection of antigens of these bacteria led to the significances rise in both the thickness of the skin and the area of the irritated area in the local rabbits to 3.21 mm and 4.25 mm after 24 hours of antigen injection respectively. Table 2 shows the susceptibility of PMNs cells to the aunt of candida yeast in the vitro, as the results showed that the highest level of the aunt of the candida yeast aunt in the totals of transactions injected with antigen 81.3% compared to control 79.33% and there were no significant differences between the injected groups and control groups. As for the reduction of the dye of Nitro blue tetrazolium (NBT), the results showed that there are significant differences in the injection of antigens compared to non-treated control and the highest reduction rate of 14.70% when injecting antigens at a concentration of 0.75 ml in the muscle compared to control 10.6% these results are consistent with the findings(10) which stated that the rates of pharyngeal coefficient in mice treated with polysaccharides fatty to klebsiella pneumoniae bacterium due to the ability of these antigens to stimulate the components of the complementary system, especially c5a and c3b, which are involved in the process of opsonization and attracting the neutrophilic cells to the site of the infection respectively(11).

Correlation between Women’s Attitudes and Abstain (Used/Unused) Contraceptive Methods at Primary Health Care Centers in Baghdad City

Maha Khaled Rida¹, Hawraa Hussein Ghafel²

¹MSc, Ministry of Health Student at Maternal and Neonate Nursing Department, College of Nursing, University of Baghdad; ²Lecturer at Maternal and Neonate Nursing Department, College of Nursing, University of Baghdad.

Abstract

**Background:** family planning is a preventive service that allows married couples achieving their desired number of children and deciding the spacing of pregnancies according to their economic opportunities and personal wishes, and to ensure that the births are at appropriate intervals for the mother and child health.

**Objective:** To find out the correlation between women attitudes and abstain and to find out the relationship between demographic characteristics and obstetrical history.

**Methodology:** A descriptive and analytic (cross sectional) study, was started at 16th September 2019 to 16th September 2020, conducted at Primary Health Care Center in Baghdad City, Iraq. Non probability (a purposive sample) the study sample consist of (150) women that attending Primary Health Care Center in Baghdad City, Iraq.

**Results:** indicates that there is significant relationship between women’s attitude and abstain of contraceptive methods as presented by significant correlation at p-value= 0.038.

**Conclusions:** there is significant relationship between women’s attitude and abstain of contraceptive methods related to Iraqi social habits that make men compel women to become pregnant and have a lot of children and there are other causes prevent women using contraceptive methods.

**Recommendation:** Designing programs to educate couples about family planning and using of contraceptive before marriage, Empowering the role of nurse in family planning to educate the women about contraceptive methods and how to use it and help them to choice the appropriate method, Activate the role of media in increase awareness of families in the Iraqi society about disadvantages of unplanned pregnancies and do not using contraceptive methods on women well-being and the luxury of community, and further studies to identifying the causes that make women do not use of contraceptive methods.

**Keywords:** Women, Attitudes, Contraceptives Methods, Abstain

**Introduction**

Family planning is defined as having the freedom and responsibility of all the couples and the individuals to decide the number of children they desire and having the knowledge, education and tools for this purpose. In other words, family planning is a preventive service that allows married couples achieving their desired number of children and deciding the spacing of pregnancies according to their economic opportunities and personal wishes, and to ensure that the births are at appropriate intervals for the mother and child health [1]. Over the past half century, an extensive literature has been accumulated on women’s attitudes and beliefs concerning contraception in general and specific methods. The extensive evidence for low- and middle-income countries (LMICs) falls into four main categories. The most common category comprises studies that examine attitudes towards and beliefs about contraception in general, with little or no distinction...
between specific methods. The emphasis in many papers is on negative perceptions, often labelled as myths and misinformation. Commonly reported themes include the belief that use of modern methods will cause long-term infertility, serious health damage, such as cancer and foetal abnormalities[2].

Low rates of unintended pregnancy are linked to access to contraceptive methods and legal access to abortion. Once women decide which tool to use, the efficacy of contraceptive methods is considered important. During contraceptive therapy, the efficacy of “typical use” rather than the “best usage” of contraceptive methods should be considered. The traditional use of contraceptive methods, however, may not be common knowledge among providers or women. Younger women have been shown to have less adherence to methods that require daily intake [3]. The most research regarding family planning methods is based on self-reported reasons for family planning non-use or discontinued use. Demo-graphic and health surveys (DHSs) are the dominant data source. The new study of reasons for non-use by married women who do not wish to become pregnant found that 20–33 percent of the 52 countries surveyed reported side effects or health concerns. This class of explanation has been the most widespread in 21 countries [4]. Moreover, the majority of women in a lot of countries who gave this reason for preventing birth control had already used a modern method. Fear of adverse effects, disapproval by couples, a limitation of option and knowledge and social disapproval give an explanation for unsatisfactory needs and low family planning use. Son preference has too been an issue in fertility especially in patrilineal societies, and this persists even with improvement in women’s levels of education social and economic-economic development. In addition, cultural differences have been highlighted, in particular traditional expectations and desires for more children and lines, as affecting family planning [5]. Important barriers to contraceptive methods use are myths and misunderstandings towards modern methods, for instance, in both developed and developing countries, many women misunderstand the use of oral contraceptives as being more dangerous than pregnancy [6].

**Methodology**

The study was started at 16th September 2019 to 16th September 2020, and the objectives were explained to the study sample by the researcher, the women’s verbal consent has been taken and the answering of questions have been done by using the self-administrative methods. In this study there is (150) women who were attending Primary Health Care Center in Baghdad City, Iraq. Which were selected according to inclusion criteria that are the females in reproductive age who attending Primary Health Care Center in Baghdad City, married women, and have children. The questionnaire consists of (3) parts, the first consists of Socio-Demographic Characteristics include: (age, level of education of women and their husband, occupation of woman and their husband, residency, socio economic status). The second consists of Reproductive History and includes (age at menarche, age at marriage, marriage duration, women parity, general information about children (gender, age, mode of delivery, and mode of feeding), age of mother at the primiparity and types of contraceptive methods that used and their duration. The third consists of Question about women attitudes is consist of (51) items which are divided in to three main domains first one is (effective domain) consist of (12) items, the second one is (behavioral domain) consist of (17) items, and the last one is (cognitive domain) consist of (22) items. participant answering the questionnaire to Evaluate their Attitudes about using of Contraceptive Methods. Some of questions had a positive Attitude and the other a negative Attitude, women that participate in this study were answering the questions by Owen selves and express their opinion about using of Contraceptive Methods without any disruption or direction from the researcher, so all the Attitudes that appear in the results it is express the Attitudes of Iraqi women about using of Contraceptive Methods.
## Results

Sig= significance

The table (2) indicates that there is significant relationship between women’s attitude and abstain of contraceptive methods as presented by significant correlation at p-value= 0.038.

Results and Discussion

Table (1) shows observed frequencies, and percentages of the studied socio-demographical characteristics variables (SDCV) which are distributed according to studied samples as well as that (44.7%) of women are with age group (25-34) years old and (29.3%) of them are with age group (35-44) years; the average mean for those women was refer to (31±7) year, (20%) among women who were graduated from college and intermediate school; while (19.3%) of them were having diploma degree. Educational level for women’s husbands, the highest percentages among them were indicated that their husbands are with bachelor degree (26.7%) and diploma degree (23.3%), half of women are housewives (54%) and (45.3%) are governmental employee, women’s husbands refers that (49.3%) of them are governmental employee and (45.3%) are Free job as presented the higher percentages among occupation for women’s husbands, majority of women are living in an urban area (94.7%) while only (5.3%) were resident in sub-urban areas, and (32%) of women are associated with monthly income of (300 000 - 600 000) Iraqi Dinars, (19.4%) of women are associated with moderate socio-economic status as reported that their income is (901,000 – 1,200,000) Iraqi dinar/ month, and (17.3%) of them are reported their monthly income is (<300,000 and 601,000-900,000) Iraqi Dinar.

Significant relationship between women’s attitude with regard to their age presented by significant difference between overall scale and age group at p-value ≤ 0.05. No significant relationship between women’s attitude with regard to their level of education, their occupation, their husband’s education, and their occupation at p-value ≤ 0.05. No significant relationship between women’s attitude with regard to their residency at p-value ≤ 0.05, no significant relationship between women’s attitude with regard to their socio-economic status at p-value ≤ 0.05.

The table (2) indicates that there is significant relationship between women’s attitude and abstain of contraceptive methods as presented by significant correlation at p-value= 0.038.

Table (3) shows that they got their first menstruation at age of (13 and 14) years old (27.3%), that half of women were marrying at the age (18-23) years old (50%), (20.7%) were marrying at age (24-29) years, that about third of women are reported (6-10) years as duration of their marriage (33.3%), and (29.3%) are reported that they married for (1-5) years ago, presented the descriptive characteristics of women’s children; the number of children is distributed among the women, all of them are reporting they have one child (N=150), 112 of them reported they have two children, 75 of them are reported they have three children, 44 of them are reported they have four children, 23 are having five, 8 are having six, only three having seven, and only one having eight children, and women are born their first child at age of (19 – 23) years with high percentage among women under the study (40%). That there is no significant relationship between women’s attitude
with regard to their age at menarche at p-value ≤ 0.05. Significant relationship between women’s attitude with regard to their age at marriage and their years of marriage indicated by significant difference between overall scale and age at p-value ≤ 0.05.

Conclusions

The study concluded the following:

1. The highest percentage of women were at age group (25-34) years old. Their educational level was intermediate school and bachelor and their husband had bachelor. Were housewives and their husband employee. They lived in an urban area with moderate income.

2. The highest percentage of women had menarche at age (13 and 14) years old. Half of them married at age (18-23) years old. Third of them had (6-10) years marriage duration. All of them have children and they have the first child at age (19-23) years old.

3. There is significant relationship between women’s attitude and abstain of contraceptive methods related to Iraqi social habits that make men compel women to become pregnant and have a lot of children and there are other causes prevent women using contraceptive methods.

Recommendations: Designing programs to educate couples about family planning and using of contraceptive before marriage, Empowering the role of nurse in family planning to initiate workshop to educate the women about contraceptive methods and how to use it and help them to choice the appropriate method, Activate the role of media in increase awareness of families in the Iraqi society about disadvantages of unplanned pregnancies and do not using contraceptive methods on women well-being and the luxury of community, and further studies to identifying the causes that make women do not use of contraceptive methods.

Clinical and Histopathological Study of Diclofenac Sodium-Acetylsalicylic Acid Toxic Effect on Liver of Mice

Rana Abdulla salih
Lect. Department of physiology, biochemistry and pharmacology, College of Veterinary Medicine, University of Baghdad, Iraq

Abstract

Both over-the-counter (OTC) and prescription analgesics-antipyretics like ibuprofen which is nonsteroidal anti-inflammatory drugs (NSAIDs) have effective as well as safe use for long time. Reversible inhibition of cyclooxygenase enzymes is the mode of action of NSAIDs over all. Use of NSAID lead to drug adverse reactions such as cardiovascular and gastrointestinal bleeding also effects of renal. Drug–drug interactions (DDIs) within the NSAID and a concomitant medication cause adverse drug reaction to several cases. DDIs have been reported for example, when commonly used medications as well as some antihypertensive, alcohol, aspirin, antidepressants are coadministered with NSAIDs. Dependent on total drug exposure cause a continuous risk in that the potential for an ADR due to interactions pharmacologic nature. When assessing ADRs potential risk is important to consideration the use of NSAID dose and duration, also the comedication type or class administered. The sub acute toxicity were carried out on thirty mice divided to three equally groups (10 mice in sub group) which were dosed for two weeks daily as follows: group one (control) was givin distilled water, the group two was get diclofenac (voltaren) (100mg/kg B.W.) and group three was givin diclofenac (voltaren) with aspirin (100mg/kg B.W.) for each together. Clinical signs of toxicity appear as following: abdominal pain, nausea, dizziness, anorexia, ataxia, blueness of the chest area, shortness of breath and Paralysis of the posterior limbs and recumbence, finally the death of mouse. Serum liver enzyme (ALT and AST) were elevated in all groups (diclofenac and diclofenac with aspirin) as compare to control after two weeks. Considering histopathological studies of liver tissue after two weeks of daily treatment, which showed moderated mononuclear cells infiltration in portal area around blood vessels and bile duct for voltaren group and fatty vacuoles in the cytoplasm of hepatic cells, single cells necrosis and severe inflammatory cells infiltration in the capsular area for voltaren with aspirin group. We concluded that diclofenac and diclofenac with aspirin have toxic effect appear by clinical symptoms and damage to liver, furthermore, don’t administration of more than one NSAID at same time.

Key word: Nonsteroidal antiinflammatory drugs, voltaren Na, aspirin, toxicity, liver

Introduction

NSAIDs (Nonsteroidal anti-inflammatory drugs), are a class of medicine that lower fever and reduce pain, prevents blood clots, with high doses lead to decrease inflammation (1). The prominent members of this drugs group, aspirin; ibuprofen also naproxen, are mostly available in most countries as over the counter (2).

Adverse effects depend upon the drug specificity, but largely included an high risk of gastrointestinal ulcers with bleeds, also heart attack, as well as disease of kidney (3 and 4).

Achieve analgesia by any member of drug groups known as an analgesic or painkiller, pain relief, the work of analgesic drugs with different ways on the peripheral and central nervous systems. Anesthetics different from analgesic, which in some states eliminate, sensation completely, or mainly with temporarily affect. paracetamol one of analgesics (acetaminophen), the nonsteroidal anti-inflammatory drugs (NSAIDs) like salicylates, and opioid drugs, like morphine and oxycodone. Severity and response to other medication was determine that agent to choice when choosing analgesics; (WHO) the World Health Organization, pain ladder, its first step is specifies mild analgesics (5).
To choose analgesic is depend on pain type: The less effective analgesics are traditional to pain of neuropathic, also drugs classes which are not considered analgesics normally is often benefit in treatment, like anticonvulsants, also tricyclic antidepressants (6).

COX inhibit is mechanism of NSAIDs over all, which is an enzyme that change arachidonic acid to prostaglandins, by which pain mediating; fever; and inflammation (7).

Diclofenac is sold with the brand name (Voltaren) within others, is a NSAID (nonsteroidal anti-inflammatory drug) used for treatment of pain, also inflammatory diseases like gout, take with oral, injection, or skin applied, typically pain released get through half an hour and it lasts for about eight hours, in combination with misoprostol voltaren also available to decline problems of stomach (8).

The pain of abdominal, nausea, gastrointestinal bleeding, headache, dizziness, and swelling are the common side effect, otherwise serious side effects like stroke, disease of heart, kidney problems, and ulceration of stomach, it is contraindicated in third pregnancy trimester, also idicated through breastfeeding, it is work depend upon decreasing prostaglandin production (1). It lead to cyclooxygenase-1 (COX-1) and cyclooxygenase-2 (COX-2) blocks (8).

The widely used non-steroidal anti-inflammatory drugs used one is, probably is highly consumed pharmaceutical product mostly in the world. Aspirin, as a cardio-protective drug with an analgesic has a bigger importance recently. Otherwise, due to its adverse effects, the consumption of aspirin is depend on significant morbidity and mortality on many systems organ (9). Therapeutic use of aspirin for long-term is reported that accompanied to gastrointestinal ulcerations, hepatotoxicity, nephrotoxicity, also renal cell cancer occurrence (9 and10).

Acetylsalicylic acid (Aspirin), is a drug of salicylate, synthetic compound has analgesic, antipyretic, antiplatelet also anti-inflammatory properties (11). Children have little indications to use aspirin in case Kawasaki disease and Rheumatic fever (12).

NSAIDs protein binding were decreased when it administered with aspirin, although unknown of this interaction significance clinically, the free NSAID clearance was not changed (13).

Materials and Methods

Drugs:

1. Voltaren (Diclofenac)

Diclofenac (Voltaren) was tablet, 100mg/kg, Novartis, Switzerland.

2. Aspirin (acetylsalicylic acid)

Aspirin was tablet, 100mg/kg, Bayer, Germany.

Experiments:

Sub acute Toxicity Study:

Animals:

Thirty mice (Albino, Seprige Dawlly BO. CL) were obtained from the Serum and Vaccination Center. The mice 10 weeks old weighing 25-40 g were maintained under uniform environmental conditions. They were housed under controlled temperature 25 °C and exposed to light 12 hours per day before and during study. The mice were placed in cages (Opaque, plastic, measuring 29 x 15 x 12 cm). The mice were supplied with feed (Pellets form, commercial type) ad libitum. The animals were adapted for 2 weeks and allocated at the weighted groups.

The mice were split as three equal groups (10 mice to every group) which were to follows:

1- First control group treated with distilled water.
2- Second treated group by100mg/kg voltaren orally for 14 days.
3- Third group treated with 100mg/kg voltaren with 100mg/kg aspirin orally for 14 days.

Clinical signs

The signs was recorded to 14 days after administration of voltaren and voltaren with aspirin.
Parameter:

Blood serum sample:

Blood sample were collected from rabbits heart directly by (5cc syringe) in a dry, clean and sterile centrifuge tubes, and then left few minutes allowed to be clotted at room temperature before circulation by centrifuge at (3000) rpm for 20 minutes to separate the clear sera which were put in eppendorf tube by micropipette till performing the biochemical analysis (14).

Serum level of Alanine aminotransferase (ALT), Aspartate aminotransferase (AST), and Alkaline phosphatase (AP).

Histopathology:

The mice treated for two weeks, doses found by previous studies as treated dose for mice, which used the 100mg/kg voltaren and 100mg/kg aspirin, liver was used as a sample in histopathological study after two weeks of experiment to each groups. The animal was killed by broken neck with scissor then the liver was obtained and put in plastic container contain formalin solution (10%) and stained with Haematoxylin and Eosin staini

Statistical Analysis

Statistical analysis of data was done by using SAS (Statistical Analysis System - version 9.1). ANOVA One-way and Little significant differences (LSD) test of post hoc were done to determine significant differences within means, significant statistically is consideration to P < 0.05 as described by (15).

Results

Subacute Toxicity:

Clinical signs

After administration of voltaren and compination of voltaren and aspirin drugs to the mice have many symptoms of toxicity appear in different degree according to the drug as following: Abdominal pain, Nausea, Dizziness, Anorexia, Ataxia, Blueness of the chest area, shortness of breath, Paralysis of the posterior limbs and recumbence, finally the death of mouse.

Serum Alanine aminotransferase (ALT), Aspartate aminotransferase (AST) and Alkaline phosphatase (AP):

The serum levels of liver enzyme (ALT, AST and ALP) were found to be relatively elevated in the animals received diclofenac and diclofenac with aspirin in all groups (table 1 and chart 1). Serum AST levels through treatment for two weeks showed significantly increase at (P<0.05) between diclofenac group and diclofenac with aspirin as compared to control group. The levels serum of Alanine aminotransferase (ALT) within two weeks of treatment showed significantly increase at (P<0.05) between diclofenac and control group and no significantly increase on (P<0.05) of diclofenac with aspirin as compared to group of control. The level of serum ALP after two weeks of treatment showed significant decrease at (P<0.05) between diclofenac group and control group, otherwise no significantly increase at (P<0.05) of diclofenac with aspirin as compared to control.

Histopathological results

Results of liver histopathology in all groups after two weeks was obtained as following:

1. Group one (control group):

Histopathological sections of the liver tissue in control group after two weeks of the experiment (figures1), with no clear lesions.

(Figure 1): Histopathological section of the liver tissue to mouse treated with distilled water shows: no lesions clear (H & E stain 400X)
2. Group two (diclofenac group):

The lesions after two weeks of the experiment in liver tissue (figure 2) were shows moderated mononuclear cells infiltration in portal area around blood vessels and bile duct.

(Figure 2): Histopathological section of the liver tissue of mouse in diclofenac group after 2 weeks of the experiment shows moderated mononuclear cells infiltration in portal area around blood vessels and bile duct (H and E stain 400X).

3. Group three (diclofenac with aspirin group):

The lesions after two weeks of the experiment in liver tissue (figure 3) were shows fatty vacuoles in the cytoplasm of hepatic cells, single cells necrosis and severe inflammatory cells infiltration in the capsular area.

(Figure 3): Histopathological section of the liver tissue of mouse treated with aspirin and diclofenac shows fatty vacuoles in the cytoplasm of hepatic cells, single cells necrosis and severe inflammatory cells infiltration in the capsular area (H & E stain 400X).
Discussion

Diclofenac sodium symptoms include: Diarrhea, drowsiness, headache, dizziness, movement problems, nausea and vomiting (bloody sometimes), numbness and tingling, blurred vision, ringing in the ears, stomach pain (bleeding in stomach and intestines possibility), unsteadiness, rash, urination problems (no urine output to little), edema (body or legs swelling), wheezing (16 and 17) and this agreement with our present study which found some of this common symptoms.

Hepatotoxicity can be viewed as a result to an adverse interaction between two xenobiotic systems within the liver. Drug metabolizing enzymes have evolved as a result of relentless animal–plant warfare for a billion years.

Alternatively, an anti-inflammatory (also immune regulatory) property of IL-10, may be important in drug-induced liver injury (18) as proven by IL-10 knockout mice susceptibility to acetaminophen-induced hepatotoxicity. For that, the relation of cytokine polymorphisms with diclofenac-induced hepatotoxicity proven by in this study probably independent upon immune mechanisms. The liver’s ability to produce anti-inflammatory cytokines like IL-10 could, to an extent, be responsible for the low frequency of clinically significant hepatotoxicity (19).

Significant changes to the parameters of biochemical used for toxicity indicators. The levels of ALT, AST and AP in the blood normally are low concentration, those enzymes are considered as biomarkers of hepatic affection and elevated of these enzymes due to a major permeability or cell rupture (20).

Drug-induced liver injuries are classified as ‘hepatocellular’ (cytolytic), with an elevation of alanine transaminase (ALT) predominantly implying hepatocyte necrosis; ‘cholestatic’, with an elevation of alkaline phosphatase (ALP) predominantly, and ‘mixed’ pattern based on the ratio of ALT/ALP activity (19).

Liver transaminases (ALT with ALP) are benifit biomarkers of liver injury in a patient has some degree of healthy liver function, since ALP can be increased in other affecting organs diseases, ALT is more considered specific for hepatotoxicity (21).

Oxidative stress which caused by nitroxide and quinone imine-related redox cycling or putative diclofenac cation radicals and mitochondrial injury (opening of the permeability transition pore and protonophoretic activity) in combination or alone have been appeared in toxicity of diclofenac. For some cases, from a number of experiments demonstrating T cell sensitization and immune mediated liver injury is involved, inferred from unintended re-challenge data (21).

NSAID (non-steroidal anti-inflammatory drug) like diclofenac, using as antipyretic agent and an analgesic. Liver toxicity with diclofenac is lethal complication when it is not common with NSAIDs (22).

Hepatic degenerative changes by diclofenac which cause cellular damages (23). In this study, treated with diclofenac sodium lead to a significantly increased in ALT, AST, MDA,NO, and Caspase-expression accompanied by significant decline in total protein and albumin, also these results were accompanied by histopathological section and agree with the research (24) who reported that, increase of ALT, AST and ALT/AST, also inhibition of albumin and total protein are coinciding with the severity of damages of liver cell because aminotransferases are intracellular enzymes furthermore, rupture of hepatic cell due to circulation escaping of these enzymes ad this agreement with our study results. Damage of liver has been accompanied with induction of the pro-oxidant enzyme iNOS (25) producing NO. histopathological results of our study similar to those studied by (24) who evoked changes in histological section of liver. Diclofenac sodium appeared to cause hepatic damage by inducing alteration of biomarkers to limit the liver. One of the most sensitive and enthusiastic signs of liver cell damage is the entry of intracellular impulses, for example, transaminases and serum acid neutralizer phosphatase in the cycle (26).

(27) who found that histopathological study explained seriousness expanded of sores with expanded medication dosage, vacuolation with direct diffuse degeneration, peri-acinar rot with mellow to direct invasion of gateway zones and mononuclear cells in hepatic tissues analyzed of rats administrated diclofenac sodium for 14 days at doses of 100 and 150 mg/kg and this agreement with present study.
was found in histopathologically slides treated by aspirin explained that found a mild to moderate portal inflammation, focal cellular swelling, micro vesicular steatosis with cytolysis and this agreement with present study.

Mitochondrial adenosine triphosphate synthesis is impairs by aspirin, by direct cytotoxic effect or active metabolites leading to permeability elevated of mitochondria, oxygen reactive species overproduction, mitochondrial swelling, nicotinamide adenine dinucleotide phosphate oxidation and protein tiolls which can cause minimal interstitial inflammation with congestion to kidney tissue and hepatic injury. During intake of acute high-dose aspirin have been reported that liver function test abnormalities were reversible; although, during chronic low dose aspirin administration there is no clear data have been reported.

Aspirin lower concentration lead to peroxidation which causes impairment in human erythrocytes defense systems antioxidant was contraindicated used diclofenac with aspirin because possibility for drug interaction and this was clear from our present study with liver section for administrated diclofenac with aspirin together and this agreement with or hisotopathological result in present study.

Dietary Habits of Iraqi Women with Breast Cancer at Oncology Hospitals in Baghdad City: Comparative Study

Hadeel Mousa Mahalhal1, Hawraa Hussein Ghafel2
1MSc, Ministry of Health Student at Maternal and Neonate Nursing Department, College of Nursing, University of Baghdad, 2Lecturer at, Maternal and Neonate Nursing Department, College of Nursing, University of Baghdad

Abstract

Background: Dietary pattern explains the overall diet; the food, food groups and nutrients included; their variety and combination. Breast cancer is the most prevalent cancer among women worldwide. Many risk factors for breast cancer contribute to personal habits, such as diet and exercise. Certain risk factors linked to lifestyle include decisions to have children and to take medicines containing hormones.

Objectives of the study: To assess women’s dietary Habits, Foods Choices, and to find out the relation between demographic characteristics and breast cancer.

Methodology: A descriptive and analytic study, non-probability (a purposive sample) consist of (100) women was carried out at three Oncology Hospitals in Baghdad City, Iraq. The study group consist of (100) women divided in two groups the first one include (50) women as a (study group) that attending An oncology Hospitals and the second include (50) women as a (control group) that attending the Primary Health Care Centers.

Results: Women in both groups are consuming red meat with low frequency and amount than normal consumption. More than half of women with breast cancer are eating red meat one time per week (54%) while those without breast cancer are eating red meat two times per week (50%).

Conclusion: Women in both groups are consuming red meat with low frequency and amount than normal consumption.

Recommendation: Avoid eating canned and processed red meat with preservatives and replaced it with fresh well cooked meat. Community orientation towards a healthy, balanced nutrition that contains the basic elements that the body needs without focusing on a specific food. Activation the role of media in increase the awareness of women in the community about healthy diet. Instruct women with breast cancer to follow a healthy diet guideline and avoid eating canned and processed red meat with preservatives during their treatment courses.

Keywords: Dietary Pattern, Breast Cancer, Oncology Hospitals, Comparative Study

Introduction

Dietary pattern explains the overall diet; the food, food groups and nutrients included; their variety and combination; and the amount and quantity with which they are typically consumed. Among the most common methods for determining dietary patterns are a priori numerical indexes, which measure adherence to a dietary pattern that has been predefined on the basis of previous scientific evidence. Numerous indices also define variants of the same dietary pattern (e.g. Mediterranean diet score) or use different scores and weighting systems, such as population-specific diets versus set intake reductions for prescribed intakes (e.g. Alternative Healthy Eating Index).

Another method is to empirically derive common patterns of foods that appear to be processed together
using principal component analysis or that explain the greatest variability in intermediate outcomes[1]. Many risk factors for breast cancer contribute to personal habits, such as diet and exercise. Certain risk factors linked to lifestyle include decisions to have children and to take medicines containing hormones[2].

No single food or diet can prevent or cause breast cancer, but while living with the disease, a person’s dietary choices can make a difference to their risk of developing breast cancer or their overall wellbeing. Breast cancer has many common factors and is a complex disease. Some of these variables are not within a person’s control, including age, family history, genetics and gender. A person can regulate other factors, such as smoking, levels of physical activity, body weight, and diet, though. Some researchers indicated that dietary factors could account for (30–40%) of all cancers[3].

Breast cancer is the most prevalent cancer among women worldwide. Humans have long known about breast cancer. The Edwin Smith Surgical Papyrus for example explains breast cancer cases. This medical text is from 3000–2,500 B.C. And probably due to Imhotep (Egyptian doctor-architect), offers authentic breast cancer accounts[4]. Food frequency intake consists of a finite list of foods and beverages with response categories that represent the normal level of consumption over the requested time period. The normal serving size can be ordered separately for each food and beverage.

To order to determine the overall diet, the amount of foods and beverages usually varies from (80 to 120). Alternatively, portion size can be paired with frequency information by asking respondents to convert the usual amount of consumption to the number of specified units (e.g. how often do you consume 1/2 cup of rice?). Many questionnaires contain portion size photographs in an attempt to improve reporting accuracy. Its objective is to obtain information on the frequency and, in some cases, the portion size of food and drink consumption over a specified period of time, usually the last month or year[5]. Dietary habits and decisions play a key role in human health. Dietary habits are common decisions made by individuals or groups of people as to what food they consume. Proper dietary choices include the use of minerals, vitamins, proteins, carbohydrates and fats[6].

Evidence has indicated that a healthy diet is associated with lower recurrence of breast cancer and increased overall mortality. Current food guidelines for cancer survivors have emphasized a plant-based diet rich in fruit and vegetables and low in red and processed meat[7]. Highly motivated individuals who maintain large reductions in their very long-term meat intake (> 3 servings per week) may gain benefits.

For people interested in reducing meat consumption (whether to improve health or mitigate the environmental effects of meat production), certainly nothing in this guideline argues against that lifestyle change[8]. Consuming meat can increase breast cancer risk. Possible causes include increased fat consumption, exposure to chemicals produced at high temperatures when cooking meat and exposure to meat hormones[9]. Some studies, however, suggest that women who eat a lot of processed meat (such as sausage and bacon) may be at increased risk of breast cancer[10].

**Methodology**

The data was collected through the use of a questionnaire. After getting the official approval from previous mentioned hospitals and primary health care centers, the sample was include (100) women divided in two groups the first one (Study Group) is consist of (50) women that with breast cancer that attending Oncology Hospitals and the second one (Control Group) consist of (50) women without breast cancer that attending Primary Health Care Centers in Baghdad City in the two directors AL-Karch and AL-Rasafa. For the purpose of dietary pattern assessment there are four methods including (Anthropometric measurement, Biochemical/biophysical methods, Clinical methods and Dietary assessment) in this study using the last one (Dietary assessment). The measurement of food and fluid intake is an essential part of the diet assessment. It provides information on dietary quality and quantity, food allergies, changes in appetite and explanations and sensitivity, for insufficient intake of food during or after illness. In this method the researcher collects the information from the participants depend on the recording or memory of the participant, so in this study the researcher depend on the memory of the women to collect the data about the dietary pattern because the data was collected about the dietary pattern before the
incidence of breast cancer and then compared with the dietary pattern of women without breast cancer. The time consumed for filling the questionnaire is 15-30 minutes.

Results and Discussion

The analysis of table (1) shows that the highest percentage regarding women’s age is refer to age (50 – 59 ) years among the women in the case study group (50%) and the women in the control group (38%). The occupational status reveals that more than half of women in both group; the case and control group are housewives (58%) and only (32%) among case group and (30%) among control group are governmental employee. Regarding residency, the women are reporting that they are resident in an urban areas (case group= 64% and control group= 80%). The educational level variable indicates that the highest percentage is referring that women are reading and writing among both groups; the case and control groups (24%). More than half of women in both groups are showing normal marital status that are married (case group=62% and control group= 66%). Regarding body mass indicators, the highest percentage is referring that women are overweight in both groups; the case and study (38% and 44%). The socioeconomic status is referring to moderate as presented by highest percentage of monthly income that is (601,000-900,000) Iraqi dinars among both groups (case group=50% and control group=30%).

The table (2) reveals that women are preferring sheep meat (study group=70% and control group= 58%). The women are preferred to eat red meat with lunch meal (study group=68% and control group=50%). (24%) of women with breast cancer are eating red meat at restaurant while (38%) of women without breast cancer are eating at restaurant. Those with breast cancer are preferred more than one type of red meat (56%) while those without are preferred the red meat (50%). They preferred the fresh meat (study= 82% and control= 66%).

The table (3) depicts the evaluation of frequency of red meat items consuming by women; the finding shows that women in both groups are consuming red meat low frequency than normal consumption as indicated by the low mean scores for all item, but the findings indicate that the boiled meat and Pasty have high significant among the items of red meat in addition to meat sausage that show significant also.

The table (4) depicts the evaluation of amount of red meat items consuming by women; the finding shows that women in both groups are consuming red meat with low amount than normal consumption as indicated by the low mean scores for all item, but the findings indicate that the boiled meat has high significant among the items of red meat consumption.

Conclusion

Women in both groups are consuming red meat with low frequency and amount than normal consumption.
**Recommendation:** Avoid eating canned and processed red meat with preservatives and replace it with fresh well-cooked meat. Community orientation towards a healthy, balanced nutrition that contains the basic elements that the body needs without focusing on a specific food. Activation the role of media in increase the awareness of women in the community about healthy diet. Instruct women with breast cancer to follow a healthy diet guideline and avoid eating canned and processed red meat with preservatives during their treatment courses. Presence of nutritional consultant in every oncology hospital to guiding all women with breast cancer about a healthy diet and finally more studies to identify the impact of nutrition upon the incidence of breast cancer in women.

**Ethical Clearance:** The Research Ethical Committee at scientific research by ethical approval of both environmental and health and higher education and scientific research ministries in Iraq

**Conflict of Interest:** The authors declare that they have no conflict of interest.

**Funding:** Self-funding

Parents’ Knowledge Concerning School Phobia of their Children in Baghdad City, Iraq

Abdulmahdi A. Hasan
PhD, Ass. prof, psychiatric & Mental Health Nursing Department, college of nursing, Babylon University

Abstract

Background: Fear from school can also be described as any rejection by a child to join a school or to have difficult time attending the school for a complete day by a child. Aims of the study: To describe parents knowledge of their children with fear from school. Methodology: This study examined the analysis on the data collected by the Ibn Alhythm primary School all through from the middle of October till the end of January 2011 school year. The sample data took the form of surveys, questionnaires, and interviews by a researcher with parents who have been analyzed to investigate the associations among variables related to fear from school behaviour. “Ibn Alhythm primary School District’s Special Education Department collected data during the 2010-2011 school year. In hopes of identifying a representative sample of the school-refusing students in the district, the Special Education Department sent participation requests to a random sample of 40 of the 40 families described as having students who missed 18 or more days of the Ibn Alhythm primary School during the 2010-2011 school year. The information obtained did not include information from any students who were in Ibn Alhythm primary School through 1st grade or who missed fewer than 18 days of school, the information has been analyzed through data analysis. The results: The results of the study revealed that the educational program had a positive impact on the knowledge of family members. The results of the study have demonstrated that there is a correlation between the mothers’ knowledge and their demographic characteristics (age of parents, educational level, occupation, residential area). In general, knowledge of parents related to fear was low. However, the parents applied preventive measure towards their children with fear. A quasi-experimental study was conducted in the Ibn Alhythm primary school from the middle of October till the end of January 2011. Recommendation: Keep the sample group large. The author should get a fair representation of the population in doing so. Parents having a minimum level of experiences at school phobia, need a specific education program and training sessions. A specific education program can be designed and described to parent’s who have a minimum level of knowledge to enhance their level of knowledge.”

Keywords: Parents, Knowledge, child, Fear

Introduction

School fear can also be described as any child’s reluctance to go to school or having a child’s trouble attending classes for a whole day (1,2). According to (3,4) children missing long periods of school time, skipping classes, arriving late at school, missing sporadic school time periods, displaying severe morning misbehaviors in attempts to refuse school, attending school with great dread and somatic complaints. According to (5), school anxiety is present in around 5 per cent of children of school age. Left untreated, school phobia can lead to many dysfunctions in the long term. According to (4,5), school behavior fear is highly comorbid with various mental disorders such as segregation anxiety disorder (SAD), generalized anxiety disorder (GAD), oppositional defiant disorder (ODD), and depression. Most children who fear school actions have a variety of issues that internalize and outsource them. Problems of internalization include general and social anxiety, terror, weariness, sociality, and somatic complaints. Outsourcing issues include non-compliance with parent and teacher orders, disobedience and violence, running away from school or home, clinging and temper tantrums.
Popular elements among anxiety-based features like high school fear include a high degree of anxiety, a power struggle between students and either or both parents over the perceptions of helplessness of the students, inability to resist a powerful parent or parents, fear of failure to measure, thoughts that love is conditional on parental expectations, a propensity to ignore or avoid difficulty.

In order to treat school fear, it is important to have an understanding of the function of school refusal of a child. According to (8,9), children typically keep refusing school for one or more of the following functional conditions, including: to avoid school-based stimuli that give rise to a general sense of negative affectivity; to run away aversive school-based social and assessment situations.

Methodology

“The descriptive study included the review of data obtained during the (2010-2011) school year by Ibn Al-hythm Primary School. A representative sample of school-refusing students in their situation, the Department of Special Education sent requests for inclusion to a random sample of 40 out of 40 families identified as having children missing 18 or more days of Ibn Al-hythm primary school (10%) of the total number of days representing a full school year) in the (2010-2011) academic year. The data collection did not include information from any students who had been through 1st grade at Ibn Al-hythm primary school or who had missed less than 18 school days.

The instrument is composed of seventeen questions, four per state of maintenance. problem is rated on a scale of between 0 and 6, from never to ever. Once the scale is applied individually to children and parents, means are measured and ranked for each case. The highest-scoring condition is considered the primary variable preserving school refusal activity for a particular child.

The Questionnaire for the Parental Authority-Adapted Student Version (PAQ – ASV). (2) developed a PAQ to calculate three prototypes of parental authority for Baum rind (1971). Such three variants include authoritarianism, permissiveness and authoritarianism. The questionnaire consists of 30 items which yield permissive, authoritarian, and authoritative scores for both the mother and the father. Every object is rated on a scale of 1 to 5, ranging from sharp disagreement to strong agreement. This scale has been field-tested and found to be a valuable tool for the investigation of parental permissiveness, authoritarianism and authoritarianism correlates.

</tbody>
</table>

Table (5) indicated the high percentage of perceptions of adapted-parent was authoritative (60%), also the low percentage (2.5%) was permissive.

Discussion

“"This current study is analyses simple data obtain from New Baghdad Area of Ibn Al-hythem primary School District in an attempt to propound and to answer four questions concerning the nature of school refusal in the Ibn Al-hythem primary School District. The study answered the following questions. Results of this study shown that the incident rate of school-refusing students in the Ibn Al-hythem primary School District was (14.75)% during the 2010-2011 school year. This rate, according to (8) is alarming because it is almost three times the rate reported thru (9); they described at that time that the prevalence rate of school refusal in school-aged children was (5%). These results suggest that school refusal behaviour is a very serious problem that needs to be addressed by the Ibn Al-hythem primary School District. High proportions of school refusal behaviour may contributed to improved drop-out rates and the reduced probability of students in the Ibn Al-hythem primary School District attending college (10). As a outcome, this number may be underrepresented in the sample. Beside, some students were might have falsely informed having a medical illness to make an excuse for their extreme absenteeism.

Regards to race, 92.5% of the sample was composed of, and the remaining (7.5)% of students were equal among races (10). While these results are not consistent with outcomes that recommend school refusal behaviour is equal among races, these results are fairly representative of the general student population in the Ibn Al-hythem primary School District more of the students in the simple data sample, who were distributed evenly across grades (3), missed (18-23) days of school. No significant differences at school refusal behavior were found between the ten different grades in the study. Research suggests that school refusal behaviour is most prevalent during transition years in school (3). Findings of current study shown most students in the sample were from single-parent homes (60%). According to the study of (6), family and marital conflict can trigger school refusal behaviour. The students were had two-parent households may have skilled just as much, if not more, family and marital conflict as those students, who survived in single-parent households. Also, it is not pure if the parents of students living in single-parent households lived with a paramour or significant other.

Around 40 students recorded a missed school in the study to seek measurable strengths (35 per cent). The pursuit of tangible reinforcements occurred most
often of the four possible functions of school refusal behaviour. Convincingly, most parents in the sample indicated that their children missed school primarily for tangible reinforcements. Such findings indicate that both students and parents have the same perceptions of school rejection behavior’s primary function. This is a issue as evidence suggests that this school refuse feature appears to be more persistent than the others, and is generally correlated with severe family conflict or issue family dynamics (7).

Worthy of note is the fact that 37.5 per cent of the student sample and 30% of the parent sample approved both things on the SRAS as uncommon or never occurring. These results indicate that viewpoint in reaction may have influenced the majority of students (35 percent) and parents (60 percent) viewed the household’s parenting style as the Authoritative Type. This model of parenting style is closely associated with middle-class ideals and involves children as authoritative parents guide their children by two-way choices in the decision-making process. These results are not consistent with the research which indicates that authoritative parenting generally predicts positive adjustment among children and adolescents (9).

One possible explanation for these results may be attributed to response on the PAQ. Students as well as parents may have supported the responses they felt would be more beneficial. As a result, these study results might not be an accurate representation of the true perceptions of parenting style of the students and parents. First, 15 percent of the student sample and 27.5 percent of the parent sample considered an Authoritarian and Authoritative parenting style in their children. Authoritarian style of parenting has been observed more often in lower class families than in middle class families. from oppressive backgrounds tend to be overly self-conscious and rebelling. This rebellious streak also contributes to drug abuse. Children from authoritarian upbringings, too, tend to be distrustful, more hostile and more resentful towards their parents, and are rarely high attaining children (9,10).

Surprisingly, only four students 10% perceived their parents as being solely in an Authoritarian parenting style, and no students perceived their parenting style as permissive. Similarly, 7.5 per cent of the parent sample perceived their style of parenting as Authoritarian. Lastly, only 2.5% of the parent sample endorsed a permissive style of parenting. Findings indicate that the same types of parenting styles were commonly regarded by both students and parents in their homes. Limitations of the study are the small sample size acquired from the shelf data from a single school district that limits the extent to which generalizations can be made to the population.”

Conclusions

A thorough investigation of the child be done to rule out any medical concerns and if necessary professional counseling should be required to help the child.

Recommendations:

1. Keep large size of sample. In so doing the researcher will have a good representation of the population.

2. Parents having the minimum level of practices at fear from school need a specific education and training programs.

3. A specific a education programs can be designed and presented to parent’s who have a minimum level of knowledge to enhance their levels of knowledge.
